

# Intel Atom® Processor E3800 Product Family

## Datasheet

**October 2018**

**Revision 4.3**

Document Number: 538136, Rev. 4.3

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document. Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Performance varies depending on system configuration. No computer system can be absolutely secure. Check with your system manufacturer or retailer or learn more at intel.com.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, and fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps

Copies of documents which have an order number and are referenced in this document may be obtained by calling 1-800-548-4725 or visit www.intel.com/design/literature.htm.

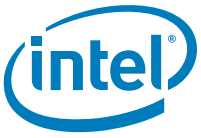
# Contents

**1 Introduction** ..... 29
- 1.1 Terminology ..... 31
- 1.2 Feature Overview ..... 32

**2 Physical Interfaces** ..... 38
- 2.1 Pin States Through Reset ..... 40
- 2.2 System Memory Controller Interface Signals ..... 41
- 2.3 PCI Express* 2.0 Interface Signals ..... 43
- 2.4 USB 2.0 Host (EHCI/xHCI) Interface Signals ..... 43
- 2.5 USB 2.0 HSIC Interface Signals ..... 44
- 2.6 USB 3.0 (xHCI) Host Interface Signals ..... 44
- 2.7 USB 2.0 Device (ULPI) Interface Signals ..... 44
- 2.8 USB 3.0 Device Interface Signals ..... 45
- 2.9 Serial ATA (SATA) 2.0 Interface Signals ..... 46
- 2.10 Integrated Clock Interface Signals ..... 46
- 2.11 Display - Digital Display Interface (DDI) Signals ..... 47
- 2.12 Display – VGA Interface Signals ..... 48
- 2.13 MIPI Camera Serial Interface (CSI) and ISP Interface Signals ..... 48
- 2.14 Intel® High Definition Audio Interface Signals ..... 49
- 2.15 Low Power Engine (LPE) for Audio ($I^2S$) Interface Signals ..... 49
- 2.16 Storage Control Cluster (eMMC, SDIO, SD) Interface Signals ..... 50
- 2.17 SIO – High Speed UART Interface Signals ..... 51
- 2.18 SIO – $I^2C$ Interface Signals ..... 52
- 2.19 SIO – Serial Peripheral Interface (SPI) Signals ..... 52
- 2.20 PCU – iLB – Real Time Clock (RTC) Interface Signals ..... 53
- 2.21 PCU – iLB – Low Pin Count (LPC) Bridge Interface Signals ..... 53
- 2.22 PCU – Serial Peripheral Interface (SPI) Signals ..... 54
- 2.23 PCU – System Management Bus (SMBus) Interface Signals ..... 55
- 2.24 PCU – Power Management Controller (PMC) Interface Signals ..... 55
- 2.25 JTAG and Debug Interface Signals ..... 56
- 2.26 Miscellaneous Signals ..... 56
- 2.27 GPIO Signals ..... 57
- 2.28 Power And Ground Pins ..... 61
- 2.29 Hardware Straps ..... 63
- 2.30 Configurable IO: GPIO Muxing ..... 64
- 2.31 Reserved Pins ..... 64

**3 Register Access Methods** ..... 65
- 3.1 Fixed IO Register Access ..... 65
- 3.2 Fixed Memory Mapped Register Access ..... 65
- 3.3 IO Referenced Register Access ..... 65
- 3.4 Memory Referenced Register Access ..... 66
- 3.5 PCI Configuration Register Access ..... 66
- 3.6 Message Bus Register Access ..... 68
- 3.7 Register Field Access Types ..... 69

**4 Mapping Address Spaces** ..... 71
- 4.1 Physical Address Space Mappings ..... 71
- 4.2 IO Address Space ..... 77



4.3 PCI Configuration Space ..... 79

**5 Integrated Clock** ..... 82

5.1 Features ..... 83

**6 Power Management** ..... 86

6.1 Power Management Features ..... 86
6.2 Power Management States Supported ..... 86
6.3 Processor Core Power Management ..... 91
6.4 Memory Controller Power Management ..... 97
6.5 PCI Express* (PCIe*) Power Management ..... 99

**7 Power Up and Reset Sequence** ..... 100

7.1 SoC System States ..... 100
7.2 Power Up Sequences ..... 100
7.3 Power Down Sequences ..... 105
7.4 Reset Behavior ..... 108

**8 Thermal Management** ..... 111

8.1 CPU Thermal Management Registers ..... 111
8.2 Thermal Sensors ..... 111
8.3 SoC Programmable Trips ..... 112
8.4 Platform Trips ..... 113
8.5 Thermal Throttling Mechanisms ..... 113
8.6 Thermal Status ..... 113

**9 Electrical Specifications** ..... 114

9.1 Thermal Specifications ..... 114
9.2 Storage Conditions ..... 115
9.3 Voltage and Current Specifications ..... 116
9.4 Crystal Specifications ..... 126
9.5 DC Specifications ..... 127
9.6 AC Specifications ..... 149

**10 Ballout and Package Information** ..... 209

10.1 SoC Attributes ..... 209
10.2 Package Diagrams ..... 210
10.3 Ball Name and Function by Location ..... 211
10.4 Alphabetical Ball Name List ..... 259

**11 Processor Core** ..... 270

11.1 Features ..... 270
11.2 Platform Identification and CPUID ..... 273
11.3 References ..... 274

**12 System Memory Controller** ..... 275

12.1 Signal Descriptions ..... 275
12.2 Features ..... 279
12.3 System Memory Controller (D-Unit) Message Registers ..... 283

**13 SoC Transaction Router** ..... 318

13.1 Transaction Router A-Unit Message Registers ..... 320
13.2 SoC Transaction Router PCI Config Access IO Registers ..... 323
13.3 Transaction Router B-Unit Message Registers ..... 325
13.4 Transaction Router C-Unit PCI Registers ..... 340

13.5 Transaction Router C-Unit Message Registers ..... 346
13.6 Transaction Router P-Unit Message Registers ..... 351

**14 Graphics, Video and Display** ..... 405

14.1 Features ..... 405
14.2 SoC Graphics Display ..... 406
14.3 Display Pipes ..... 407
14.4 Display Physical Interfaces ..... 407
14.5 References ..... 413
14.6 3D Graphics and Video ..... 413
14.7 Features ..... 414
14.8 VED (Video Encode/Decode) ..... 416
14.9 PCI Configuration Registers ..... 419
14.10 Memory Mapped Registers (1 of 2) ..... 445
14.11 Memory Mapped Registers (2 of 2) ..... 637
14.12 Memory Mapped Registers (Read Only) ..... 1029
14.13 Memory Mapped Registers (Write Only) ..... 1035

**15 MIPI-Camera Serial Interface (CSI) and ISP** ..... 1039

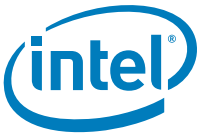
15.1 Signal Descriptions ..... 1039
15.2 Features ..... 1041
15.3 Imaging Subsystem Integration ..... 1044
15.4 Functional Description ..... 1046
15.5 MIPI-CSI-2 Receiver ..... 1048
15.6 Register Map ..... 1050
15.7 Image Signal Processor PCI Configuration Registers ..... 1052
15.8 Image Signal Processor Memory Mapped IO Registers ..... 1078

**16 Storage Control Cluster (eMMC, SDIO, SD Card)** ..... 1746

16.1 Signal Descriptions ..... 1746
16.2 Features ..... 1748
16.3 References ..... 1750
16.4 Register Map ..... 1751
16.5 SDIO for Wifi PCI Configuration Registers ..... 1753
16.6 SDIO for Wifi Memory Mapped IO Registers ..... 1765
16.7 SD Card PCI Configuration Registers ..... 1809
16.8 SD Card Memory Mapped IO Registers ..... 1821
16.9 eMMC 4.5 PCI Configuration Registers ..... 1865
16.10 eMMC 4.5 Memory Mapped IO Registers ..... 1877

**17 Serial ATA (SATA)** ..... 1921

17.1 Signal Descriptions ..... 1921
17.2 Features ..... 1922
17.3 References ..... 1924
17.4 Register Map ..... 1925
17.5 SATA PCI Configuration Registers ..... 1926
17.6 SATA Legacy IO Registers ..... 1955
17.7 SATA Index Pair IO Registers ..... 1961
17.8 SATA AHCI Memory Mapped IO Registers ..... 1963
17.9 SATA Primary Read Command IO Registers ..... 2000
17.10 SATA Primary Write Command IO Registers ..... 2005
17.11 SATA Primary Read Control IO Registers ..... 2007
17.12 SATA Primary Write Control IO Registers ..... 2008
17.13 SATA Secondary Read Command IO Registers ..... 2009



17.14 SATA Secondary Write Command IO Registers ..... 2014
17.15 SATA Secondary Read Control IO Registers ..... 2016
17.16 SATA Secondary Write Control IO Registers ..... 2017
17.17 SATA Lane 0 Electrical Register Address Map ..... 2019
17.18 SATA Lane 0 Electrical Register Address Map ..... 2049
17.19 SATA Lane 1 Electrical Register Address Map ..... 2066
17.20 SATA Lane 1 Electrical Register Address Map ..... 2096

**18 USB Host Controller Interfaces (xHCI, EHCI) ..... 2113**

18.1 Signal Descriptions ..... 2113
18.2 USB 3.0 xHCI (Extensible Host Controller Interface) ..... 2115
18.3 USB 2.0 Enhanced Host Controller Interface (EHCI) ..... 2116
18.4 References ..... 2117
18.5 Register Map ..... 2118
18.6 USB xHCI PCI Configuration Registers ..... 2120
18.7 USB xHCI Memory Mapped I/O Registers ..... 2163
18.8 USB EHCI PCI Configuration Registers ..... 2345
18.9 USB EHCI Memory Mapped IO Registers ..... 2369
18.10 USB EHCI Electrical Message Bus Registers ..... 2426

**19 USB Device Controller Interfaces (3.0, ULPI) ..... 2442**

19.1 USB Device Controller ..... 2444
19.2 References ..... 2445
19.3 Register Map ..... 2445
19.4 USB 3.0 Device PCI Configuration Registers ..... 2446
19.5 USB 3.0 Device PCI Configuration Registers ..... 2455
19.6 USB 3.0 Device Memory Mapped I/O Registers ..... 2460
19.7 USB 3.0 Device Memory Mapped I/O Registers ..... 2641

**20 Intel® High Definition Audio ..... 2661**

20.1 Signal Descriptions ..... 2662
20.2 Features ..... 2663
20.3 References ..... 2663
20.4 Register Map ..... 2664
20.5 HD Audio PCI Configuration Registers ..... 2666
20.6 HD Audio Memory Mapped I/O Registers ..... 2697

**21 Low Power Engine (LPE) for Audio ($I^2S$) ..... 2797**

21.1 Signal Descriptions ..... 2797
21.2 Features ..... 2798
21.3 Detailed Block Level Description ..... 2799
21.4 Software Implementation Considerations ..... 2802
21.5 Clocks ..... 2804
21.6 SSP ($I^2S$) ..... 2807
21.7 Programming Model ..... 2812
21.8 Register Map ..... 2817
21.9 Low Power Audio PCI Configuration Registers ..... 2818
21.10 pci_mem Address Map ..... 2826
21.11 Memory Mapped Shim Registers ..... 2837
21.12 Low Power Audio $I^2S0$ Address Map ..... 2864
21.13 Low Power Audio $I^2S0$ Address Map ..... 2884
21.14 Low Power Audio $I^2S0$ Address Map ..... 2904
21.15 Low Power Audio DMA0 Memory Mapped IO Registers ..... 2924
21.16 Low Power Audio DMA1 Memory Mapped IO Registers ..... 3037

**22 Intel® Trusted Execution Engine (TXE) ..... 3150**
22.1 Features ..... 3150
22.2 Register Map ..... 3151
22.3 Intel® TXE PCI Configuration Registers ..... 3153

**23 PCI Express* 2.0 ..... 3179**
23.1 Signal Descriptions ..... 3179
23.2 Features ..... 3180
23.3 References ..... 3183
23.4 Register Map ..... 3183
23.5 PCI Configuration Registers ..... 3184
23.6 PCI Express* PCI Configuration Registers ..... 3185
23.7 PCI Express* Lane 0 Electrical Address Map ..... 3229
23.8 PCI Express* Lane 0 Electrical Address Map ..... 3259
23.9 PCI Express* Lane 1 Electrical Address Map ..... 3277
23.10 PCI Express* Lane 1 Electrical Address Map ..... 3307
23.11 PCI Express* Lane 2 Electrical Address Map ..... 3325
23.12 PCI Express* Lane 2 Electrical Address Map ..... 3355
23.13 PCI Express* Lane 3 Electrical Address Map ..... 3373
23.14 PCI Express* Lane 3 Electrical Address Map ..... 3403

**24 Serial IO (SIO) Overview ..... 3420**
24.1 Serial I/O (SIO) Register Map ..... 3420
24.2 SIO DMA PCI Configuration Registers for SPI, HSUART, PWM ..... 3421
24.3 SIO DMA Memory Mapped I/O Registers for SPI, HSUART, PWM ..... 3430
24.4 SIO DMA PCI Configuration Registers for $I^2C$ ..... 3604
24.5 SIO DMA Memory Mapped I/O Registers for I2C ..... 3613

**25 SIO - Serial Peripheral Interface (SPI) ..... 3788**
25.1 Signal Descriptions ..... 3788
25.2 Features ..... 3789
25.3 Register Map ..... 3792
25.4 SIO SPI PCI Configuration Registers ..... 3793
25.5 SIO SPI Memory Mapped I/O Registers ..... 3802

**26 SIO - $I^2C$ Interface ..... 3819**
26.1 Signal Descriptions ..... 3819
26.2 Features ..... 3820
26.3 Use ..... 3826
26.4 References ..... 3827
26.5 Register Map ..... 3827
26.6 SIO $I^2C$ 0 PCI Configuration Registers ..... 3829
26.7 SIO $I^2C$ 0 Memory Mapped I/O Registers ..... 3838
26.8 SIO $I^2C$ 1 PCI Configuration Registers ..... 3877
26.9 SIO $I^2C$ 1 PCI Configuration Registers ..... 3887
26.10 SIO $I^2C$ 2 PCI Configuration Registers ..... 3926
26.11 SIO $I^2C$ 2 Memory Mapped I/O Registers ..... 3936
26.12 SIO $I^2C$ 3 PCI Configuration Registers ..... 3975
26.13 SIO $I^2C$ 3 Memory Mapped I/O Registers ..... 3985
26.14 SIO $I^2C$ 4 PCI Configuration Registers ..... 4024
26.15 SIO $I^2C$ 4 Memory Mapped I/O Registers ..... 4034
26.16 SIO $I^2C$ 5 PCI Configuration Registers ..... 4073
26.17 SIO $I^2C$ 5 Memory Mapped I/O Registers ..... 4083

26.18 SIO I2C 6 PCI Configuration Registers ..... 4122
26.19 SIO I2C 6 Memory Mapped I/O Registers ..... 4132

**27 SIO – High Speed UART** ..... 4171

27.1 Signal Descriptions ..... 4171
27.2 Features ..... 4172
27.3 Use ..... 4174
27.4 Register Map ..... 4175
27.5 SIO HSUART 0 PCI Configuration Registers ..... 4177
27.6 SIO HSUART 0 Memory Mapped I/O Registers ..... 4186
27.7 PCU PMC Memory Mapped I/O Registers ..... 4219
27.8 SIO HSUART 1 PCI Configuration Registers ..... 4253
27.9 SIO HSUART 0 Memory Mapped I/O Registers ..... 4262

**28 SIO – Pulse Width Modulation (PWM)** ..... 4295

28.1 Signal Descriptions ..... 4295
28.2 Features ..... 4296
28.3 Use ..... 4297
28.4 Register Map ..... 4297
28.5 SIO PWM 0 PCI Configuration Registers ..... 4299
28.6 SIO PWM 0 Memory Mapped I/O Registers ..... 4308
28.7 SIO PWM 1 PCI Configuration Registers ..... 4311
28.8 SIO PWM 1 Memory Mapped I/O Registers ..... 4320

**29 Platform Controller Unit (PCU) Overview** ..... 4323

29.1 Features ..... 4323
29.2 PCU iLB LPC Port 80h I/O Registers ..... 4325

**30 PCU – Power Management Controller (PMC)** ..... 4332

30.1 Signal Descriptions ..... 4332
30.2 Features ..... 4334
30.3 USB Per-Port Register Write Control ..... 4343
30.4 References ..... 4343
30.5 Register Map ..... 4343
30.6 PCU PMC IO Registers ..... 4344
30.7 PCU iLB PMC I/O Registers ..... 4347

**31 PCU – Serial Peripheral Interface (SPI)** ..... 4364

31.1 Signal Descriptions ..... 4364
31.2 Features ..... 4365
31.3 Use ..... 4377
31.4 Register Map ..... 4379
31.5 PCU SPI for Firmware Memory Mapped I/O Registers ..... 4380

**32 PCU – Universal Asynchronous Receiver/Transmitter (UART)** ..... 4414

32.1 Signal Descriptions ..... 4414
32.2 Features ..... 4415
32.3 Use ..... 4417
32.4 UART Enable/Disable ..... 4417
32.5 IO Mapped Registers ..... 4418
32.6 PCU iLB UART IO Registers ..... 4419

**33 PCU – System Management Bus (SMBus)** ..... 4428

33.1 Signal Descriptions ..... 4428

33.2 Features ....4429
33.3 Use ....4437
33.4 References ....4437
33.5 Register Map ....4437
33.6 PCU SMBUS PCI Configuration Registers ....4439
33.7 PCU SMBUS Memory Mapped I/O Registers ....4453
33.8 PCU SMBUS I/O Registers ....4465

**34 PCU – Intel® Legacy Block (iLB) Overview** ....4477

34.1 Signal Descriptions ....4477
34.2 Features ....4478
34.3 PCU iLB Interrupt Decode and Route ....4480

**35 PCU – iLB – Low Pin Count (LPC) Bridge** ....4514

35.1 Signal Descriptions ....4514
35.2 Features ....4515
35.3 Use ....4520
35.4 References ....4522
35.5 Register Map ....4522
35.6 PCU iLB Low Pin Count (LPC) Bridge PCI Configuration Registers ....4524
35.7 PCU iLB LPC BIOS Control Memory Mapped I/O Registers ....4541

**36 PCU – iLB – Real Time Clock (RTC)** ....4542

36.1 Signal Descriptions ....4542
36.2 Features ....4543
36.3 Interrupts ....4544
36.4 References ....4546
36.5 Register Map ....4546
36.6 IO Mapped Registers ....4546
36.7 Indexed Registers ....4546
36.8 PCU iLB Real Time Clock (RTC) I/O Registers ....4548

**37 PCU – iLB – 8254 Timers** ....4550

37.1 Signal Descriptions ....4550
37.2 Features ....4551
37.3 Use ....4551
37.4 Register Map ....4554
37.5 IO Mapped Registers ....4554
37.6 PCU iLB 8254 Timers IO Registers ....4555

**38 PCU – iLB – High Precision Event Timer (HPET)** ....4560

38.1 Features ....4560
38.2 References ....4562
38.3 Register Map ....4562
38.4 Memory Mapped Registers ....4562
38.5 PCU iLB High Performance Event Timer (HPET) Memory Mapped IO Registers ....4563

**39 PCU – iLB – GPIO** ....4571

39.1 Signal Descriptions ....4571
39.2 Features ....4571
39.3 Legacy Use ....4572
39.4 Memory Mapped Use ....4572
39.5 Register Map ....4574
39.6 GPIO Registers ....4574

39.7 PCU iLB GPIO S0 IO Addressed Registers ..... 4576
39.8 PCU iLB GPIO S0 Memory Addressed Registers ..... 4600
39.9 PCU iLB GPIO S5 IO Addressed Registers ..... 5044
39.10 PCU iLB GPIO S5 Memory Address Map ..... 5058

**40 PCU – iLB – Interrupt Decoding and Routing** ..... 5282

40.1 Features ..... 5282

**41 PCU – iLB – IO APIC** ..... 5284

41.1 Features ..... 5284
41.2 Use ..... 5286
41.3 Indirect I/O APIC Registers ..... 5287
41.4 PCU iLB IO APIC Memory Mapped I/O Registers ..... 5288

**42 PCU – iLB – 8259 Programmable Interrupt Controllers (PIC)** ..... 5290

42.1 Features ..... 5290
42.2 IO Mapped Registers ..... 5297
42.3 PCU iLB 8259 Interrupt Controller (PIC) I/O Registers ..... 5299

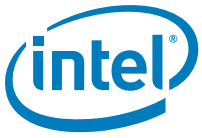
# Revision History

| Revision Number | Description | Revision Date |
|---|---|---|
| 1.0 | Initial release. | October 2013 |
| 1.5 | Chapter 2, "Physical Interfaces"<br>• Updated the table details of the GPIO Signals for GPIO_S0_SC[046], GPIO_S0_SC[047], GPIO_S0_SC[048], GPIO_S5[15], GPIO_S5[16], GPIO_S5[17].<br>Chapter 5, "Integrated Clock"<br>• Added table note (SoC Clock Outputs) that Intel recommends 25 MHz. 19.2 MHz is not validated.<br>Chapter 6, "Power Management"<br>• De-featured C6IS for all SKUs.<br>• Updated the table details of the SoC Sx-States to SLPT_S*# for PMC_PLTRST# from 0 or 1 to High or Low to match platform understanding.<br>• Remove VCC and VNN from Bay Trail-M/D SoC Power Rail DC Specs & Max Current table.<br>Chapter 7, "Power Up and Reset Sequence"<br>• Updated the figure and notes of the S0 to S3 to S4/S5 (Power Down) Sequence.<br>• Updated the table of the S4/S5 to S0 (Power Up) Sequence for t3 parameter from 100 max to 95 min (no max).<br>Chapter 9, "Electrical Specifications"<br>• Updated the table details of the 25 MHz Platform Clock AC Specification.<br>Chapter 11, "Processor Core"<br>• Updated 11.1 note on Thermal management support.<br>Chapter 12, "System Memory Controller"<br>• Updated 12.2.2 table title and details for "Supported DDR3L Memory Size Per Rank" and "Supported DDR3L SO-DIMM Size".<br>Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)"<br>• Updated the supported SDIO/SD card bandwidth is up to 400Mbits per seconds.<br>Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)"<br>• Added figure note of the xHCI and EHCI Port Mapping.<br>• Updated USB configuration register to correctly reflect the power well.<br>Chapter 22, "Intel® Trusted Execution Engine (TXE)"<br>• Updated chapter title to Intel® Platform Trust Technology (PTT).<br>Chapter 29, "Platform Controller Unit (PCU) Overview"<br>• Added a note to Platform Clock Support section that Intel recommends 25 MHz as 19.2 MHz is not validated. | December 2013 |
| 2.0 | Chapter 7, "Power Up and Reset Sequence"<br>• Updated the 7.2.2 note 4<br>• OK to swap V1P0A and V1P8A<br>• Measurement point for timing is 90% (10% on power down)<br>Chapter 9, "Electrical Specifications"<br>• Added S3 power spec per measurements<br>• Added generic clock jitter specs | February 2014 |

| Revision Number | Description | Revision Date |
|---|---|---|
| 2.5 | Chapter 2, "Physical Interfaces"<br>• Updated 2.28 RTC_VCC detail<br>Chapter 7, "Power Up and Reset Sequence"<br>• Updated the 7.2.2 note 7<br>• Updated the 7.3.1 note 6 and note 7<br>• Measurement point for timing is 90% (10% on power down)<br>Chapter 9, "Electrical Specifications"<br>• Added 9.5.18 GPIO VIH max and VIL min<br>• Added 9.5.19 I2C VIH max and VIL min | April 2014 |
| 3.0 | Chapter 2, "Physical Interfaces"<br>• Updated RTC_VCC detail<br>Chapter 7, "Power Up and Reset Sequence"<br>• Updated slew rate to 10ms.<br>• Measurement point for timing is 10% on power down<br>Chapter 9, "Electrical Specifications"<br>• Added 9.5.18 GPIO VIH max and VIL min<br>• Added 9.5.19 I2C VIH max and VIL min<br>Chapter 11, "Processor Core"<br>• Removed support on C1E and C6C<br>Chapter 14, "Graphics, Video and Display"<br>• Updated 14.10.11 MSR (MSR_READ) offset to 180000h<br>Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)"<br>• Updated the Preset value feature to not PoR.<br>• Updated SDIO support SDR12/25.<br>Chapter 22, "Intel® Trusted Execution Engine (TXE)"<br>• Updated name of chapter to "Intel® Trusted Execution Engine (TXE)".<br>• Clarified use of descriptor mode and other requirements for the boot SPI.<br>• Added registers for Intel® TXE. | July 2014 |



| Revision Number | Description | Revision Date |
|---|---|---|
| 3.5 | Chapter 2, "Physical Interfaces"<br>• Changed Figure 3 USB_ULPI_REFCLK to output<br><br>Chapter 5, "Integrated Clock"<br>• Updated the MCSI clock to 80-500 MHz<br><br>Chapter 7, "Power Up and Reset Sequence"<br>• Updated Table 58, max tolerance time, to 2000us - to avoid in rush current<br>• removed PMC_SUSPWRDNACK from figure 13<br>• updated PMC_SUSPWRDNACK in figure 14<br><br>Chapter 9, "Electrical Specifications"<br>• Added SPI NOR AC Spec<br>• Updated GPIO Vih/Vil min and max<br>• changed the I2S max clock frequency to 12.288 MHz<br><br>Chapter 11, "Processor Core"<br>• Added Note: "L1 has parity protection and L2 has an ECC Protection."<br><br>Chapter 12, "System Memory Controller"<br>• Removed DECCSTAT OFFSET 61h register<br><br>Chapter 13, "SoC Transaction Router"<br>• Updated register TRR - OFFSET B1h<br><br>Chapter 22, "Intel® Trusted Execution Engine (TXE)"<br>• updated the SSP to support 24 bits data sample sizes<br><br>Chapter 29, "Platform Controller Unit (PCU) Overview"<br>• De-Featured Top Swap Mechanism | September 2014 |

| Revision Number | Description | Revision Date |
|---|---|---|
| 3.6 | Chapter 1, "Introduction"<br>• Changed Figure 1, "SoC Block Diagram" on page 34<br>• Changed Chapter 1, "Terminology"<br>• Changed Chapter 1, "Display Controller"<br>• Changed Chapter 1, "Graphics and Media Engine"<br>• Changed Chapter 1, "SKU List"<br><br>Chapter 2, "Physical Interfaces"<br>• Changed Figure 3, "Signals (2 of 2)" on page 43<br>• Changed Chapter 2, "Pin States Through Reset"<br>• Changed Table 9, "USB 2.0 Device Interface Signals" on page 49<br>• Changed Table 13, "Digital Display Interface Signals" on page 51<br>• Changed Chapter 2, "PCU – iLB – Low Pin Count (LPC) Bridge Interface Signals"<br>• Changed Table 24, "PCU - Serial Peripheral Interface (SPI) Signals" on page 58<br>• Changed Table 30, "Power and Ground Pins" on page 66<br><br>Chapter 5, "Integrated Clock"<br>• Updated Table 48, "SoC Clock Outputs" on page 88<br><br>Chapter 6, "Power Management"<br>• Updated Table 50, "General Power States for System" on page 92<br>• Changed Chapter 6, "Package C-States"<br><br>Chapter 7, "Power Up and Reset Sequence"<br>• Updated Chapter 7, "G3 to S0"<br>• Updated Table 63, "S3/S4/S5 to S0 Cause of Wake Events" on page 111<br>• Updated Chapter 7, "S0 to S3 and S4/S5/G3 Sequence"<br>• Updated Chapter 7, "S0 to S3 to S4/S5 (Power Down) Sequence without S0ix"<br>• Updated Table 63, "S3/S4/S5 to S0 Cause of Wake Events" on page 111<br>• Updated Chapter 7, "Reset Behavior"<br><br>Chapter 8, "Thermal Management"<br>• Updated Chapter 8, "Thermal Management"<br><br>Chapter 9, "Electrical Specifications"<br>• Updated Table 66, "Intel Atom® Processor E3800 Product Family Thermal Specifications" on page 118<br>• Updated Table 68, "Power Rail DC Specs and Max Current" on page 120<br>• Updated Table 69, "VCC and VNN Currents" on page 122<br>• Updated Table 75, "VGA_DDCCLK, VGA_DDCDATA Signal DC Specification" on page 133<br>• Updated Table 79, "DDI DDC Signal DC Specification (DDI[1:0]_DDCDATA, DDI[1:0]_DDCCLK)" on page 135<br>• Updated Table 83, "PCI Express* DC Clock Request Input Signal Characteristics" on page 137<br>• Updated Table 86, "SD Card DC Specification" on page 138<br>• Updated Table 87, "eMMC 4.5 Signal DC Electrical Specifications" on page 139<br>• Updated Table 88, "TAP Signal Group DC Specification (TAP_TCK, TAP_TRSRT#, TAP_TMS, TAP_TDI)" on page 140<br>• Updated Table 89, "TAP Signal Group DC Specification (TAP_TDO)" on page 140<br>• Updated Table 90, "TAP Signal Group DC Specification (TAP_PRDY#, TAP_PREQ#)" on page 141<br>• Updated Table 97, "Power Management 1.8V Suspend Well Signal Group DC Specification" on page 148<br>• Updated Table 100, "iLB RTC Well DC Specification (ILB_RTC_TEST#)" on page 149<br>• Added Table 105, "GPIO 3.3V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])" on page 151<br>• Updated Table 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0])" on page 152<br>• Updated Table 107, "GPIO 1.8V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])" on page 152<br>• Updated Table 108, "I2C Signal Electrical Specifications" on page 153 | January 2015 |

| Revision Number | Description | Revision Date |
|---|---|---|
| 3.6 | • Updated Table 140, "PCU - SPI NOR AC Specification" on page 197<br>• Updated Table 140, "PCU - SPI NOR AC Specification" on page 197<br><br>Chapter 12, "System Memory Controller"<br>• Updated Chapter 12, "Features"<br><br>Chapter 14, "Graphics, Video and Display"<br>• Updated Chapter 14, "Features"<br>• Updated Chapter 14, "Video Engine"<br>• Updated Table 170, "Hardware Accelerated Video Decode Codec Support" on page 423<br><br>Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP"<br>• Updated Chapter 15, "Features"<br><br>Updated Table 178, "Imaging Capabilities" on page 1048<br><br>Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)"<br>• Updated Chapter 16, "SDIO/SD Card Interface Features"<br><br>Chapter 21, "Low Power Engine (LPE) for Audio ($I^{2S)}$"<br>• Updated Chapter 21, "External Timer"<br>• Updated Table 227, "Clock Frequencies" on page 2817<br><br>Chapter 30, "PCU – Power Management Controller (PMC)"<br>• Updated Table 292, "Transitions Due to Power Button" on page 4348<br>• Updated Chapter 30, "PMC_RSTBTN# Signal"<br>• UpdatedTable 293, "System Power Planes" on page 4349<br>• Updated Table 294, "Causes of SMI and SCI" on page 4352<br><br>Chapter 31, "PCU – Serial Peripheral Interface (SPI)"<br>• Updated Chapter 31, "Descriptor Mode"<br><br>Chapter 32, "PCU – Universal Asynchronous Receiver/Transmitter (UART)"<br>• Updated Chapter 32, "UART Enable/Disable"<br><br>Chapter 33, "PCU – System Management Bus (SMBus)"<br>• Added Chapter 33, "SPD Write Disable"<br><br>Chapter 34, "PCU – Intel® Legacy Block (iLB) Overview"<br>• Updated Chapter 34, "Non-Maskable Interrupt" | January 2015 |

| Revision Number | Description | Revision Date |
|---|---|---|
| 3.7 | Chapter 1<br>• Remove eSATA capable from Section 1.2.8<br>Chapter 7.2.1<br>• Updated Table 60<br>• Updated Table 61<br>Chapter 9.3<br>• Updated Table 68, Added AC Voltage Tolerance for Platform Rail<br>Chapter 9.6.1<br>• Removed Figure 19, Crystal Clock Timing<br>• Removed Table 106, Crystal Clock Timings<br>Chapter 9.5.8<br>• Updated Table 91<br>Chapter Note:<br>• Updated Table 140<br>• Added Figure 68<br>Chapter 9.6.19<br>• Updated Table 142<br>• Updated Figure 69<br>Chapter 19.6.87<br>• Added Note to Bit Range 31<br>Section 23.6<br>• Removed Note from Bit Range 28<br>Chapter 39<br>• Added a note to Chapter 39, “Memory Mapped Use”<br>• Updated Section 39.8.299<br>— Removed the VLV_GPIO_configuration_primer_presentation<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.8.300<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.8.301<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.8.302<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.10.143<br>— Removed the VLV2_GPIO_configuration_primer_presentation<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.10.144<br>• Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.10.145<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0<br>• Updated Section 39.10.146<br>— Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 | April 2015 |

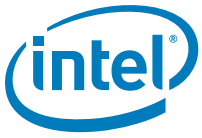
§ §



# 1 Introduction

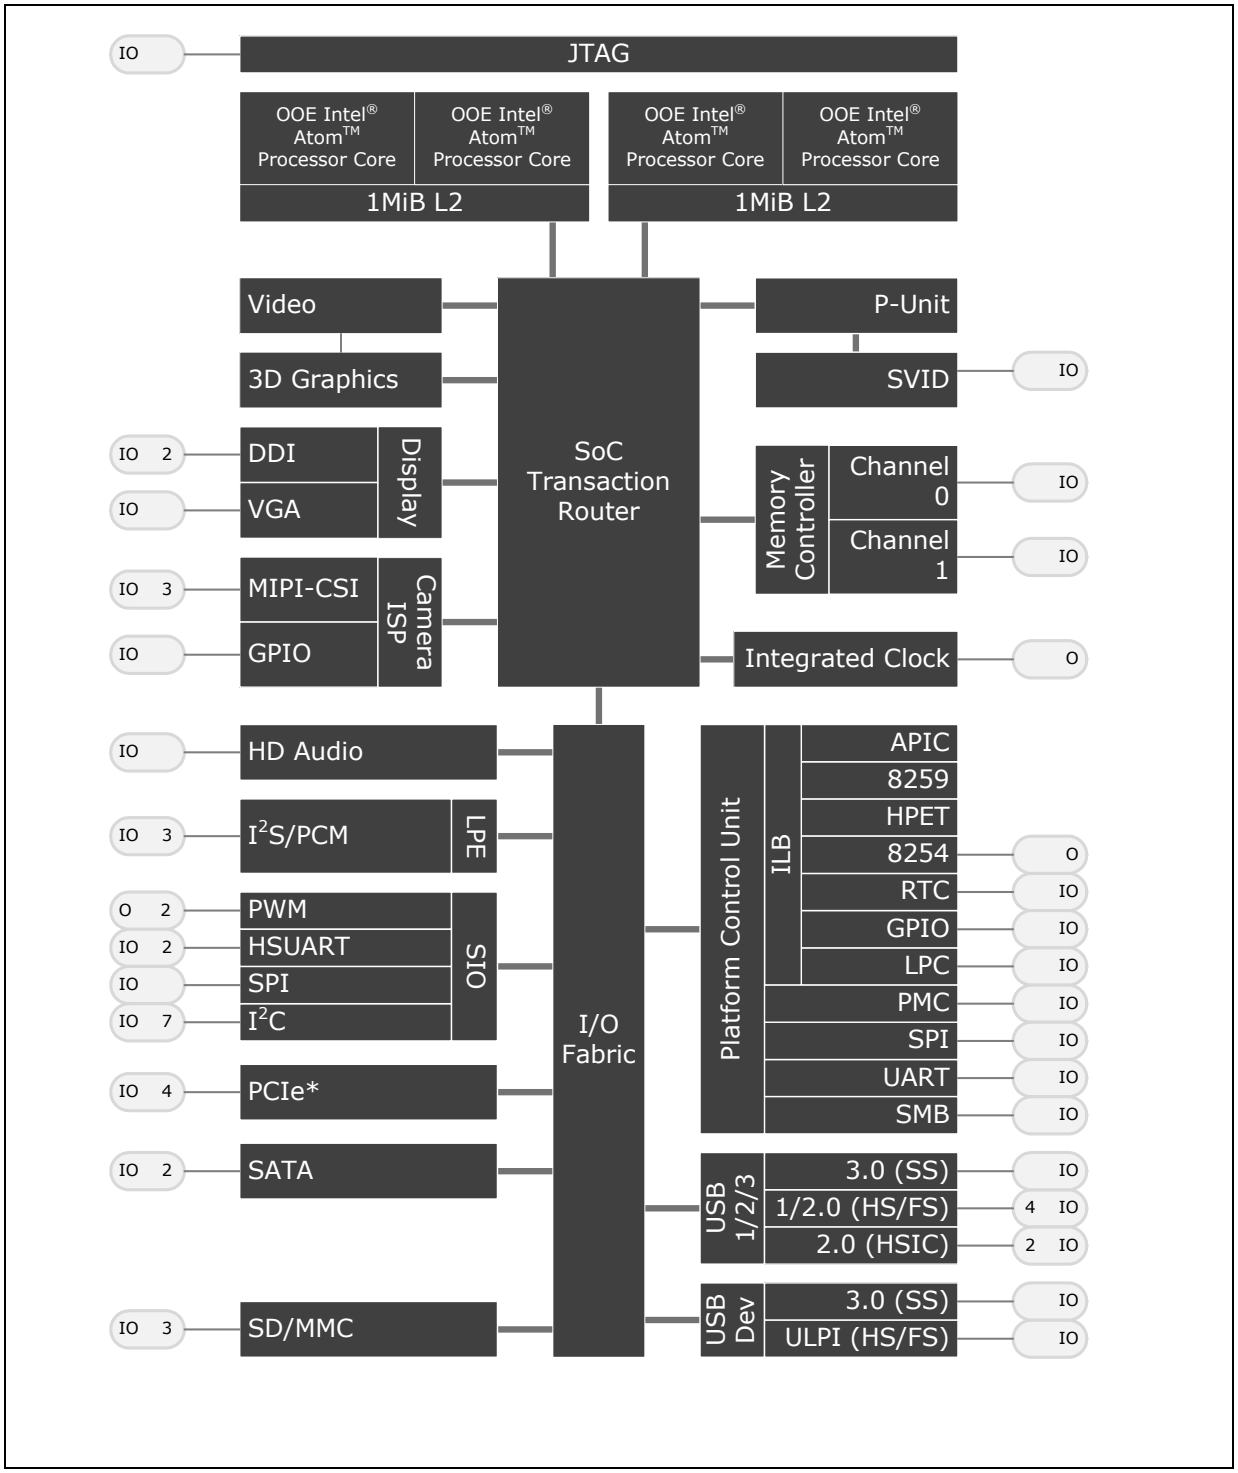
The Intel Atom ® Processor E3800 Product Family is the Intel Architecture (IA) SoC that integrates the next generation Intel® processor core, Graphics, Memory Controller, and I/O interfaces into a single system-on-chip solution.

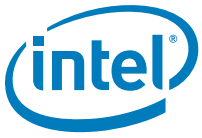
The figures below show the system level block diagram of the SoC. Refer to the subsequent chapters for detailed information on the functionality of the different interface blocks.

***Notes:*** Throughout this document Intel Atom ® Processor E3800 Product Family is referred to as the SoC or Processor.

This document details features of the silicon only. For platform support and software, contact your Intel representative.

**Figure 1. SoC Block Diagram**





## 1.1 Terminology

| Term | Description |
|---|---|
| ACPI | Advanced Configuration and Power Interface |
| Cold Reset | A Host reset with Power Cycle. See Table 135 |
| CRT | Cathode Ray Tube |
| CRU | Clock Reset Unit |
| DP | Display Port |
| DTS | Digital Thermal Sensor |
| EMI | Electro Magnetic Interference |
| eDP | embedded Display Port |
| HDMI | High Definition Multimedia Interface. HDMI supports standard, enhanced, or high-definition video, plus multi-channel digital audio on a single cable. HDMI transmits all Advanced Television Systems Committee (ATSC) HDTV standards and supports 8-channel digital audio, with bandwidth to spare for future requirements and enhancements (additional details available at http://www.hdmi.org/). |
| IGD | Internal Graphics Unit |
| Intel® TXE | Intel® Trusted Execution Engine |
| LCD | Liquid Crystal Display |
| LPE | Low Power Engine |
| MIPI CSI | MIPI Camera Interface Specification |
| MPEG | Moving Picture Experts Group |
| MSI | Message Signaled Interrupt. MSI is a transaction initiated outside the host, conveying interrupt information to the receiving agent through the same path that normally carries read and write commands. |
| MSR | Model Specific Register, as the name implies, is model-specific and may change from processor model number (n) to processor model number (n+1). An MSR is accessed by setting ECX to the register number and executing either the RDMSR or WRMSR instruction. The RDMSR instruction will place the 64 bits of the MSR in the EDX: EAX register pair. The WRMSR writes the contents of the EDX: EAX register pair into the MSR. |
| PCIe* | PCI Express* (PCIe*) is a high-speed serial interface. The PCIe* configuration is software-compatible with the existing PCI specifications. |
| PWM | Pulse Width Modulation |
| Rank | A unit of DRAM corresponding to the set of SDRAM devices that are accessed in parallel for a given transaction. For a 64-bit wide data bus using 8-bit (x8) wide SDRAM devices, a rank would be eight devices. Multiple ranks can be added to increase capacity without widening the data bus, at the cost of additional electrical loading. |
| SCI | System Control Interrupt. SCI is used in the ACPI protocol. |
| SDRAM | Synchronous Dynamic Random Access Memory |
| SERR | System Error. SERR is an indication that an unrecoverable error has occurred on an I/O bus. |

| Term | Description |
|---|---|
| SMI | System Management Interrupt is used to indicate any of several system conditions (such as thermal sensor events, throttling activated, access to System Management RAM, chassis open, or other system state related activity). |
| SIO | Serial I/O |
| TMDS | Transition-Minimized Differential Signaling. TMDS is a serial signaling interface used in DVI and HDMI to send visual data to a display. TMDS is based on low-voltage differential signaling with 8/10b encoding for DC balancing. |
| VCO | Voltage Controlled Oscillator |
| Warm Reset | Host Reset without Power Cycle. See Table 134 |

## 1.2 Feature Overview

All features subject to software availability.

### 1.2.1 Processor Core

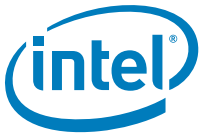
See Chapter 11, "Processor Core" for more details.

- Up to four IA-compatible low power Intel® processor cores
  - — One thread per core
- Two-wide instruction decode, out of order execution
- On-die, 32 KB 8-way L1 instruction cache and 24 KB 6-way L1 data cache per core
- On-die, 1 MB, 16-way L2 cache, shared per two cores
- L1 has parity protection and L2 has ECC protection
- 36-bit physical address, 48-bit linear address size support
- Supported C-states: C0, C1, C6
- Supports Intel® Virtualization Technology (Intel® VT-x)

### 1.2.2 System Memory Controller

See Chapter 12, "System Memory Controller" for more details.

- Supports up to two channels of DDR3L
- 64 bit data bus for each channel
- ECC supported in single channel mode only
- Supports x8 and x16 DDR3L SDRAM device data widths
- Supports DDR3L with 1066 or 1333 MT/s data rates
  - — Total memory bandwidth supported is 8.5 GB/s (for 1066 MT/s single channel) scalable to 21.3GB/s(for 1333 MT/s dual channel)
- Supports different physical mappings of bank addresses to optimize performance



- Out-of-order request processing to increase performance
- Aggressive power management to reduce power consumption
- Proactive page closing policies to close unused pages

### 1.2.3 Display Controller

See Chapter 14, "Graphics, Video and Display" for more details.

- Support 2 DDI ports to enable eDP 1.3, DP 1.1a, DVI, or HDMI 1.4a
- Support 2 panel power sequence for 2 eDP ports
- Support Audio on DP and HDMI
- Supports Intel® Display Power Saving Technology (DPST) 6.0, Panel Self Refresh (PSR) and Display Refresh Rate Switching Technology (DRRS)
- Supports one VGA port

***Note:*** These feature are not applicable to the E3805 SKU.

### 1.2.4 Graphics and Media Engine

See Chapter 14, "Graphics, Video and Display" for more details.

- Intel's 7th generation (Gen 7) graphics and media encode/decode engine
- VED video decoder in addition to Gen 7 Media decoder
- Supports DX*11, OpenGL 3.0 (OGL 3.0), OpenCL 1.2 (OCL 1.2), OpenGLES 2.0 (OGLES 2.0)
- GPU shader is capable of up to 8 gigaflops
- 4x anti-aliasing
- Full HW acceleration for decode of Up to 1080p@60fps and 3x 4kx2k @30fps (H.264/JPEG/MJPEG/MVC/MPEG-2 /WMV9/VC1)
- Full HW acceleration for encode of Up to 1080p@60fps and 1x 4kx2k @30fps (H.264)
- Supports 2.0 Stereoscopic 3D Stretch
- Polyphase 8 tap scaling
- HD HQV

***Note:*** These feature are not applicable to the E3805 SKU.

### 1.2.5 Image Signal Processor

See Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" for more details.

- Support up to three MIPI CSI ports
- Support for up to 24MP sensors

- Supports Stereoscopic Video

### 1.2.6 Power Management

See Chapter 6, "Power Management" for more details.

- ACPI 5.0 support
- Processor states: C0-C6
- Display device states: D0, D3
- Graphics device states: D0, D3
- System sleep states: S0, S3, S4, S5
- Dynamic I/O power reductions (disabling sense amps on input buffers, tristating output buffers)
- Active power-down of display links
- Downloadable power management firmware

### 1.2.7 PCI Express*

The SoC has four PCI Express* lanes and up to four PCI Express root ports, each supporting the PCI Express Base specification Rev 2.0 at a maximum of 5 Gbit/s data transfer rates.The root ports configurations are flexible and can be configured to be (4) x1, (2) x2's, (1) x2 plus (2) x1's, and (1) x4.

See Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" for more details.

### 1.2.8 SATA

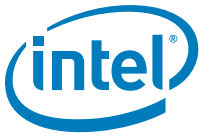
See Chapter 17, "Serial ATA (SATA)" for more details.

- Two (2) SATA Revision 2.0 ports
- Legacy IDE (including IRQ)/Native IDE/AHCI appearance to OS
- Partial/Slumber power management modes with wake
- Capable of 3 Gbit/s transfer rate

### 1.2.9 USB xHCI Controller

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

- Supports USB 3.0/2.0/1.1
- Implements xHCI software host controller interface
- One USB 3.0 Super Speed (SS) port
- Four ports multiplexed with EHCI controller that are High Speed/Full Speed (HS/FS)
- Two High Speed Inter Chip (HSIC) ports compliant with USB 2.0



### 1.2.10 USB 2.0 EHCI Controller

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

- Internal Rate Matching Hub to support USB 1.1 to 2.0 devices
- Four Ports multiplexed with xHCI controller
- Enhanced EHCI descriptor caching

### 1.2.11 USB 2.0 (ULPI) and 3.0 Device

See Chapter 19, "USB Device Controller Interfaces (3.0, ULPI)" for more details.

- Supports one USB 3.0 SS port with USB device compatibility
- Supports one ULPI port with HS/LS support

### 1.2.12 Audio Controllers

#### 1.2.12.1 Low Power Engine (LPE) Audio

LPE is a complete audio solution based on an internal audio processing engine, which includes three $I^2S$ output ports. See Chapter 21, "Low Power Engine (LPE) for Audio ($I^2S$)" for more details.

LPE supports:

- $I^2S$ and DDI with dedicated DMA
- MP3, AAC, AC3/DD+, WMA9, PCM (WAV)

***Note:*** Codecs supported depend on software and may be different.

#### 1.2.12.2 Intel® High Definition Audio (Intel® HD Audio)

See Chapter 20, "Intel® High Definition Audio" for more details.

- Four in + four out streams (Only 3 used)
- One stream for each DDI, available for HDMI and DP
- No wake on audio (modem) support

### 1.2.13 Storage Control Cluster (eMMC, SDIO, SD)

See Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)" for more details.

- Supports one SDIO 3.0 controller
- Supports one eMMC 4.5 controller
- Supports one SDXC controller

### 1.2.14 Intel® Trusted Execution Engine (Intel® TXE)

Intel® TXE is a security co-processor used to enable security features.

See Chapter 22, "Intel® Trusted Execution Engine (TXE)" for more details.

Security features include:

- Isolated execution environment for crypto operations (SKU-enabled)
- Supports secure boot - with customer programmable keys to secure code

***Note:*** The SoC requires TXE firmware in the PCU SPI flash image to function. Contact your Intel® representative for details.

### 1.2.15 Serial I/O (SIO)

See Chapter 24, "Serial IO (SIO) Overview" for links to more information about each interface.

- Controller for external devices via SPI, UART, $I^2C$ or PWM
- Each port is multiplexed with general purpose I/O for configurations flexibility
- Supports up to 7 $I^2C$, 2 HSUART, 2 PWM, 1 SPI interface

### 1.2.16 Platform Control Unit (PCU)

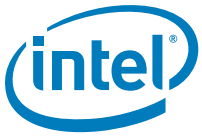
The platform controller unit is a collection of HW blocks, including SMBus, UART, debug/boot SPI and Intel legacy block (iLB), that are critical to implement a Windows* compatible platform. See Chapter 29, "Platform Controller Unit (PCU) Overview" for links to more information about each interface.

Key PCU features include:

- SMBus Host controller - supports SMBus 2.0 specification
- Universal Asynchronous Receiver/Transmitter (UART) with COM1 interface
- A Serial Peripheral Interface (SPI) for Flash only - stores boot FW and system configuration data
- Intel Legacy Block (iLB) supports legacy PC platform features
  - RTC, Interrupts, Timers, General Purpose I/Os (GPIO) and Peripheral interface (LPC for TPM) blocks.

### 1.2.17 Package

This SoC is packaged in a Flip-Chip Ball Grid Array (FCBGA) package with 1170 solder balls with 0.593 mm (minimum) ball pitch. The package dimensions are 25mm x 27mm. See Chapter 10, "Ballout and Package Information" for more details.



## 1.2.18 SKU List

**Table 1. Intel Atom ® Processor E3800 Product Family SKUs**

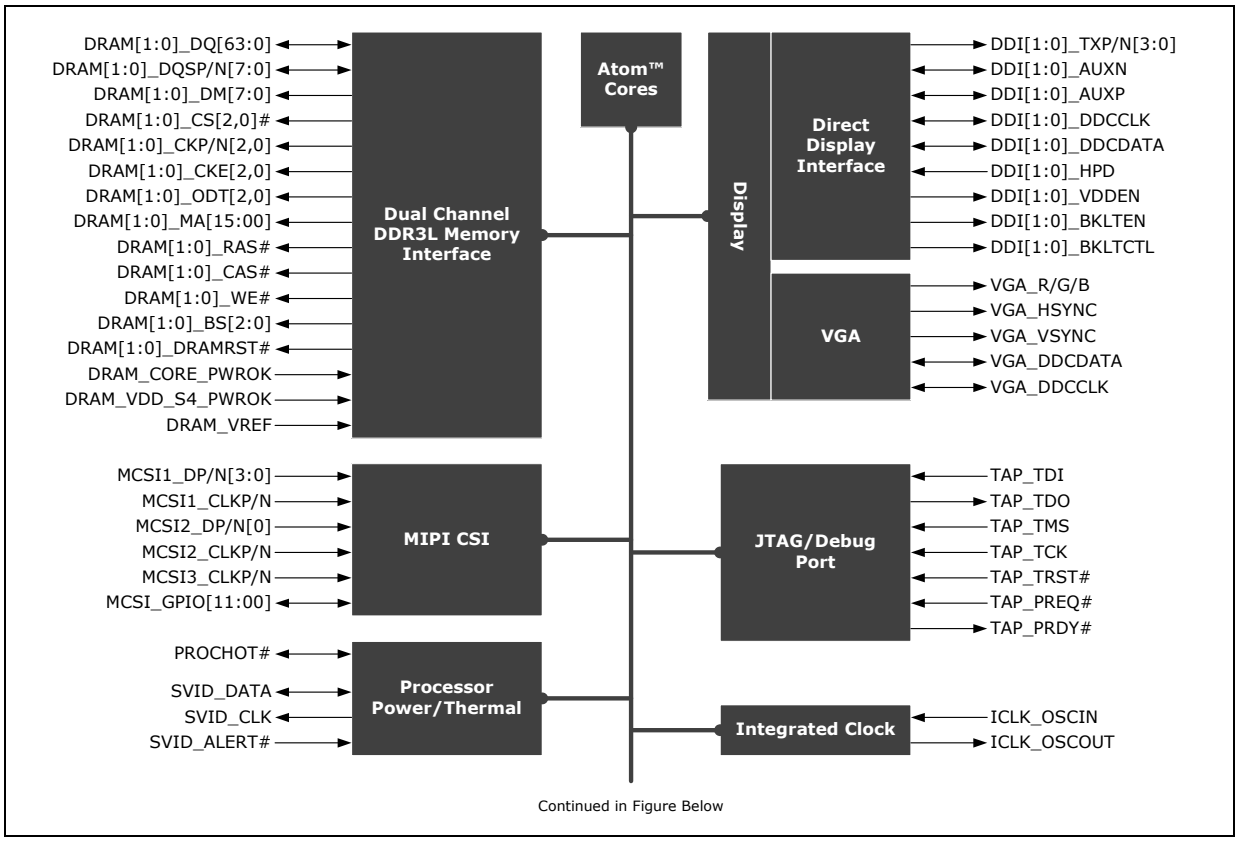
| SKU | Processor Number | CPU | TDP (W) | Core LFM (MHz)/ HFM (GHz) | Tj (°C) | GFX Normal / Burst (MHz) | DDR (MT/s) |
|---|---|---|---|---|---|---|---|
| Premium | E3845 | 4 | 10 | 500 / 1.91 | -40 to 110 | 542 / 792 | 1333 |
| Hi | E3827 | 2 | 8 | 500 / 1.75 | -40 to 110 | 542 / 792 | 1333 |
| Intermediate | E3826 | 2 | 7 | 533 / 1.46 | -40 to 110 | 533 / 667 | 1066 |
| Mid | E3825 | 2 | 6 | 533 / 1.33 | -40 to 110 | 533 / NA | 1066 |
| Entry | E3815 | 1 | 5 | 533 / 1.46 | -40 to 110 | 400 / NA | 1066 |
| Headless | E3805 | 2 | 3 | 533 / 1.33 | -40 to 110 | NA | 1066 |

§

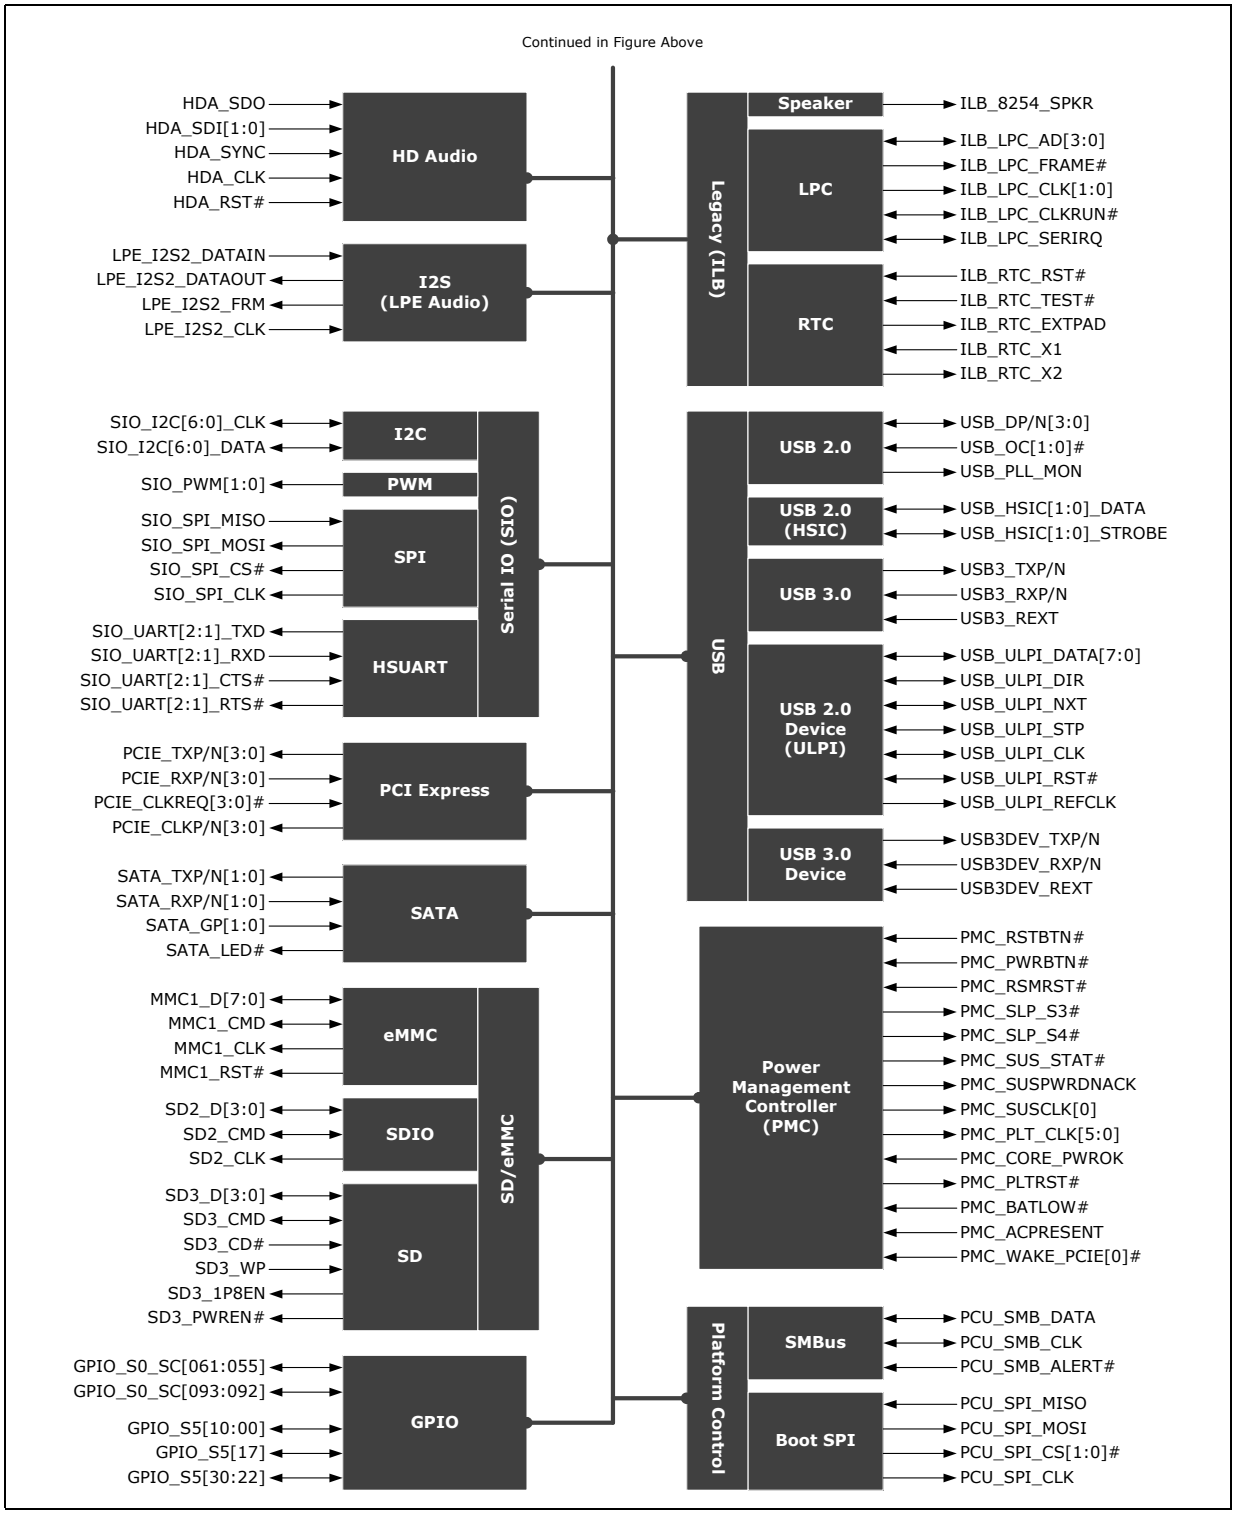
# 2 Physical Interfaces

Many interfaces contain physical pins. These groups of pins make up the physical interfaces. Because of the large number of interfaces and the small size of the package, Some interfaces share their pins with GPIOs, while others use dedicated physical pins. This chapter summarizes the physical interfaces, including the diversity in GPIO multiplexing options.

**Figure 2. Signals (1 of 2)**



## Figure 3. Signals (2 of 2)



## 2.1 Pin States Through Reset

This chapter describes the states of each signal before, during and directly after reset. Additionally, Some signals have internal pull-up/pull-down termination resistors, and their values are also provided (Term). Termination tolerances are +/- 50% unless otherwise specified by electrical specs (PCIe*, and other differential termination). All signals with the "†" symbol are muxed and may not be available without configuration. See Section 2.30, "Configurable IO: GPIO Muxing" on page 68.

***Note:*** The internal termination resistor values & pull directions described in this chapter are the power-on defaults. Firmware & software may change the termination value, pull direction or disable the termination completely, on a pin-by-pin basis, using the _PCONF0 register corresponding to that pin.

**Table 2. Platform Power Well Definitions**

| Power Type | Power Well Description |
|---|---|
| V1P05S | 1.05 V rail. On in S0 only. |
| V1P0A | 1.0 V rail. On in S0 through S4/5. |
| V1P0S | 1.0 V rail. On in S0 only. |
| V1P24A | 1.24 V rail. On in S0 through S4/5. |
| V1P24S | 1.24 V rail. On in S0 only. |
| V1P35U | 1.35 V rail. On in S0 through S3. |
| V1P8A | 1.8 V rail. On in S0 through S4/5. |
| V1P35S | 1.35 V rail. On in S0 only. |
| V1P8S | 1.8 V rail. On in S0 only. |
| V3P3A | 3.3 V rail. On in S0 through S4/5. |
| VAUD | 1.5 V rail for HD Audio. 1.8 V rail for $I^2S$. On in S0 only. |
| VCC | Variable core rail. On in S0 only. |
| VLPC | 1.8 or 3.3 V rail for LPC. On in S0 only. |
| VNN | Variable rail. On in S0 only. |
| VPCIESATA | 1.0 V rail for PCIe* and SATA. On in S0 only. |
| VRTC | RTC voltage rail. On in S0 through G3. |
| VSDIO | 1.8 or 3.3 V rail for SD3. On in S0 only. |
| VSFR | 1.35 V rail for internal PLLs. On in S0 only. |
| VUSB2 | 3.3 V rail. On in S0 through S4/5. |
| VVGA_GPIO | 3.3 V rail for VGA sideband. On in S0 only. |

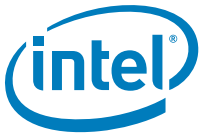


**Table 3. Default Buffer State Definitions**

| Buffer State | Description |
|---|---|
| High-Z | The SoC places this output in a high-impedance state. For inputs, external drivers are not expected. |
| Do Not Care | The state of the input (driven or tristated) does not affect the SoC. For outputs, it is assumed that the output buffer is in a high-impedance state. |
| $V_{OH}$ | The SoC drives this signal high with a termination of 50 Ω. |
| $V_{OL}$ | The SoC drives this signal low with a termination of 50 Ω. |
| Unknown | The SoC drives or expects an indeterminate value. |
| $V_{IH}$ | The SoC expects/requires the signal to be driven high. |
| $V_{IL}$ | The SoC expects/requires the signal to be driven low. |
| Pull-up | This signal is pulled high by a pull-up resistor (internal value specified in "Term" column). |
| Pull-down | This signal is pulled low by a pull-down resistor (internal value specified in "Term" column). |
| Running/T | The clock is toggling, or the signal is transitioning. |
| Off | The power plane for this signal is powered down. The SoC does not drive outputs, and inputs should not be driven to the SoC. (VSS on output) |

## 2.2 System Memory Controller Interface Signals

See Chapter 12, "System Memory Controller" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

### Table 4. DDR3L System Memory Signals

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| DRAM0_CKP[2,0] | O | - | V1P35U | Off | High-Z | High-Z | High-Z | |
| DRAM0_CKN[2,0] | O | - | V1P35U | Off | High-Z | High-Z | High-Z | |
| DRAM0_CS#[2,0] | O | - | V1P35U | Off | $V_{OH}$ | $V_{OH}$ | $V_{OH}$ | |

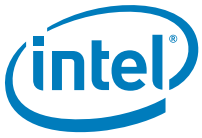
| DRAM1_DQSN[7:0] | I/O | - | V1P35U | Off | High-Z | High-Z | High-Z | |
| DRAM_VDD_S4_PWROK | I | - | V1P35U | $V_{IL}$ | $V_{IH}$ | Unknown | $V_{IH}$ | |
| DRAM_CORE_PWROK | I | - | V1P35U | $V_{IL}$ | $V_{IL}$ | Unknown | $V_{IH}$ | |
| DRAM_VREF | I | - | V1P35U | | | | | |
| DRAM_RCOMP[2:0] | - | - | V1P35U | | | | | |



## 2.3 PCI Express* 2.0 Interface Signals

See Chapter 21, "PCI Express* 2.0" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 5. PCI Express* 2.0 Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| PCIE_TXP[3:0] | O | 50 | VPCIESATA | Off | Off | $V_{OL}$ | $V_{OL}$ | |
| PCIE_TXN[3:0] | O | 50 | VPCIESATA | Off | Off | $V_{OL}$ | $V_{OL}$ | |
| PCIE_RXP[3:0] | I | 50 | VPCIESATA | Off | Off | High-Z | High-Z | |
| PCIE_RXN[3:0] | I | 50 | VPCIESATA | Off | Off | High-Z | High-Z | |
| PCIE_CLKP[3:0] | O | - | V1P0S | Off | Off | Running/ $V_{IL}$ | Running/ $V_{IL}$ | |
| PCIE_CLKN[3:0] | O | - | V1P0S | Off | Off | Running/ $V_{IL}$ | Running/ $V_{IL}$ | |
| PCIE_CLKREQ[3:0]#† | I | 20k(H) | V1P8S | Off | Off | Pull_up | Pull_up | |
| PCIE_RCOMP_P/N | - | - | | | | | | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.4 USB 2.0 Host (EHCI/xHCI) Interface Signals

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 6. USB 2.0 Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| USB_DN[3:0] | I/O | - | VUSB2 | | | | | |
| USB_DP[3:0] | I/O | - | VUSB2 | | | | | |
| USB_OC[1:0]#† | I | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Pull-up | |
| USB_RCOMPI | I | - | - | | | | | |
| USB_RCOMPO | O | - | - | | | | | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.5 USB 2.0 HSIC Interface Signals

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 7. USB 2.0 HSIC Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| USB_HSIC0_DATA | I/O | - | V1P24A | Running | Running | $V_{OH}$ | Running | |
| USB_HSIC0_STROBE | I/O | - | V1P24A | $V_{OH}$ | | | | |
| USB_HSIC1_DATA | I/O | - | V1P24A | | | $V_{OH}$ | | |
| USB_HSIC1_STROBE | I/O | - | V1P24A | $V_{OH}$ | | | | |
| USB_HSIC_RCOMP | I | - | V1P24A | | | $V_{OH}$ | | |

## 2.6 USB 3.0 (xHCI) Host Interface Signals

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 8. USB 3.0 Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| USB3_TXN[0] | O | - | V1P0A | | | | | |
| USB3_TXP[0] | O | - | V1P0A | | | | | |
| USB3_RXN[0] | I | - | V1P0A | | | | | |
| USB3_RXP[0] | I | - | V1P0A | | | | | |
| USB3_REXT[0] | I | - | V1P0A | $V_{OL}$ | $V_{OL}$ | $V_{OH}$ | $V_{OH}$ | |

## 2.7 USB 2.0 Device (ULPI) Interface Signals

See Chapter 19, "USB Device Controller Interfaces (3.0, ULPI)" for more details.

***Note:*** S0ix is not supported for Bay Trail-I SKUs.

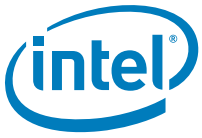


**Table 9. USB 2.0 Device Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| USB_ULPI_CLK† | I | 20k(L) | V1P8A | Pull-down | Pull-down | Pull-down | Pull-down | Pull-down |
| USB_ULPI_DATA[0:7]† | I/O | 20k(L) | V1P8A | Pull-down | Pull-down | Pull-down | Pull-down | Pull-down |
| USB_ULPI_DIR† | I | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Pull-up | Pull-up |
| USB_ULPI_NXT† | I | 20k(L) | V1P8A | Pull-down | Pull-down | Pull-down | Pull-down | Pull-down |
| USB_ULPI_STP† | O | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Pull-up | Pull-up |
| USB_ULPI_REFCLK† | O | 20k(L) | V1P8A | Pull-down | Pull-down | Pull-down | Pull-down | Pull-down |
| USB_ULPI_RST#† | O | - | V1P8A | Pull-down | Pull-down | Pull-down | Pull-down | Pull-down |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.8 USB 3.0 Device Interface Signals

See Chapter 19, "USB Device Controller Interfaces (3.0, ULPI)" for more details.

***Note:*** S0ix is not supported for Bay Trail-I SKUs.

**Table 10. USB 3.0 Device Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| USB3DEV_TXN[0] | O | - | V1P0S | | | | | |
| USB3DEV_TXP[0] | O | - | V1P0S | | | | | |
| USB3DEV_RXN[0] | I | - | V1P0S | | | | | |
| USB3DEV_RXP[0] | I | - | V1P0S | | | | | |
| USB3DEV_REXT[0] | I | - | V1P0S | | | | | |

## 2.9 Serial ATA (SATA) 2.0 Interface Signals

See Chapter 17, "Serial ATA (SATA)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 11. SATA 2.0 Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| SATA_TXP[1:0] | O | | VPCIESATA | Off | Off | | | |
| SATA_TXN[1:0] | O | | VPCIESATA | Off | Off | | | |
| SATA_RXP[1:0] | I | | VPCIESATA | Off | Off | | | |
| SATA_RXN[1:0] | I | | VPCIESATA | Off | Off | | | |
| SATA_LED#† | O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | Pull-up |
| SATA_GP[1:0]† | I | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | Pull-down |
| SATA_RCOMP_P/N | - | - | 1.0 V | | | | | |

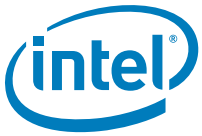
**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.10 Integrated Clock Interface Signals

See Chapter 5, "Integrated Clock" for more details..

**Table 12. Integrated Clock Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| ICLK_OSCIN | I | - | | Off | Off | Running | Running | |
| ICLK_OSCOUT | O | - | | Off | Off | Running | Running | |
| ICLK_ICOMP | - | - | | Off | Off | | | |
| ICLK_RCOMP | - | - | | Off | Off | | | |
| ICLK_DRAM_TERM[1:0] | - | - | - | Pull-down | Pull-down | Pull-down | Pull-down | |
| ICLK_USB_TERM[1:0] | - | - | - | Pull-down | Pull-down | Pull-down | Pull-down | |



## 2.11 Display - Digital Display Interface (DDI) Signals

See Chapter 14, "Graphics, Video and Display" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 13. Digital Display Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| DDI0_TXP[3:0] | O | | V1P0S | Off | Off | | | |
| DDI0_TXN[3:0] | O | | V1P0S | Off | Off | | | |
| DDI0_AUXP | I/O | | V1P0S | Off | Off | | | |
| DDI0_AUXN | I/O | | V1P0S | Off | Off | | | |
| DDI0_BKLTCTL† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI0_BKLTEN† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI0_DDCCLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| DDI0_DDCDATA† | I/O | 20k(L)[1] | V1P8S | Off | Off | Pull-down[1] | Pull-up[2] | |
| DDI0_HPD† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI0_VDDEN† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI_RCOMP_P/N | - | - | V1P0S | | | | | |
| DDI1_TXP[3:0] | O | | V1P0S | Off | Off | | | |
| DDI1_TXN[3:0] | O | | V1P0S | Off | Off | | | |
| DDI1_AUXP | I/O | | V1P0S | Off | Off | | | |
| DDI1_AUXN | I/O | | V1P0S | Off | Off | | | |
| DDI1_BKLTCTL† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI1_BKLTEN† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI1_DDCCLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| DDI1_DDCDATA† | I/O | 20k(L)[1] | V1P8S | Off | Off | Pull-down[1] | Pull-up[2] | |
| DDI1_HPD† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| DDI1_VDDEN† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |

**NOTE:** 1. The internal pull-down resistor is disabled upon assertion of PMC_CORE_PWROK.
**NOTE:** 2. When the corresponding DDI port is used, an external pull-up resistor is required.
**NOTE:** 3. All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.12 Display – VGA Interface Signals

See Chapter 14, "Graphics, Video and Display" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 14. VGA Interface Signals**

| | | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **Type** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| VGA_RED | O | | VVGA_GPIO | | Off | Off | High-Z | | |
| VGA_GREEN | O | | VVGA_GPIO | | Off | Off | High-Z | | |
| VGA_BLUE | O | | VVGA_GPIO | | Off | Off | High-Z | | |
| VGA_IREF | | | | | Off | Off | $V_{OL}$ | | |
| VGA_IRTN | | | | | Off | Off | High-Z | | |
| VGA_HSYNC | O | | VVGA_GPIO | | Off | Off | $V_{OL}$ | | |
| VGA_VSYNC | O | | VVGA_GPIO | | Off | Off | $V_{OL}$ | | |
| VGA_DDCCLK | O | | VVGA_GPIO | | Off | Off | High-Z | | |
| VGA_DDCDATA | I/O | | VVGA_GPIO | | Off | Off | High-Z | | |

## 2.13 MIPI Camera Serial Interface (CSI) and ISP Interface Signals

See Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" for more details.

***Note:*** S0ix is not supported for Bay Trail-I SKUs.

**Table 15. MIPI CSI Interface Signals (Sheet 1 of 2)**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| MCSI1_CLKN | I | | V1P24S | Off | | | | |
| MCSI1_CLKP | I | | V1P24S | Off | | | | |
| MCSI1_DN[0:3] | I | | V1P24S | Off | | | | |
| MCSI1_DP[0:3] | I | | V1P24S | Off | | | | |
| MCSI2_CLKN | I | | V1P24S | Off | | | | |
| MCSI2_CLKP | I | | V1P24S | Off | | | | |
| MCSI2_DN[0] | I | | V1P24S | Off | | | | |
| MCSI2_DP[0] | I | | V1P24S | Off | | | | |

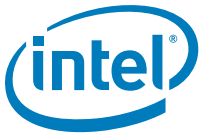


**Table 15. MIPI CSI Interface Signals (Sheet 2 of 2)**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| MCSI3_CLKN | I | | V1P24S | Off | | | | |
| MCSI3_CLKP | I | | V1P24S | Off | | | | |
| MCSI_RCOMP | - | | V1P24S | Off | High-Z | High-Z | High-Z | |

## 2.14 Intel® High Definition Audio Interface Signals

See Chapter 20, "Intel® High Definition Audio" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 16. HD Audio Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| HDA_SDO† | O | 20k(L) | VAUD | Off | Off | Pull-down | Pull-down | |
| HDA_SDI[1:0]† | I | 20k(L) | VAUD | Off | Off | Pull-down | Pull-down | |
| HDA_CLK† | O | 20k(L) | VAUD | Off | Off | Pull-down | Pull-down | |
| HDA_RST#† | O | 20k(L) | VAUD | Off | Off | Pull-down | Pull-down | |
| HDA_SYNC† | O | 20k(L) | VAUD | Off | Off | Pull-down | Pull-down | |
| HDA_LPE_RCOMP | - | | | | | | | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.15 Low Power Engine (LPE) for Audio ($I^2S$) Interface Signals

See Chapter 21, "Low Power Engine (LPE) for Audio ($I^2S$)" for more details.

***Note:*** S0ix is not supported for Bay Trail-I SKUs.

**Table 17. LPE Interface Signals**

| Signal Name | Dir | Term | Plat. Power | Default Buffer State | | | | Notes |
|---|---|---|---|---|---|---|---|---|
| | | | | S4/S5 | S3 | Reset | Enter S0 | |
| LPE_I2S[2:0]_CLK | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| LPE_I2S[2:0]_FRM | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| LPE_I2S[2:0]_DATAOUT | O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| LPE_I2S[2:0]_DATAIN | I | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |

## 2.16 Storage Control Cluster (eMMC, SDIO, SD) Interface Signals

See Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 18. Storage Control Cluster (eMMC, SDIO, SD) Interface Signals (Sheet 1 of 2)**

| Signal Name | Dir | Term | Plat. Power | Default Buffer State | | | | Notes |
|---|---|---|---|---|---|---|---|---|
| | | | | S4/S5 | S3 | Reset | Enter S0 | |
| MMC1_D[7:0]† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| MMC1_CMD† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| MMC1_CLK† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| MMC1_RST#† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| MMC1_RCOMP | I/O | - | V1P8S | | | | | |
| SD2_D[3:0]† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SD2_CMD† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SD2_CLK† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| SD3_D[3:0]† | I/O | 20k(H) | VSDIO | Off | Off | Pull-up | Pull-up | |
| SD3_CMD† | I/O | 20k(H) | VSDIO | Off | Off | Pull-up | Pull-up | |
| SD3_CLK† | I/O | 20k(L) | VSDIO | Off | Off | Pull-down | Pull-down | |
| SD3_PWREN#† | O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SD3_CD#† | I | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SD3_1P8EN† | O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |

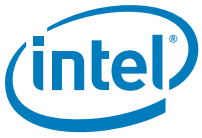

**Table 18. Storage Control Cluster (eMMC, SDIO, SD) Interface Signals (Sheet 2 of 2)**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| SD3_WP† | I | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SD3_RCOMP | - | - | VSDIO | | | | | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.
**NOTE:** VSDIO voltage selection is controlled by SD3_1P8EN. 3.3V is default due to pull-down. VSDIO can be either 1.8 or 3.3 V when these VSDIO referenced signals are configured to be GPIO's to meet different platform requirements.

## 2.17 SIO – High Speed UART Interface Signals

See Chapter 27, "SIO – High Speed UART" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 19. High Speed UART Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| SIO_UART1_RXD† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART1_TXD† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART1_RTS#† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART1_CTS#† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART2_RXD† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART2_TXD† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART2_RTS#† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_UART2_CTS#† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.18 SIO – I2C Interface Signals

See Chapter 26, "SIO - I2C Interface" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 20. SIO - I2C Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| SIO_I2C0_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C0_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C1_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C1_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C2_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C2_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C3_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C3_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C4_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C4_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C5_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C5_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C6_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_I2C6_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.19 SIO – Serial Peripheral Interface (SPI) Signals

See Chapter 25, "SIO - Serial Peripheral Interface (SPI)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 21. SIO - Serial Peripheral Interface (SPI) Signals (Sheet 1 of 2)**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| SIO_SPI_CLK† | I/O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down | |
| SIO_SPI_CS#† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |

**Table 21. SIO - Serial Peripheral Interface (SPI) Signals (Sheet 2 of 2)**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| SIO_SPI_MOSI† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| SIO_SPI_MISO† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.20 PCU – iLB – Real Time Clock (RTC) Interface Signals

See Chapter 36, "PCU – iLB – Real Time Clock (RTC)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 22. PCU - iLB - Real Time Clock (RTC) Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |
| ILB_RTC_X1 | I | - | VRTC | Running | Running | Running | Running | |
| ILB_RTC_X2 | O | - | VRTC | Running | Running | Running | Running | |
| ILB_RTC_RST# | I | - | VRTC | $V_{IH}$ | $V_{IH}$ | $V_{IH}$ | $V_{IH}$ | |
| ILB_RTC_TEST# | I | - | VRTC | $V_{IH}$ | $V_{IH}$ | $V_{IH}$ | $V_{IH}$ | |
| ILB_RTC_EXTPAD | O | - | VRTC | | | | | |

## 2.21 PCU – iLB – Low Pin Count (LPC) Bridge Interface Signals

See Chapter 35, "PCU – iLB – Low Pin Count (LPC) Bridge" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

***Note:*** If the VGA interface is used, VLPC must have a nominal voltage of 3.3V.

**Table 23. PCU - iLB - LPC Bridge Interface Signals**

| Signal Name | Dir | Term | Plat. Power | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | S4/S5 | S3 | Reset | Enter S0 | Notes |
| ILB_LPC_AD[3:0]† | I/O | 20k(H) | VLPC | Off | Off | Pull-up | Running | |
| ILB_LPC_FRAME#† | I/O | 20k(H) | VLPC | Off | Off | $V_{OH}$ | Running | |
| ILB_LPC_SERIRQ† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Running | |
| ILB_LPC_CLKRUN#† | I/O | 20k(H) | VLPC | Off | Off | Pull-up | Running | |
| ILB_LPC_CLK[1:0]† | I/O | 20k(L) | VLPC | Off | Off | $V_{OL}$ | Running | |
| LPC_RCOMP | - | | VLPC | | | | | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

## 2.22 PCU – Serial Peripheral Interface (SPI) Signals

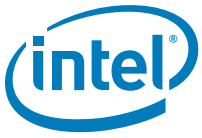
See Chapter 31, "PCU – Serial Peripheral Interface (SPI)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 24. PCU - Serial Peripheral Interface (SPI) Signals**

| Signal Name | Dir | Term | Plat. Power | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | S4/S5 | S3 | Reset | Enter S0 | Notes |
| PCU_SPI_CLK | O | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Running | |
| PCU_SPI_CS[0]# | O | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Running | |
| PCU_SPI_CS[1]#† | O | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Running | |
| PCU_SPI_MOSI | I/O | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Pull-up | |
| PCU_SPI_MISO | I | 20k(H) | V1P8A | Pull-up | Pull-up | Pull-up | Pull-up | |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.



## 2.23 PCU – System Management Bus (SMBus) Interface Signals

See Chapter 33, "PCU – System Management Bus (SMBus)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 25. PCU - System Management Bus (SMBus) Interface Signals**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | |
| PCU_SMB_CLK† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| PCU_SMB_DATA† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |
| PCU_SMB_ALERT#† | I/O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up | |

## 2.24 PCU – Power Management Controller (PMC) Interface Signals

See Chapter 30, "PCU – Power Management Controller (PMC)" for more details.

***Note:*** S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

**Table 26. PCU - Power Management Controller (PMC) Interface Signals (Sheet 1 of 2)**

| | | | | Default Buffer State | | | | |
|---|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** | **Notes** |

## 2.26 Miscellaneous Signals

**Table 28. Miscellaneous Signals and Clocks (Sheet 1 of 2)**

| | | | | Default Buffer State | | | |
|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** |
| SVID_DATA | I/O | 2k(H) | V1P0S | Off | Off | Pull-up | Pull-up |
| SVID_CLK | O | 2k(H) | V1P0S | Off | Off | Pull-up | Pull-up |
| SVID_ALERT# | I | 2k(H) | V1P0S | Off | Off | Pull-up | Pull-up |
| PROCHOT# | I/O | 2k(H) | V1P0S | Off | Off | Pull-up | Pull-up |
| ILB_8254_SPKR† | O | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up |
| ILB_NMI† | I | 20k(H) | V1P8S | Off | Off | Pull-up | Pull-up |

**Table 28. Miscellaneous Signals and Clocks (Sheet 2 of 2)**

| Signal Name | Dir | Term | Plat. Power | Default Buffer State | | | |
|---|---|---|---|---|---|---|---|
| | | | | S4/S5 | S3 | Reset | Enter S0 |
| PMC_PLT_CLK[5:0]† | O | 20k(L) | V1P8S | Off | Off | Pull-down | Pull-down |
| GPIO_RCOMP | - | - | V1P8S | Off | Off | Active | Active |

**NOTE:** All signals with the "†" symbol are muxed and may not be available without configuration.

**NOTE:** GPIO_RCOMP provides compensation for the following pins: GPIO_S5[10], PMC_SUSPWRDNACK PMC_SUSCLK[0], GPIO_S5[13], PMC_SLP_S4#, PMC_SLP_S3#, USB_ULPI_RST#, PMC_ACPRESENT, PMC_WAKE_PCIE[0]#, PMC_BATLOW#, PMC_PWRBTN#, PMC_PLTRST#, GPIO_S5[17], PMC_SUS_STAT#, USB_OC[1:0]#, GPIO_S5[09:00], GPIO_S5[30:22], TAP_TCK TAP_TRST#, TAP_TMS, TAP_TDI, TAP_TDO, TAP_PRDY#, TAP_PREQ#

## 2.27 GPIO Signals

Most GPIO's are configurable via multiplexors. See "Chapter 10, "Ballout and Package Information" for configuration options with the interfaces presented in this chapter.

**Table 29. GPIO Signals (Sheet 1 of 5)**

| Signal Name | Dir | Term | Plat. Power | Default Buffer State | | | |
|---|---|---|---|---|---|---|---|
| | | | | S4/S5 | S3 | Reset | Enter S0 |
| GPIO_S0_SC[000]† | I/O | 20k,L | V1P8S | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[001]† | I/O | 20k,L | V1P8S | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[002]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |
| GPIO_S0_SC[003]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |
| GPIO_S0_SC[004]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |
| GPIO_S0_SC[005]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |
| GPIO_S0_SC[006]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |
| GPIO_S0_SC[007]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |
| GPIO_S0_SC[008]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[009]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[010]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[011]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[012]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[013]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[014]† | I/O | 20k,L | VAUD | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[015]† | I/O | 20k,L | V1P8S | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[016]† | I/O | 20k,L | V1P8S | Off | Off | Pull-down | Pull-down |
| GPIO_S0_SC[017]† | I/O | 20k,H | V1P8S | Off | Off | Pull-up | Pull-up |

**Table 29. GPIO Signals (Sheet 2 of 5)**

| | | | | Default Buffer State | | | |
|---|---|---|---|---|---|---|---|
| **Signal Name** | **Dir** | **Term** | **Plat. Power** | **S4/S5** | **S3** | **Reset** | **Enter S0** |

## 2.28 Power And Ground Pins

Power Rail Ball Name Format: [Function]_[Voltage]_[S-State]{_[Filter]}:

- [Function]: The SoC function associated with the power rail.
  - — E.g CORE, USB, …
- [Voltage]: The nominal voltage associated with the power rail.
  - — E.g. 1P05, 3P3, VCC, …
- [S-State]: The ACPI system state, from S0 to G3, when the this rail is turned off.
- [Filter]: An optional indicator that one or more power rail balls have unique filtering requirements or requirement to be uniquely identified.

***Note:*** The Resume power well is a set of supply rails (where [S-State] = G3) that must be powered even when S3/4/5 states aren't used. The "Resume Well" is also referred to as the "Suspend Power Well", "Always on/SUS", "SUS power", or "SUS well".

**Table 30. Power and Ground Pins (Sheet 1 of 2)**

| Power Rails | Platform Power | Nominal Voltages | First Off State |
|---|---|---|---|
| CORE_V1P05_S3 | V1P05S | 1.05 V | S3 |
| CORE_VCC_S3 | VCC | Variable | S3 |

***Note:*** USB_HSIC_V1P24_G3 pin(s) can be connected to V1P0A platform rail if USB HSIC is not used. MIPI_V1P24_S3 can be grounded if MIPI interfaces (CSI) aren't used.

***Note:*** If the VGA interface is used, LPC_V1P8V3P3_S3 must have a nominal voltage of 3.3V.

## 2.29 Hardware Straps

All straps are sampled on the rising edge of PMC_CORE_PWROK. Defaults are based on internal termination.

**Table 31. Straps**

| Signal Name | Function | Default | Strap Exit | Strap Description |
|---|---|---|---|---|
| GPIO_S0_SC[056] | Legacy | 1b | PMC_CORE_PWROK de-asserted | Top Swap (A16 Override)<br>0 = Top address bit is inverted<br>1 = Top address bit is unchanged |
| GPIO_S0_SC[063] | Legacy | 1b | PMC_CORE_PWROK de-asserted | BIOS Boot Selection<br>0 = LPC<br>1 = SPI |
| GPIO_S0_SC[065] | Legacy | 1b | PMC_CORE_PWROK de-asserted | Security Flash Descriptors<br>0 = Override<br>1 = Normal Operation |

| DDI1_DDCDATA | Display | 0b | PMC_CORE_PWROK de-asserted | DDI1 Detect<br>0 = DDI1 not detected<br>1 = DDI1 detected |

## 2.30 Configurable IO: GPIO Muxing

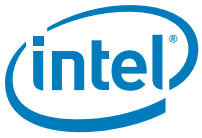
Not all interfaces may be active at the same time. To provide flexibility, some interfaces are muxed with configurable IO balls. An interface's signal is selected by a function number. See Section 10.3, "Ball Name and Function by Location" on page 214 for details of which balls are muxed, and what functions are available by ball.

***Note:*** Configurable IO defaults to function 0 at boot. All configurable IO with GPIO's for function 0 default to input at boot.

## 2.31 Reserved Pins

Reserved pins are non functional pins. Unless otherwise specified in this document or related collateral, reserved pins should not be connected to anything. RSVD_GND pins must be connect to the common ground plane (VSS), but don't provide a return path for currents.

§



# 3 Register Access Methods

There are six different common register access methods:

- Fixed IO Register Access
- Fixed Memory Mapped Register Access
- IO Referenced Register Access
- Memory Referenced Register Access
- PCI Configuration Register Access (Indirect - via Memory or IO registers)
- Message Bus Register Access (Indirect - via PCI Configuration Registers)

## 3.1 Fixed IO Register Access

Fixed IO registers are accessed by specifying their 16-bit address in a PORT IN and/or PORT OUT transaction from the CPU core. This allows direct manipulation of the registers. Fixed IO registers are unmovable register in IO space.

**Table 32. Fixed IO Register Access Method Example (P80 Register)**

| | |
|---|---|
| **Type:** I/O Register (Size: 32 bits) | **P80:** 80h |

## 3.2 Fixed Memory Mapped Register Access

Fixed Memory Mapped IO (MMIO) registers are accessed by specifying their 32/36-bit address in a memory transaction from the CPU core. This allows direct manipulation of the registers. Fixed MMIO registers are unmovable registers in memory space.

**Table 33. Fixed Memory Mapped Register Access Method Example (IDX Register)**

| | |
|---|---|
| **Type:** Memory Mapped I/O Register (Size: 32 bits) | **IDX:** FEC00000h |

## 3.3 IO Referenced Register Access

IO referenced registers use programmable base address registers (BARs) to select a range of IO addresses that it will use to decode PORT IN and/or PORT OUT transactions from the CPU to directly access a register. Thus, the IO BARs act as pointers to blocks of actual IO registers. To access an IO referenced register for a specific IO base address, start with that base address and add the register's offset. Example pseudo code for an IO referenced register read is shown below:

```
Register_Snapshot = IOREAD([IO_BAR]+Register_Offset)
```

Base address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other base address register types may include fixed memory registers, fixed IO registers or message bus registers.

**Table 34. Referenced IO Register Access Method Example (HSTS Register)**

| | |
|---|---|
| **Type:** I/O Register (Size: 8bits) | **HSTS:** [_IOBAR] + 0h<br><br>**_IOBAR Type:** PCI Configuration Register (Size: 32 bits)<br>**_IOBAR Reference:** [B:0, D:31, F:3] + 20h |

## 3.4 Memory Referenced Register Access

The SoC uses programmable base address registers (BARs) to set a range of physical address (memory) locations that it will use to decode memory reads and writes from the CPU to directly access a register. These BARs act as pointers to blocks of actual memory mapped IO (MMIO) registers. To access a memory referenced register for a specific base address, start with that base address and add the register's offset. Example pseudo code for a read is shown below:

```
Register_Snapshot = MEMREAD([Mem_BAR]+Register_Offset)
```

Base address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other common base address register types include fixed memory registers and IO registers that point to MMIO register blocks.

**Table 35. Memory Mapped Register Access Method Example (_MBAR Register)**

| | |
|---|---|
| **Type:** Memory Mapped I/O Register (Size: 8bits) | **HSTS:** [_MBAR] + 0h<br><br>**_MBAR Type:** PCI Configuration Register (Size: 32 bits)<br>**_MBAR Reference:** [B:0, D:31, F:3] + 10h |

## 3.5 PCI Configuration Register Access

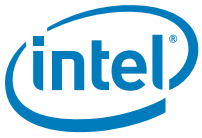
Access to PCI configuration space registers is performed through one of two different configuration access methods (CAMs):

- IO indexed - PCI CAM
- Memory mapped - PCI Enhanced CAM (ECAM)

Each PCI function has a standard PCI header consisting of 256 bytes for the IO access scheme (CAM), or 4096 bytes for the enhanced memory access method (ECAM). Invalid read accesses return binary strings of 1s.

**Table 36. PCI Register Access Method Example (VID Register)**

| | |
|---|---|
| **Type:** PCI Configuration Register (Size: 16bits) | **VID:** [B:0, D:31, F:3] + 0h |



## 3.5.1 PCI Configuration Access - CAM: IO Indexed Scheme

Accesses to configuration space using the IO method relies on two 32-bit IO registers:

- **CONFIG_ADDRESS** - IO Port CF8h
- **CONFIG_DATA** - IO Port CFCh

These two registers are both 32-bit registers in IO space. Using this indirect access mode, software uses CONFIG_ADDRESS (CF8h) as an index register, indicating which configuration space register to access, and CONFIG_DATA (CFCh) acts as a window to the register pointed to in CONFIG_ADDRESS. Accesses to CONFIG_ADDRESS (CF8h) are internally captured. Upon a read or write access to CONFIG_DATA (CFCh), configuration cycles will be generated to the PCI function specified by the address captured in CONFIG_ADDRESS. The format of the address is shown below.

**Table 37. PCI CONFIG_ADDRESS Register (IO PORT CF8h) Mapping**

| Field | CONFIG_ADDRESS Bits |
|---|---|
| Enable PCI Config. Space Mapping | 31 |
| Reserved | 30:24 |
| **Bus** Number | 23:16 |
| **Device** Number | 15:11 |
| **Function** Number | 10:08 |
| **Register/Offset** Number | 07:02 |

***Note:*** Bit 31 of CONFIG_ADDRESS must be set for a configuration cycle to be generated.

Pseudo code for a PCI register read is shown below:

- MyCfgAddr[23:16] = bus; MyCfgAddr[15:11] = device; MyCfgAddr[10:8] = funct;
- MyCfgAddr[7:2] = dWordMask(offset); MyCfgAddr[31] = 1;
- IOWRITE(0xCF8, MyCfgAddr)
- Register_Snapshot = IOREAD(0xCFC)

## 3.5.2 PCI Configuration Access - ECAM: Memory Mapped Scheme

A flat, 256 MiB memory space may also be allocated to perform configuration transactions. This is enabled through the BUNIT.BECREG message bus register (Port: 3h, Register: 27h) found in the SoC Transaction Router. BUNIT.BECREG allows remapping this 256 MiB region anywhere in physical memory space. Memory accesses within the programmed MMIO range result in configuration cycles to the appropriate PCI devices specified by the memory address as shown below.

**Table 38. PCI Configuration Memory Bar Mapping**

| ECAM Memory Address Field | ECAM Memory Address Bits |
|---|---|
| Use from BAR: BUNIT.BECREG[31:28] | 31:28 |
| **Bus** Number | 27:20 |
| **Device** Number | 19:15 |
| **Function** Number | 14:12 |
| **Register** Number | 11:02 |

***Note:*** ECAM accesses are only possible when BUNIT.BECREG.ECENABLE (bit 0) is set.

Pseudo code for an enhanced PCI configuration register read is shown below:

- MyCfgAddr[27:20] = bus; MyCfgAddr[19:15] = device; MyCfgAddr[14:12] = funct;
- MyCfgAddr[11:2] = dw_offset; MyCfgAddr[31:28] = BECREG[31:28];
- Register_Snapshot = MEMREAD(MyCfgAddr)

## 3.6 Message Bus Register Access

Accesses to the message bus space is through the SoC Transaction Router's PCI configuration registers. This unit relies on three 32-bit PCI configuration registers to generate messages:

- Message Bus Control Register (MCR) - PCI[B:0,D:0,F:0] + D0h
- Message Data Register (MDR) - PCI[B:0,D:0,F:0] + D4h
- Message Control Register eXtension (MCRX) - PCI[B:0,D:0,F:0] + D8h

This indirect access mode is similar to PCI CAM. Software uses the MCR/MCRX as an index register, indicating which message bus space register to access (MCRX only when required), and MDR as the data register. Writes to the MCR trigger message bus transactions.

Writes to MCRX and MDR will be captured. Writes to MCR will generate an internal 'message bus' transaction with the opcode and target (port, offset, bytes) specified in the MCR and the captured MCRX. When a write opcode is specified in MCR, the data that was captured by MDR is used for the write. When a data read opcode is specified in MCR, the data will be available in the MDR register after the MCR write completes (non-posted). The format of MCR and MCRX are shown below.

**Table 39. MCR Description (Sheet 1 of 2)**

| Field | MBPR Bits |
|---|---|
| OpCode (typically 10h for read, 11h for write) | 31:24 |

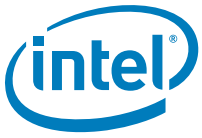


**Table 39. MCR Description (Sheet 2 of 2)**

| Field | MBPR Bits |
|---|---|
| Port | 23:16 |
| Offset/Register | 15:08 |
| Byte Enable | 07:04 |

**Table 40. MCRX Description**

| Field | MBPER Bits |
|---|---|
| **Offset/Register Extension**. This is used for messages sent to end points that require more than 8 bits for the offset/register. These bits are a direct extension of MCR[15:8]. | 31:08 |

Most message bus registers are located in the SoC Transaction Router. The default opcode messages for those registers are as follows:

- Message 'Read Register' Opcode: 06h
- Message 'Write Register' Opcode: 07h

Registers with different opcodes will be specified as applicable. Pseudo code of a message bus register read is shown below (where ReadOp==0x06):

- MyMCR[31:24] = ReadOp; MyMCR[23:16] = port; MyMCR[15:8] = offset;
- MyMCR[7:4] = 0xf
- PCIWRITE(0, 0, 0, 0xD0, MyMCR)
- Register_Snapshot = PCIREAD(0, 0, 0, 0xD4)

## 3.7 Register Field Access Types

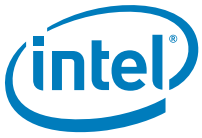
**Table 41. Register Access Types and Definitions (Sheet 1 of 2)**

| Access Type | Meaning | Description |
|---|---|---|
| RO | Read Only | In some cases, if a register is read only, writes to this register location have no effect. However, in other cases, two separate registers are located at the same location where a read accesses one of the registers and a write accesses the other register. See the I/O and memory map tables for details. |
| WO | Write Only | In some cases, if a register is write only, reads to this register location have no effect. However, in other cases, two separate registers are located at the same location where a read accesses one of the registers and a write accesses the other register. See the I/O and memory map tables for details. |
| R/W | Read/Write | A register with this attribute can be read and written. |

**Table 41. Register Access Types and Definitions (Sheet 2 of 2)**

| Access Type | Meaning | Description |
|---|---|---|
| R/WC | Read/Write Clear | A register bit with this attribute can be read and written. However, a write of 1 clears (sets to 0) the corresponding bit and a write of 0 has no effect. |
| R/WO | Read/Write-Once | A register bit with this attribute can be written only once after power up. After the first write, the bit becomes read only. |
| R/WLO | Read/Write, Lock-Once | A register bit with this attribute can be written to the non-locked value multiple times, but to the locked value only once. After the locked value has been written, the bit becomes read only. |
| Default | Default | When the processor is reset, it sets its registers to predetermined default states. The default state represents the minimum functionality feature set required to successfully bring up the system. Hence, it does not represent the optimal system configuration. It is the responsibility of the system initialization software to determine configuration, operating parameters, and optional system features that are applicable, and to program the processor registers accordingly. |

§



# 4 Mapping Address Spaces

The SoC supports four different address spaces:

- Physical Address Space Mappings
- IO Address Space
- PCI Configuration Space
- Message Bus Space

The CPU core can only directly access *memory space* through memory reads and writes and *IO space* through the IN and OUT IO port instructions. *PCI configuration space* is indirectly accessed through IO or memory space, and the *Message Bus space* is accessed through PCI configuration space. See Chapter 3, "Register Access Methods" for details.

This chapter describes how the memory, IO, PCI and Message Bus spaces are mapped to interfaces in the SoC.

***Note:*** See Chapter 13, "SoC Transaction Router" for registers specified in the chapter.

## 4.1 Physical Address Space Mappings

There are 64 GB (36-bits) of physical address space that can be used as:

- Memory Mapped IO (MMIO - IO fabric)
- Physical Memory (DRAM)

The CPU core can access the full physical address space, while downstream devices can only access SoC DRAM, and each CPU core's local APIC. Peer to peer transactions are not supported.

Most devices map their registers and memory to the physical address space. This chapter summarizes the possible mappings.

### 4.1.1 SoC Transaction Router Memory Map

The SoC Transaction Router maps the physical address space as follows:

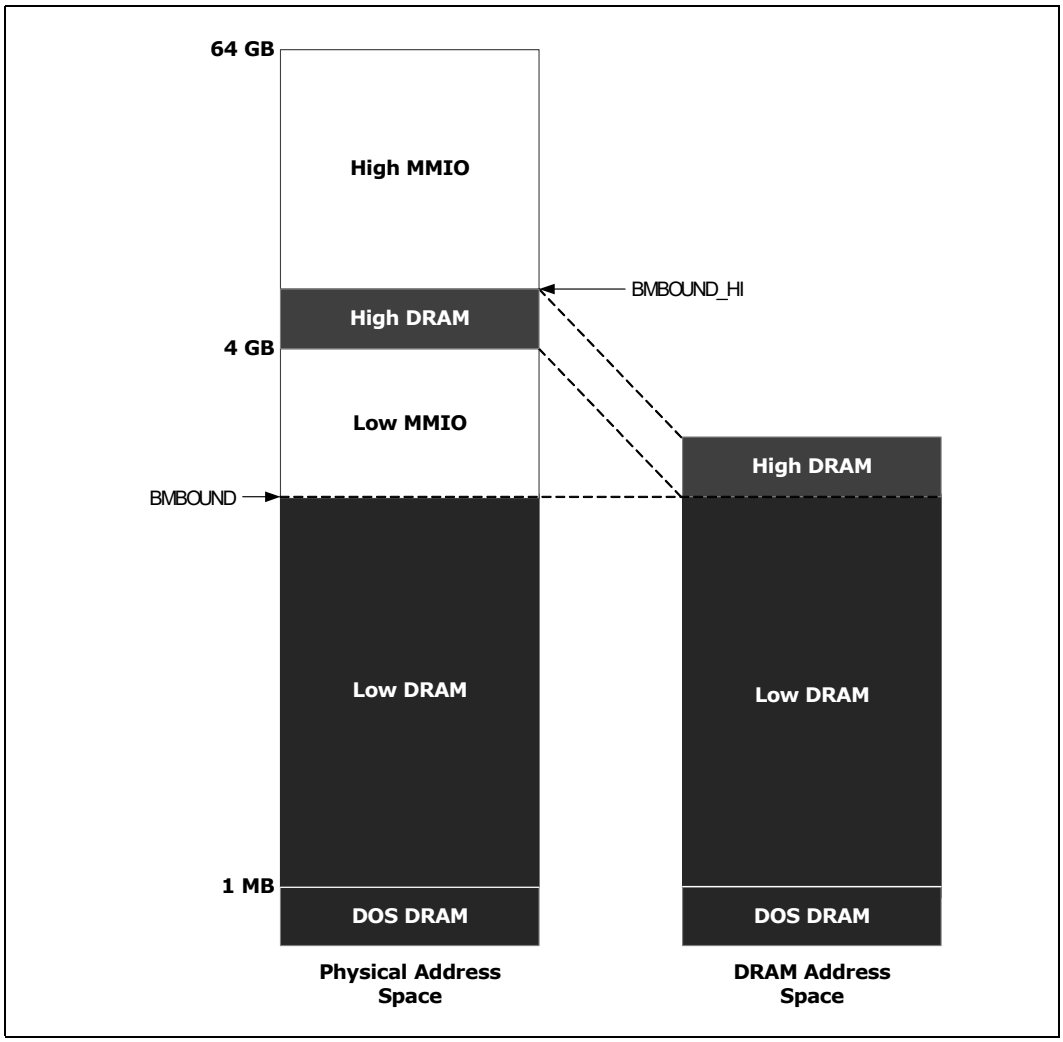
- CPU core to DRAM
- CPU core to IO fabric (MMIO)
- CPU core to extended PCI registers (ECAM accesses)
- IO fabric to CPU cores (local APIC interrupts)

Although 64 GB (36-bits) of physical address space is accessible, some MMIO must exist for devices and software with 32-bit limits. Further, all DRAM should remain accessible for devices and software with access to memory above 4 GB. These goals are accomplished by moving a section DRAM to start at the fixed 4 GB boundary, leaving a hole below 4 GB for MMIO. This creates the following distinct memory regions:

- DOS DRAM + Low DRAM
- Low MMIO
- High DRAM
- High MMIO

There are two registers used to create these regions, BMBOUND and BMBOUND_HI. Their use is shown in Figure 4.

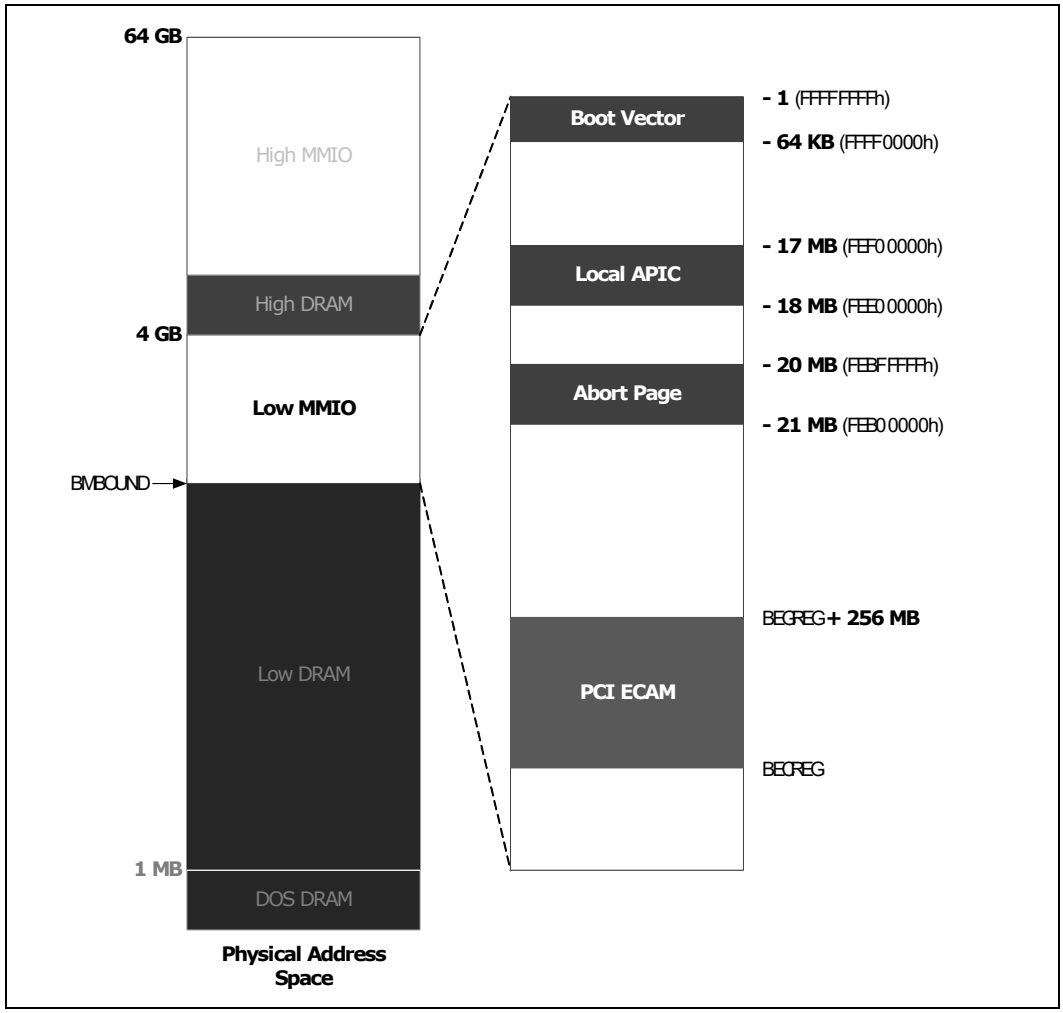
**Figure 4. Physical Address Space - DRAM & MMIO**



### 4.1.1.1 Low MMIO

The low MMIO mappings are shown in Figure 5.

**Figure 5. Physical Address Space - Low MMIO**



By default, CPU core reads targeting the **Boot Vector** range (FFFFFFFFh-FFFF0000h) are sent to the boot Flash connected to the Platform Controller Unit, and write accesses target DRAM. This allows the boot strap CPU core to fetch boot code from the boot Flash, and then shadow that code to DRAM.

Upstream writes from the IO fabric to the **Local APIC** range (FEE00000h-FEF00000h) are sent to the appropriate CPU core's APIC.

Write accesses from a CPU core to the **Abort Page** range (FEB00000h-FEBFFFFFh) will be dropped, and reads will always return all 1's in binary.

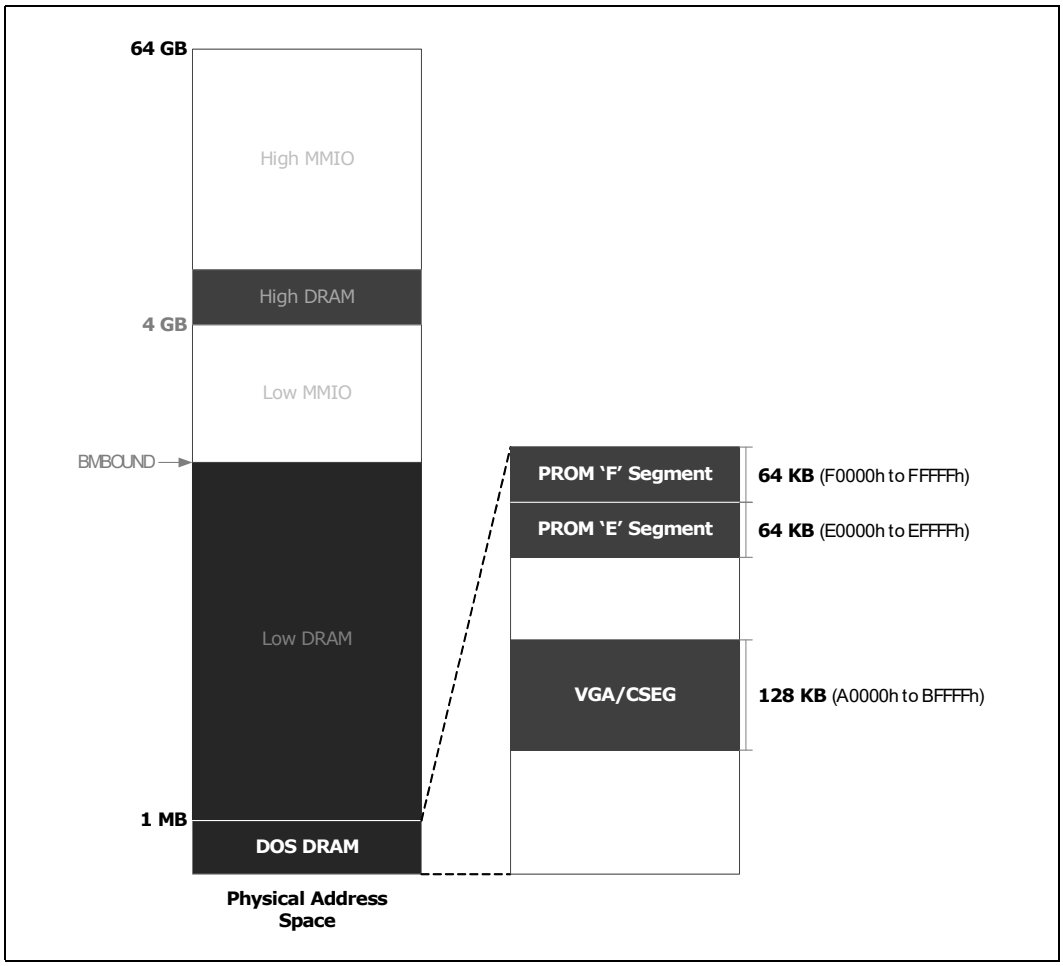
Accesses in the 256 MB **PCI ECAM** range starting at BECREG generate enhanced PCI configuration register accesses when enabled (BECREG.ECENABLE). Unlike traditional memory writes, writes to this range are non-posted when enabled. See Chapter 3, "Register Access Methods" for more details.

All other downstream accesses in the Low MMIO range are sent to the IO Fabric for further decode based on PCI resource allocations. The IO Fabric's subtractive agent (for unclaimed accesses) is the Platform Controller Hub.

### 4.1.1.2 DOS DRAM

The DOS DRAM is the memory space below 1 MB. In general, accesses from a processor targeting DOS DRAM target system DRAM. Exceptions are shown in the below figure.

**Figure 6. Physical Address Space - DOS DRAM**



Processor writes to the 64 KB (each) **PROM 'E'** and **'F'** segments (E0000h-EFFFFh and F0000h-FFFFFh) always target DRAM. The BMISC register is used to direct CPU core reads in these two segments to DRAM or the IO fabric (MMIO).

CPU core accesses to the 128 KB **VGA/CSEG** range (A0000h-BFFFFh) can target DRAM or the IO fabric (MMIO). The target is selected with the BMISC.ABSEGINDRAM register.

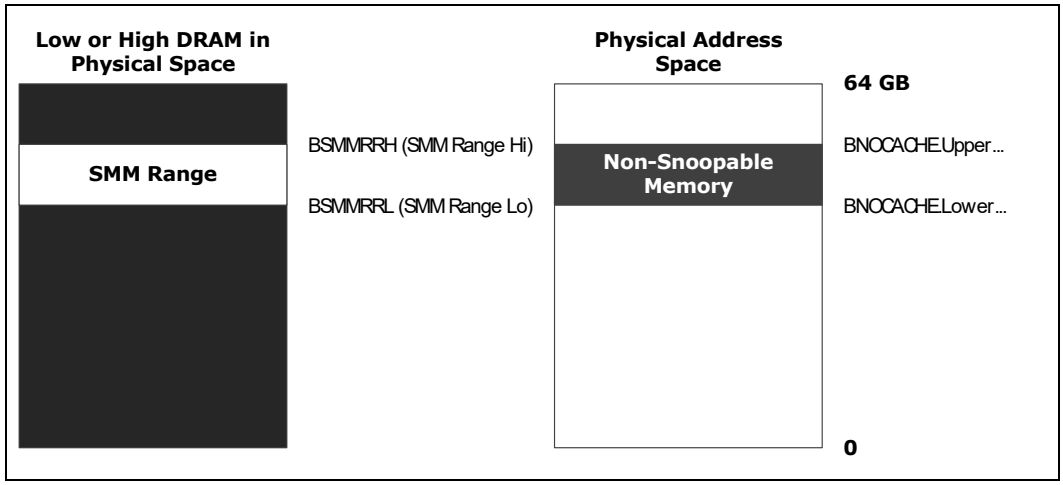
#### 4.1.1.3 Additional Mappings

There are two additional mappings available in the SoC Transaction Router:

- SMM range
- Non-snoop range

Figure 7 shows these mappings.

**Figure 7. Physical Address Space - SMM and Non-Snoop Mappings**



SMI handlers running on a CPU core execute out of SMM memory. To protect this memory from non-CPU core access, the **SMM Range** (BSMMRRL-BSMMRRH) may be programmed anywhere in low or high DRAM space (1 MB aligned). This range will only allow accesses from the CPU cores.

To prevent snoops of the CPU cores when DMA devices access a specific memory region, the **Non-Snoopable Memory range** (BNOCACHE.Lower-BNOCACHE.Upper) can be programmed anywhere in physical address space. This range is enabled via the BNOCACHECTL register's enable bit (BNOCACHECTL.Enable).

### 4.1.2 IO Fabric (MMIO) Map

Memory accesses targeting MMIO are routed by the IO fabric to programmed PCI ranges, or routed to the PCU by default (subtractive agent). Programmed PCI ranges can be moved within low or high MMIO, and most can be disabled.

***Note:*** Not all devices can be mapped to high MMIO.

Fixed MMIO is claimed by the Platform Controller Unit (PCU). The default regions are listed below. Movable ranges are not shown. See the register maps of all PCU devices for details.

**Table 42. Fixed Memory Ranges in the Platform Controller Unit (PCU)**

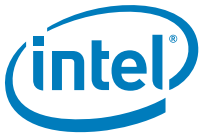
| Device | Start Address | End Address | Comments |
|---|---|---|---|
| Low BIOS (Flash Boot) | 000E0000h | 000FFFFFh | Starts 128 KB below 1 MB; Firmware/ BIOS |
| IO APIC | FEC00000h | FEC00040h | Starts 20 MB below 4 GB |
| HPET | FED40000h | FED003FFh | Starts 19 MB below 4 GB |
| TPM (LPC) | FED40000h | FED40FFFh | Starts 16 KB above HPET range |
| High BIOS/Boot Vector | FFFF0000h | FFFFFFFFh | Starts 64 KB below 4 GB; Firmware/ BIOS |

The following PCI devices may claim memory resources in MMIO space:

- Graphics/Display (High MMIO capable)
- PCI Express* (High MMIO capable)
- SATA
- SD/MMC/SDIO
- SIO
- HD Audio
- Platform Controller Unit (PCU) (Multiple BARs)
- xHCI USB
- EHCI USB
- USB Device
- LPE/$I^2S$
- ISP/MIPI-CSI

See each device's interface chapter for details.

***Warning:*** Variable memory ranges should not be set to conflict with other memory ranges. There will be unpredictable results if the configuration software allows conflicts to occur. Hardware does not check for conflicts.



## 4.2 IO Address Space

There are 64 KB + 3 bytes of IO space (0h-10002h) for accessing IO registers. Most IO registers exists for legacy functions in the PCU or for PCI devices, while some are claimed by the SoC Transaction Router for graphics and for the PCI configuration space access registers.

### 4.2.1 SoC Transaction Router IO Map

The SoC claims IO transactions for VGA/Extended VGA found in the display/graphics interface. It also claims the two 32-bit registers at port CF8h and CFCh used to access PCI configuration space.

### 4.2.2 IO Fabric IO Map

#### 4.2.2.1 PCU Fixed IO Address Ranges

Below table shows the fixed IO space ranges seen by a processor.

**Table 43. Fixed IO Ranges in the Platform Controller Unit (PCU)**

| Device | IO Address | Comments |
|---|---|---|
| 8259 Master | 20h-21h, 24h-25h, 28h-29h, 2Ch-2Dh, 30h-31h, 34h-35h, 38h-39-, 3Ch-3Dh | |
| 8254s | 40h-43h, 50h-53h | |
| PS2 Control | 60h, 64h | |
| NMI Controller | 61h, 63h, 65h, 67h | |
| RTC | 70h-77h | |
| Port 80h | 80h-83h | |
| Init Register | 92h | |
| 8259 Slave | A0h-A1h, A4h-A5h, A8h-A9h, ACh-ADh, B0h-B1h, B4h-B5h, B8h-B9h, BCh-BDh, 4D0h-4D1h | |
| PCU UART | 3F8h-3FFh | |
| Reset Control | CF9h | Overlaps PCI IO registers |
| Active Power Management | B2h-B3h | |

**Table 44. Fixed IO Ranges in the SoC Transaction Router, Serial ATA and PCIe* Blocks**

| Device | IO Address | Comments |
|---|---|---|
| SATA Legacy IDE Mode - Secondary Channel Legacy Taskfile Command Block | 170h - 177h | |
| SATA Legacy IDE Mode - Primary Channel Legacy Taskfile Command Block | 1F0h - 1F7h | |
| SATA Legacy IDE Mode - Secondary Channel Legacy Taskfile Control Block | 374h - 377h | |
| SATA Legacy IDE Mode - Primary Channel Legacy Taskfile Control Block | 3F4h - 3F7h | |
| PCI Express*: VGA Legacy Control & Status | 3B0h - 3BBh, 3C0h - 3DFh | Only active if INTR_BCTRL.VE=1b |
| PCI Configuration Access Address | CF8h | |
| PCI Configuration Access Data | CFCh | |

### 4.2.2.2 Variable IO Address Ranges

Table 45 shows the variable IO decode ranges. They are set using base address registers (BARs) or other similar means. Plug-and-play (PnP) software (PCI/ACPI) can use their configuration mechanisms to set and adjust these values.

***Warning:*** The variable IO ranges should not be set to conflict with other IO ranges. There will be unpredictable results if the configuration software allows conflicts to occur. Hardware does not check for conflicts.

**Table 45. Movable IO Ranges Decoded by PCI Devices on the IO Fabric (Sheet 1 of 2)**

| Device | Size (bytes) | Target |
|---|---|---|
| ACPI Power Management (PCU) | 128 | ACPI_BASE_ADDR (PM1BLK): PCI[B:0,D:31,F:0] + 40h |
| SMBus (PCU) | 32 | SMBA: PCI[B:0,D:31,F:3] + 20h |
| GPIO (PCU) | 256 | GBA: PCI[B:0,D:31,F:0] + 48h |
| RCBA (PCU) | 1024 | RCRB_BA: PCI[B:0,D:31,F:0] + F0h |
| Display Controller | 8 | IOBAR (PCI[B:0,D2,F:0] + 20h) |
| PCI Express: ISA Legacy | Variable[1] | IOBL_SSTS.IOBA (PCI[B:0,D28,F:0] + 1Ch) |
| SATA Native & AHCI Mode - Legacy IDE / AHCI Index Data Pair | 32 | LBAR (PCI[B:0,D19,F:0] + 20h) |
| SATA Native Mode - Serial ATA Index Data Pair | 16 | SIDPBA (PCI[B:0,D19,F:0] + 24h) |
| SATA Native Mode - Primary Command Block | 8 | PCMDBA (PCI[B:0,D19,F:0] + 10h) |

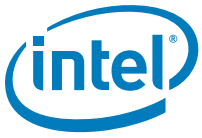


**Table 45. Movable IO Ranges Decoded by PCI Devices on the IO Fabric (Sheet 2 of 2)**

| Device | Size (bytes) | Target |
|---|---|---|
| SATA Native Mode - Secondary Command Block | 8 | SCMDBA (PCI[B:0,D19,F:0] + 18h) |
| SATA Native Mode - Primary Control Block | 4 | PCTLBA (PCI[B:0,D19,F:0] + 14h |
| SATA Native Mode - Secondary Control Block | 4 | SCTLBA (PCI[B:0,D19,F:0] + 1Ch) |

**NOTES 1:** Size is defined by the configuration of `IOBL_SSTS.IOLA`

## 4.3 PCI Configuration Space

All PCI devices/functions are shown below. Table below will always take priority.

**Table 46. PCI Devices and Functions (Sheet 1 of 2)**

| Bus | Device | Function | Device ID | Device Description | Function Description |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 0F00h | SoC Transaction Router | |
| 0 | 2 | 0 | 0F31h | Graphics & Display | |

# 5 Integrated Clock

Clocks are integrated, consisting of multiple variable frequency clock domains, across different voltage domains. This architecture achieves a low power clocking solution that supports the various clocking requirements of the SoC's many interfaces.

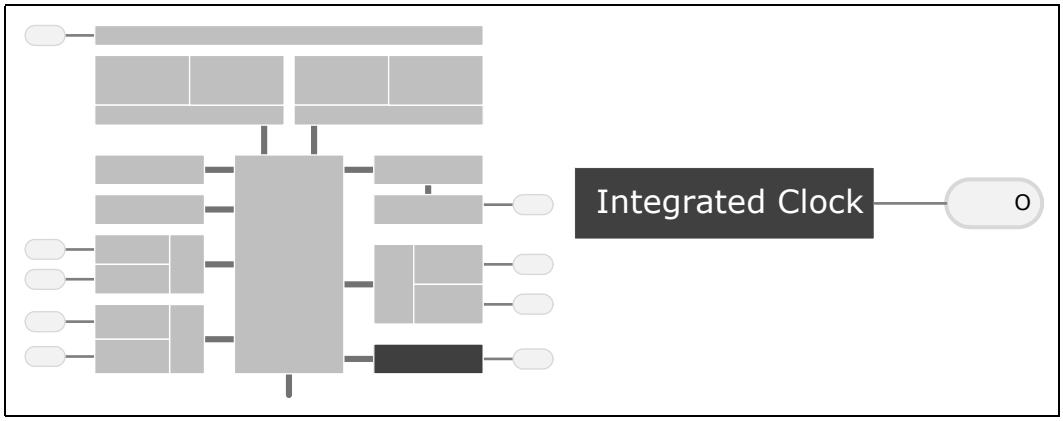

**Figure 9. Clocking Example**

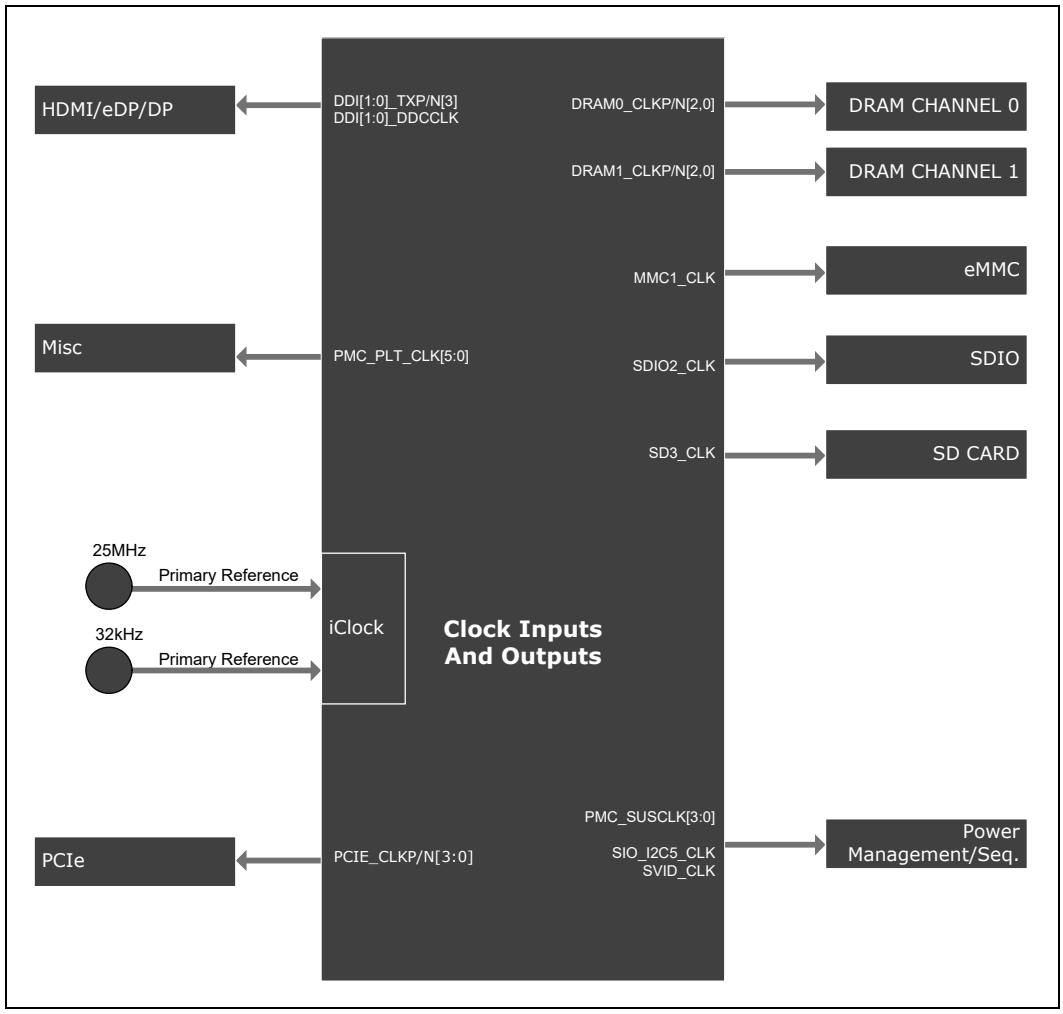

## 5.1 Features

Platform clocking is provided internally by the Integrated Clock logic. No external clock chips are required for the SoC to function. All the required platform clocks are provided by two crystal inputs: a 25 MHz primary reference for the integrated clock block and a 32.768 kHz reference for the Real Time Clock (RTC) block.

The different inputs and outputs are listed below.

### Table 47. SoC Clock Inputs

| Clock Domain | Signal Name | Frequency | Usage/Description |
|---|---|---|---|
| Main | ICLK_OSCIN<br>ICLK_OSCOUT | 25 MHz | Reference crystal for the iCLK PLL |
| RTC | ILB_RTC_X1<br>ILB_RTC_X2 | 32.768 kHz | RTC crystal I/O for RTC block |
| MIPI CSI | MCSI1_CLKP/N<br>MCSI2_CLKP/N<br>MCSI3_CLKP/N | 80-500 MHz | Clocks for cameras |
| LPC | ILB_LPC_CLK[1] | 33 MHz | Can be configured as an input to compensate for board routing delays through Soft Strap. |
| USB PHY | USB_ULPI_CLK | 60 MHz | Interface clock from ULPI PHY. |

### Table 48. SoC Clock Outputs (Sheet 1 of 2)

| Clock Domain | Signal Name | Frequency | Usage/Description |
|---|---|---|---|
| Memory | DRAM0_CKP/N[2,0]<br>DRAM1_CKP/N[2,0] | 533/667 MHz | Drives the Memory ranks 0-1. Data rate (MT/s) is 2x the clock rate.<br>Note: The frequency is fused in each SoC. It is not possible to support both frequencies on one SoC. |
| eMMC | MMC1_CLK<br>MMC1_45_CLK | 25-50 MHz<br>25-200 MHz | Clock for eMMC 4.41 devices<br>Clock for eMMC 4.51 devices<br>Actual clock can run as low as 400 kHz during initialization. |
| SDIO | SD2_CLK | 25-50 MHz | Clock for SDIO devices |
| SD Card | SD3_CLK | 25-50 MHz | Clock for SD card devices |
| SPI | PCU_SPI_CLK | 20 MHz,<br>33 MHz,<br>50 MHz | Clock for SPI flash |
| PMIC/COMMS | PMC_SUSCLK[3:0] | 32.768 kHz | Pass through clock from RTC oscillator |
| LPC | ILB_LPC_CLK[0:1] | 33 MHz | Provided to devices requiring LPC clock |
| HDA | HDA_CLK | 24 MHz | Serial clock for external HDA codec device |
| PCI Express | PCIE_CLKN[3:0]<br>PCIE_CLKP[3:0] | 100 MHz | Differential Clocks supplied to external PCI express devices based on assertion of PCIE_CLKREQ[3:0]# inputs |
| USB PHY | USB_ULPI_REFCLK | 19.2 MHz | Clock for USB devices |
| HDMI | DDI[1:0]_TXP/N[3] | 25-148.5 MHz | Differential clock for HDMI devices |
| HDMI DDC | DDI[1:0]_DDCCLK | 100 kHz | Clock for HDMI DDC devices |

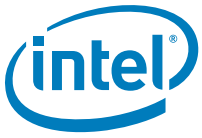

**Table 48. SoC Clock Outputs (Sheet 2 of 2)**

| Clock Domain | Signal Name | Frequency | Usage/Description |
|---|---|---|---|
| VGA DDC | VGA_DDCCLK | 100 kHz | Clock for VGA DDC devices |
| SVID | SVID_CLK | 25 MHz | Clock used by voltage regulator |
| $I^2S$ | LPE_I2S[2:0]_CLK | 12.5 MHz | Continuous serial clock for $I^2S$ interfaces |
| Platform Clocks | PMC_PLT_CLK [5:0] | 25 MHz | Platform clocks. For example:<br>PLT_CLK [2:0] - Camera<br>PLT_CLK [3] - Audio Codec<br>PLT_CLK [4] -<br>PLT_CLK [5] - COMMs |
| SIO SPI | SIO_SPI_CLK | 15 MHz | SPI clock output |
| $I^2C$ | SIO_I2C[6:0]_CLK | 100 kHz,<br>400 kHz,<br>1 MHz,<br>3.4 MHz | $I^2C$ clocks<br>Note: In I2C Controller the parameter called IC_CAP_LOADING can be set to 400pf/100pf. As per specification 3.4MHz is supported in 100pf loading while 1.7MHz is the max frequency at 400pf load. |
| SMBus | PCU_SMB_CLK | 10 kHz -<br>100 kHz | Drives SMBus device |

§

# 6 Power Management

This chapter provides information on the following power management topics:

- ACPI States
- Processor Core
- PCI Express
- Integrated Graphics Controller

## 6.1 Power Management Features

- ACPI System States support (S0, S3, S4, S5)
- Processor Core/ States support (C0 – C6)
- Processor Package States Support (C0-C7)
- SoC Graphics Adapter States support D0 – D3.
- Support Link Power Management (LPM)
- Thermal throttling
- Dynamic I/O power reductions (disabling sense amps on input buffers, tri-stating output buffers)
- Active power down of Display links

## 6.2 Power Management States Supported

The Power Management states supported by the processor are described in this section.

### 6.2.1 S-State Definition

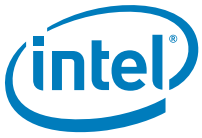
#### 6.2.1.1 S0 - Full On

This is the normal operating state of the processor. In S0, the core processor will transition in and out of the various processor C-States and P-States.

#### 6.2.1.2 S3 - Suspend to RAM (Standby)

S3 is a suspend state in which the core power planes of the processor are turned off and the suspend wells remain powered.

- All power wells are disabled, except for the suspend and RTC wells.
- The core processor’s macro-state is saved in memory.



- Memory is held in self-refresh and the memory interface is disabled, except the CKE pin as it is powered from the memory voltage rail. CKE is driven low.

#### 6.2.1.3 S4 - Suspend to Disk (Hibernate)

S4 is a suspend state in which most power planes of the processor are turned off, except for the suspend and RTC well. In this ACPI state, system context is saved to the hard disk.

Key features:

- No activity is allowed.
- All power wells are disabled, except for the suspend and RTC well.

#### 6.2.1.4 S5 - Soft Off

From a hardware perspective the S5 state is identical to the S4 state. The difference is purely software; software does not write system context to hard disk when entering S5.

The following table shows the differences in the sleeping states with regards to the processor's output signals.

**Table 49. SoC Sx-States to SLP_S*#**

| State | S0 | S3 | S4 | S5 | Reset w/o Power Cycle | Reset w/ Power Cycle |
|---|---|---|---|---|---|---|
| CPU Executing | In C0 | OFF | OFF | OFF | No | OFF |
| PMC_SLP_S3# | HIGH | LOW | LOW | LOW | HIGH | LOW |
| PMC_SLP_S4# | HIGH | HIGH | LOW | LOW | HIGH | LOW |
| S0 Power Rails | ON | OFF | OFF | OFF | ON | OFF |
| PMC_PLTRST# | HIGH | LOW | LOW | LOW | LOW | LOW |
| PMC_SUS_STAT# | HIGH | LOW | LOW | LOW | HIGH | LOW |
| PCIe Links | L0, L1 | L3 | L3 | L3 | L3 Ready | L3 |

**NOTES:** The processor treats S4 and S5 requests the same. The processor does not have PMC_SLP_S5#. PMC_SUS_STAT# is required to drive low (asserted) even if core well is left on because PMC_SUS_STAT# also warns of upcoming reset.

## 6.2.2 System States

**Table 50. General Power States for System**

| States/Sub-states | Legacy Name / Description |
|---|---|
| G0/S0/C0 | **FULL ON:** CPU operating. Individual devices may be shut down to save power. The different CPU operating levels are defined by Cx states. |
| G0/S0/Cx | **Cx State:** CPU manages C-state itself. |
| G1/S3 | **Suspend-To-RAM(STR):** The system context is maintained in system DRAM, but power is shut to non-critical circuits. Memory is retained, and refreshes continue. All external clocks are shut off; RTC clock and internal ring oscillator clocks are still toggling. |
| G1/S4 | **Suspend-To-Disk (STD):** The context of the system is maintained on the disk. All of the power is shut down except power for the logic to resume.<br>The S4 and S5 states are treated the same. |
| G2/S5 | **Soft-Off:** System context is not maintained. All of the power is shut down except power for the logic to restart. A full boot is required to restart. A full boot is required when waking.<br>The S4 and S5 states are treated the same. |
| SoC G3 | **SoC Mechanical OFF.** System context is not maintained. All power to the SoC is shutdown except for the RTC. All of the power to the rest of the system is shut down except power for the logic to restart. No SoC "Wake" events are possible, because the SoC does not have any power. when SoC power returns, transition will depend on the state just prior to the entry to SoC G3. |
| G3 | **Mechanical OFF.** System is not maintained. All power shutdown except for the RTC. No "Wake" events are possible, because the system does not have any power. This state occurs if the user removes the batteries, turns off a mechanical switch, or if the system power supply is at a level that is insufficient to power the "waking" logic. When system power returns, transition will depend on the state just prior to the entry to G3. |

Table 51 shows the transitions rules among the various states. Note that transitions among the various states may appear to temporarily transition through intermediate states. These intermediate transitions and states are not listed in the table.

**Table 51. ACPI PM State Transition Rules (Sheet 1 of 2)**

| Present State | Transition Trigger | Next State |
|---|---|---|
| G0/S0/C0 | IA Code **MWAIT** or LVL Rd | C0/S0/Cx |
| | PM1_CNT.SLP_EN bit set | G1/Sx or G2/S5 state (specified by PM1_CNT.SLP_TYP) |
| | Power Button Override | G2/S5 |
| | Mechanical Off/Power Failure | G3 |

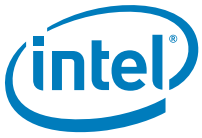


**Table 51. ACPI PM State Transition Rules (Sheet 2 of 2)**

| Present State | Transition Trigger | Next State |
|---|---|---|
| G0/S0/Cx | Cx break events which include: CPU snoop, MSI, Legacy Interrupt, AONT timer | G0/S0/C0 |
| | Power Button Override | G2/S5 |
| | System Power Failure | G3 |
| G1/S3,G1/S4 | Any Enabled Wake Event | G0/S0/C0 |
| | Power button Override | G2/S5 |
| | Resume Well Power Failure | G3 |
| G2/S5 | Any Enabled Wake Event | G0/S0/C0 |
| | Resume Well Power Failure | G3 |
| G3 | Power Returns | Option to go to S0/C0 (reboot) or G2/S5 (stay off until power button pressed or other enabled wake event) or G1/S4 (if system state was S4 prior to the power failure). Some wake events are preserved through a power failure. |

## 6.2.3 Processor States

**Table 52. Processor Core/ States Support**

| State | Description |
|---|---|
| C0 | Active mode, processor executing code |
| C1 | AutoHALT state |
| C6 | Deep Power Down. Prior to entering the Deep Power Down Technology (code named C6) State, The core process will flush its cache and save its core context to a special on die SRAM on a different power plane. Once Deep Power Down Technology (code named C6) sequence has completed. The core processor's voltage is completely shut off. |

## 6.2.4 Integrated Graphics Display States

**Table 53. SoC Graphics Adapter State Control**

| State | Description |
|---|---|
| D0 | Full on, Display active |
| D3 | Power off display |

## 6.2.5 Integrated Memory Controller States

**Table 54. Main Memory States**

| States | Description |
|---|---|
| Powerup | CKE asserted. Active mode. |
| Precharge Powerdown | CKE de-asserted (not self-refresh) with all banks closed. |
| Active Powerdown | CKE de-asserted (not self-refresh) with at least one bank active. |
| Self-Refresh | CKE de-asserted using device self-refresh |

## 6.2.6 PCI Express* (PCIe*) States

**Table 55. PCI Express* States**

| States | Description |
|---|---|
| L0 | Full on – Active transfer state |
| L0s | First Active Power Management low power state – Low exit latency |
| L1 | Lowest Active Power Management - Longer exit latency |
| L3 | Lowest power state (power-off) – Longest exit latency |

## 6.2.7 Interface State Combinations

**Table 56. G, S and C State Combinations**

| Global (G) State | Sleep (S) State | Processor Core (C) State | Processor State | System Clocks | Description |
|---|---|---|---|---|---|
| G0 | S0 | C0 | Full On | On | Full On |
| G0 | S0 | C1 | Auto-Halt | On | Auto-Halt |
| G0 | S0 | C6 | Deep Power Down | On | Deep Power Down |
| G1 | S3 | Power off | | Off except RTC & internal ring OSC | Suspend to RAM |
| G1 | S4 | Power off | | Off except RTC & internal ring OSC | Suspend to Disk |
| G2 | S5 | Power off | | Off except RTC & internal ring OSC | Soft Off |
| G3 | NA | Power Off | | Power off | Hard Off |

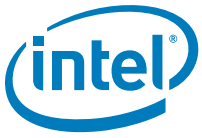

**Table 57. D, S and C State Combinations**

| Graphics Adapter (D) State | Sleep (S) State | (C) State | Description |
|---|---|---|---|
| D0 | S0 | C0 | Full On, Displaying |
| D0 | S0 | C1 | Auto-Halt, Displaying |
| D0 | S0 | C6 | Deep Sleep, Display Off |
| D3 | S0 | Any | Not Displaying |
| D3 | S3 | | Not Displaying<br>Graphics Core power off. |
| D3 | S4 | | Not Displaying<br>Suspend to disk<br>Core power off |

**NOTE:**S0ix is not supported for Bay Trail-M/D and Bay Trail-I.

## 6.3 Processor Core Power Management

While executing code, Enhanced Intel SpeedStep® Technology optimizes the processor's frequency and core voltage based on workload. Each frequency and voltage operating point is defined by ACPI as a P-state. When the processor is not executing code, it is idle. A low-power idle state is defined by ACPI as a C-state. In general, lower power C-states have longer entry and exit latencies.

### 6.3.1 Enhanced Intel SpeedStep® Technology

The following are the key features of Enhanced Intel SpeedStep® Technology:

- Applicable to Processor Core Voltage and Graphic Core Voltage
- Multiple frequency and voltage points for optimal performance and power efficiency. These operating points are known as P-states.
- Frequency selection is software controlled by writing to processor MSRs. The voltage is optimized based on the selected frequency:
  - If the target frequency is higher than the current frequency, Core_VCC_S3 is ramped up slowly to an optimized voltage. This voltage is signaled by the SVID signals to the voltage regulator. Once the voltage is established, the PLL locks on to the target frequency.
  - If the target frequency is lower than the current frequency, the PLL locks to the target frequency, then transitions to a lower voltage by signaling the target voltage on the SVID signals.
- The processor controls voltage ramp rates by requesting appropriate ramp rates from an external SVID controller.
- Because there is low transition latency between P-states, a significant number of transitions per second are possible.

- Thermal Monitor mode.
  - Refer to Chapter 8, "Thermal Management"

### 6.3.2 Dynamic Cache Sizing

Dynamic Cache Sizing allows the processor to flush and disable a programmable number of L2 cache ways upon each Deeper Sleep entry under the following condition:

- The C0 timer that tracks continuous residency in the Normal state, has not expired. This timer is cleared during the first entry into Deeper Sleep to allow consecutive Deeper Sleep entries to shrink the L2 cache as needed.
- The predefined L2 shrink threshold is triggered.

The number of L2 cache ways disabled upon each Deeper Sleep entry is configured in the BBL_CR_CTL3 MSR. The C0 timer is referenced through the CLOCK_CORE_CST_CONTROL_STT MSR. The shrink threshold under which the L2 cache size is reduced is configured in the PMG_CST_CONFIG_CONTROL MSR. If the ratio is zero, then the ratio will not be taken into account for Dynamic Cache Sizing decisions. Refer to the BIOS Writer's Guide for more details.

### 6.3.3 Low-Power Idle States

When the processor core is idle, low-power idle states (C-states) are used to save power. More power savings actions are taken for numerically higher C-state. However, higher C-states have longer exit and entry latencies. Resolution of C-state occur at the thread, processor core, and processor core level.

#### 6.3.3.1 Clock Control and Low-Power States

The processor core supports low power states at core level. The central power management logic ensures the entire processor core enters the new common processor core power state. For processor core power states higher than C1, this would be done by initiating a P_LVLx (P_LVL6) I/O read to all of the cores. States that require external intervention and typically map back to processor core power states. States for processor core include Normal (C0, C1).

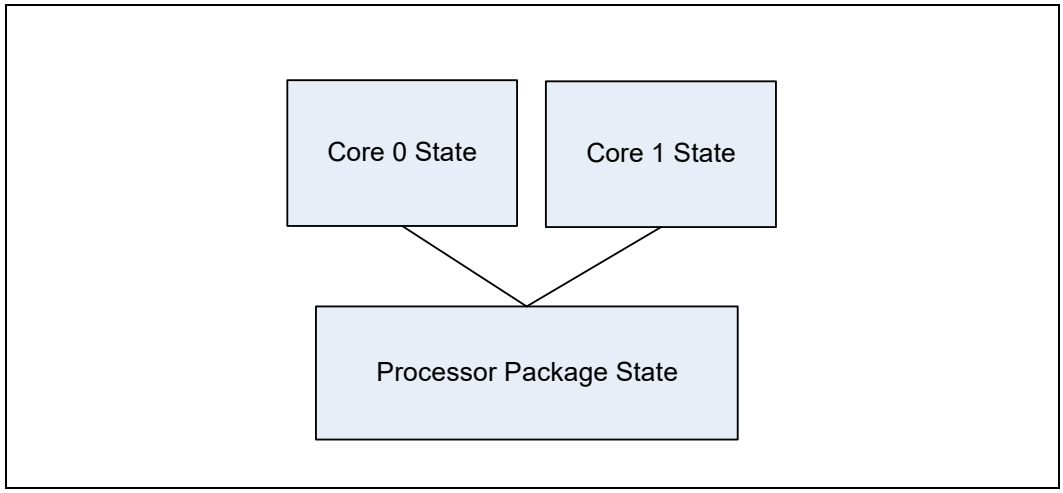
The processor core implements two software interfaces for requesting low power states: MWAIT instruction extensions with sub-state specifies and P_LVLx reads to the ACPI P_BLK register block mapped in the processor core's I/O address space. The P_LVLx I/O reads are converted to equivalent MWAIT C-state requests inside the processor core and do not directly result in I/O reads on the processor core bus. The monitor address does not need to be setup before using the P_LVLx I/O read interface. The sub-state specifications used for each P_LVLx read can be configured in a software programmable MSR by BIOS.

The Cx state ends due to a break event. Based on the break event, the processor returns the system to C0. The following are examples of such break events:

- Any unmasked interrupt goes active

- Any internal event that will cause an NMI or SMI_B
- CPU Pending Break Event (PBE_B)
- MSI

**Figure 10. Idle Power Management Breakdown of the Processor Cores**



## 6.3.4 Processor Core C-States Description

The following state descriptions assume that both threads are in common low power state.

### 6.3.4.1 Core C0 State

The normal operating state of a core where code is being executed.

### 6.3.4.2 Core C1 State

C1 is a low power state entered when a core execute a HLT or MWAIT(C1) instruction.

A System Management Interrupt (SMI) handler returns execution to either Normal state or the C1 state. See the *Intel® 64 and IA-32 Architecture Software Developer's Manual, Volume 3A/3B: System Programmer's Guide* for more information.

While a core is in C1 state, it processes bus snoops and snoops from other threads.

### 6.3.4.3 Core C6 State

Individual core can enter the C6 state by initiating a P_LVL3 I/O read or an MWAIT(C6) instruction. Before entering core C6, the core will save its architectural state to a dedicated SRAM. Once complete, a core will have its voltage reduced to zero volts. During exit, the core is powered on and its architectural state is restored.

There are various types of C-state:

- C6NS implies only the core should be powergated, but the L2 cache contents should be retained.
- C6FS implies the core should be powergates, and the L2 cache can be fully flushed to get even more power savings.

### 6.3.5 Package C-States

The processor supports package C0, C6 and C7 power states. The following is a summary of the general rules for package C-state entry. These apply to all package Cstates unless specified otherwise:

- Package C-state request is determined by the lowest numerical core C-state amongst all cores.
- A package C-state is automatically resolved by the processor depending on the core idle power states and the status of the platform components.
- Each core can be at a lower idle power state than the package if the platform does not grant the processor permission to enter a requested package C-state.
- The platform may allow additional power savings to be realized in the processor.
- For package C-states, the processor is not required to enter C0 before entering any other C-state.
- Entry in to a package C-state may be subject to auto-demotion - that is the processor may keep the package in a shallower package C-state then requested by the OS if the processor determines via heuristics that the shallower C-state results in better power/performance.

The processor exits a package C-state when a break event is detected. Depending on the type of break event, the processor does the following:

- If a core break event is received, the target core is activated and the break event message is forwarded to the target core.
  - If the break event is not masked, the target core enters the core C0 state and the processor enters package C0.
  - If the break event is masked, the processor attempts to re-enter its previous package state.
- If the break event was due to a memory access or snoop request.
  - But the platform did not request to keep the processor in a higher package C-state, the package returns to its previous C-state.
  - And the platform requests a higher power C-state, the memory access or snoop request is serviced and the package remains in the higher power C-state.

**Table 58. Coordination of Module and Core Power States at the Package Level**

| Module C-State | | Core/Module 1 | | | |
|---|---|---|---|---|---|
| | | C0 | C1 | C6NS | C6FS |
| Core 0 | C0 | C0 | C0 | C0 | C0 |
| | C1 | C0 | C0 | C0 | C0 |
| | C6NS | C0 | C0 | C0 | C6c |
| | C6FS | C0 | C0 | C6C | C6 |

| Package C-State | | Core/Module 1 | | |
|---|---|---|---|---|
| | | C0 | C6C | C6 |
| Module 0 | C0 | C0 | C0 | C0 |
| | C6C | C0 | C6C | C6C |
| | C6 | C0 | C6C | C7 |

**NOTE:**
1. 2 Cores of the SoC will make up one module.

### 6.3.5.1 Package C0

The normal operating state for the processor. The processor remains in the normal state when at least one of its cores is in the C0 state or when the platform has not granted permission to the processor to go into a low power state. Individual cores may be in lower power idle states while the package is in C0.

### 6.3.5.2 Package C1

No additional power reduction actions are taken in the package C1 state.

The package enters the C1 low power state when:

- At least one core is in the C1 state.
- The other cores are in a C1 or lower power state.

No notification to the system occurs upon entry to C1.

### 6.3.5.3 Package C6 State

A processor enters the package C6 low power state when:

- At least one core is in the C6 state.

- The other cores are in a C6 or lower power state, and the processor has been granted permission by the platform.
- The platform has allowed a package C6 state.

In package C6 state, all cores have saved their architectural state and have had their core voltages reduced to zero volts.

## 6.3.6 Graphics Power Management

### 6.3.6.1 Graphics and video decoder C-State

GFX C-State (GC6) and VED C-state (VC6) are designed to optimize the average power to the graphics and video decoder engines during times of idleness. GFX C-state is entered when the graphics engine, has no workload being currently worked on and no outstanding graphics memory transactions. VED S-state is entered when the video decoder engine has no workload being currently worked on and no outstanding video memory transactions. When the idleness condition is met, the processor will power gate the Graphics and video decoder engines.

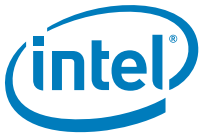
### 6.3.6.2 Intel® Display Power Saving Technology (Intel® DPST)

The Intel DPST technique achieves backlight power savings while maintaining visual experience. This is accomplished by adaptively enhancing the displayed image while decreasing the backlight brightness simultaneously. The goal of this technique is to provide equivalent end-user image quality at a decreased backlight power level.

1. The original (input) image produced by the operating system or application is analyzed by the Intel DPST subsystem. An interrupt to Intel® DPST software is generated whenever a meaningful change in the image attributes is detected. (A meaningful change is when the Intel DPST software algorithm determines that enough brightness, contrast, or color change has occurred to the displaying images that the image enhancement and backlight control needs to be altered.)
2. Intel DPST subsystem applies an image-specific enhancement to increase image contrast, brightness, and other attributes.
3. A corresponding decrease to the backlight brightness is applied simultaneously to produce an image with similar user-perceived quality (such as brightness) as the original image. Intel DPST 5.0 has improved the software algorithms and has minor hardware changes to better handle backlight phase-in and ensures the documented and validated method to interrupt hardware phase-in.

### 6.3.6.3 Intel® Automatic Display Brightness

The Intel Automatic Display Brightness feature dynamically adjusts the backlight brightness based upon the current ambient light environment. This feature requires an additional sensor to be on the panel front. The sensor receives the changing ambient light conditions and sends the interrupts to the Intel Graphics driver. As per the change



in Lux, (current ambient light illuminance), the new backlight setting can be adjusted through BLC. The converse applies for a brightly lit environment. Intel Automatic Display Brightness increases the back light setting.

#### 6.3.6.4 Intel® Seamless Display Refresh Rate Switching Technology (Intel® SDRRS Technology)

When a Local Flat Panel (LFP) supports multiple refresh rates, the Intel® Display Refresh Rate Switching power conservation feature can be enabled. The higher refresh rate will be used when on plugged in power or when the end user has not selected/ enabled this feature. The graphics software will automatically switch to a lower refresh rate for maximum battery life when the design application is on battery power and when the user has selected/enabled this feature.

There are two distinct implementations of Intel SDRRS—static and seamless. The static Intel SDRRS method uses a mode change to assign the new refresh rate. The seamless Intel SDRRS method is able to accomplish the refresh rate assignment without a mode change and therefore does not experience some of the visual artifacts associated with the mode change (SetMode) method.

## 6.4 Memory Controller Power Management

The main memory is power managed during normal operation and in low-power ACPI Cx states.

### 6.4.1 Disabling Unused System Memory Outputs

Any system memory (SM) interface signal that goes to a memory module connector in which it is not connected to any actual memory devices (such as DIMM connector is unpopulated, or is single-sided) is tri-stated. The benefits of disabling unused SM signals are:

- Reduced power consumption.
- Reduced possible overshoot/undershoot signal quality issues seen by the processor I/O buffer receivers caused by reflections from potentially un-terminated transmission lines.

When a given rank is not populated, the corresponding chip select and CKE signals are not driven.

At reset, all rows must be assumed to be populated, until it can be proven that they are not populated. This is due to the fact that when CKE is tristated with an SO-DIMM present, the DIMM is not guaranteed to maintain data integrity.

SCKE tri-state should be enabled by BIOS where appropriate, since at reset all rows must be assumed to be populated.

## 6.4.2 DRAM Power Management and Initialization

The processor implements extensive support for power management on the SDRAM interface. There are four SDRAM operations associated with the Clock Enable (CKE) signals, which the SDRAM controller supports. The processor drives four CKE pins to perform these operations.

### 6.4.2.1 Initialization Role of CKE

During power-up, CKE is the only input to the SDRAM that is recognized (other than the DDR3 reset pin) once power is applied. It must be driven LOW by the DDR controller to make sure the SDRAM components float DQ and DQS during power- up.

CKE signals remain LOW (while any reset is active) until the BIOS writes to a configuration register. Using this method, CKE is guaranteed to remain inactive for much longer than the specified 200 micro-seconds after power and clocks to SDRAM devices are stable.

### 6.4.2.2 Conditional Self-Refresh

Intel Rapid Memory Power Management (Intel RMPM) conditionally places memory into self-refresh in the package C3 and C6 low-power states. RMPM functionality depends on graphics/display state (relevant only when internal graphics is being used), as well as memory traffic patterns generated by other connected I/O devices.

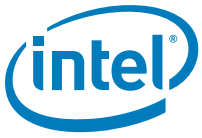
When entering the Suspend-to-RAM (STR) state, the processor core flushes pending cycles and then places all SDRAM ranks into self refresh. In STR, the CKE signals remain LOW so the SDRAM devices perform self-refresh.

The target behavior is to enter self-refresh for the package C3 and C6 states as long as there are no memory requests to service.

### 6.4.2.3 Dynamic Power Down Operation

Dynamic power-down of memory is employed during normal operation. Based on idle conditions, a given memory rank may be powered down. The IMC implements aggressive CKE control to dynamically put the DRAM devices in a power down state.The processor core controller can be configured to put the devices in active power down (CKE deassertion with open pages) or precharge power down (CKE deassertion with all pages closed). Precharge power down provides greater power savings but has a bigger performance impact, since all pages will first be closed before putting the devices in power down mode.

If dynamic power-down is enabled, all ranks are powered up before doing a refresh cycle and all ranks are powered down at the end of refresh.



#### 6.4.2.4 DRAM I/O Power Management

Unused signals should be disabled to save power and reduce electromagnetic interference. This includes all signals associated with an unused memory channel. Clocks can be controlled on a per SO-DIMM basis. Exceptions are made for per SO-DIMM control signals such as CS#, CKE, and ODT for unpopulated SO-DIMM slots.

The I/O buffer for an unused signal should be tri-stated (output driver disabled), the input receiver (differential sense-amp) should be disabled, and any DLL circuitry related ONLY to unused signals should be disabled. The input path must be gated to prevent spurious results due to noise on the unused signals (typically handled automatically when input receiver is disabled).

## 6.5 PCI Express* (PCIe*) Power Management

- Active power management support using L0s, and L1 states.
- All inputs and outputs disabled in L3 Ready state.

§

# 7 Power Up and Reset Sequence

This chapter provides information on the following topics:

- "Power Up Sequences"
- "Power Down Sequences"
- "Reset Behavior"

## 7.1 SoC System States

### 7.1.1 System Sleeping States Control (S-states)

The SoC supports the S0, S3, S4, and S5 sleep states. S4 and S5 states are identical from a hardware and power perspective. The differentiation is software determined (S4 = Suspend to Disk).

The SoC platform architecture assumes the usage of an external power management controller e.g., CPLD or PMIC. Some flows in this section refer to the power management controller for support of the S-states transitions.

The SoC sleep states are described in Chapter 6, "Power Management".

## 7.2 Power Up Sequences

### 7.2.1 RTC Power Well Transition (G5 to G3 States Transition)

When RTC_VCC (Real Time Clock power) is applied via RTC battery, the following occurs (see Figure 11 for timing):

1. RTC_VCC ramps. ILB_RTC_TEST# should be low.
2. The system starts the real time clock oscillator.
3. A minimum of t1 units after RTC_VCC ramps, the external RTC RC circuit de-asserts ILB_RTC_TEST# and ILB_RTC_RTC#. The system is now in the G3 state. RTC oscillator is unlikely to be stable at this point.

**Figure 11. RTC Power Well Timing Diagrams**

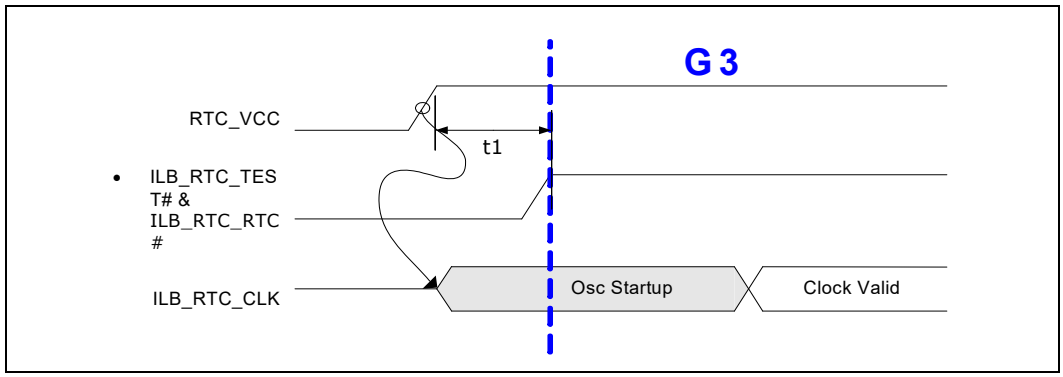


**Table 60. RTC Power Well Timing Parameters**

| Parameter | Description | Min | Max | Units |
|---|---|---|---|---|
| t1 | RTC_VCC to ILB_RTC_TEST# and ILB_RTC_RTC# de-assertion | 18 | - | ms |

**NOTES:**
1. This delay is typically created from an RC circuit.
2. The oscillator startup times are component and design specific. A crystal oscillator can take several second to reach a large enough voltage swing. A silicon oscillator can have startups times <10 ms.

## 7.2.2 G3 to S0

The timings shown in Figure 12 occur when a board event such as AC power is applied or power management controller (PMIC) power button is pressed. The following occurs:

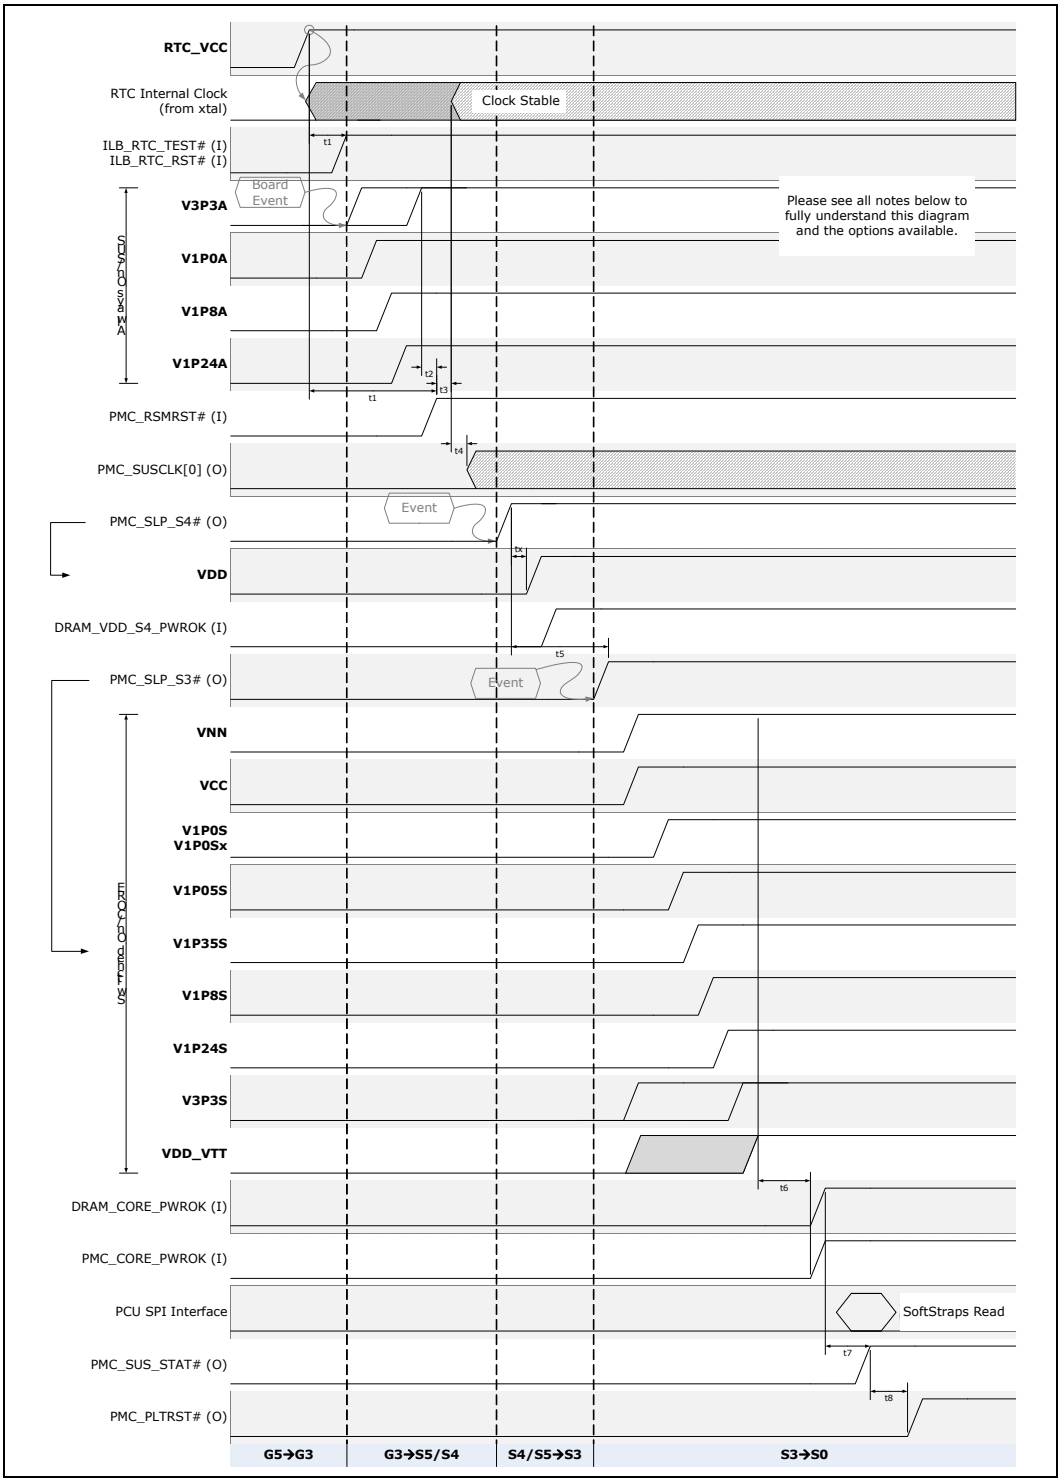
1. Suspend (SUS/Always On) wells ramp in the order shown.
2. The external power management controller de-asserts PMC_RSMRST# after the suspend rails become stable.
3. PMC_SUSCLK will begin toggling after the de-assertion of PMC_RSMRST#.
4. The system is now in S4/S5 state. Depending on policy bits (GEN_PMCON1.PWR_FLR & GEN_PMCON1.AG3E), the SoC either waits for a wake event to transition to S0 or continues to S0 state automatically.
5. The transition from S4/S5 to S0 is initiated.
6. The SoC de-asserts PMC_SLP_S4#, and the DRAM (VDD/Un-switched) well ramps.
7. After the DRAM power rail ramp, the external power management controller drives DRAM_VDD_S4_PWROK high.
8. The SoC de-asserts PMC_SLP_S3#, and the Core (S0/Switched On) wells ramp in the order shown.
9. After all of Core power rails are stable, external power management controller drives PMC_CORE_PWROK and DRAM_CORE_PWROK to HIGH, the SoC will then

fetch the descriptor region and soft straps data from the PCU located SPI interface, followed by the SoC de-asserting PMC_SUS_STAT#.

10. The SoC de-asserts PMC_PLTRST# after PMC_SUS_STAT# is stable. The PMC_PLTRST# is the main platform reset to other components.
11. The SoC will begin fetching data from the PCU-located SPI interface and proceed to finish initialization and start code execution (BIOS).

***Note:*** There is no hard time requirement for transitions for the Always on/SUS rails (V1.0A, V1.2A, V1.8A, V3.3A). A 10 µs to 10 ms delay is required for two adjacent rails of them to avoid inrush current which may be caused by multiple loads turning on simultaneously or fast charging of VR output decoupling.

## Figure 12. G3/S5 to S0 Cold Boot Sequence

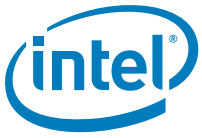


### Table 61. S4/S5 to S0 (Power Up) Sequence

| Parameter | | Min | Max | Unit |
|---|---|---|---|---|
| t1 | RTC_VCC to ILB_RTC_TEST# and ILB_RTC_RTC# de-assertion<br>RTC_VCC to PMC_RSMRST# de-assertion | 18 | - | ms |
| t2 | V3P3A (SUS Rails) valid to PMC_RSMRST# de-assertion (t1 still applies in applications without RTC battery) | 10 | - | us |
| t3 | PMC_RSMRST# to Internal RTC Clock assumed stable[2] | 95 | | ms |
| t4 | Internal RTC Clock assumed stable to PMC_SUSCLK[0] toggling[2] | 5 | | ms |
| t5 | PMC_SLP_S4# de-assertion to PMC_SLP_S3# de-assertion | 30 | - | us |
| t6a | Core well stable to DRAM_CORE_PWROK and PMC_CORE_PWROK assertion (No PCIe devices) | 10 | - | ms |
| t6b | Core well stable to DRAM_CORE_PWROK and PMC_CORE_PWROK assertion (for power rails needed by PCIe devices) | 99 | - | ms |
| t7 | DRAM/PMC_CORE_PWROK to PMC_SUS_STAT# | 1 | - | ms |
| t8 | PMS_SUS_STAT# de-assertion to PMC_PLTRST# de-assertion | 60 | - | us |
| tx | PMC_SLP_S4# de-assertion to VDDQ ramp start | 0 | - | ms |

**NOTES:**.

1. RTC and SUS power rails may come up at the same time if no RTC battery is used.
2. Must ensure RTC clock is oscillating before these counts. SoC counts this time assuming a RTC clock of 32.768 KHz. Depending on how stable the oscillations are, however, this time can vary (+/-). This is effectively the *typical* amount of time the SoC waits to help ensure the clock is stable enough to proceed with power sequencing. It's more likely a min since RTC clock will typically run slow until stable.
3. Wake events shown in figure depend on platform configuration.
4. In the SUS rail sequence, V3P3A can be first in sequence if required for designs, otherwise it can end the SUS sequence.
5. An alternate SUS rail sequence allows swapping V1P8A with V1P0A.
6. For power rail sequences, at least 10us delay is required between rails to avoid inrush current caused by multiple loads turning on simultaneously and fast charging of VR output decoupling. A maximum delay of 2 ms is allowed. Measurement of delay is at the 90% of full voltage mark of the prior rail to 10% later rail.
7. VCC can follow VNN in the CORE rail sequence or at the same time. Reference platform sequences both at the same time.
8. "Board Event" is platform specific. Most likely enabled by a platform power management controller or PMIC via a dedicated power button or when AC power is applied.
9. For exit from S4 and S3 Events, see "Cause of Wake Events" table in this chapter. S4 wake is required from PMC_PWRBTN# without prior configuration. S3 wake event is only used when the platform directly transitions to S3 (STR).
10. The V1P35S rail "VGA_V1P35_S3_F1" must be powered on as shown above. All other V1P35S/VSFR ([X]_V1P35_S3_F[x]) rails can either power on as shown, or power on after V3P3S.
11. PMC_SUSPWRDNACK is intended to be used at power-down and, since its state after a power-down is variable, it is recommended that a system treats PMC_SUSRWRDNACK as a Do Not Care during power-on. For systems that are unable to treat PMC_SUSPWRDNACK as a Do Not Care during power-on, the following power-on state is always valid: - 1) PMC_SUSPWRDNACK will always be low, until PMC_SLP_S3# de-asserts, if PMC_SUSPWRDNACK was low upon entry into S5. PMC_SUSPWRDNACK is always low when entering S5 from G3.
12. Where no maximum timing is specified, it is expected that the maximum timing should typically be within one unit of time of the minimum timing, under normal operating conditions. Due to potential variability in operating conditions, no maximum timing can be guaranteed however.
13. When HDA_LPE_V1P5V1P8_S3 is powered by a V1P5S rail, the V1P5S rail sequencing should meet the same sequencing requirements as the V1P8S rail.



# 7.3 Power Down Sequences

## 7.3.1 S0 to S3 and S4/S5/G3 Sequence

Entry to Sleep states (S3,S4, S5) is initiated by any of the following methods:

- Setting the desired sleep type in PM1_CNT.SLP_TYP and setting PM1_CNT.SLP_EN.
- Detection of an external catastrophic temperature event may cause a transition to S5, if the system is designed to do so.

The following sequence applies to S0-S3 and S0-S4/S5 transitions.

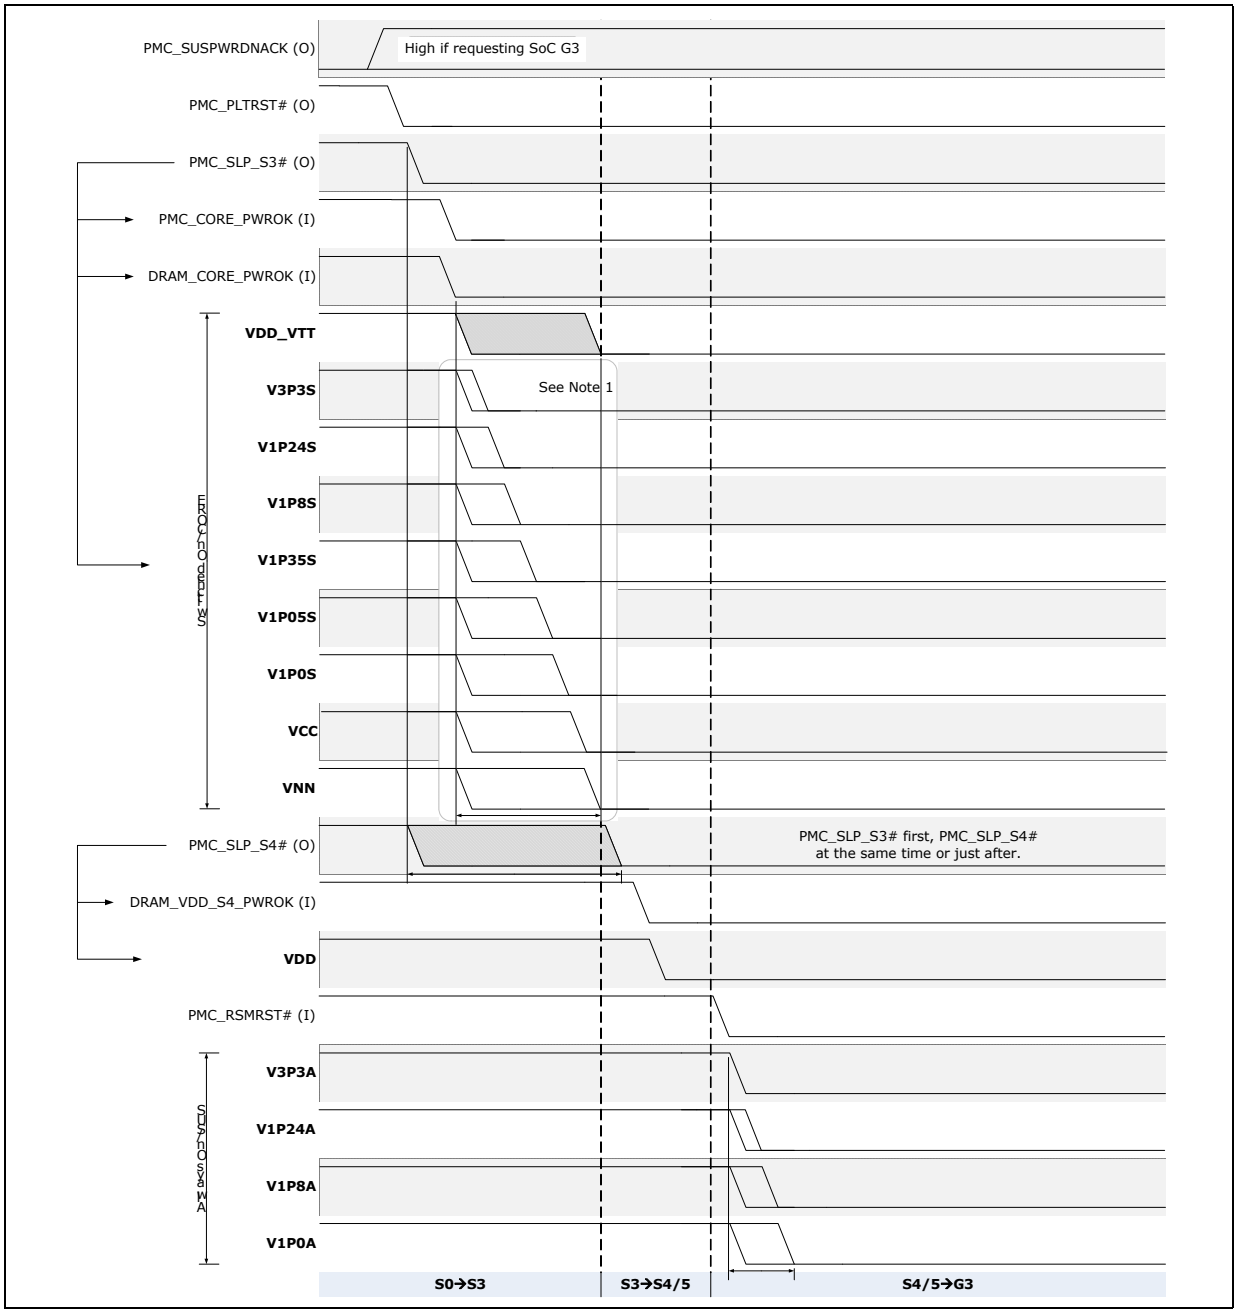
1. The Operating System Power Management (OSPM) will handle the enabling or disabling of interrupt generation after S3 resume. The Operating System Power Management (OSPM) will need to read and clear Wake status information and the processing of the clearing wake status which will include enabling interrupts (both at the core level and platform level).
2. All interrupts in the processor need to be disabled before the S3 sequence is started (and re-enabled on exit). The CPU APIC must be disabled.
3. When the desired sleep state is set in the PM1_CNT.TYP and PM1_CNT.SLP_EN registers, a sleep state request is sent to the PMC.
4. The PMC flushes all the internal buffers to main memory.
5. The PMC places the PCI Express* devices into the L2/L3 state. The PMC will wait until the PCI Express* devices are in the L2/L3 state before preceding. A timeout will occur in 1 ms if there is a non-functional PCI Express* device.

The Power Down Sequence is shown in Figure 13 below.

Additional assumptions:

- Entry to a Cx state is mutually exclusive with software-initiated entry to a Sleep state. This is because the processor(s) can only perform one register access at a time. This requirement is enforced by the CPU as well as the OS. The system may hang if it attempts to do a C-state and S-state at the same time.
- The G3 system state cannot be entered via any software mechanism. The G3 state indicates a complete loss of power. In this state, the RTC well may or may not be powered by an external coin cell battery.
- An external Power Management Controller (PMIC/EC) can be used to put the SoC in G3 when the S4/S5 state is requested by the SoC. This is done to save power in S4/S5 state. This G3 like state, known as SoC G3, is enabled by removing SUS rails via when the SUSPWRDNACK pin is asserted on power down. Doing so prevents the use of any of SUS wake events including USB, RTC, and GPIOs including the power button. The external Power Management Controller (or re-application of power) is required to return to S0.

**Figure 13. S0 to S3 to S4/S5 (Power Down) Sequence without S0ix**



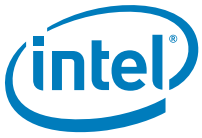


**Table 62. S0 to G3 (Power Down) Sequence**

| Parameter | Description | Min | Max | Unit |
|---|---|---|---|---|
| t1 | Power rail slew rate:<br>From 90% to 10% of voltage typical | 0.1 | 10 | ms |
| t2 | Tail to rail kick off delay[1] | 0 | 3 | ms |

**NOTES:**.
1. The rail to rail kick off delay min is 0 ms and max 3 ms.
2. The Power Down Slew rate min is 0.1 ms and max is 10 ms.
3. Switched/CORE rails should be turned off at the same time. Alternately, it's ok to turn off all Switch/CORE rails in the reverse order of power up paying attention to t2 timing if so. Both sequences are shown.
4. An alternate SUS rail sequence allows swapping V1P8A with V1P0A.
5. SUS rails are turned off only if entering SoC G3 state (SoC lets the board/PMIC power management system know if this is ok - that there are no wake up events expected by the SoC). They can turn off at the same time, or in reverse power up order, just like the Switched/CORE rails.
6. VDD_VTT shows a range of times at which it can turn off. Any time within this range is fine.
7. SLP_S3# can be active before or after DRAM_CORE_PWROK and PMC_CORE_PWROK, but DRAM_CORE_PWROK should go low before memory power rails go low and PMC_CORE_PWROK should go low before Switched/CORE rails go low.
8. Measurement of delays is at the 10% voltage mark. Contact your Intel representative for additional details.
9. The V1P35S rail "VGA_V1P35_S3_F1" must be powered down as shown above. All other V1P35S/VSFR ([X]_V1P35_S3_F[x]) rails can either power down as shown, or power down before V3P3S.

## 7.3.2 S3/S4/S5 to S0 (Exit Sleep States)

Sleep states (S3-S5) are exited based on Wake events. The Wake events will force the system to a full on state (S0), although some non-critical subsystems might still be powered down and have to be brought back manually. For example, the hard disk may be powered down during a sleep state, and have to be enabled via an I/O pin before it can be used. Upon exit from software-entered Sleep states (i.e., those initiated via the PM1_CNT.SLP_EN bit), the PM1_STS_EN.WAK_STS bit will be set.

To enable Wake Events, the possible causes of wake events (and their restrictions) are shown in Table 63.

**Table 63. S3/S4/S5 to S0 Cause of Wake Events (Sheet 1 of 2)**

| Cause | Type | How Enabled |
|---|---|---|
| RTC Alarm[1] | Internal | Set PM1_STS_EN.RTC_EN register bit |
| PMC_PWRBTN#<br>(Power Button) | External | Default enabled as Wake event |
| GPIO_S5[7:0][1] | External | GPE0a_EN register (after having gone to S5 via PM1_CNT.SLP_EN, but not after a power failure.)<br>Note: GPIOs that are in the core well are not capable of waking the system from sleep states where the core well is not powered. |

**Table 63. S3/S4/S5 to S0 Cause of Wake Events (Sheet 2 of 2)**

| Cause | Type | How Enabled |
|---|---|---|
| PMC_WAKE_PCIE[0:3]#[1] (PCI Express WAKE#) | External | PM1_STS_EN.PCIEXP_WAKE_DIS register bit<br>Note: When the PMC_WAKE_PCIE# pin is active and the PM1_STS_EN.PCIEXP_WAKE_DIS register bit is clear, CPU will wake the platform. |
| Primary PME#[1] | Internal | GPEOa_EN.PME_B0_EN register bit. This wake status bit includes multiple internal agents:<br>HD Audio<br>EHCI (USB2) xHCI<br>SATA<br>Note: SATA can only trigger a wake event if it had asserted its PME prior to S3/S4/S5 entry and software doesn't clear GPE0a_STS.PME_B0_STS, a wake event would still result.<br>PME_B0_S5_DIS bit is used to prevent these devices from waking from S5. Does not apply to wake from S3. |
| PMC - Initiated[1] | Internal | No enable bits. The PMC can wake the host independent of other wake events listed, if desired. A bit is provided in PRSTS for reporting this wake event to BIOS. Note that this wake event may be used as a wake trigger on behalf of some other wake source. |

***Note:*** 1. It is not possible to wake the SoC using this event after a Global Reset, Go-to-S5 type reset.

2. When the HDA_LPE_V1P5V1P8_S3 is powered by a V1P5S rail, the V1P5S rail sequencing should meet the same sequencing requirements as the V1P8S rail.

### 7.3.3 Handling Power Failures

The power failures can occur if the AC power or battery is removed. In this case, when the system was originally in a S0 state, power failure bit (GEN_PMCON1.PWR_FLR) is set after a power failure. Software can clear the bit.Chapter 7, “Handling Power Failures”

## 7.4 Reset Behavior

There are several ways to reset the processor.

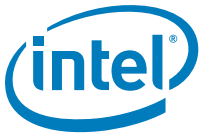

**Table 64. Types of Resets (Sheet 1 of 2)**

| Trigger | Description | Note |
|---|---|---|
| Write of 0Eh to Reset Control Register (RST_CNT) | Write of 0Eh to the Reset Control register | Host Reset with Power Cycle |
| Write of 06h to Reset Control Register (RST_CNT) | Write of 06h to the Reset Control register | Host Reset without Power Cycle with PMC_PLTRST# assertion |
| PMC_RSTBTN# & RST_CNT.full_rst = 0 | User presses the reset button, causing the PMC_RSTBTN# signal to go active (after the debounce logic) | Host Reset without Power Cycle PMC_PLTRST# assertion enabled/ disabled by RST_CNT.sys_rst |
| Write of 4h to Reset Control Register (RST_CNT) | Write of 4h to Reset Control Register (RST_CNT) | Host Reset without Power Cycle without PMC_PLTRST# assertion |
| PMC_RSTBTN# & RST_CNT.full_rst = 1 | User presses the reset button, causing the PMC_RSTBTN# signal to go active (after the debounce logic) | Host Reset with Power Cycle |
| Power Failure | PMC_CORE_PWROK signal goes inactive in S0/S1 | Global Reset with Power Cycle |
| S3/S4/S5 | The processor is reset when going to S3, S4 or S5 state | Sx Entry |
| Processor Thermal Trip | The internal thermal sensor signals a catastrophic temperature condition – transition to S5 and reset asserts | Global Reset, Go-to-S5 |
| PMC_PWRBTN# Power Button Override | 4-second press causes transition to S5 (and reset asserts) | Global Reset, Go-to-S5 |
| CPU Shutdown with Policy to assert PMC_PLTRST# | Shutdown special cycle from CPU can cause either INIT or Reset Control-style PMC_PLTRST# | Global Reset with Power Cycle (if ETR.CF9GR = 1b)<br>Host Reset with Power Cycle (if RST_CNT.full_rst= 1b),<br>Host Reset without Power Cycle (others setting) |
| Write of 06h or 0Eh to Reset Control Register (RST_CNT) | ETR.CF9GR = 1b | Global Reset with Power Cycle |
| Host Partition Reset Entry Timeout | Host partition reset entry sequence took longer than the allowed timeout value (presumably due to a failure to receive one of the internal or external handshakes) | Global Reset with Power Cycle |
| S3/S4/S5 Entry Timeout | S3, S4, or S5 entry sequence took longer than the allowed timeout value (presumably due to a failure to receive one of the internal or external handshakes) | Global Reset, Go-to-S5 |

**Table 64. Types of Resets (Sheet 2 of 2)**

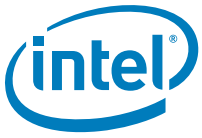
| Trigger | Description | Note |
|---|---|---|
| PMC Watchdog Timer | PMC firmware watchdog time expires twice | Global Reset, Go-to-S5 |
| TCO Watchdog Timer | TCO timer | RST_CNT.full_rst = 0: Host Reset without Power Cycle<br>RST_CNT.full_rst = 1: Host Reset with Power Cycle |
| Host Reset promoted to Global Reset | During boot, TXE FW may promote a Host Reset to a Global Reset in order to apply new TXE or PMC firmware | Global Reset with Power Cycle |

***Note:*** - Host Reset without Power Cycle: All processor functionality not required for correct operation during & after reset, excluding the PMC, is reset and the SoC remain in S0.

- Host Reset with Power Cycle: All processor functionality not required for correct operation during & after reset, excluding the PMC, is reset and the SoC transitions to S5 and then to S0.

- Global Reset with Power Cycle: All processor functionality not required for correct operation during & after reset, including the PMC, is reset and the SoC transitions to S5 and then S0.

- Global Reset, Go-to-S5: All processor functionality not required for correct operation upon wake, including the PMC, are reset and the SoC transitions to S5.



# 8 Thermal Management

The SoC's thermal management system helps in managing the overall thermal profile of the system to prevent overheating and system breakdown. The architecture implements various proven methods of maintaining maximum performance while remaining within the thermal spec. Throttling mechanisms are used to reduce power consumption when thermal limits of the device are exceeded and the system is notified of critical conditions via interrupts or thermal signalling pins. SoC thermal management differs from legacy implementations primarily by replacing dedicated thermal management hardware with firmware.

The thermal management features are:

- Eight digital thermal sensors (DTS)
- Supports a hardware trip point and four programmable trip points based on the temperature indicated by thermal sensors.
- Supports different thermal throttling mechanisms.

## 8.1 CPU Thermal Management Registers

The description of the control and status registers can be found in the *Bay Trail SoC BIOS Writer's Guide*.

## 8.2 Thermal Sensors

SoC provides thermal sensors that use ring oscillator based DTS (Digital Thermal Sensor) to provide more accurate measure of system thermals.

The SoC instantiates multiple digital thermal sensors (one DTS for each processor core, one for each BIU-Bus Interface Unit, and two for non-core SoC) and sensor grouping configurations are provided to optionally select the maximum of all sensors for thermal readout and interrupt generation.

DTS output are adjusted for silicon variations. For a given temperature the output from DTS is always the same irrespective of silicon.

**Table 65. Temperature Reading Based on DTS (If $T_{J-MAX}$ =90°C) (Sheet 1 of 2)**

| DTS Counter Value | Temperature Reading |
|---|---|
| 127 | 90°C |
| 137 | 80°C |
| 147 | 70°C |
| 157 | 60°C |
| 167 | 50°C |

**Table 65. Temperature Reading Based on DTS (If $T_{J-MAX}$ =90°C) (Sheet 2 of 2)**

| DTS Counter Value | Temperature Reading |
|---|---|
| 177 | 40°C |
| 187 | 30°C |
| 197 | 20°C |
| 207 | 10°C |

***Note:*** DTS encoding of 127 always represents $T_{J-MAX}$.If $T_{J-MAX}$ is at 110°C instead of 90°C then the encoding 127 from DTS indicates 110°C, 137 indicates 90°C and so forth.

Thermal trip points are of two types:

- **Hard Trip**: The Catastrophic trip points generated by DTS's based on predefined temperature setting defined in fuses.
- **Programmable Trips**: four programmable trip settings (Hot, Aux2, Aux1, Aux0) that can be set by firmware/software. Default value for Hot Trip is from Fuses.

***Note:*** DTS accuracy is around 8°C under 60°C and around 6°C above 60°C.

## 8.3 SoC Programmable Trips

Programmable trips can be programmed to cause different actions when triggered to reduce temperature of the die.

### 8.3.1 Aux3 Trip

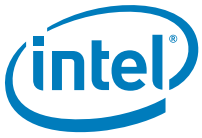
By default, the Aux 3 (Hot Trip) point is set by fuses but the software/firmware has an option to set these to a different value.

This trip point is enabled by firmware to monitor and control the system temperature while the rest of the system is being set up.

### 8.3.2 Aux2, Aux1, Aux0 Trip

These are fully programmable trip points for general hardware protection mechanisms. The programmable trips are only active after software/firmware enables the trip.

***Note:*** Unlike Aux3, the Aux[2:0] trip registers are defaulted to zero. To prevent spurious results, software/firmware should program the trip values prior to enabling the trip point.



## 8.4 Platform Trips

### 8.4.1 PROCHOT#

The platform components use the signal PROCHOT# to indicate thermal events to SoC.

The processor core HOT trip as well as the processor AUX 3 trip are individually sent to firmware, which internally combines them and drives the appropriate PROCHOT back. Assertion of the PROCHOT# input will trigger Thermal Monitor 1 or Thermal Monitor 2 throttling mechanisms if they are enabled.

## 8.5 Thermal Throttling Mechanisms

Thermal throttling mechanisms are implemented to try to reduce temperature by reducing power consumption in response to a HOT condition. Actions taken as a result of Thermal Trip indication can be as simple as throttling bandwidth and frequency to as drastic as shutting down the PLL's and the entire system. Actions are primarily taken in to prevent system breakdown and are dependent on the severity of the trips.

## 8.6 Thermal Status

The firmware captures Thermal Trip events (other than THERMTRIP) in status registers to trigger thermal actions. Associated with each event is a set of programmable actions. For a complete list of refer to the *Bay Trail SoC BIOS Writer's Guide.*

§

# 9 Electrical Specifications

This chapter is split into the following sections:

- "Thermal Specifications"
- "Storage Conditions"
- "Voltage and Current Specifications"
- "Crystal Specifications"
- "DC Specifications"
- "AC Specifications"

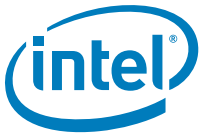
## 9.1 Thermal Specifications

These specifications define the operating thermal limits of the SoC. Thermal solutions not designed to provide the following level of thermal capability may affect the long-term reliability of the processor and system, but more likely result in performance throttling to ensure silicon junction temperatures within spec. For more details on thermal solution design, refer to this product's Thermal/Mechanical Design Guide.

This section specifies the thermal specifications for all SKUs. Some definitions are needed, however. "Tj Max" defines the maximum operating silicon junction temperature. Unless otherwise specified, all specifications in this document assume Tj Max as the worse case junction temperature. This is the temperature needed to ensure TDP specifications when running at guaranteed CPU and graphics frequencies. "TDP" defines the thermal dissipated power for a worse case estimated real world thermal scenario.

**Table 66. Intel Atom® Processor E3800 Product Family Thermal Specifications**

| SKU | $T_j$ Min/Max | TDP |
|---|---|---|
| E3845 | -40 to 110 °C | 10 W @ Tj Max |
| E3827 | -40 to 110 °C | 8 W @ Tj Max |
| E3826 | -40 to 110 °C | 7 W @ Tj Max |
| E3825 | -40 to 110 °C | 6 W @ Tj Max |
| E3815 | -40 to 110 °C | 5 W @ Tj Max |
| E3805 | -40 to 110 °C | 3 W @ Tj Max |



## 9.2 Storage Conditions

This section specifies absolute maximum and minimum storage temperature and humidity limits for given time durations. Failure to adhere to the specified limits could result in physical damage to the component. If this is suspected, Intel recommends a visual inspection to determine possible physical damage to the silicon or surface components.

**Table 67. Storage Conditions Prior to Board Attach**

| Symbol | Parameter | Min | Max |
|---|---|---|---|
| Tabsolute storage | Device storage temperature when exceeded for any length of time. | -25 °C | 125 °C |
| Tshort term storage | The ambient storage temperature and time for up to 72 hours. | -25 °C | 85 °C |
| Tsustained storage | The ambient storage temperature and time for up to 30 months. | -5 °C | 40 °C |
| RHsustained storage | The maximum device storage relative humidity for up to 30 months. | | 60% @ 24 °C |

***Note:***

- Specified temperatures are not to exceed values based on data collected. Exceptions for surface mount re-flow are specified by the applicable JEDEC standard. Non-adherence may affect processor reliability.
- Component product device storage temperature qualification methods may follow JESD22-A119 (low temperature) and JESD22-A103 (high temperature) standards when applicable for volatile memory.
- Component stress testing is conducted in conformance with JESD22-A104.
- The JEDEC J-JSTD-020 moisture level rating and associated handling practices apply to all moisture sensitive devices removed from the moisture barrier bag.

### 9.2.1 Post Board-Attach

The storage condition limits for the component once attached to the application board are not specified. Intel does not conduct component-level certification assessments post board-attach given the multitude of attach methods, socket types, and board types used by customers.

Provided as general guidance only, board-level Intel-branded products are specified and certified to meet the following temperature and humidity limits:

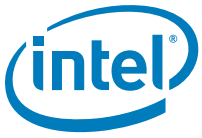
- Non-Operating Temperature Limit: -40 °C to 70 °C
- Humidity: 50% to 90%, non-condensing with a maximum wet-bulb of 28 °C

## 9.3 Voltage and Current Specifications

The I/O buffer supply voltages are specified at the SoC package balls. The tolerances shown in Table 86 are inclusive of all noise from DC up to 20 MHz. The voltage rails should be measured with a bandwidth limited oscilloscope with a roll-off of 3 dB/decade above 20 MHz under all operating conditions. Table 94 indicates which supplies are connected directly to a voltage regulator or to a filtered voltage rail. For voltage rails that are connected to a filter, they should be measured at the input of the filter. If the recommended platform decoupling guidelines cannot be met, the system designer will have to make trade-offs between the voltage regulator out DC tolerance and the decoupling performances of the capacitor network to stay within the voltage tolerances listed below.

**Table 68. Power Rail DC Specs and Max Current**

| Platform Rail | Voltage Tolerances | Max Icc |
|---|---|---|
| V1P0A<br>- UNCORE_V1P0_G3<br>- USB3_V1P0_G3 | 1.0 V<br><br>DC: ±2%<br>AC: ±3% | 375 mA |
| V1P24A<br>- USB_HSIC_V1P24_G3<br>(Can connect to V1P0A when USB HSIC isn't used) | 1.24 V<br><br>DC: ±3%<br>AC: ±2% | 35 mA |
| V1P8A<br>- PCU_V1P8_G3<br>- PMC_V1P8_G3<br>- UNCORE_V1P8_G3<br>- USB_V1P8_G3<br>- USB_ULPI_V1P8_G3 | 1.8 V<br><br>DC: ±3%<br>AC: ±2% | 65 mA |
| V3P3A<br>- PCU_V3P3_G3<br>- USB_V3P3_G3 | 3.3 V<br><br>DC: ±2%<br>AC: ±3% | 55 mA |
| V1P0S<br>- GPIO_V1P0_S3<br>- PCIE_SATA_V1P0_S3<br>- PCIE_V1P0_S3<br>- SATA_V1P0_S3<br>- SVID_V1P0_S3<br>- USB3DEV_V1P0_S3<br>- USB_V1P0_S3<br>- VGA_V1P0_S3 | 1.0 V<br><br>DC: ±2%<br>AC: ±3% | 1.1 A |
| V1P0S<br>- DRAM_V1P0_S3<br>- DDI_V1P0_S3<br>- UNCORE_V1P0_S3 | 1.0 V<br><br>DC: ±2%<br>AC: ±3% | 2.5 A |



### Table 68. Power Rail DC Specs and Max Current

| Platform Rail | Voltage Tolerances | Max Icc |
|---|---|---|
| V1P05S<br>- CORE_V1P05_S3 | 1.05 V<br><br>DC: ±2%<br>AC: ±3% | 1.3 A |
| V1P24S<br>- MIPI_V1P24_S3 (can be grounded if MIPI CSI not used) | 1.24 V<br><br>DC: ±2%<br>AC: ±3% | 45 mA |
| V1P35S (VSFR)<br>- ICLK_V1P35_S3_F[2:1]<br>- VGA_V1P35_S3_F1( grounded if VGA not used)<br>- DRAM_V1P35_S3_F1<br>- UNCORE_V1P35_S3_F[6:1] | 1.35 V<br><br>DC: ±3%<br>AC: ±2% | 400 mA |
| V1P5V1P8S (VAUD)<br>- HDA_LPE_V1P5V1P8_S3 | 1.5 V (LV HDA)<br>1.8 V (LPE) | In V1P8S |

| VCC<br>- CORE_VCC_S3 | See Table 70 | See Table 69 |
| VNN<br>- UNCORE_VNN_S3 | See Table 70 | See Table 69 |
| VDD<br>- DRAM_VDD_S4 | 1.35 V<br><br>DC: ±2%<br>AC: ±3% | 1.3 A |
| VRTC<br>- RTC_VCC | G3: 2-3.3 V at SoC<br>Otherwise: V3P3A (pre diode drop) | 100 uA<br>(6 uA Avg.)<br>(see note) |

***Note:*** RTC_VCC average current draw (G3) is specified at 27°C under battery conditions.

***Note:*** S3/S4/S5 power is 20 mW max. S3/S4/S5 power is measured during S3/S4/S5 idle as a long term average over worst case silicon at room temperature (27°C). It is intended

to define a limit of the power consumed by the SoC during the S3/S4/S5 state for battery life estimates and power budgeting. Breakdown is as follows: < 4 mA on V1P8A, < 15 mA on V1P0A, < 1 mW on V1P35U/V3P3A/V1P24A.

**Table 69. VCC and VNN Currents**

| SKU | VCC Icc Max | VNN Icc Max |
|---|---|---|
| E3845 | 9 A | 10 A |
| E3827 | 4 A | 10 A |
| E3826 | 4 A | 10 A |
| E3825 | 4 A | 9 A |
| E3815 | 2 A | 8 A |
| E3805 | 4 A | 7 A |

## 9.3.1 VCC and VNN Voltage Specifications

Table 70 and Table 86 list the DC specifications for the SoC power rails. They are valid only while meeting specifications for junction temperature, clock frequency, and input voltages. Care should be taken to read all notes associated with each parameter.

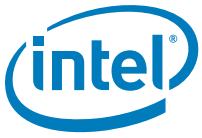
**Table 70. VCC and VNN DC Voltage Specifications**

| Symbol | Parameter | Min | Typ | Max | Unit | Note |
|---|---|---|---|---|---|---|
| CORE_VCC_S3 VID | Core VID (voltage) Target Range | 0.40 | | 1.0 | V | 1 |
| UNCORE_VNN_S3 VID | Uncore VID (voltage) Target Range | 0.50 | | 1.05 | V | 1 |
| CORE_VCC/ UNCORE_VNN $V_{BOOT}$ | Default target $V_{CC}/V_{NN}$ voltage for initial power up. | | 1.0 or 1.1 | | V | 2 |
| VCC/VNN Tolerance | Tolerance of VCC/VNN voltage at VID target. | -5 | | 5 | % | |

**NOTES:**
1. Each SoC is programmed with voltage identification value (VID), which is set at manufacturing and cannot be altered. Individual VID values are calibrated during manufacturing such that two SoCs at the same frequency may have different settings within the VID range above. VID targets employed by the SoC during a power management event are selected within the range uniquely hard-coded into each SoC.
2. See the VR12/IMVP7 Pulse Width Modulation specification for additional details. Either value is ok.

## 9.3.2 Voltage Identification (VID)

The VID specifications for the SoC CORE_VCC_S3 and UNCORE_VNN_S 3are defined by the IMVP7 Pulse Width Modulation (PWM) Specification. Table 71 specifies the voltage level corresponding to the eight bit VID value transmitted over serial VID (SVID)



interface per IMVP7 specification. A '1' in this table refers to a high voltage level and a '0' refers to a low voltage level. If the voltage regulation circuit cannot supply the voltage that is requested, the voltage regulator must disable itself.

The SVID signals are CMOS push/pull drivers. Refer to Table 103 for the DC specifications for these signals. The VID codes will change due to performance, temperature and/or current load changes in order to minimize the power of the part. A voltage range is provided in Table 70. The specifications are set so that one voltage regulator can operate with all supported frequencies.

Individual SoC VID values may be set during manufacturing so that two devices at the same core frequency may have different default VID settings. This is shown in the VID range values in Table 70. The SoC provides the ability to operate while transitioning to an adjacent VID and its associated voltage. This will represent a DC shift in the loadline.

***Note:*** Table below lists all voltages possible per IMVP7 specification. Not all voltages are valid on actual SKUs.

**Table 71. IMVP7.0 Voltage Identification Reference (Sheet 1 of 8)**

| VID7 | VID6 | VID5 | VID4 | VID3 | VID2 | VID1 | VID0 | Hex bit 1 | Hex bit 0 | $V_{CC}$ (V) |

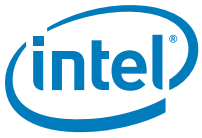
## 9.4 Crystal Specifications

There are two crystal. One for RTC which maintains time and provides initial timing reference for power sequencing. The other is for the Integrated Clock, which covers clocking for the entire SoC.

**Table 72. ILB RTC Crystal Specification**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $F_{RTC}$ | Frequency | - | 32.768 | - | kHz | 1 |
| $T_{PPM}$ | Crystal frequency tolerance (see notes) | - | - | +/-50 | ppm | 1 |
| $R_{ESR}$ | ESR | - | - | 50 | kOhm | 1 |
| $C_{X1,2}$ | Capacitance of X1, X2 pins | | | | pF | 1 |

**NOTES:**
1. These are the specifications needed to select a crystal oscillator for the RTC circuit.



2. Crystal tolerance impacts RTC time. A 10 ppm crystal is recommended for 1.7 s tolerance per day, RTC circuit itself contributes addition 10 ppm for a total of 20 ppm in this example.

**Table 73. Integrated Clock Crystal Specification**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $F_{ICLK}$ | Frequency | - | 25 | - | MHz | 1 |
| $T_{PPM}$ | Crystal frequency tolerance & stability | - | - | +/-100 | ppm | 1 |
| $P_{DRIVE}$ | Crystal drive load | - | - | 100 | uW | 1 |
| $R_{ESR}$ | ESR | - | - | 100 | Ohm | 1 |
| $C_{LOAD}$ | Crystal load capacitance | | 18 | | pF | |
| $C_{SHUNT}$ | Crystal shunt capacitance | - | - | 6 | pF | 1 |
| $C_{IN/OUT}$ | Capacitance of oscillator pins | | | | pF | 1 |

**NOTES:**
1. These are the specifications needed to select a crystal oscillator for the Integrated Clock circuit. Crystal must be AT cut, fundamental, parallel resonance.

## 9.5 DC Specifications

Platform reference voltages are specified at DC only. $V_{REF}$ measurements should be made with respect to the supply voltages specified in "Voltage and Current Specifications".

See the following DC Specifications in this section:

- "Display DC Specification"
- "PCI Express* DC Specification"
- "MIPI-Camera Serial Interface (CSI) DC Specification"
- "SCC - SDIO DC Specification"
- "SCC - SD Card DC Specification"
- "SCC - eMMC 4.5 DC Specification"
- "SATA DC Specification"
- "JTAG (TAP) DC Specification"
- "DDR3L Memory Controller DC Specification"
- "USB 2.0 Host DC Specification"
- "USB 3.0 DC Specification"
- "PCU - iLB - LPC DC Specification"
- "PCU - SPI (Platform Control Unit) DC Specification"
- "PCU - Power Management/Thermal (PMC) & iLB RTC DC Specification"
- "SVID DC Specification"
- "GPIO DC Specification"

- "SIO - I2C DC Specification"
- "SIO - UART DC Specification"
- "I2S (Audio) DC Specification"

***Note:*** Care should be taken to read all notes associated with each parameter.

## 9.5.1 Display DC Specification

DC specifications for display interfaces:

- "Analog VGA Video DC Specification"
- "Digital Display Interface (DDI) Signals DC Specification"

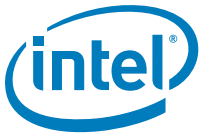
### 9.5.1.1 Analog VGA Video DC Specification

Interface DC Specifications are referred to the VESA Video Signal Standard, version 1 revision 2.

**Table 74. R,G,B/VGA DAC Display DC specification (Functional Operating Range)**

| Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|
| Resolution | | 8 | | bits | 1 |
| Max Luminance (full-scale) | 0.665 | 0.700 | 0.770 | V | 1,2,4 (white video level voltage) |
| Min Luminance | | 0.0 | | V | 1,3,4 (black video level voltage) |
| LSB Current | | 73.2 | 8 | µA | 4,5 |
| Integral Non Linearity (INL) | -1.0 | | +1.0 | LSB | 1,6 |
| Differential Non-Linearity (DNL) | -1.0 | | +1.0 | LSB | 1,6 |
| Video Channel-to-Channel Voltage amplitude mismatch | | | 6 | % | 7 |
| Monotonicity | | Guaranteed | | | |

**NOTES:**
1. Measured at each R,G,B termination according to the VESA Test Procedure – Evaluation of Analog Display Graphics Subsystems Proposal (Version 1, Draft 4, December 1, 2000).
2. Max steady-state amplitude
3. Min steady-state amplitude
4. Defined for a double 75 Ω termination
5. Set by external reference resistor value
6. INL & DNL measured and calculated according to VESA Video Signal Standards
7. Max fill-scale voltage difference among R,G,B outputs (percentage of steady-state full-scale voltage).



### Table 75. VGA_DDCCLK, VGA_DDCDATA Signal DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | VGA_V3P3_S3 | | | | |
| $V_{IH}$ | Input High Voltage | 2 | | Vref | V | 1 |
| $V_{IL}$ | Input Low Voltage | 0 | | 0.8 | V | 2 |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.4 | V | 3 |
| $I_i$ | Input Pin Leakage | -45 | | 45 | µA | 4 |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. 3 mA sink current.
4. For VIN between 0V and VGA_V3P3_S3. Measured when driver is tri-stated.

### Table 76. VGA_HSYNC and VGA_VSYNC DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | VGA_V3P3_S3 | | | | |
| $V_{OH}$ | Output High Voltage | 2.4 | | $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.5 | V | |
| $I_{OH}$ | Output High Current | | | 8 | mA | |
| $I_{OL}$ | Output Low Current | | | 8 | mA | |
| $I_i$ | Input Pin Leakage | -35 | | 35 | µA | 1 |

**NOTE:**
1. For $V_{IN}$ between 0-V and VGA_V3P3_S3. Measured when driver is tri-stated.

## 9.5.1.2 Digital Display Interface (DDI) Signals DC Specification

### Table 77. DDI Main Transmitter DC specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{TX\text{-}DIFFp\text{-}p\text{-}Level0}$ | Differential Peak-to-peak Output Voltage Level 0 | 0.34 | 0.4 | 0.46 | V | 1 |
| $V_{TX\text{-}DIFFp\text{-}p\text{-}Level1}$ | Differential Peak-to-peak Output Voltage Level 1 | 0.51 | 0.6 | 0.68 | V | 1 |
| $V_{TX\text{-}DIFFp\text{-}p\text{-}Level2}$ | Differential Peak-to-peak Output Voltage Level 2 | 0.69 | 0.8 | 0.92 | V | 1 |
| $VT_{X\text{-}DIFFp\text{-}p\text{-}Level3}$ | Differential Peak-to-peak Output Voltage Level 3 | 0.85 | 1.2 | 1.38 | V | 1 |
| $V_{TX\text{-}PREEMP\text{-}RATIO}$ | No Pre-emphasis | 0.0 | 0.0 | 0.0 | dB | 1 |
| | 3.5 dB Pre-emphasis | 2.8 | 3.5 | 4.2 | dB | 1 |

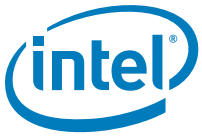
### Table 77. DDI Main Transmitter DC specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| | 6.0 dB Pre-emphasis | 4.8 | 6.0 | 7.2 | dB | 1 |
| | 9.5 dB Pre-emphasis | 7.5 | 9.5 | 11.4 | dB | 1 |
| $V_{TX-DC-CM}$ | Tx DC Common Mode Voltage | 0 | | 2.0 | V | 1 |
| RLTX-DIFF | Differential Return Loss at 0.675GHz at Tx Package pins | 12 | | | dB | 4 |
| | Differential Return Loss at 1.35 GHz at Tx Package pins | 9 | | | dB | 4 |
| $C_{TX}$ | AC Coupling Capacitor | 75 | | 200 | nF | 5 |
| Voff | Single Ended Standby (off), output voltage | -10 | | 10 | mV | 6 @ AVcc |
| Vswing | Single Ended output swing voltage | 400 | | 600 | mV | |
| $V_{OH}$ (<=165 MHz) | Single Ended high level, output voltage | -10 | | 10 | mv | 6 @ AVcc |
| $V_{OH}$(>165 MHz) | Single Ended high level, output voltage | -200 | | 10 | mV | 6 @ AVcc |
| $V_{OL}$(<=165 MHz) | Single Ended low level, output voltage | -600 | | -400 | mV | 6 @ AVcc |
| $V_{OL}$(>165MHz) | Single Ended low level, output voltage | -700 | | -400 | mV | 6 @ AVcc |

**NOTES:**
1. For embedded connection, support of programmable voltage swing levels is optional.
2. Total drive current of the transmitter when it is shorted to its ground.
3. Common mode voltage is equal to Vbias_Tx voltage shown in Figure 14.
4. Straight loss line between 0.675 GHz and 1.35 GHz.
5. All DisplayPort Main Link lanes as well as AUX CH must be AC coupled. AC coupling capacitors must be placed on the transmitter side. Placement of AC coupling capacitors on the receiver side is optional.
6. AVcc =Analog Voltage level

### Table 78. DDI AUX Channel DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{AUX-DIFFp-p}$ | AUX Peak-to-peak Voltage at a transmitting Device | 0.29 | | 1.38 | V | 1 |
| $V_{AUX-\_TERM\_R}$ | AUX CH termination DC resistance | | 100 | | Ω | |
| $V_{AUX-DC-CM}$ | AUX DC Common Mode Voltage | 0 | | 2.0 | V | 2 |



### Table 78. DDI AUX Channel DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{AUX-TURN-CM}$ | AUX turn around common mode voltage | | | 0.3 | V | 3 |
| $I_{AUX\_SHORT}$ | AUX Short Circuit Current Limit | | | 90 | mA | 4 |
| $C_{AUX}$ | AC Coupling Capacitor | 75 | | 200 | nF | 5 |

**NOTES:**
1. $V_{AUX-DIFFp-p} = 2*|V_{AUXP} - V_{AUXM}|$
2. Common mode voltage is equal to $V_{bias\_Tx}$ (or $V_{bias\_Rx}$) voltage.
3. Steady state common mode voltage shift between transmit and receive modes of operation.
4. Total drive current of the transmitter when it is shorted to its ground.
5. All DisplayPort Main Link lanes as well as AUX CH must be AC coupled. AC coupling capacitors must be placed on the transmitter side. Placement of AC coupling capacitors on the receiver side is optional.

NOTES:

### Table 79. DDI DDC Signal DC Specification (DDI[1:0]_DDCDATA, DDI[1:0]_DDCCLK)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | MIPI_V1P8_S3 | | | V | |
| $V_{IH}$ | Input High Voltage | $0.65*V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{IL}$ | Input Low Voltage | 0 | | $0.35*V_{REF}$ | V | 2 |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.4 | V | 3 |
| $I_i$ | Input Pin Leakage | -30 | | 30 | µA | 4 |

1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the maximum voltage level at a receiving agent that will be interpreted as a logical low value.
3. 3mA sink current.
4. For VIN between 0V and CORE_VCC_S3. Measured when driver is tri-stated.

### Table 80. DDI DDC Misc Signal DC Specification (DDI[1:0]_HPD, DDI[1:0]_BKLTCTL, DDI[1:0]_VDDEN, DDI[1:0]_BKLTEN)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | MIPI_V1P8_S3 | | | V | |
| $V_{IH}$ | Input High Voltage | $0.65*V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{IL}$ | Input Low Voltage | 0 | | $0.35*V_{REF}$ | V | 2 |
| $Z_{pu}$ | Pull up Impedance | 40 | 50 | 60 | Ω | 3 |
| $Z_{pd}$ | Pull down Impedance | 40 | 50 | 60 | Ω | 3 |
| $I_i$ | Input Pin Leakage | -20 | | 20 | µA | 4 |

1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the maximum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at CORE_VCC_S3.
4. For VIN between 0V and CORE_VCC_S3. Measured when driver is tri-stated.

**Figure 14. Definition of Differential Voltage and Differential Voltage Peak-to-Peak**

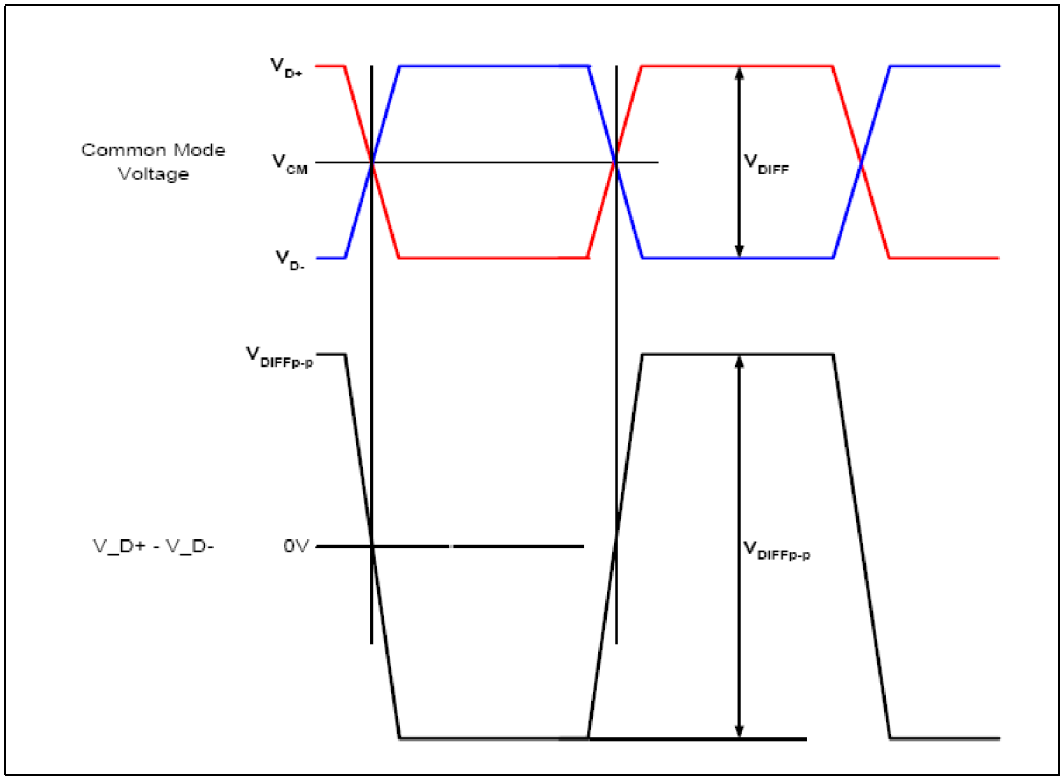


**Figure 15. Definition of Pre-emphasis**

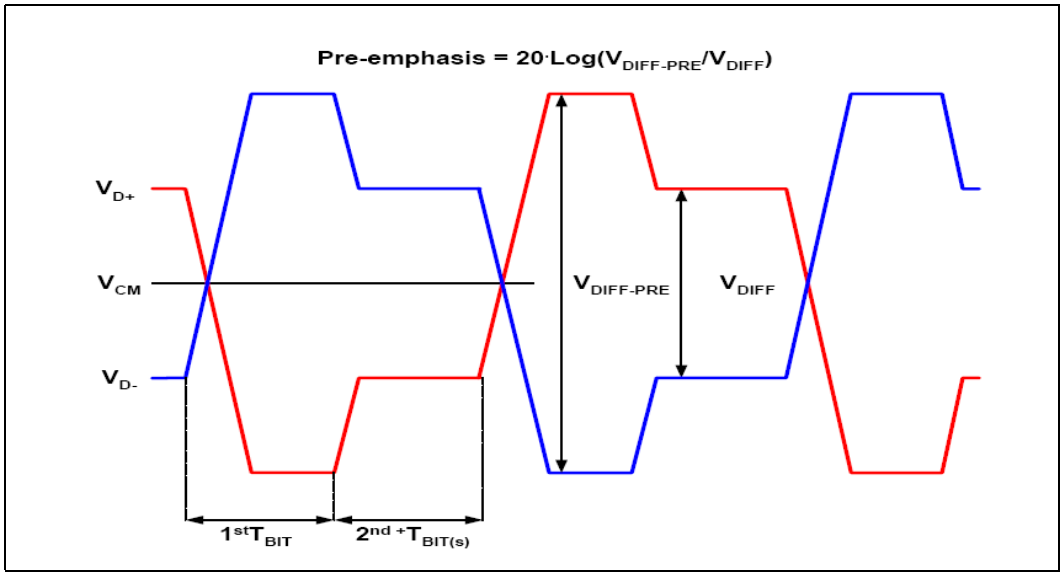
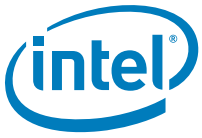




## 9.5.2 PCI Express* DC Specification

### Table 81. PCI Express* DC Receive Signal Characteristics

| Symbol | Parameter | Min | Typ | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| $V_{RXDIFF\ Gen1}$ | Differential RX Peak to Peak | 175 | | 1200 | mV | 1 |
| $V_{RXDIFF\ Gen2}$ | Differential RX Peak to Peak | 100 | | 1200 | mV | 1 |

**NOTE:**
1. PCI Express differential peak to peak = 2*|RXp[x] – RXn[x]|

### Table 82. PCI Express* DC Transmit Characteristics

| Symbol | Parameter | Min | Typ | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| $V_{TXDIFF}$ | Differential TX Peak to Peak | 800 | | 1200 | mV | 1 |
| $V_{TXDIFF-LP}$ | Differential TX Peak to Peak (low power mode) | 400 | | 1200 | mV | 1 |

**NOTE:**
1. PCI Express differential peak to peak = 2*|TXp[x] – TXn[x]|

### Table 83. PCI Express* DC Clock Request Input Signal Characteristics

| Symbol | Parameter | Min | Typ | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | UNCORE_V1P8_S3 | | | | |
| $V_{IL}$ | Input Low Voltage | 0 | | $0.3*V_{REF}$ | V | 1 |
| $V_{IH}$ | Input High Voltage | $0.65*V_{REF}$ | | $V_{REF}$ | V | 1 |

## 9.5.3 MIPI-Camera Serial Interface (CSI) DC Specification

### Table 84. MIPI HS-RX/MIPI LP-RX Minimum, Nominal, and Maximum Voltage Parameters (Sheet 1 of 2)

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| $I_{LEAK}$ | Pin Leakage current | -10 | – | 10 | µA | |
| **MIPI-CSI HS-RX Mode** | | | | | | |
| $V_{CMRX(DC)}$ | Common-mode voltage HS receive mode | 70 | – | 330 | mV | |
| $V_{IDTH}$ | Differential input high threshold | – | – | 70 | mV | |
| $V_{IDTL}$ | Differential input low threshold | -70 | – | – | mV | |
| $V_{IHHS}$ | Single-ended input high voltage | – | – | 460 | mV | |
| $V_{ILHS}$ | Single-ended input low voltage | -40 | – | – | mV | |
| $V_{TERM-EN}$ | Single-ended threshold for HS termination enable | – | – | 450 | mV | |
| $Z_{ID}$ | Differential input impedance | 80 | 100 | 125 | Ω | |

**Table 84. MIPI HS-RX/MIPI LP-RX Minimum, Nominal, and Maximum Voltage Parameters (Sheet 2 of 2)**

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| **MIPI-CSI LP-RX Mode** | | | | | | |
| $V_{IH}$ | Logic 1 input voltage | 880 | – | – | mV | |
| $V_{IL}$ | Logic 0 input voltage, not in ULP state | – | – | 550 | mV | |
| $V_{IL-ULPS}$ | Logic 0 input voltage, ULP state | – | – | 300 | mV | |
| $V_{HYST}$ | Input hysteresis | 25 | – | – | mV | |

## 9.5.4 SCC - SDIO DC Specification

Table 85 provides the SDIO DC Specification, for all other DC Specifications not listed in Table 85, refer to Table 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0]).

**Table 85. SDIO DC Specification**

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| $V_{OH}$ | Output High Voltage | 1.4 | – | – | V | Measured at $I_{OH}$ maximum. |
| $I_{OH}/I_{OL}$ | Current at VoL/Voh | -2 | – | – | mA | |

## 9.5.5 SCC - SD Card DC Specification

Table 86 provides the SD Card DC Specification, for all other DC Specifications not listed in Table 86, refer to Table 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0]).

**Table 86. SD Card DC Specification**

| Symbol | Parameter | Min. | Max. | Unit |
|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | SD3_V1P8V3P3_S3 | | |
| $V_{OH}$ | Output High Voltage | $0.75*V_{REF}$ | $V_{REF}$ | V |
| $V_{OL}$ | Output Low Voltage | 0 | $0.125*V_{REF}$ | V |
| $V_{IH\ (3.3)}$ | Input High Voltage (3.3 V) | $0.625*V_{REF}$ | $V_{REF}$ | V |
| $V_{IL\ (3.3)}$ | Input Low Voltage (3.3 V) | 0 | $0.25*V_{REF}$ | V |
| $V_{PEAK\ (3.3)}$ | Peak Voltage on All lines | -0.3 | $V_{REF}+0.3$ | V |
| $V_{IH\ (1.8)}$ | Input High Voltage (1.8 V) | 1.28 | $V_{REF}$ | V |

**Table 86. SD Card DC Specification**

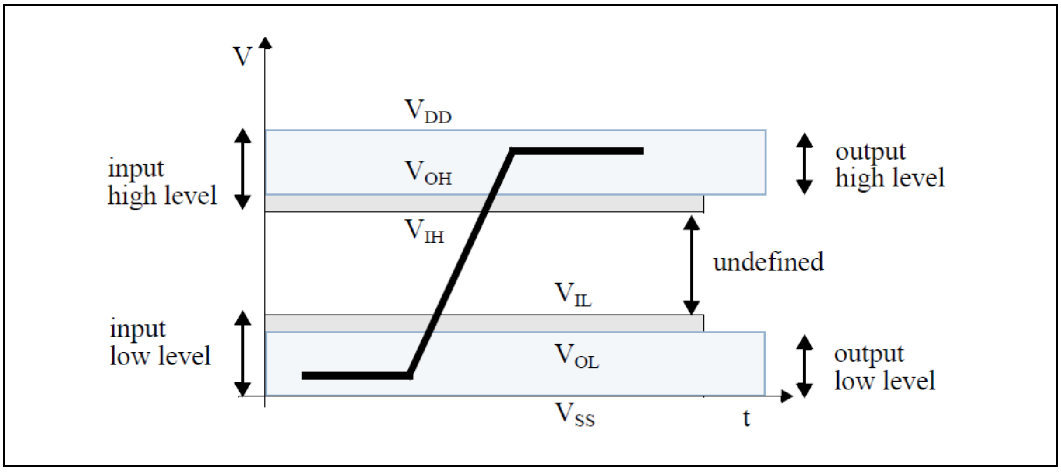
| Symbol | Parameter | Min. | Max. | Unit |
|---|---|---|---|---|
| $V_{IL\ (1.8)}$ | Input Low Voltage (1.8 V) | 0 | 0.58 | V |
| $V_{PEAK\ (1.8)}$ | Peak Voltage on All lines | -0.3 | $V_{REF}$+0.3 | V |
| $I_{OH}/I_{OL}$ | Current at VoL/Voh | -45 | 45 | µA |
| $V_{hysteresis}$ | Input Hysteresis | None | | V |
| $C_{LOAD}$ | Input Load Capacitance | 4 | 9 | pF |

## 9.5.6 SCC - eMMC 4.5 DC Specification

**Table 87. eMMC 4.5 Signal DC Electrical Specifications**

| Symbol | Parameter | Min | Max | Units |
|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | UNCORE_V1P8_S3 | | |
| $V_{OH}$ | Output HIGH voltage | $V_{REF}$ - 0.45 | $V_{REF}$ | V |
| $V_{OI}$ | Output LOW voltage | 0 | 0.45 | V |
| $V_{IH}$ | Input HIGH voltage | 0.65 * $V_{REF}$ | $V_{REF}$ + 0.3 | V |
| $V_{IL}$ | Input LOW voltage | -0.3 | 0.35 * $V_{REF}$ | V |
| $C_L$ | Bus Signal Line capacitance | - | 30 | pF |
| $I_{LI}$ | Input Leakage Current | -2 | 2 | µA |
| $I_{L0}$ | Output Leakage Current | -2 | 2 | µA |

**Figure 16. eMMC DC Bus signal level**



## 9.5.7 JTAG (TAP) DC Specification

### Table 88. TAP Signal Group DC Specification (TAP_TCK, TAP_TRSRT#, TAP_TMS, TAP_TDI)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PMC_V1P8_G3 | | | | |
| $V_{IH}$ | Input High Voltage | $0.8*V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{IL}$ | Input Low Voltage | 0 | | $0.4*V_{REF}$ | V | 2 |
| $Z_{pu}$ | Pull up Impedance | | | 60 | Ω | 3 |
| $Z_{pd}$ | Pull down Impedance | | | 60 | Ω | 3 |
| $R_{wpu}$ | Weak Pull Impedance | 1 | | 4 | kΩ | 3 |
| $R_{wpd}$ | Weak Pull Down Impedance | 1 | | 4 | kΩ | 3 |
| $R_{wpu-40K}$ | Weak Pull Up Impedance 40K | 20 | | 70 | kΩ | 4 |
| $R_{wpd-40K}$ | Weak Pull Down Impedance 40K | 20 | | 70 | kΩ | 4 |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at PMC_V1P8_G3/2.
4. Rwpu_40k and Rwpd_40k are only used for TAP_TRST#

### Table 89. TAP Signal Group DC Specification (TAP_TDO)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PMC_V1P8_G3 | | | | |
| $V_{IH}$ | Input High Voltage | $0.8*V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{IL}$ | Input Low Voltage | 0 | | $0.5*V_{REF}$ | V | 2 |
| $Z_{pd}$ | Pull down Impedance | | | 30 | Ω | 3 |
| $R_{wpu}$ | Weak Pull Impedance | 1 | | 4 | kΩ | 3 |
| $R_{wpd}$ | Weak Pull Down Impedance | 1 | | 4 | kΩ | 3 |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at PMC_V1P8_G3/2.

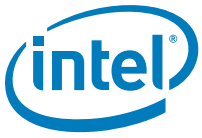


**Table 90. TAP Signal Group DC Specification (TAP_PRDY#, TAP_PREQ#)**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PMC_V1P8_G3 | | | | |
| $V_{IH}$ | Input High Voltage | 0.64*$V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{IL}$ | Input Low Voltage | 0 | | 0.4*$V_{REF}$ | V | 2 |
| $Z_{pd}$ | Pull down Impedance | | | 30 | Ω | 3 |
| $R_{wpu}$ | Weak Pull Impedance | 1 | | 4 | kΩ | 3 |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at PMC_V1P8_G3/2.

## 9.5.8 DDR3L Memory Controller DC Specification

**Table 91. DDR3L Signal Group DC Specifications (Sheet 1 of 2)**

| Symbol | Parameter | Min | Type | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{IL}$ | Input Low Voltage | | | DRAM_VREF - 200mV | V | 1 |
| $V_{IH}$ | Input High Voltage | DRAM_VREF + 200mV | | | V | 2, 3 |
| $V_{OL}$ | Output Low Voltage | | (DRAM_VDD_S4 / 2)* (RON / (RON+RVTT_TERM)) | | | 3,4 |
| $V_{OH}$ | Output High Voltage | | DRAM_VDD_S4 - ((DRAM_VDD_S4 /2)* (RON/(RON+RVTT_TERM)) | | V | 3,4 |
| $I_{IL}$ | Input Leakage Current | | | 5 | µA | For all DRAM Signals |
| $R_{ON}$ | DDR3L-RS Clock Buffer strength | 26 | | 40 | Ω | 5 |
| $C_{IO}$ | DQ/DQS/DQS# DDR3L-RS IO Pin Capacitance | | 3.0 | | pF | |
| VIH | Input High Voltage | 1.1 | | | V | DRAM_VDD_S4_PWROK<br>DRAM_CORE_PWROK |

**Table 91. DDR3L Signal Group DC Specifications (Sheet 2 of 2)**

| Symbol | Parameter | Min | Type | Max | Units | Notes |
|---|---|---|---|---|---|---|
| VIL | Input Low Voltage | | | 0.3 | V | DRAM_VDD_S4_PWROK<br>DRAM_CORE_PWROK |
| Pin Leakage | | | | 100 | µA | |
| VIH | Input High Voltage | 0.83 | | | V | CMD/CTL |
| VIL | Input Low Voltage | | | 0.55 | V | CMD/CTL |
| Pin Leakage | | | | 50 | µA | |

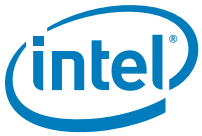
**NOTES:**
1. $V_{IL}$ is defined as the maximum voltage level at the receiving agent that will be received as a logical low value. DRAM_VREF is normally DRAM_VDD_S4/2
2. $V_{IH}$ is defined as the minimum voltage level at the receiving agent that will be received as a logical high value. DRAM_VREF is normally DRAM_VDD_S4/2
3. $V_{IH}$ and $V_{OH}$ may experience excursions above DRAM_VDD_S4. However, input signal drivers must comply with the signal quality specifications.
4. RON is DRAM driver resistance whereas RTT_TERM is DRAM ODT resistance which is controlled by DRAM.
5.
6. DDR3L-1333 CLK buffer Ron is 26ohm and SR target is 4V/ns; DQ-DQS buffer Ron is 30ohms and SR target is 4V/ns; CMD/CTL buffer Ron is 20ohms and SR target is 1.8V/ns.

## 9.5.9 Intel® HD Audio DC Specification

**Table 92. HDA Signal Group DC Specifications**

| Symbol | Parameter | Condition | Min | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| $VCC_{HDA}$ | HDA Supply Voltage | | HDA_LPE_V1P5V1P8_S3 | | | |
| $V_{IH\_HDA}$ | Input High Voltage | | $0.6*VCC_{HDA}$ | | V | |
| $V_{IL\_HDA}$ | Input Low Voltage | | | $0.4*VCC_{HDA}$ | V | |
| $V_{OH\_HDA}$ | Output High Voltage | Iout = -500µA | $0.9*VCC_{HDA}$ | | V | |
| $V_{OL\_HDA}$ | Output Low Voltage | Iout = 1500µA | | $0.1*VCC_{HDA}$ | V | |
| IIL_HDA | Input Leakage Current | $0<Vin<VCC_{HDA}$ | | ±175 | µA | 1 |
| $C_{IN\_HDA}$ | Input Pin Capacitance | | | 7.5 | pF | |
| $L_{PIN\_HDA}$ | Pin Inductance | | | 20 | nH | 2 |

**NOTES:**
1. For HDA_SDI[x] buffers (or in general any bidirectional buffer with tri-state output), input leakage current also include hi-Z output leakage.
2. This is a recommendation, not an absolute requirement.



## 9.5.10 USB 2.0 Host DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| **Supply Voltage:** | | | | | | |
| VBUS | High-power Port | 4.75 | | 5.25 | V | 2 |
| VBUS | Low-power Port | | | | | |
| **Supply Current:** | | | | | | |
| ICCPRT | High-power Hub Port (out) | 500 | | | mA | |
| ICCUPT | Low-power Hub Port (out) | 100 | | | mA | |
| ICCHPF | High-power Function (in) | | | 500 | mA | |
| ICCLPF | Low-power Function (in) | | | 100 | mA | |
| ICCINIT | Unconfigured Function/Hub (in) | | | 100 | mA | |
| ICCSH | Suspended High-power Device | | | 2.5 | mA | 15 |
| ICCSL | Suspended Low-power Device | | | 500 | µA | |
| **Input Levels for Low-/full-speed:** | | | | | | |
| VIH | High (driven) | 2.0 | | | V | 4 |
| VIHZ | High (floating) | 2.7 | | 3.6 | V | 4 |
| VIL | Low | | | 0.8 | V | 4 |
| VDI | Differential Input Sensitivity | 0.2 | | | V | \|(D+)-(D-)\|;Figure; Note 4 |
| VCM | Differential Common Mode Range | 0.8 | | 2.5 | V | Includes VDI range; Figure; Note 4 |
| **Input Levels for High-speed:** | | | | | | |
| VHSSQ | High-speed squelch detection threshold (differential signal amplitude) | 100 | | 150 | mV | |
| VHSDSC | High speed disconnect detection threshold (differential signal amplitude) | 525 | | 625 | mV | |
| | High-speed differential input signaling levels | | | | | |
| VHSCM | High-speed data signaling common mode voltage range (guideline for receiver) | -50 | | 500 | mV | |
| **Output Levels for Low-/full-speed:** | | | | | | |
| VOL | Low | 0.0 | | 0.3 | V | 4,5 |

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| VOH | High (Driven) | 2.8 | | 3.6 | V | 4,6 |
| VOSE1 | SE1 | 0.8 | | | V | |
| VCRS | Output Signal Crossover Voltage | 1.3 | | 2.0 | V | 10 |
| **Output Levels for High-speed:** | | | | | | |
| VHSOI | High-speed idle level | -10 | | 10 | mV | |
| VHSOH | High-speed data signaling high | 360 | | 440 | mV | |
| VHSOL | High-speed data signaling low | -10 | | 10 | mV | |
| VCHIRPJ | Chirp J level (differential voltage) | 700 | | 1100 | mV | |
| VCHIRPK | Chirp K level (differential voltage) | -900 | | -500 | mV | |
| **Decoupling Capacitance:** | | | | | | |
| CHPB | Downstream Facing Port Bypass Capacitance (per hub) | 120 | | | µF | |
| CRPB | Upstream Facing Port Bypass Capacitance | 1.0 | | 10.0 | µF | 9 |
| **Input Capacitance for Low-/full-speed:** | | | | | | |
| CIND | Downstream Facing Port | | | 150 | pF | 2 |
| CINUB | Upstream Facing Port (w/o cable) | | | 100 | pF | 3 |
| CEDGE | Transceiver edge rate control capacitance | | | 75 | pF | |
| **Input Impedance for High-speed:** | | | | | | |
| | TDR spec for high-speed termination | | | | | |
| **Terminations:** | | | | | | |
| RPU | Bus Pull-up Resistor on Upstream Facing Port | 1.425 | | 1.575 | kΩ | 1.5 kΩ ±5% |
| RPD | Bus Pull-down Resistor on Downstream Facing Port | 14.25 | | 15.75 | kΩ | 1.5 kΩ ±5% |
| ZINP | Input impedance exclusive of pull-up/pull-down (for low-/full speed) | 300 | | | kΩ | |
| VTERM | Termination voltage for upstream facing port pull-up (RPU) | 3.0 | | 3.6 | V | |
| **Terminations in High-speed:** | | | | | | |
| VHSTERM | Termination voltage in high speed | -10 | | 10 | mV | |

**NOTES:**
1. Measured at A plug.
2. Measured at A receptacle.
3. Measured at B receptacle.

4. Measured at A or B connector.
5. Measured with RL of 1.425 kΩ to 3.6 V.
6. Measured with RL of 14.25 kΩ to GND.
7. Timing difference between the differential data signals.
8. Measured at crossover point of differential data signals.
9. The maximum load specification is the maximum effective capacitive load allowed that meets the target VBUS drop of 330 mV.
10. Excluding the first transition from the Idle state.
11. The two transitions should be a (nominal) bit time apart.
12. For both transitions of differential signaling.
13. Must accept as valid EOP.
14. Single-ended capacitance of D+ or D- is the capacitance of D+/D- to all other conductors and, if present, shield in the cable. That is, to measure the single-ended capacitance of D+, short D-, VBUS, GND, and the shield line together and measure the capacitance of D+ to the other conductors.
15. For high power devices (non-hubs) when enabled for remote wakeup.

## 9.5.11 USB 3.0 DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| UI | Unit Interval | 199.94 | | 200.06 | ps | 1 |
| $V_{TX-DIFF-PP}$ | Differential peak-peak Tx voltage swing | 0.9 | 1 | 1.05 | V | |
| $V_{TX-DIFF-PP-LOW}$ | Low-Power Differential peak-peak Tx voltage swing | 0.4 | | 1.2 | V | 2 |
| $V_{TX-DE-RATIO}$ | Tx De-Emphasis | 3.45 | 3.5 | 3.65 | dB | |
| $R_{TX-DIFF-DC}$ | DC differential impedance | 88 | | 92 | Ω | |
| $V_{TX-RCV-DETECT}$ | The amount of voltage change allowed during Receiver Detection | | | 0.6 | V | 3 |
| $C_{AC-COUPLING}$ | AC Coupling Capacitor | 75 | | 200 | nF | 4 |
| $t_{CDR\_SLEW\_MAX}$ | Maximum slew rate | | | 10 | ms/s | |

**NOTES:**
1. The specified UI is equivalent to a tolerance of 300ppm for each device. Period does not account for SSC induced variations.
2. There is no de-emphasis requirement in this mode. De-emphasis is implementation specific for this mode.
3. Detect voltage transition should be an increase in voltage on the pin looking at the detect signal to avoid a high impedance requirement when an “off” receiver's input goes below output.
4. All transmitters shall be AC coupled. The AC coupling is required either within the media or within the transmitting component itself.

## 9.5.12 SATA DC Specification

**Table 93. SATA TX/RX Signal Group DC Specifications**

| Symbol | Parameter | Min | Max | Unit | Notes |
|---|---|---|---|---|---|
| $V_{IMIN\_Gen1i}$ | Minimum Input Voltage for 1.5 Gb/s | 325 | - | mVdiffp-p | 1 |
| $V_{IMAX\_Gen1i}$ | Maximum Input Voltage for 1.5 Gb/s | - | 600 | mVdiffp-p | 1 |
| $V_{IMIN\_Gen2i}$ | Minimum Input Voltage for 3 Gb/s | 275 | - | mVdiffp-p | 2 |
| $V_{IMAX\_Gen2i}$ | Maximum Input Voltage for 3 Gb/s | - | 750 | mVdiffp-p | 2 |
| $V_{OMIN\_Gen1i,m}$ | Minimum Output Voltage for 1.5 Gb/s | 400 | - | mVdiffp-p | 3 |
| $V_{OMAX\_Gen1i,m}$ | Maximum Output Voltage for 1.5 Gb/s | - | 600 | mVdiffp-p | 3 |
| $V_{OMIN\_Gen2i,m}$ | Minimum Output Voltage for 3 Gb/s | 400 | - | mVdiffp-p | 3 |
| $V_{OMAX\_Gen2i,m}$ | Maximum Output Voltage for 3 Gb/s | - | 700 | mVdiffp-p | 3 |

1. Applicable only when SATA port signaling rate is 1.5 Gb/s: SATA Vdiff, rx is measured at the SATA connector on the receiver side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA_RXP[x] – SATA_RXN[x]|
2. Applicable only when SATA port signaling rate is 3 Gb/s: SATA Vdiff, rx is measured at the SATA connector on the receiver side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA_RXP[x] – SATA_RXN[x]|
3. SATA Vdiff, tx is measured at the SATA connector on the transmit side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA_TXP[x] – SATA_TXN[x]|

For SATA_GP[x] and SATA_LED#, Please refer to the GPIO Buffer (1.8V) DC Specification in section "GPIO DC Specification".

## 9.5.13 PCU - SMBUS DC Specification

For SMBUS, Please refer to the GPIO Buffer (1.8V) DC Specification in section "GPIO DC Specification".

## 9.5.14 PCU - iLB - LPC DC Specification

**Table 94. LPC Signal Group DC Specification (LPC_V1P8V3P3_S = 1.8V (ILB_LPC_AD][3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ, ILB_LPC_CLKRUN#))**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{IH}$ | Input High Voltage | 1.27 | 1.8 | 1.8 +0.1 | V | |
| $V_{IL}$ | Input Low Voltage | -0.1 | 0 | 0.58 | V | |
| $V_{OH}$ | Output High Voltage | 0.9 x 1.8 | | | V | |
| $V_{OL}$ | Output Low Voltage | | | 0.1 x 1.8 | V | |
| $I_{OH}$ | Output High Current | | 1.5 | | mA | |

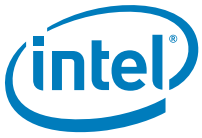


**Table 94. LPC Signal Group DC Specification (LPC_V1P8V3P3_S = 1.8V (ILB_LPC_AD][3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ, ILB_LPC_CLKRUN#))**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $I_{OL}$ | Output Low Current | | -0.5 | | mA | |
| $I_{LEAK}$ | Input Leakage Current | | | 30 | µA | |
| $C_{IN}$ | Input Capacitance | 1 | | 9 | pF | |

**Table 95. LPC Signal Group DC Specification LPC_V1P8V3P3_S = 3.3V (ILB_LPC_AD[3:0], ILB_LPC_FRAME#, ILB_LPC_CLKRUN#)**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{IH}$ | Input High Voltage | 0.5 x 3.3+ 0.7 | 3.3 | 3.3 +0.1 | V | 1 |
| $V_{IL}$ | Input Low Voltage | -0.1 | 0 | 0.5 x 3.3 - 0.7 | V | 2 |
| $V_{OH}$ | Output High Voltage | 0.9 x 3.3 | | | V | 3 |
| $V_{OL}$ | Output Low Voltage | | | 0.1 x 3.3 | V | 3 |
| $I_{OH}$ | Output High Current | | 1.5 | | mA | 3 |
| $I_{OL}$ | Output Low Current | | -0.5 | | mA | 3 |
| $I_{LEAK}$ | Input Leakage Current | | | 30 | µA | |
| $C_{IN}$ | Input Capacitance | 1 | | 9 | pF | |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value, Applies to ILB_LPC_AD[3:0], ILB_LPC_CLKRUN#
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value. Applies to ILB_LPC_AD[3:0], ILB_LPC_CLKRUN#
3. $V_{OH}$ is tested with Iout=500uA, $V_{OL}$ is tested with Iout=1500uA
4. Applies to ILB_LPC_AD[3:0],ILB_LPC_CLKRUN# and ILB_LPC_FRAME#
5. ILB_LPC_SERIRQ is always a 1.8V I/O irrespective of the value of LPC_V1P8V3P3_S.

## 9.5.15 PCU - SPI (Platform Control Unit) DC Specification

**Table 96. SPI Signal Group DC Specification (PCU_SPI_MISO, PCU_SPI_CS[1:0]#, PCU_SPI_MOSI, PCU_SPI_CLK)**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PCU_1P8_G3 | | | V | 3 |
| $V_{IH}$ | Input High Voltage | 0.5 *$V_{REF}$ | | $V_{REF}$ + 0.5 | V | 2 |
| $V_{IL}$ | Input Low Voltage | -0.5 | | 0.3 * $V_{REF}$ | V | 2 |
| $V_{OH}$ | Output High Voltage | 0.9 * $V_{REF}$ | | 1.8V | V | 1 |
| $V_{OL}$ | Output Low Voltage | | | 0.1 * $V_{REF}$ | V | 1 |
| $I_{OH}$ | Output High Current | | | 1.5 | mA | 1 |
| $I_{OL}$ | Output Low Current | -0.5 | | | mA | 1 |

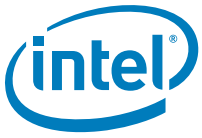
**NOTES:**
1. Applies to PCU_SPI_CS[1:0], PCU_SPI_CLK, PCU_SPI_MOSI
2. Applies to PCU_SPI_MISO and PCU_SPI_MOSI
3. The I/O buffer supply voltage is measured at the SoC package pins. The tolerances shown are inclusive of all noise from DC up to 20 MHz. In testing, the voltage rails should be measured with a bandwidth limited oscilloscope that has a rolloff of 3 dB/decade above 20 MHz.

## 9.5.16 PCU - Power Management/Thermal (PMC) & iLB RTC DC Specification

### Table 97. Power Management 1.8V Suspend Well Signal Group DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PCU_1P8_G3 | | | V | |
| $V_{IH}$ | Input High Voltage | $0.8*V_{REF}$ | | | V | 1 |
| $V_{IL}$ | Input Low Voltage | | | $0.5*V_{REF}$ | V | 2 |
| $V_{OH}$ | Output High Voltage | $0.9*V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{OL}$ | Output Low Voltage | | | $0.1*V_{REF}$ | V | 1 |

**NOTES:**
1. The data in this table apply to signals - PMC_ACPRESENT, PMC_BATLOW#, PMC_PLTRST#, PMC_PWRBTN#, PMC_SLP_S4#, PMC_SUS_STAT#, PMC_SUSCLK[3:0], PMC_SUSPWRDNACK
2. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
3. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.



### Table 98. PMC_RSTBTN# 1.8V Core Well Signal Group DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| VREF | I/O Voltage | UNCORE_V1P8_S3 | | | V | |
| $V_{IH}$ | Input High Voltage | 0.8* VREF | | | V | 1 |
| $V_{IL}$ | Input Low Voltage | | | 0.5* VREF | V | 2 |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

### Table 99. Power Management & RTC Well Signal Group DC Specification (PMC_RSMRST#, PMC_CORE_PWROK, ILB_RTC_RST#)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| VREF | I/O Voltage | RTC_VCC | | | | |
| $V_{IH}$ | Input High Voltage | 2.0 | - | VREF +0.5 | V | 1 |
| $V_{IL}$ | Input Low Voltage | - 0.5 | - | 0.78 | V | 2 |
| $I_I$ | Input leakage Current | 0.1 | 1 | 100 | µA | 3 |

NOTES:
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. $I_I$ (Tyical) is specified at 30°C. $V_{IL}$ (Maximum) is specified at $Tj_{MAX}$.

### Table 100. iLB RTC Well DC Specification (ILB_RTC_TEST#)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{IH}$ | Input High Voltage | 2.0 | - | VREF + 0.5 | V | 1 |
| $V_{IL}$ | Input Low Voltage | - 0.5 | - | 0.78 | V | 1 |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

### Table 101. ILB RTC Oscillator Optional DC Specification (ILB_RTC_X1)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{IH}$ | Input High Voltage | 0.65 | 0.8 | 1.2 | V | 1 |
| $V_{IL}$ | Input Low Voltage | | | 0.25 | V | 1 |

**NOTES:**
1. ILB_RTC_X1 DC specification is **only** used for applications with an active external clock source instead of a crystal. When a crystal is used (typical case) between ILB_RTC_X2 and ILB_RTC_X1, this spec is not used.

### Table 102. PROCHOT# Signal Group DC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | CORE_V1P0_S3 | | | | |
| $V_{IH}$ | Input High Voltage | 0.8*$V_{REF}$ | | $V_{REF}$ | V | 1 |
| $V_{IL}$ | Input Low Voltage | | | 0.4*$V_{REF}$ | V | 2 |
| $V_{OH}$ | Output High Voltage | 0.9*$V_{REF}$ | | $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | | | 0.1*$V_{REF}$ | V | |

**NOTES:**
1. $V_{IH}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. $V_{IL}$ is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

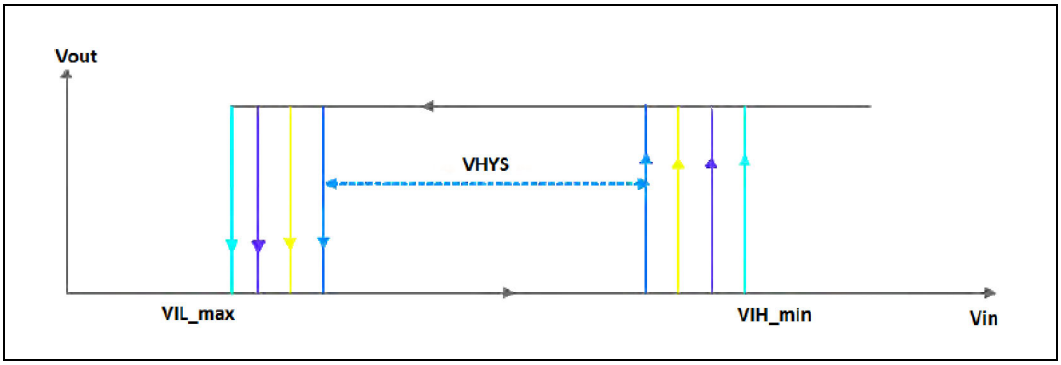
## 9.5.17 SVID DC Specification

### Table 103. SVID Signal Group DC Specification (SVID_DATA, SVID_CLK, SVID_ALERT#)

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | SVID_V1P0_S3 | | | | |
| $V_{IH}$ | Input High Voltage | 0.65*$V_{REF}$ | | | V | 1 |
| $V_{IL}$ | Input Low Voltage | | | 0.44*$V_{REF}$ | V | 1 |
| $V_{OH}$ | Output High Voltage | | | | V | 1 |
| $V_{OL}$ | Output Low Voltage | | | 0.1*$V_{REF}$ | V | 4 |
| $V_{HYS}$ | Hysteresis Voltage | 0.05 | | | V | |
| $R_{ON}$ | BUffer on Resistance | 10 | | 20 | Ω | 2 |
| $I_L$ | Leakage Current | -100 | | 100 | µA | 3 |
| $C_{PAD}$ | Pad Capacitance | | | 4.0 | pF | 4 |
| $V_{PIN}$ | Pin Capacitance | | | 5.0 | pF | |

**NOTES:**
1. SVID_V1P0_S3 refers to instantaneous voltage VSS_SENSE
2. Measured at 0.31 * SVID_V1P0_S3
3. $V_{IN}$ between 0V and SVID_V1P0_S3
4. CPAD includes die capacitance only. No package parasitic included.

**Figure 17. Definition of VHYS in Table 169**



## 9.5.18 GPIO DC Specification

GPIO Buffer is used across various interfaces on the SoC such as, GPIOs, $I^2C$, I2S, SPI, SDIO, SVID, UART, JTAG and ULPI

***Note:*** $I_{OX}$# -> Spec is used for those GPIO which does not have industrial spec. Those GPIO interfaces that have its own industrial spec shouldn't refer to this spec.

**Table 104. GPIO 3.3V Core Well Signal Group DC Specification(GPIO_S0_SC[101:0])**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | UNCORE_V3P3_S3 | | | | |
| $V_{IH}$ | Input High Voltage | 0.61* $V_{REF}$ | | 1.24*$V_{REF}$ | V | |
| $V_{IL}$ | Input Low Voltage | -0.21*$V_{REF}$ | | 0.24*$V_{REF}$ | V | |
| $V_{OH}$ | Output High Voltage | 0.95* $V_{REF}$ | | $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.1* $V_{REF}$ | V | |
| $V_{Hys}$ | Input Hysteresis | 0.1 | | | V | |
| $I_L$ | Leakage Current | | | 5 | µA | |
| $I_{OH}$# | Output High Current | | | 3 | mA | |
| $I_{OL}$# | Output Low Current | | | -3 | mA | |
| $C_{LOAD}$ | Load Capacitance | 2 | | 75 | pF | |

**Table 105. GPIO 3.3V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PMC_V3P3_G3 | | | V | |
| $V_{IH}$ | Input High Voltage | 0.61* $V_{REF}$ | | 1.24*$V_{REF}$ | V | |
| $V_{IL}$ | Input Low Voltage | -0.21*$V_{REF}$ | | 0.24*$V_{REF}$ | V | |
| $V_{OH}$ | Output High Voltage | 0.95* $V_{REF}$ | | $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.1* $V_{REF}$ | V | |

### Table 105. GPIO 3.3V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])

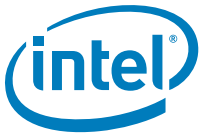
| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{Hys}$ | Input Hysteresis | 0.1 | | | V | |
| $I_L$ | Leakage Current | | | 5 | µA | |
| $I_{OH}$# | Output High Current | | | 3 | mA | |
| $I_{OL}$# | Output Low Current | | | -3 | mA | |
| $C_{LOAD}$ | Load Capacitance | 2 | | 75 | pF | |

### Table 106. GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0])

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | UNCORE_V1P8_S3 | | | | |
| $V_{IH}$ | Input High Voltage | 0.65*$V_{REF}$ | | 1.24*$V_{REF}$ | V | |
| $V_{IL}$ | Input Low Voltage | -0.21*$V_{REF}$ | | 0.35 * $V_{REF}$ | V | |
| $V_{OH}$ | Output High Voltage | $V_{REF}$ -0.45 | | $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.45 | V | |
| $V_{Hys}$ | Input Hysteresis | 0.1 | | | V | |
| $I_L$ | Leakage Current | | | 5 | µA | |
| $I_{OH}$# | Output High Current | | | 3 | mA | |
| $I_{OL}$# | Output Low Current | | | -3 | mA | |
| $C_{LOAD}$ | Load Capacitance | 2 | | 75 | pF | |

### Table 107. GPIO 1.8V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | PMC_V1P8_G3 | | | V | |
| $V_{IH}$ | Input High Voltage | 0.65*$V_{REF}$ | | 1.24*$V_{REF}$ | V | |
| $V_{IL}$ | Input Low Voltage | -0.21*$V_{REF}$ | | 0.35*$V_{REF}$ | V | |
| $V_{OH}$ | Output High Voltage | $V_{REF}$ - 0.45 | | $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.45 | V | |
| $V_{Hys}$ | Input Hysteresis | 0.1 | | | V | |
| $I_L$ | Leakage Current | | | 5 | µA | |
| $I_{OH}$# | Output High Current | | | 3 | mA | |
| $I_{OL}$# | Output Low Current | | | -3 | mA | |
| $C_{LOAD}$ | Load Capacitance | 2 | | 75 | pF | |



### 9.5.19 SIO - I²C DC Specification

**Table 108. I²C Signal Electrical Specifications**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $V_{REF}$ | I/O Voltage | UNCORE_V1P8_S3 | | | V | |
| $V_{IH}$ | Input High Voltage | 0.7 * $V_{REF}$ | | 1.24*$V_{REF}$ | V | |
| $V_{IL}$ | Input Low Voltage | 0.21*$V_{REF}$ | | 0.3 * $V_{REF}$ | V | |
| $V_{OL}$ | Output Low Voltage | 0 | | 0.2 * $V_{REF}$ | V | |
| $V_{Hys}$ | Input Hysteresis | 0.1 | | | V | |
| $C_{PIN}$ | Pin Capacitance | 2 | | 5 | pF | |

### 9.5.20 SIO - UART DC Specification

Refer to the GPIO Buffer (1.8V) DC Specification, mentioned Section 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0])" on page 152

### 9.5.21 I²S (Audio) DC Specification

Refer to the GPIO Buffer (1.8V) DC Specification, mentioned Section 107, "GPIO 1.8V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])" on page 152

## 9.6 AC Specifications

The timings specified in this section are defined at the SoC pads. Therefore, proper simulation of the signals is the only means to verify proper timing and signal quality.

See Chapter 2, "Physical Interfaces" for signal definitions and Chapter 10, "Ballout and Package Information" for the ball map. Generic timing diagrams can be found in "General AC Timing Diagrams".

The timings specified in this section should be used in conjunction with the SoC signal integrity models provided by Intel.

See the following DC Specifications in this section:

- "Integrated Clock 25 MHz Crystal AC Specification"
- "Platform Clocks AC Specification"
- "SVID AC Specification"
- "DDR3L Memory Controller AC Specification"
- "Display AC Specifications"
- "MIPI-Camera Serial Interface (CSI) AC Specification"
- "SCC - SD Card AC Specification"
- "SSC - SDIO AC specification"

- "SCC - eMMC 4.5 AC Specification"
- "SATA AC Specification"
- "USB 3.0 AC Specification"
- "ULPI USB 2.0 Device AC Specification"
- "Intel® HD Audio AC Specification"
- "I2S (Audio) AC Specification"
- "PCI Express* AC Specification"
- "PCU - PMC - Suspended Clock AC Specification"
- "1. SUSCLK duty cycle can range from 30% minimum to 70% maximum."
- "PCU - SPI NOR AC Specification"
- "PCU - iLB - LPC AC Specification"
- "SIO - I2C AC Specifications"
- "SIO - UART AC Specification"
- "JTAG AC Specification"

***Note:*** Care should be taken to read all notes associated with a particular timing parameter.

### 9.6.1 Integrated Clock 25 MHz Crystal AC Specification

See"Crystal Specifications" for crystal selection.

### 9.6.2 Generic Clock Jitter AC Specification

Applies to the following clocks unless overridden below: SIO_I2C[0:6]_CLK, PMC+PLT_CLK[0:6], SIO_SPI_CLK, LPE_I2S[0:2]_CLK, TAP_CLK, PCU_SPI_CLK, ILB_LPC_CLK[0:1], SD3_CLK, SD2_CLK, MMC1_CLK, HDA_CLK, SVID_CLK, DDI[0:1]_DDCCLK, VGA_DDCLK.

**Table 109. Generic Clock Jitter AC Specification**

| Symbol | Parameter | Min. | Typ | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| $T_{RISE/FALL}$ | Minimum and Maximum Rise/Fall Time | 1.5 | | 20 | ns | 1, 3 |
| $T_{DC}$ | Duty Cycle | 45 | | 55 | % | 2 |
| $T_{PEAKJIT}$ | Peak Jitter (cycle to cycle) | | | 300 | ps | 2 |
| $T_{PERJIT}$ | Period Jitter (peak to peak) | | | 500 | ps | 4 |
| $T_{TIE}$ | Time Interval Error (peak to peak) | | | 400 | ps | 5 |
| $T_{LONG}$ | Long Term Accuracy | -100 | | 100 | ps | |

**NOTES:**
1. Edge Rate is measured from 10%-90% of supply voltage.
2. Cycle to cycle jitter measure for 100K samples.

3. Based on trace length of 25–200 mm, total maximum far end capacitance of 5 pF, EDS of 10 pF and board impedance of 30–75 Ω.
4. Period jitter value is measured by adjusting an oscilloscope to display a little more than one complete clock cycle with the display set to infinite persistence. Scope trigger is set on the first edge, and the period jitter is captured by measuring spread/peak-peak value of the second edge. 100K samples.
5. The TIE is estimated by measuring how far each active edge of the clock varies from its ideal position. 100K samples.

## 9.6.3 Platform Clocks AC Specification

### Table 110. 25 MHz Platform Clock AC Specification

| Symbol | Parameter | Min. | Typ | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| $F_{PLT}$ | Frequency | | 25 | | MHz | |
| $T_{DC}$ | Duty Cycle | 45 | | 55 | % | |
| $T_{RISE/FALL}$ | Minimum and Maximum Rise/Fall Time | 5 | | 20 | ns | |
| $V_{SWING}$ | Voltage Swing | | 1.8 | | V | |
| $T_{PEAKJIT}$ | Peak Jitter (c-c) | -300 | | 300 | ps | |
| $T_{PERJIT}$ | Period Jitter | | | 500 | ps | |

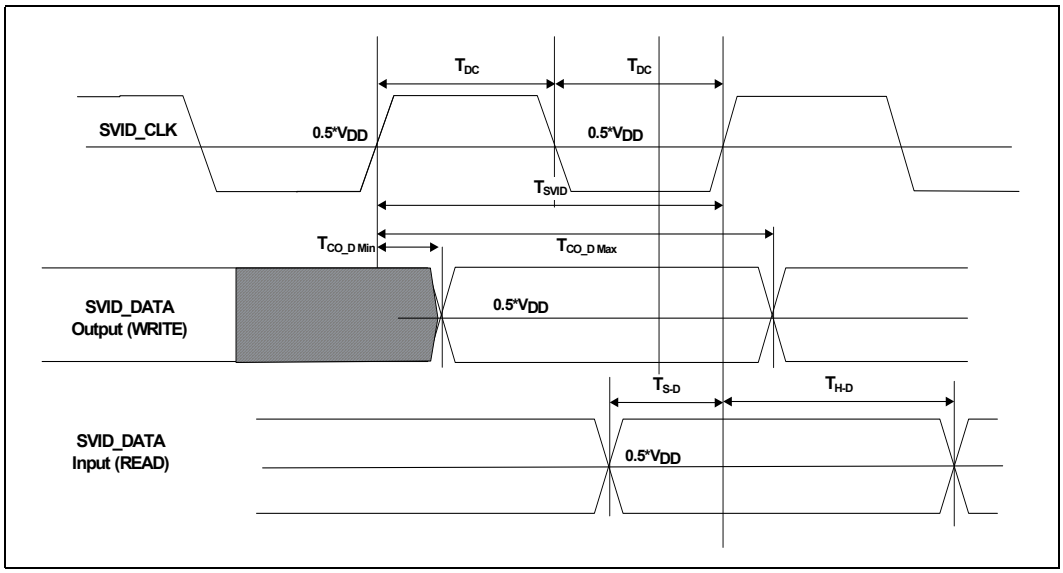
## 9.6.4 SVID AC Specification

### Table 111. SVID AC Specification

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $F_{SVID}$ | SVID_CLK Frequency | | 25 | MHz | 18 | |
| $T_{DC}$ | SVID_CLK Duty Cycle | 45 | 55 | % | | |
| $T_{S\_D}$ | SVID_DATA Input Setup Time | -2 | | ns | 18 | |
| $T_{H\_D}$ | SVID_DATA Input Hold Time | 9 | | ns | 18 | |
| $T_{CO\_D}$ | Rising edge SVID_CLK to SVID_DATA Output | 0 | 5 | ns | 18 | |
| TRISE/ FALL | Minimum and Maximum Rise/Fall Time | 0 | 5 | ns | | 1, 2 |

**NOTES:**
1. Based on trace length of 0.2–4 inches, total maximum far end capacitance of 5 pF and board impedance of 25–75 Ω.
2. Measured from 30–70%

**Figure 18. SVID Timing Diagram**



## 9.6.5 DDR3L Memory Controller AC Specification

***Note:*** The contents of this section are only valid for DRAM_VDD_S4 = 1.35V

**Table 112. DDR3L Interface Timing Specification (Sheet 1 of 3)**

| Symbol | Parameter | Min | Max | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| **DDR3L Electrical Characteristic and AC timings at 1066 MT/s** | | | | | | |
| $T_{SLR\_D}$ | DQ, DQSP, DQSN Input Slew Rate | 3 | 5.5 | V/ns | | |
| **System Memory Clock Timings** | | | | | | |
| $T_{CK(AVG)}$ | Average CK Period | | 1.875 | ns | | |
| $T_{CH}$ | Average CK High Time | 0.45 | | tCKAVG | | |
| $T_{CL}$ | Average CK Low Time | 0.45 | | tCKAVG | | |
| $T_{SKEW}$ | Skew between any System Memory Differential Clock Pair (CKP/CKN) | | 30 | ps | | |
| **System Memory Command Signal Timings** | | | | | | |
| $T_{CMD}$ (tCMDVB+tCMDVA) | Total CMD Buffer window available for command buffers (RAS#, CAS#, WE#, BS[2:0], MA) | 1380 | | ps | | 1 |
| **System Memory Control Signal Timings** | | | | | | |

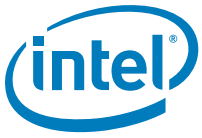


**Table 112. DDR3L Interface Timing Specification (Sheet 2 of 3)**

| Symbol | Parameter | Min | Max | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $T_{CTL}$ (tCTLVB + tCTLVA) | Total Control buffer Window available for Control buffers (CS#, CKE) | 1400 | | ps | | 2 |
| **System Memory Data and Strobe Signal Timings** | | | | | | |
| $T_{DVB}+T_{VDA}$ | Data, DQ and DM timing window available at the interface output for write commands. tDVB is data available before strobe and tDVA is data available after corresponding slope. | 645 | | ps | | 3 |
| $T_{SU} + T_{HD}$ | Data, DQ Input Setup Plus Hold Time requirement for successful Read operation. These Setup and Hold numbers are measured w.r.t. corresponding strobe or Falling Edge | 310 | | ps | | 4 |
| $T_{DQSS}$ | Strobe to rising clock edge during write. | -120 | | 120 | ps | |
| $T_{WPRE}$ | DQSP/N Preamble duration (one dummy cycle) | 0.9 | | tCKAVG | | |
| $T_{WPST}$ | DQSP/N Postamble Duration | 0.4 | | tCKAVG | | |
| **DDR3L Electrical Characteristic and AC timings at 1333 MT/s. DRAM_VDD_S4 = 1.35 V** | | | | | | |
| $T_{SLR\_D}$ | DQ, DQSP, DQSN Input Slew Rate | 3 | 5.5 | V/ns | | |
| **System Memory Clock Timings** | | | | | | |
| $T_{CK(AVG)}$ | Average CK Period | | 1.5 | ns | | |
| $T_{CH}$ | Average CK High Time | 0.45 | | tCKAVG | | |
| $T_{CL}$ | Average CK Low Time | 0.45 | | tCKAVG | | |
| $T_{SKEW}$ | Skew between any System Memory Differential Clock Pair (CKP/CKN) | | 30 | ps | | |
| **System Memory Command Signal Timings** | | | | | | |
| $T_{CMD}$ (tCMDVB+tCMDVA) | Total CMD Buffer window available for command buffers (RAS#, CAS#, WE#, BS[2:0], MA) | 1075 | | ps | | 1 |
| **System Memory Control Signal Timings** | | | | | | |
| $T_{CTL}$ (tCTLVB + tCTLVA) | Total Control buffer Window available for Control buffers (CS#, CKE) | 1125 | | ps | | 2 |
| **System Memory Data and Strobe Signal Timings** | | | | | | |

### Table 112. DDR3L Interface Timing Specification (Sheet 3 of 3)

| Symbol | Parameter | Min | Max | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $T_{DVB}+T_{VDA}$ | Data, DQ and DM timing window available at the interface output for write commands. tDVB is data available before strobe and tDVA is data available after corresponding slope. | 495 | | ps | | 3 |
| $T_{SU} + T_{HD}$ | Data, DQ Input Setup Plus Hold Time requirement for successful Read operation. These Setup and Hold numbers are measured w.r.t. corresponding strobe or Falling Edge | 255 | | ps | | 4 |
| $T_{DQSS}$ | | -120 | | 120 | ps | |
| $T_{WPRE}$ | DQSP/N Preamble duration (one dummy cycle) | 0.9 | | tCKAVG | | |
| $T_{WPST}$ | DQSP/N Postamble Duration | 0.4 | | tCKAVG | | |

**NOTES:**
1. The CMD time is measured w.r.t. differential crossing of DRAM_CKP and DRAM_CKN. The tCMDVB and tCMDVA will be adjusted for proper CMD Setup and Hold time requirement at DRAM. The command timing assumes CMD-1N Mode.
2. The CTL time is measured w.r.t. differential crossing of DRAM_CKP and DRAM_CKN. The tCTLVB and tCTLVA will be adjusted for proper CTL Setup and Hold time requirement at DRAM.
3. The accurate strobe placement using write training algorithm will be performed which will guarantee the required Data setup/hold time w.r.t. strobe differential crossing at the DRAM input.
4. The Read training algorithm will center the DQS internally inside DRAM interface in order to have equal tSU and tHD timings.
5. All the timing windows are measured at 50% of the respective DRAM signal swing.

## 9.6.6 Display AC Specifications

### 9.6.6.1 DDI Main Transmitter AC specification

**Table 113. DDI Main Transmitter AC specification (Sheet 1 of 2)**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $f_{HBR}$ | Frequency for High Bit Rate | 2.68569 | 2.7 | 2.70081 | Gbps | 1 |
| $f_{RBR}$ | Frequency for Reduced Bit Rate | 1.61141 | 1.62 | 1.620048 | Gbps | 1 |
| UI_High_Rate | Unit Interval for high bit rate (2.7 Gbps / lane) | | 370 | | ps | 1 |
| UI_Low_Rate | Unit Interval for high bit rate (1.62 Gbps / lane) | | 617 | | ps | 1 |
| Down_Spread_Amplitude | Link clock down Spreading | 0 | | 0.5 | % | 2 |
| Down_Spread_Frequency | Link Clock down Spreading Frequency | 30 | | 33 | kHz | 3 |

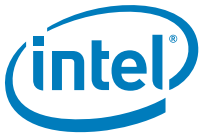

**Table 113. DDI Main Transmitter AC specification (Sheet 2 of 2)**

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $T_{TX-EYE\_CHIP\_High\_Rate}$ | Minimum TX Eye Width at Tx package pins | 0.72 | | | UI | 4 |
| $T_{TX-EYE-MEDIAN-to-MAX-JITTER\_CHIP\_\_High\_Rate}$ | Maximum time between the jitter median and maximum deviation from the median at Tx package pins | | | 0.147 | UI | 4 |
| $T_{TX-EYE\_CHIP\_Low\_Rate}$ | Minimum TX Eye Width at Tx package pins | 0.82 | | | UI | 5 |
| $T_{TX-EYE-MEDIAN-to-MAX-JITTER\ CHIP\ Low\_Rate}$ | Maximum time between the jitter median and maximum deviation from the median at Tx package pins | | | 0.09 | UI | 5 |
| $T_{TX-RISE\_CHIP}$, $T_{TX-FALL\_CHIP}$ | D+/D- TX Output Rise/Fall Time at Tx package pins | 50 | | 130 | ps | 6 |
| $I_{TX-SHORT}$ | TX Short Circuit Current Limit | | | 50 | mA | 7 |
| $L_{TX-SKEWINTER\_PAIR}$ | Lane-to-Lane Output Skew at Tx package pins | | | 2 | UI | |
| $L_{TX-SKEWINTRA\_PAIR}$ | Lane Intra-pair Output Skew at Tx package pins | | | 20 | ps | |
| $T_{TX-RISE\_FALL\_MISMATCH\_CHIPDIFF}$ | Lane Intra-pair Rise-fall Time Mismatch at Tx package pins. | | | 5 | % | 8 |
| $F_{TX-REJECTION-BW}$ | Clock Jitter Rejection Bandwidth | | | 4 | MHz | 9 |
| $V_{TX-AC-CM}$ | TX AC Common Mode Voltage | | | 20 | mV | 2 |
| $C_{TX}$ | AC Coupling Capacitor | 75 | | 200 | nF | 11 |
| $T_{RISE}/T_{FALL}$ | Rise time/ Fall time (20%-80%) | 75 | | - | ps | |
| $V_{UNDERSHOOT}$ | Undershoot, max | | | 0.25 of full differential amplitude | | |
| $L_{TX-SKEWINTER\_PAIR}$ | Intra-Pair skew at source connector | | | 0.15 UI | ps | |
| $L_{TX-SKEWINTRA\_PAIR}$ | Intra-Pair skew at source connector | | | 1.212 | ns | 12 |
| | Clock duty cycle, min/average/max | 40 | 50 | 60 | % | |
| | TMDS differential Clock Jitter | | | 0.25 | UI | |

**NOTES:**
1. Frequency High limit = +300ppm; Low limit = -5300ppm
2. Range: 0% ~ 0.5% when downspread enabled
3. Range: 30 kHz ~33 kHz when downspread enabled.
4. For High Bit Rate.
5. For Reduced Bit Rate.
6. At 20 to 80
7. Total drive current of the transmitter when it is shorted to its ground.
8. Informative. D+ rise to D- fall mismatch and D+ fall to D- rise mismatch.

9. Informative. Transmitter jitter must be measured at source connector pins using a signal analyzer that has a 2nd order PLL with tracking bandwidth of 20MHz (for D10.2 pattern) and damping factor of 1.428.
10. Measured at 1.62 GHz and 2.7 GHz (if supported), within the frequency tolerance range. Time-domain measurement using a spectrum analyzer.
11. All DisplayPort Main Link lanes as well as AUX CH must be AC coupled. AC coupling capacitors must be placed on the transmitter side. Placement of AC coupling capacitors on the receiver side is optional.
12. 0.20* Tcharacter @165MHz

**Table 114. DDI AUX Channel AC Specification**

| Symbol | Parameter | Min | Typ | Max | Units | Notes[1] |
|---|---|---|---|---|---|---|
| UI | AUX Unit Interval | 0.4 | 0.5 | 0.6 | µs | 1 |
| $T_{AUX-BUS-PARK}$ | AUX CH bus park time | 10 | | | ns | 2 |
| $T_{CYCLE-to-CYCLE\ Jitter}$ | Maximum allowable UI variation within a single transaction at connector pins of a transmitting Device | | | 0.08 | UI | 3 |
| | Maximum allowable variation for adjacent bit times within a single transaction at connector pins of a transmitting Device | | | 0.04 | UI | 4 |
| $I_{AUX\_SHORT}$ | AUX Short Circuit Current Limit | | | 90 | mA | 5 |
| $C_{AUX}$ | AC Coupling Capacitor | 75 | | 200 | nF | 6 |

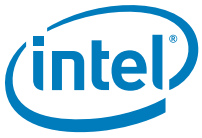
**NOTES:**
1. Results in the bit rate of 1Mbps including the overhead of ManchesterII coding.
2. Period after the AUX CH STOP condition for which the bus is parked
3. Equal to 48 ns maximum. The transmitting Device is a Source Device for a Request transaction and a Sink Device for a Reply Transaction
4. Equal to 24 ns maximum. The transmitting Device is a Source Device for a Request transaction and a Sink Device for a Reply Transaction.
5. Total drive current of the transmitter when it is shorted to its ground.
6. The AUX CH AC-coupling capacitor placed on both the DP upstream and downstream devices.

### 9.6.6.2 Analog VGA Display AC Specification

The VGA DAC (digital-to-analog converter) consists of three identical 8-bit DACs to provide red, green, and blue color components. Each DAC can output a current from 0 to 255 units of current, where one unit of current (LSB) is defined based on the VESA video signal standard.

**Table 115. R,G,B / VGA DAC Display AC Specification (Sheet 1 of 2)**

| Symbol | Parameter | Min | Nom | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| **Pixel Clock Frequency = 300 MHz** | | | | | | |
| $T_{RISE}$ | R,G,B Video Rise TIme | 0.33 | | 1.67 | ns | 1,2,8 (10-90% of “black”-to-”white” video transition) |
| $T_{FALL}$ | R,G,B Video Fall TIme | 0.33 | | 1.67 | ns | 1,3,8 (90-10% of “black”-to-”white” video transition) |
| $T_{SETTLING}$ | Settling time | | 1.0 | | ns | 1,4,8 |
| VO | Video Channel-to-Channel output skew | | 0.833 | | ns | 1,5,8 |
| | Overshoot/ Undershoot | -0.084 | | +0.084 | V | 1,6,8 (0.7V full-scale voltage step) |



### Table 115. R,G,B / VGA DAC Display AC Specification (Sheet 2 of 2)

| Symbol | Parameter | Min | Nom | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| | Noise Injection Ratio | | 2.5 | | % | |
| **Pixel Clock Frequency = 350 MHz** | | | | | | |
| $T_{RISE}$ | R,G,B Video Rise TIme | 0.286 | | 1.43 | ns | 1,2,8 (10-90% of "black"-to-"white" video transition) |
| $T_{FALL}$ | R,G,B Video Fall TIme | 0.286 | | 1.43 | ns | 1,3,8 (90-10% of "black"-to-"white" video transition) |
| $T_{SETTLING}$ | Settling time | | 0.857 | | ns | 1,4,8 |
| VO | Video Channel-to-Channel output skew | | 0.714 | | ns | 1,5,8 |
| | Overshoot/ Undershoot | -0.084 | | +0.084 | V | 1,6,8 (0.7V full-scale voltage step) |
| | Noise Injection Ratio | | 2.5 | | % | |

**NOTES:**
1. Measured at each R,G,B termination according to the VESA Test Procedure - Evaluation of Analog Display Graphics Subsystems Proposal (Version 1, Draft 4, December 1, 2000).
2. R,G,B Max Video Rise/Fall Time: 50% of minimum pixel clock period
3. R,G,B Min Video Rise./Fall Time: 10% of minimum pixel clock period
4. Max settling time: 30% of minimum pixel clock period
5. Video channel-to-channel output skew: 25% of minimum pixel clock period
6. Overshoot/Undershoot: ±12% of "black"-to-"white" video step function
7. Noise Injection Ratio: 2.5% of maximum luminance voltage (dc to max pixel clock frequency)
8. R,G,B AC parameters are strongly dependent on the board design & implementation: actual performance may differ from values noted above depending on board implementation.

### Table 116. VGA_HSYNC and VGA_VSYNC AC Specification

| Symbol | Parameter | Min | Max | Units | Notes[1] |
|---|---|---|---|---|---|
| $T_F$ | Fall Time | -- | 80% of minimum pixel clock period | ns | |
| $T_R$ | Rise Time | -- | 80% of minimum pixel clock period | ns | |
| -- | Overshoot/Undershoot | -- | 30% of high level signal voltage range | mA | 1 |
| -- | Jitter (measured between Hsync pulses) | -- | One half of the difference between max and min interval <15% of the pixel clock, DC to max. | V | 2 |

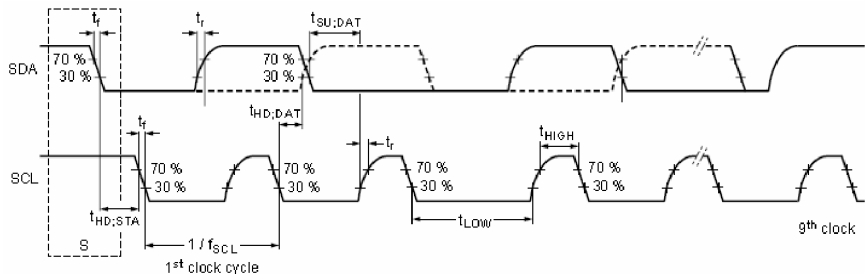
**NOTES:**
1. No signal non-monotonicity / excursions allowed in the 0.5 to 2.4V range
2. Measured over 100,000 intervals. Horizontal refresh rate at all image format, worse-case screen patterns.

### Table 117. VGA_DDCDATA, and VGA_DDCCLK Timing Specification

| Symbol | Parameter | Standard mode 100kbits/s | | Units | Figures |
|---|---|---|---|---|---|
| | | Min | Max | | |
| $f_{SCL}$ | SCL Clock Frequency | 0 | 100 | kHz | 34 |
| $t_{LOW}$ | Low Period of SCL Clock | 4.7 | -- | µs | |
| $t_{HIGH}$ | High Period of SCL Clock | 4 | -- | µs | |
| $t_R$ | Rise Time[1] of Both SDA and SCL Signals | -- | 1000 | ns | |
| $t_F$ | Fall Time[1] of Both SDA and SCL Signals | -- | 300 | ns | |
| $t_{HD:DAT}$ | Data Hold Time[3] | 0 | -- | µs | |
| $t_{SU:DAT}$ | Data Setup Time | 250 | -- | ns | |

**NOTES:**
1. Measurement point for rise and fall time: $V_{IL}$(min) - $V_{IL}$(max)
2. $t_{HD:DAT}$ is the data hold time that is measured from the falling edge of SCL, applies to data in transmission and the acknowledge.

### Figure 34. VGA_DDCDATA, and VGA_DDCCLK Timing Diagram



## 9.6.7 MIPI-Camera Serial Interface (CSI) AC Specification

Based on version 2 of the MIPI-CSI specification.

### Table 118. MIPI-CSI-2 Receiver Characteristics (Sheet 1 of 2)

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| **MIPI HS-Receiver Mode** | | | | | | |
| $\Delta V_{CMRX(HF)}$ | Common-mode interference above 450 MHz | – | – | 100 | mV | 2, 9 |
| $\Delta V_{CMTX(LF)}$ | Common-mode interference between 50–450 MHz | -50 | – | 50 | mV | 1, 4 |
| $C_{CM}$ | Common-mode termination | – | – | 60 | pF | 3 |

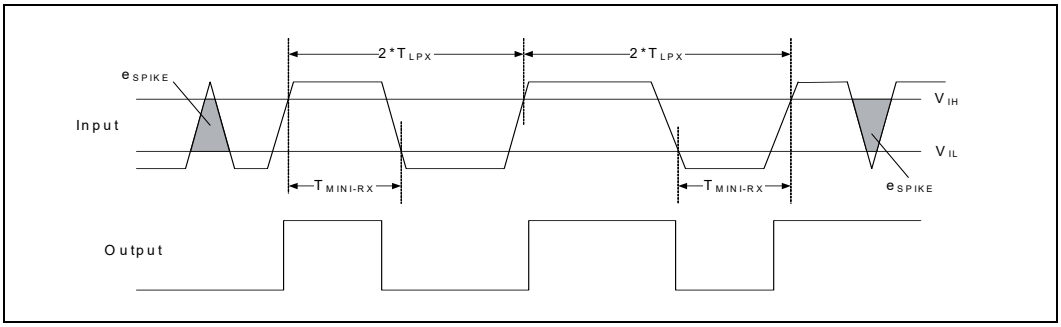
### Table 118. MIPI-CSI-2 Receiver Characteristics (Sheet 2 of 2)

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| $S_{CDRX}$ | differential to common-mode | – | – | -26 | dB | From 0 to fMAX (1.33Ghz) |
| **MIPI LP-Receiver Mode** | | | | | | |
| $e_{spike}$ | Input pulse rejection | – | – | 300 | V*ps | 5, 6, 7 |
| $T_{MIN-RX}$ | Minimum pulse width response | 20 | – | – | ns | 8 |
| $V_{INT}$ | Peak interference amplitude | – | – | 200 | mV | |
| $f_{INT}$ | Interference frequency | 450 | – | – | MHz | |

## NOTES:

1. Excluding static ground shift of 50 mV.
2. $\Delta V_{CMRX(HF)}$ is the peak amplitude of a sine wave superimposed on the receiver inputs.
3. For higher bit rates a 14 pF capacitor is needed to meet the common-mode return loss specification.
4. Voltage difference compared to the DC average common-mode potential.
5. Time-voltage integration of a spike above $V_{IL}$ when in the LP-0 state or below $V_{IH}$ when in the LP-1 state.
6. An impulse spike less than this will not change the receiver state.
7. In addition to the required glitch rejection, designers shall ensure rejection of known RF-interference.
8. An input pulse greater than this will toggle the output
9. Improves on DPHY specification, which requires 100 mV maximum.

### Figure 35. Input Glitch Rejection of Low-Power Receivers

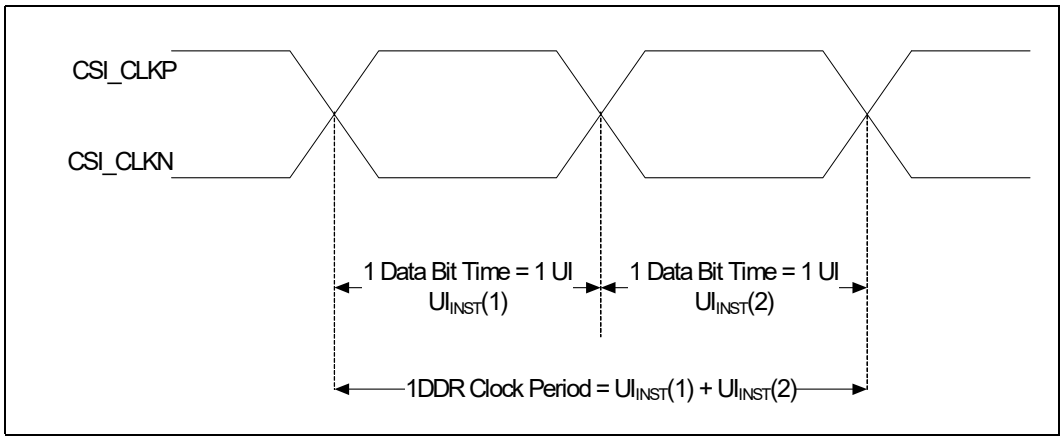


### Table 119. MIPI-CSI-2 Clock Signal Specification

| Symbol | Clock Parameter | Min. | Typ. | Max. | Unit | Notes |
|---|---|---|---|---|---|---|
| $UI_{INST}$ | UI Instantaneous (In 1 or 2 or 3 or 4 Lane configuration) | 1 (1Gbps/ 500Mhz) | | 2.77 (163 Mbps/ 80Mhz) | ns | 1 |

**NOTE:** [1]The minimum UI shall not be violated for any single bit period, that is, any DDR half cycle within a data burst.

### Figure 36. MIPI-CSI-2 Clock Definition

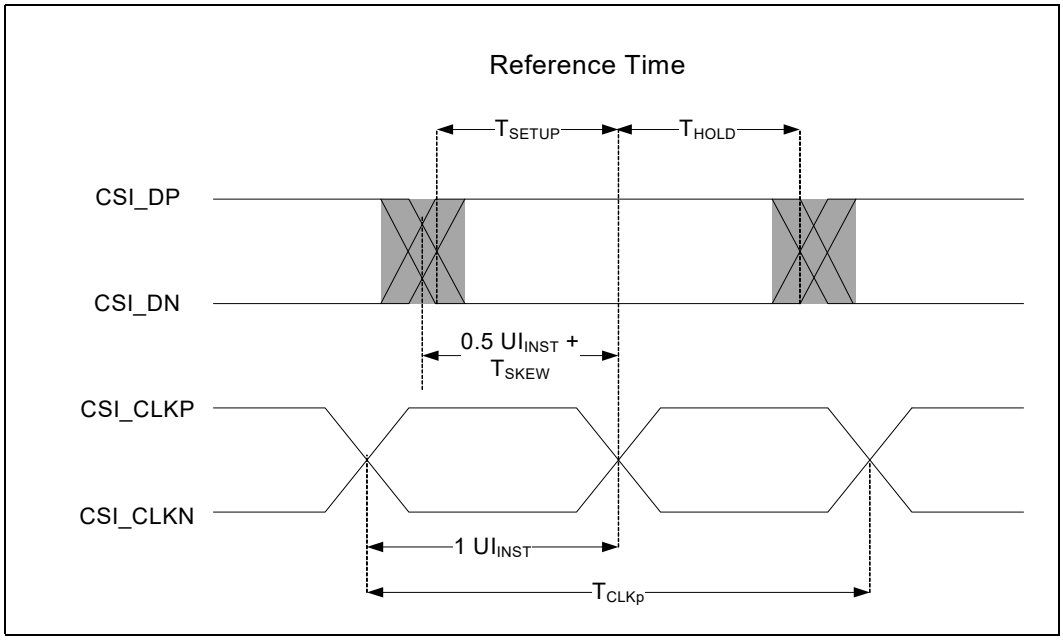


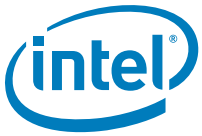
### Table 120. MIPI CSI 2 Data Clock Timing Specifications

| Symbol | Parameter | Min. | Typ. | Max. | Units | Notes |
|---|---|---|---|---|---|---|
| TSETUP[RX] | Data to Clock Setup Time [receiver] | 0.15 | – | – | $UI_{INST}$ | 1, 2 |
| THOLD[RX] | Clock to Data Hold Time [receiver] | 0.15 | – | – | $UI_{INST}$ | 1, 2 |

**NOTES:**
1. Total silicon and package delay budget of 0.3*$UI_{INST}$
2. Total setup and hold window for receiver of 0.3*$UI_{INST}$

### Figure 37. MIPI-CSI-2 Data to Clock Timing Definitions





## 9.6.8 SCC - SD Card AC Specification

**Table 121. SD Card AC Specification**

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $T_{wc(DDR50)}$ | CLK cycle time for DDR50 Mode | 19 | – | ns | 41 | |
| $T_{wc(SDR25)}$ | CLK cycle time for SDR25 Mode | 19 | – | ns | 42 | |
| $T_{wc(SDR12)}$ | CLK cycle time for SDR12 Mode | 39 | – | ns | 45 | |
| $T_{ODLY(DDR50)}$ | SD_CLK Transitioning Edge to SDIO_D | 2 | 6 | ns | 41 | |
| $T_{ODLY(SDR25)}$ | SD_CLK Rising Edge to SDIO_D | 2 | 12 | ns | 42 | |
| $T_{ODLY(SDR12)}$ | SD_CLK Falling Edge to SDIO_D | 0 | 12 | ns | 45 | |
| $T_{SU\_SOC}$ (DDR) | SoC setup time (data valid before clock launched) | 3 | – | ns | 41 (For DDR50 Mode) | |
| $T_{SU\_SOC}$ (SDR) | SoC setup time (data valid before clock launched) | 5 | – | ns | 40 (For SDR12/25 Mode) | |
| $T_{HD\_SOC}$ (DDR) | SoC hold time (data valid after clock launched) | 2 | – | ns | 41 (For DDR50 Mode) | |
| $T_{HD\_SOC}$ (SDR) | SoC hold time (data valid after clock launched) | 2 | – | ns | 40 (For SDR12/25 Mode) | |
| $T_{RISE\ CLK}$/ $T_{FALL\ CLK}$ (1.8V) | Clock Rise and Fall Time (1.8V operation) | 1 | 4 | ns | | 1, 2, 3, 4 |
| $T_{RISE\ CLK}$/ $T_{FALL\ CLK}$ (3.3V) | Clock Rise and Fall Time (3.3V operation) | 1 | 4 | ns | | 1, 2, 3, 4 |

1. Based on trace length of 0.25”–4”, 2–5 pF Far End Load for Port 0 AND 2–10 pF Far End Load (for Port 1 and Board impedance of 25–75 Ω.
2. Minimum time deviates from SDIO Specification 2.0, minimum time is not defined in specification.
3. Measured from 0.58–1.27V.

4. Takes into consideration EMI filter of 10 pF - 40 Ω -10 pF.

**Figure 38. SD Card Timing Diagram (DDR50)**

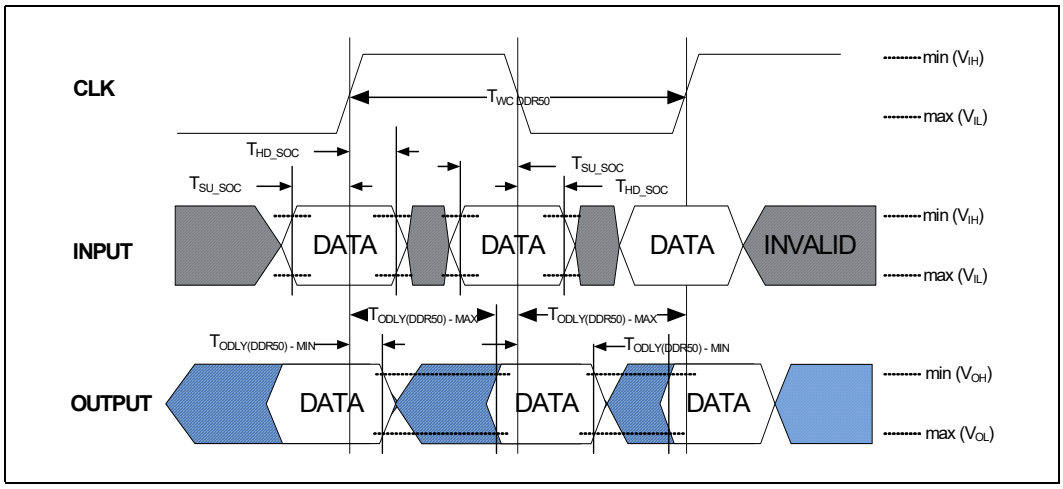


**Figure 39. SD card Output Timing Diagram (SDR25)**

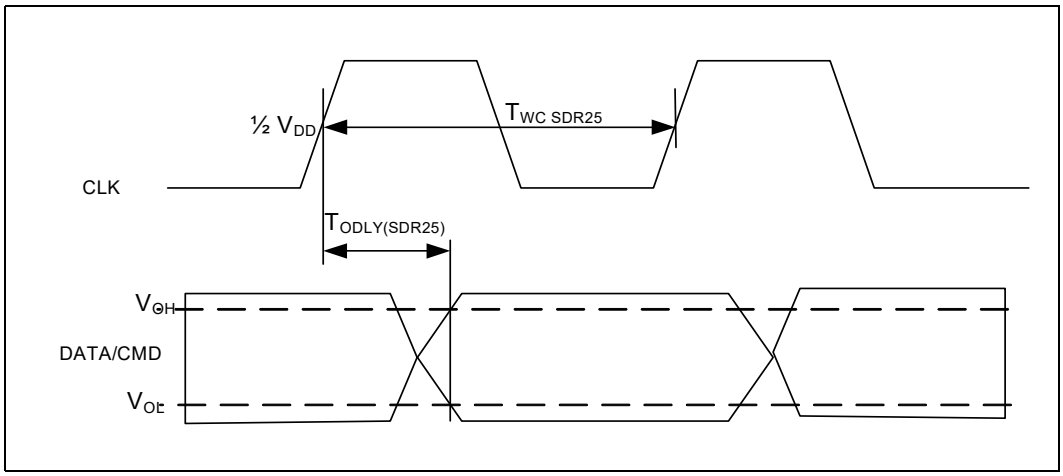

**Figure 40. SD Card Input Timing Diagram (SDR12)**

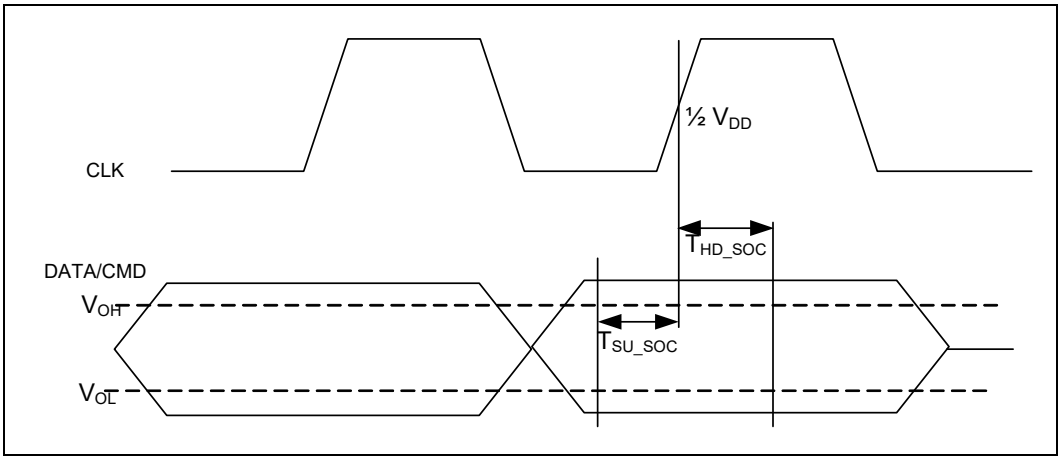

### 9.6.8.1 SD Card Default Speed Specification

**Table 122. SD Card Default Speed AC Specification**

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $f_{PP}$ | Clock Frequency Data transfer mode | 0 | 25 | MHz | | |
| $f_{OD}$ | Clock Frequency identification mode | 0 | 400 | kHz | | 1 |
| $t_{FL}$ | Clock low time | 10 | - | ns | Figure 54, 55 | |
| $t_{WH}$ | Clock High time | 10 | - | ns | Figure 54, 55 | |
| $t_{TLH}$ | Clock Rise time | - | 10 | ns | Figure 54, 55 | |
| $t_{THL}$ | Clock Fall time | - | 10 | ns | Figure 54, 55 | |
| | Clock Overshoot | - | 4.5 | V | | |
| | Clock undershoot | -1.5 | - | V | | |
| Outputs CMD,DAT (referenced to CLK) | | | | | | |
| $t_{ODLY}$ | Output Delay time during Data Transfer Mode | 0 | 14 | ns | Figure 55 | |
| $t_{ODLY}$ | Output Delay time during Identification Mode | 0 | 50 | ns | Figure 55 | |
| Inputs CMD, DAT (referenced to CLK) | | | | | | |
| $t_{ISU}$ | Input Set-up time | 5 | - | ns | Figure 54 | |
| $t_{IH}$ | Input hold time | 5 | - | ns | Figure 54 | |

**NOTES:**
1. 0 Hz means to stop the clock. The given minimum frequency range is for cases were continues clock is required.

**Figure 41. SD Card Input Timing Diagram (Default)**

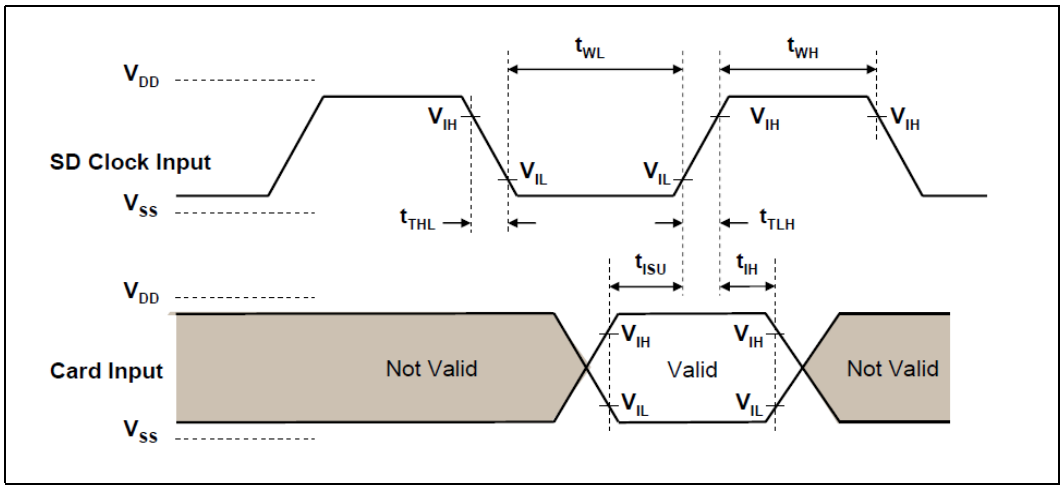

**Figure 42. SD card Output Timing Diagram (Default)**

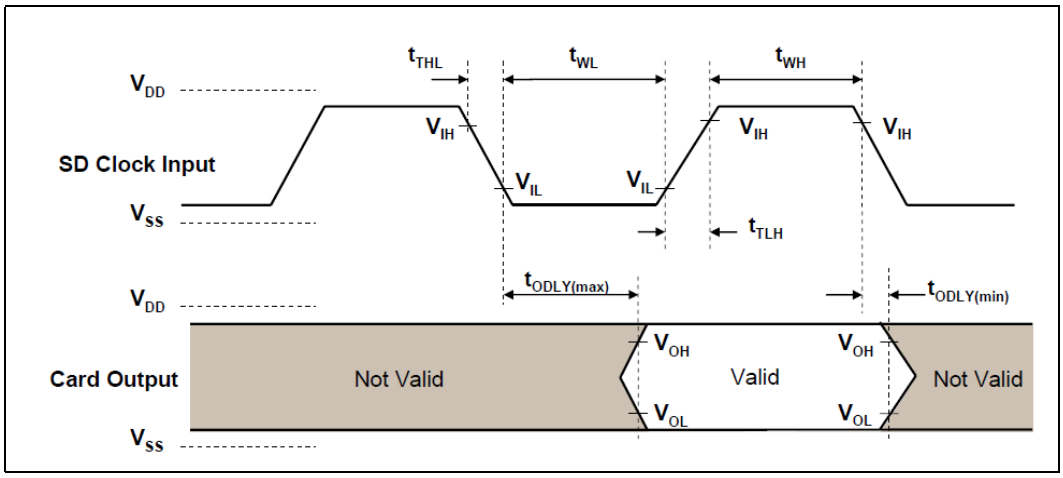

### 9.6.8.2 SD Card High Speed Specification

**Table 123. SD Card High Speed AC Specification (Sheet 1 of 2)**

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $f_{PP}$ | Clock Frequency Data transfer mode | 0 | 50 | MHz | | |
| $t_{FL}$ | Clock low time | 7 | - | ns | Figure 56, 57 | |
| $t_{WH}$ | Clock High time | 7 | - | ns | Figure 56, 57 | |
| $t_{TLH}$ | Clock Rise time | - | 3 | ns | Figure 56, 57 | |
| $t_{THL}$ | Clock Fall time | - | 3 | ns | Figure 56, 57 | |
| | Clock Overshoot | - | 4.5 | V | | |

**Table 123. SD Card High Speed AC Specification (Sheet 2 of 2)**

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| | Clock undershoot | -1.5 | - | V | | |
| Outputs CMD,DAT (referenced to CLK) | | | | | | |
| $t_{ODLY}$ | Output Delay time during Data Transfer Mode | - | 14 | ns | Figure 57 | |
| $t_{ODLY}$ | Output Delay time during Identification Mode | 2.5 | - | ns | Figure 57 | |
| Inputs CMD, DAT (referenced to CLK) | | | | | | |
| $t_{ISU}$ | Input Set-up time | 6 | - | ns | Figure 56 | |
| $t_{IH}$ | Input hold time | 2 | - | ns | Figure 56 | |
| $C_L$ | Total Capacitance for each line | - | 40 | pF | | |

**NOTES:**
1. 0 Hz means to stop the clock. The given minimum frequency range is for cases were continues clock is required.

**Figure 43. SD Card Input Timing Diagram (High Speed)**

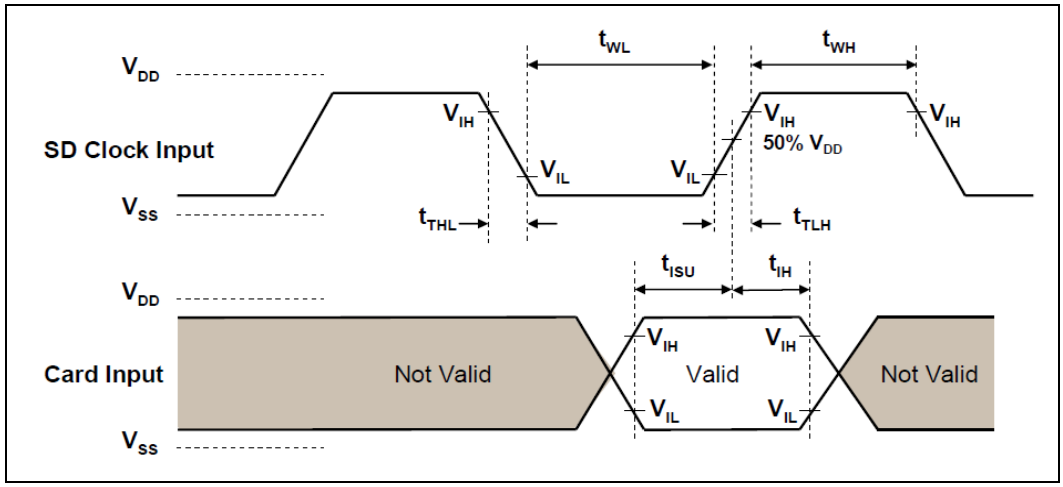

**Figure 44. SD card Output Timing Diagram (High Speed)**

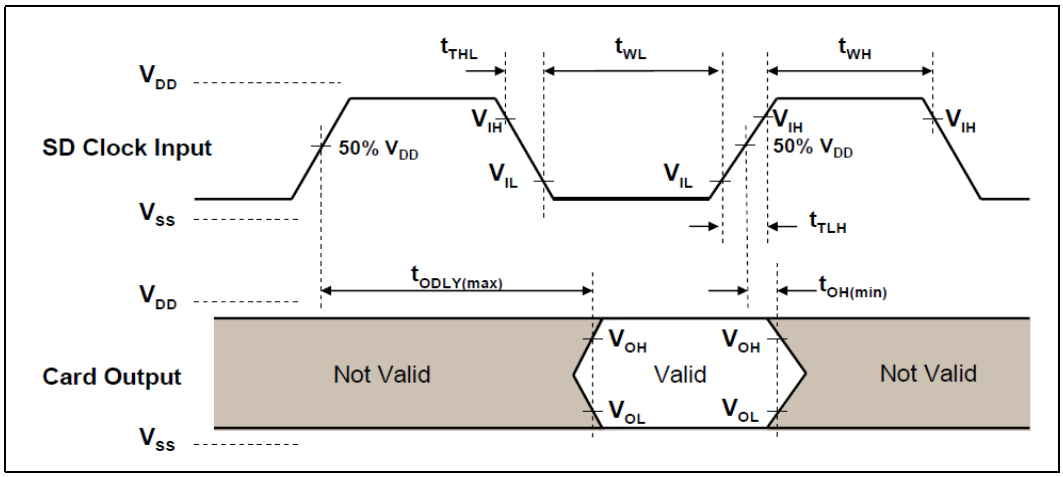

## 9.6.9 SSC - SDIO AC specification

**Table 124. SDIO AC Specification**

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $T_{wc(DDR50)}$ | CLK cycle time for DDR50 Mode | 19 | – | ns | 45 | |
| $T_{wc(SDR25)}$ | CLK cycle time for SDR25 Mode | 19 | – | ns | 46 | |
| $T_{wc(SDR12)}$ | CLK cycle time for SDR12 Mode | 39 | – | ns | 47 | |
| $T_{ODLY(DDR50)}$ | SD_CLK Transitioning Edge to SDIO_D | 1.5 | 6 | ns | 45 | |
| $T_{ODLY(SDR25)}$ | SD_CLK Rising Edge to SDIO_D | 3 | 11.9 | ns | 46 | |
| $T_{ODLY(SDR12)}$ | SD_CLK Falling Edge to SDIO_D | 0 | 11.9 | ns | 47 | |
| $T_{SU\_SOC}$ (DDR) | SoC setup time (data valid before clock launched) | 1 | – | ns | 45 (For DDR50 Mode) | |
| $T_{SU\_SOC}$ (SDR) | SoC setup time (data valid before clock launched) | 4 | – | ns | 48 (For SDR12/25 Mode) | |
| $T_{HD\_SOC}$ (DDR) | SoC hold time (data valid after clock launched) | 2 | – | ns | 45 (For DDR50 Mode) | |

### Table 124. SDIO AC Specification

| Symbol | Parameter | Min. | Max. | Unit | Figure | Notes |
|---|---|---|---|---|---|---|
| $T_{HD\_SOC}$ (SDR) | SoC hold time (data valid after clock launched) | 2 | – | ns | 48 (For SDR12/25 Mode) | |
| $T_{RISE\ CLK}$/ $T_{FALL\ CLK}$ (1.8V) | Clock Rise and Fall Time (1.8V operation) | 1 | 3 | ns | | 1, 2, 3, 4 |
| $T_{RISE\ CLK}$/ $T_{FALL\ CLK}$ (3.3V) | Clock Rise and Fall Time (3.3V operation) | 1 | 3 | ns | | 1, 2, 3, 4 |

**NOTES:**
1. Based on trace length of 0.25”–4”, 2–5 pF Far End Load for Port 0 AND 2–10 pF Far End Load (for Port 1 and Board impedance of 25–75 Ω.
2. Minimum time deviates from SDIO Specification 2.0, minimum time is not defined in specification.
3. Measured from 0.58–1.27V.
4. Takes into consideration EMI filter of 10 pF - 40 Ω -10 pF.

## 9.6.10 SCC - eMMC 4.5 AC Specification

### 9.6.10.1 HS/DDR Mode AC Characteristics

**Table 125. eMMC 4.5 AC Characteristics (Sheet 1 of 2)**

| Symbol | Parameter | Min. | Max. | Units | Figures | Notes |
|---|---|---|---|---|---|---|
| $F_{pp}$ | Clock Frequency Data transfer Mode | | 200 | MHZ | | |
| $T_{wc(HS/DDR)}$ | CLK Cycle Time (High Speed Mode and DDR Modes) | 20 | – | ns | 49 | |
| $T_{DC}$ | CLK Duty Cycle | 40 | 55 | % | | |
| $T_{ODLY(HS)}$ | EMMC_CLK Rising Edge to EMMC_D (High Speed Mode) | - | 13.7 | ns | 49 | |
| $T_{ODLY(DDR)}$ | EMMC_CLK Rising Edge to EMMC_D (DDR Mode) | 1.5 | 7 | ns | 50 | |
| $T_{OH(HS)}$ | Output hold time (HS mode) | 2.5 | – | ns | | |
| $T_{SU(HS)}$ | EMMC_D Input Setup Time to EMMC_CLK Rising Edge (data read - HS mode) | 1.5 | – | ns | 50 | |
| $T_{H(HS)}$ | EMMC_D Input Hold Time to EMMC_CLK Rising Edge (data read - HS mode) | 3 | – | ns | 51 | |
| $T_{SU(DDR)}$ | EMMC_D Input Setup Time to EMMC_CLK Rising Edge (data read - DDR Mode) | 2.5 | – | ns | 50 | |
| $T_{H(DDR)}$ | EMMC_D Input Setup Time to EMMC_CLK Rising Edge (data read–DDR Mode) | 2.5 | – | ns | 50 | |
| $T_{RISE(HS)}$ | Rise Time (Output - HS mode) | - | 3 | ns | | 1, 2, 3 |
| $T_{FALL(HS)}$ | Fall Time (Output -HS mode) | - | 3 | ns | | 1, 2, 3 |

### Table 125. eMMC 4.5 AC Characteristics (Sheet 2 of 2)

| Symbol | Parameter | Min. | Max. | Units | Figures | Notes |
|---|---|---|---|---|---|---|
| $T_{RISE(DDR)}$ | Rise Time (Output - DDR mode) | - | 2 | ns | | 1, 2, 3 |
| $T_{FALL(DDR)}$ | Fall Time (Output - DDR mode) | - | 2 | ns | | 1, 2, 3 |
| $T_{RSTW}$ | eMMC_RST# Pulse Width | 1 | – | µs | | |
| $T_{RSTCA}$ | eMMC_RST# to Command Time | 200 | – | µs | | 4 |
| $T_{RSTH}$ | eMMC_RST# High Period (interval time) | 1 | – | µs | | |

**NOTES:**
1. Based on trace length of 0.25 –2", 2–12 pF Far End Load and Board impedance of 25–75 Ω.
2. Measured from 35–65%.
3. Minimum time deviates from e-MMC* Specification 4.41, minimum time is not defined in the specification.
4. Seventy-four (74) clock cycles are required before issuing CMD1 or CMD0 with argument 0xFFFFFFFA.

| TLEOPT | Source SE0 interval of EOP | 1.25 | 1.50 | us | | 47 |

**NOTES:**
1. Measured at A plug.
2. Measured at A receptacle.
3. Measured at B receptacle.
4. Measured at A or B connector.
5. Measured with RL of 1.425 kΩ to 3.6 V.
6. Measured with RL of 14.25 kΩ to GND.
7. Timing difference between the differential data signals.
8. Measured at crossover point of differential data signals.
9. The maximum load specification is the maximum effective capacitive load allowed that meets the target VBUS drop of 330 mV.
10. Excluding the first transition from the Idle state.
11. The two transitions should be a (nominal) bit time apart.
12. For both transitions of differential signaling.
13. Must accept as valid EOP.
14. Single-ended capacitance of D+ or D- is the capacitance of D+/D- to all other conductors and, if present, shield in the cable. That is, to measure the single-ended capacitance of D+, short D-, VBUS, GND, and the shield line together and measure the capacitance of D+ to the other conductors.
15. For high power devices (non-hubs) when enabled for remote wakeup.

### Figure 54. USB Rise and Fall Times

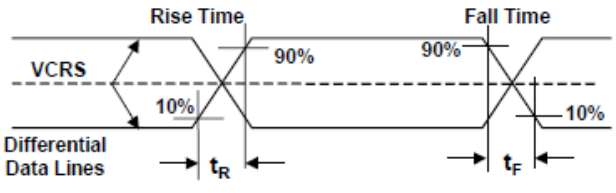

**Figure 55. USB Full Speed Load**

## 9.6.13 USB 3.0 AC Specification

### Figure 58. USB 3.0 Signals AC Specification

| Symbol | Parameter | Min | Max | Units | Notes |
|---|---|---|---|---|---|
| TMIN-PULSE-DJ | Deterministic min Pulse | - | 0.96 | UI | 1 |
| TMIN-PULSE-TJ | Tx min Pulse | - | 0.90 | UI | 2 |
| TTX-EYE | Transmitter Eye | 0.625 | - | UI | 3 |
| TTx-DJ-DD | Tx deterministic jitter | - | .205 | UI | 4 |

**NOTES:**
1. Tx pulse width variation that is deterministic.
2. Min Tx Pulse at $10^{-12}$ including Dj and Rj.
3. Includes all jitter sources.
4. Deterministic jitter only assuming the Dual Dirac distribution

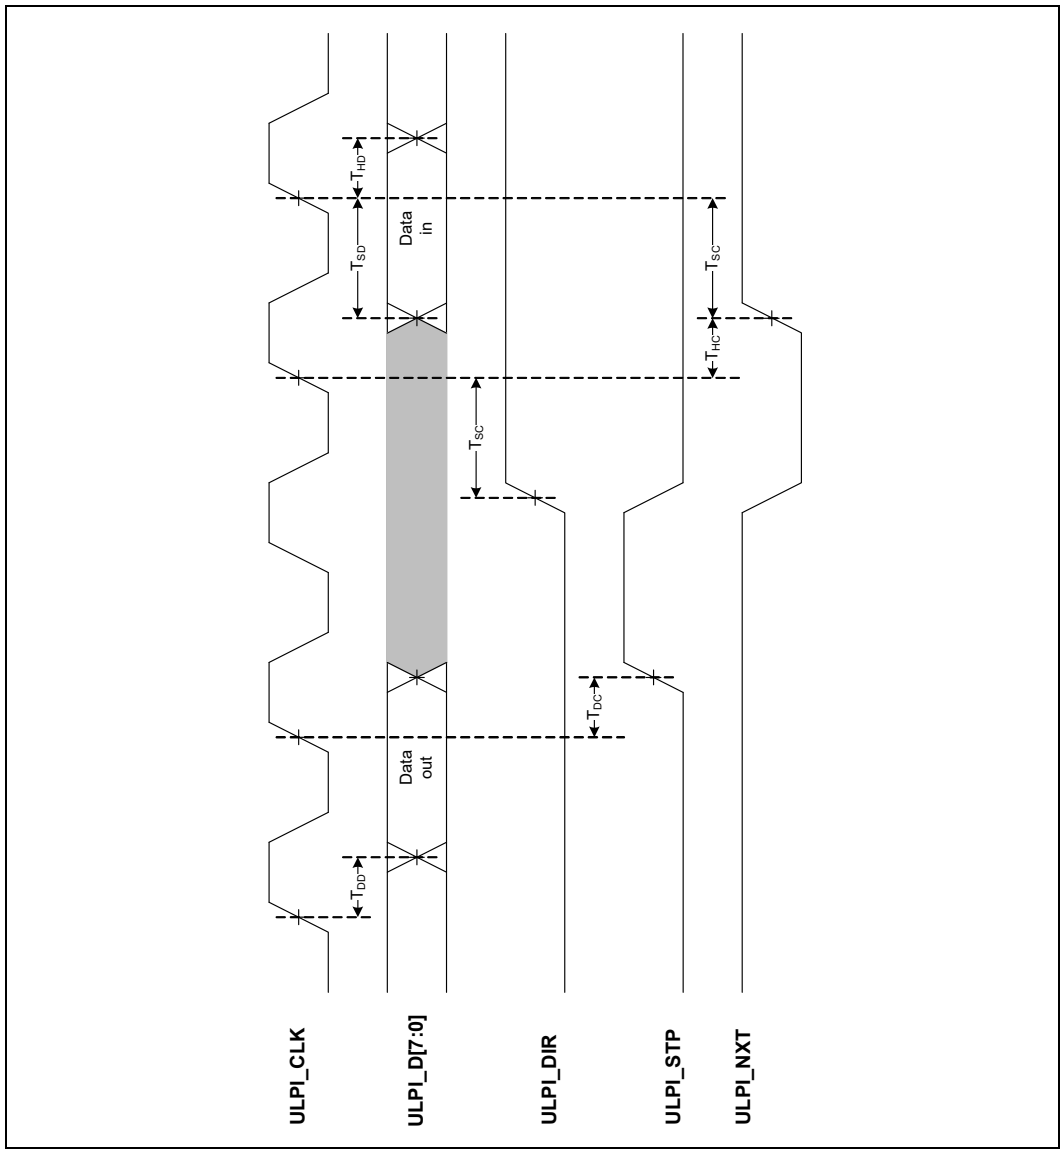
## 9.6.14 ULPI USB 2.0 Device AC Specification

### Table 131. ULPI Signals AC Specification

| Symbol | Parameter | Min | Typ | Max | Units | Notes |
|---|---|---|---|---|---|---|
| $F_{STEADY}$ | Clock frequency steady state | 59.97 | 60 | 60.03 | MHz | |
| TRISE/FALL | Input clock rise/fall time | 2 | | 7 | ns | 1,2 |
| TSC,TSD | Setup time (control in, 8-bit data in) relative to rising clock edge at host | 6 | | - | ns | |
| THC,THD | Hold time (control in, 8-bit data in) relative to rising clock edge at host | 0 | | | ns | |
| TDC,TDD | Output delay (control in, 8-bit data in) relative to rising clock edge at host | 0 | | - | ns | 3 |
| TRISE/FALL | Rise/Fall time (control out, 8-bit data out) | 2 | | 7 | ns | 1,2,4 |

**NOTES:**
1. Based on trace length of 1–4”, Far End Load of 1–5 pF and board impedance of 30–75 ohms.
2. Measured from 10–90%.
3. Minimum time deviates from ULPI Specification, minimum time is not defined in ULPI Specification.
4. Minimum time and Maximum time not mentioned in the ULPI Specification.

**Figure 59. ULPI Timing Diagram**



## 9.6.15 Intel® HD Audio AC Specification

### 9.6.15.1 1.5-V AC specification

The output driver on the Intel HD Audio electrical link must be able to deliver an initial voltage of at least $V_{IL\_HDA}$ or $V_{IH\_HDA}$ respectively at the receiver through the bus with known characteristic impedance and at the same time meeting signal quality requirements.

The minimum and maximum drive characteristics of Intel HD Audio output buffers are defined by the V/I curves. Table 132 and Figure 60 describe the SDO buffer AC drive specification where as the Table 133 and Figure 61 describe the AC drive specification of the HDA_SDI[x] buffers. The AC drive specification for HDA_SYNC, HDA_RST# and HDA_CLK buffers is same as that of HDA_SDO.

These curves should be interpreted as traditional 'DC' transistor curves with the following exceptions: 'DC drive point' is the only position on the curves at which steady state operation is intended, while the higher currents are only reached momentarily during bus switching transients. The 'AC drive point' (real definition of buffer strength) defines the minimum instantaneous current required to switch the bus.

Adherence to these curves should be evaluated at worst case conditions. Minimum pull up curve is evaluated at minimum $VCC_{HDA}$ and high temperature. Minimum pull down curve is evaluated at minimum $VCC_{HDA}$ and high temperature. The maximum curve test points are evaluated at maximum $VCC_{HDA}$ and low temperature.

Inputs must be clamped to both ground and power rails. The clamp diode characteristics are also listed here for reference.

**Figure 60. V/I Curves for HDA_SDO buffers**

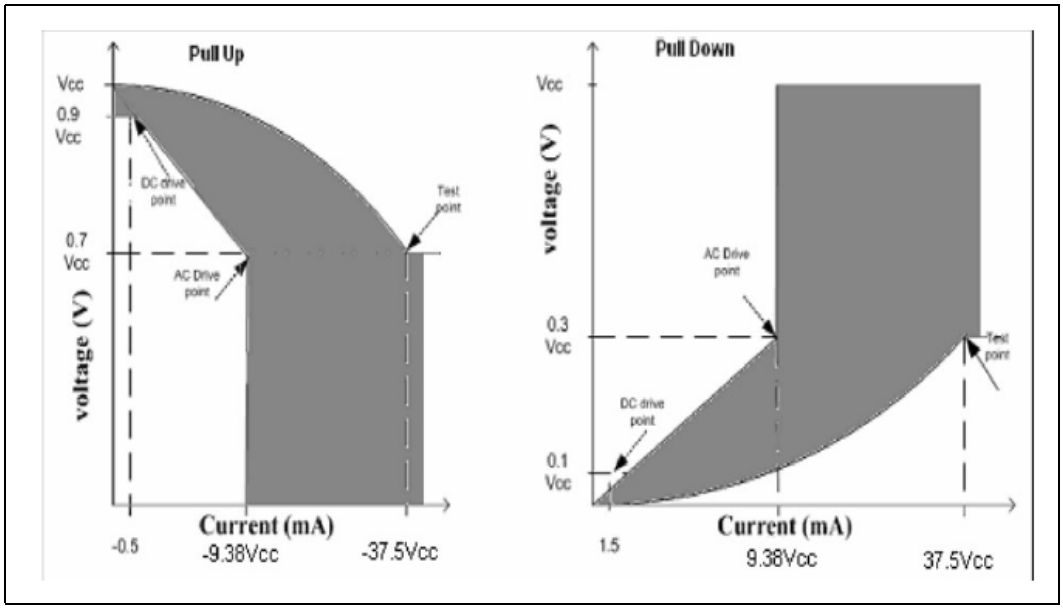


**Table 132. HDA_SDO 1.5V Buffer AC Specification (Sheet 1 of 2)**

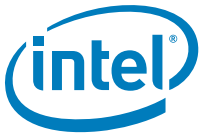
| Symbol | Parameter | Condition | Min | Max | Unit |
|---|---|---|---|---|---|
| $I_{OH}$ | switching Current High | $0 < V_{O\_HDA} < 0.7VCC_{HDA}$ | $-16.67VCC_{HDA}$ | | mA |
| | | $0.7VCC_{HDA} < V_{O\_HDA} < 0.9VCC_{HDA}$ | $-55.57(VCC_{HDA}-Vout)$ | | mA |



### Table 132. HDA_SDO 1.5V Buffer AC Specification (Sheet 2 of 2)

| Symbol | Parameter | Condition | Min | Max | Unit |
|---|---|---|---|---|---|
| | | $0.7VCC_{HDA} < V_{O\_HDA} < VCC_{HDA}$ | | $(151.52/VCC_{HDA}) * (V_{O\_HDA}-VCC_{HDA}) * (V_{O\_HDA} + 0.4VCC_{HDA})$ | mA |
| | (Test Point) | $V_{O\_HDA} = 0.7VCC_{HDA}$ | | $-50VCC_{HDA}$ | mA |
| $I_{OL}$ | Low Period of SCL Clock | $VCC_{HDA} > V_{O\_HDA} > 0.3VCC_{HDA}$ | $16.67VCC_{HDA}$ | | mA |
| | | $0.3VCC_{HDA} > V_{O\_HDA} > 0.1VCC_{HDA}$ | 57.57Vout | | mA |
| | | $0.3VCC_{HDA} > V_{O\_HDA} > 0$ | | $(238.1/VCC_{HDA}) * V_{O\_HDA} * (VCC_{HDA}-V_{O\_HDA})$ | mA |
| | (Test Point) | $V_{O\_HDA} = 0.3VCC_{HDA}$ | | $50VCC_{HDA}$ | mA |
| $I_{CL}$ | Low Clamp Current | $-3 < V_{I\_HDA} < -1$ | $-25 + (V_{I\_HDA}+1)/0.015$ | | |
| $I_{CH}$ | High Clamp Current | $VCC_{HDA}+4 > Vin > VCC_{HDA}+1$ | $25+(V_{I\_HDA}-VCC_{HDA}-1)/0.015$ | | |
| Slew_r | Output rise Slew rate | $0.25VCC_{HDA}$ to $0.75VCC_{HDA}$ | 0.5 | 1.5 | V/ns Slew rate (note1) |
| Slew_f | Output rise Slew rate | $0.75VCC_{HDA}$ to $0.25VCC_{HDA}$ | 0.5 | 1.5 | V/ns Slew rate (note1) |

**NOTE:**

1. Slew rate is to be interpreted as the cumulative edge rate across the specified range, ($0.25VCC_{HDA}$ to $0.75VCC_{HDA}$ load for rise and $0.75VCC_{HDA}$ to $0.25VCC_{HDA}$ load for fall), rather than instantaneous rate at any point within the transition range.

### Table 133. HDA_SDI[x] 1.5V Buffer AC Specification (Sheet 1 of 2)

| Symbol | Parameter | Condition | Min | Max | Unit |
|---|---|---|---|---|---|
| $I_{OH}$ | switching Current High | $0 < V_{O\_HDA} < 0.7VCC_{HDA}$ | $-9.38VCC_{HDA}$ | | mA |
| | | $0.7VCC_{HDA} < V_{O\_HDA} < 0.9VCC_{HDA}$ | $-31.27(VCC_{HDA}-V_{O\_HDA})$ | | mA |

**Table 133. HDA_SDI[x] 1.5V Buffer AC Specification (Sheet 2 of 2)**

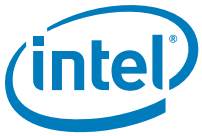
| Symbol | Parameter | Condition | Min | Max | Unit |
|---|---|---|---|---|---|
| | | $0.7VCC_{HDA} < V_{O\_HDA} < VCC_{HDA}$ | | $(113.64/VCC_{HDA}) * (V_{O\_HDA}-VCC_{HDA}) * (V_{O\_HDA}+0.4VCC_{HDA})$ | mA |
| | (Test Point) | $V_{O\_HDA} = 0.7VCC_{HDA}$ | | $-37.5VCC_{HDA}$ | mA |
| $I_{OL}$ | Low Period of SCL Clock | $VCC_{HDA} > V_{O\_HDA} > 0.3VCC_{HDA}$ | $9.38VCC_{HDA}$ | | mA |
| | | $0.3VCC_{HDA} > V_{O\_HDA} > 0.1VCC_{HDA}$ | $31.27V_{O\_HDA}$ | | mA |
| | | $0.3VCC_{HDA} > V_{O\_HDA} > 0$ | | $(178.57/VCC_{HDA}) * V_{O\_HDA} * (VCC_{HDA}-V_{O\_HDA})$ | mA |
| | (Test Point) | $V_{O\_HDA} = 0.3VCC_{HDA}$ | | $37.55VCC_{HDA}$ | mA |
| $I_{CL}$ | Low Clamp Current | $-3 < V_{I\_HDA} < -1$ | $-25 +(V_{I\_HDA}+1)/0.015$ | | |
| $I_{CH}$ | High Clamp Current | $VCC_{HDA}+4 > V_{I\_HDA} > VCC_{HDA}+1$ | $25+(V_{I\_HDA}-VCC_{HDA}-1)/0.015$ | | |
| Slew_r | Output rise Slew rate | $0.25VCC_{HDA}$ to $0.75VCC_{HDA}$ | 0.5 | 1.5 | V/ns Slew rate (note1) |
| Slew_f | Output rise Slew rate | $0.75VCC_{HDA}$ to $0.25VCC_{HDA}$ | 0.5 | 1.5 | V/ns Slew rate (note1) |

**NOTE:**

1. Slew rate is to be interpreted as the cumulative edge rate across the specified range, ($0.25VCC_{HDA}$ to $0.75VCC_{HDA}$ load for rise and $0.75VCC_{HDA}$ to $0.25VCC_{HDA}$ load for fall), rather than instantaneous rate at any point within the transition range.

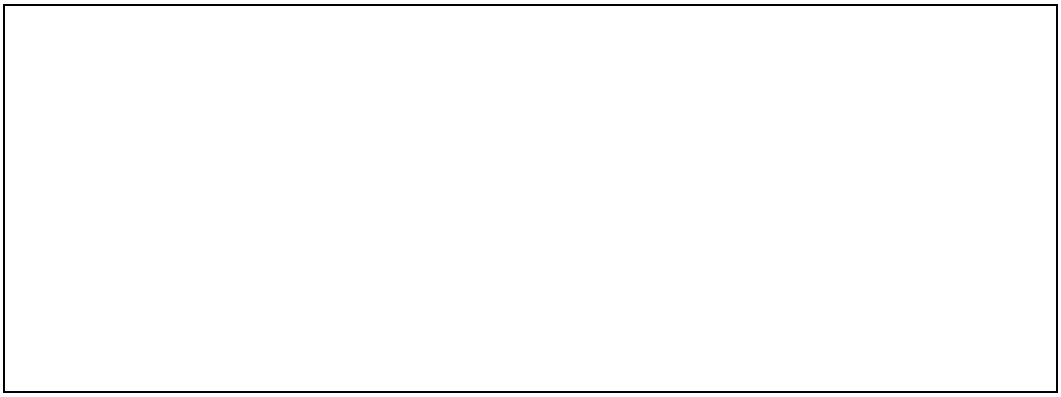
### 9.6.15.2 Maximum AC Ratings and Device Protection

All Intel HD Audio buffers should be capable of withstanding continuous exposure to the waveform shown in Figure 61. It is recommended that these waveforms be used as qualification criteria against which the long term reliability of each device is evaluated. Table 134 and Table 135 list the parameters of the waveform. This level of robustness should be guaranteed by design; it is not intended that this waveform should be used as a production test.



These waveforms are applied with the equivalent of a zero impedance voltage source, driving through a series resistor directly into each input or tri-stated output pin. The open-circuit voltage of the voltage source is shown in Figure 61, which is based on the worst case overshoot and undershoot expected in actual Intel HD Audio buses. The resistor values are calculated to produce the worst case current into an effective internal clamp diode.

**Figure 61. Maximum AC Waveforms for 1.5 V Signaling**



**NOTE:**
1. The voltage waveform is supplied at the resistor shown in the evaluation setup, not the package pin.
2. Any internal clamping in the device being tested will greatly reduce the voltage levels seen at the package pin.

**Table 134. 1.5V Parameters for Maximum AC Signalling Waveforms**

| Symbol | Parameter | Min | Max | Unit |
|---|---|---|---|---|
| $V_1$ | Overshoot Voltage | | 3.25 | V |
| $V_2$ | Undershoot Initial Voltage | | 1.65 | V |
| $V_3$ | Undershoot Voltage | -1.6 | | V |
| $V_{pu}$ | Waveform peak-to-peak | | 3.25 | V |
| $V_{po}$ | Waveform peak-to-peak | | 3.25 | V |
| $t_{rf}$ | Rise/fall time | 0.5 | 1.5 | V/ns |
| $f_{SDI}$ | Frequency of AC rating waveform as applied to SDI input buffers | | 24 | MHz |
| $f_{SDO}$ | Frequency of AC rating waveform as applied to SDO input buffers | | 24 | MHz |

**Table 135. Resistance value for the AC rating Waveform**

| Condition | Value |
|---|---|
| Overshoot waveform at the codec | 65 Ohms |
| Undershoot waveform ar the codec | 101 Ohms |
| Overshoot waveform at the controller | 108 Ohms |

### Table 135. Resistance value for the AC rating Waveform

| Condition | Value |
|---|---|
| Undershoot waveform ar the controller | 133 Ohms |

**NOTE:**
1. The voltage waveform is supplied at the resistor shown in the evaluation setup, not the package pin.
2. Any internal clamping in the device being tested will greatly reduce the voltage levels seen at the package pin.

## 9.6.16 I²S (Audio) AC Specification

### 9.6.16.1 I²S Slave Mode AC Specification

### Table 136. I²S AC Timings

| Symbol | Parameter | Min. | Max. | Units | Figure | Notes |
|---|---|---|---|---|---|---|
| $T_{DC}$ | Clock Duty Cycle | 45 | 55 | % | 62, 63, 64 | |
| $T_{I2S}$ | Clock Frequency | | 12.25 | MHz | 62, 63, 64 | |
| $T_{S-RXD}$ | Setup for DATAIN with respect to the CLK active edge. | 6 | – | ns | 62, 63, 64 | 1, 2, 3 |
| $T_{H\_RXD}$ | Hold for DATAIN with respect to the CLK active edge. | 6 | – | ns | 62, 63, 64 | 1, 2, 3 |
| $T_{S-FS}$ | Setup for FRM with respect to the CLK active edge. | 6 | – | ns | 62, 63, 64 | 1, 2, 3 |
| $T_{H\_FS}$ | Hold for FRM with respect to CLK active edge. | 20 | – | ns | 62, 63, 64 | 1, 2, 3 |
| $T_{CO\_TXD}$ | Tco of DATAOUT with respect to CLK active edge at the host | – | 18 | ns | 62, 63, 64 | 1, 2,3 |

**NOTE:**
1. Active edge refers to the mode selected.
2. For I²S mode, data launches at falling edge and is being captured at rising edge.
3. For PCM mode data launches at rising edge and is being captured at falling edge. PCM Mode has two different modes, Short Frame Mode and Long Frame Mode.
   a. Short Frame Mode—FS is asserted one clock cycle earlier than data is launched by the Master.
   b. Long Frame Mode—FS and Data are launched on the same clock edge by the Master.

**Figure 62. I²S Slave Port Timings in I²S Mode**

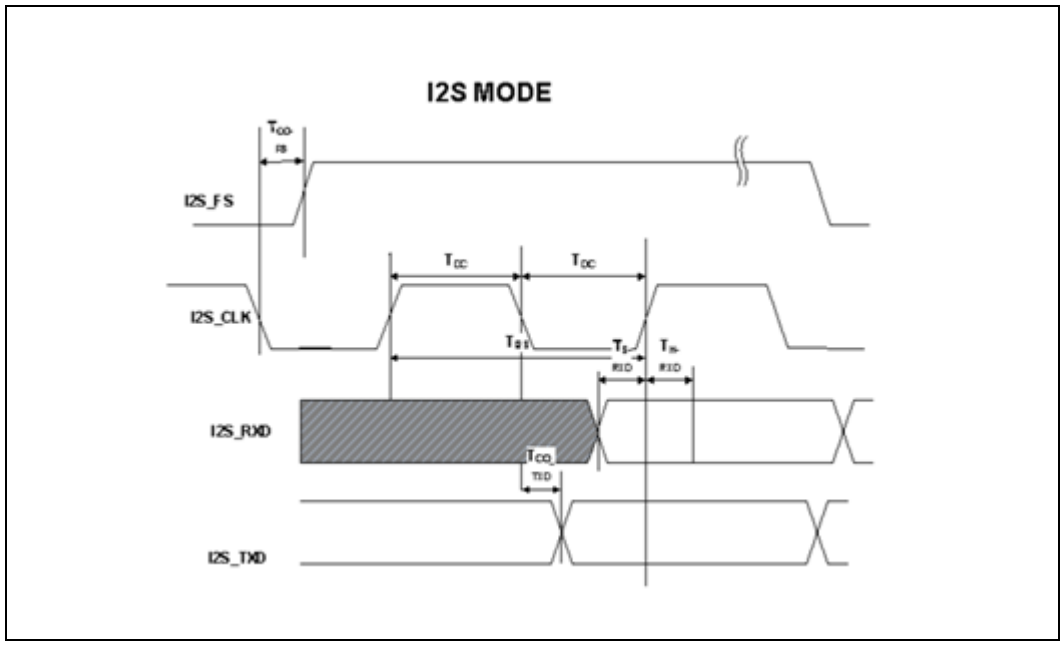


**Figure 63. I²S Slave Port Timings in PCM Short Frame Mode**

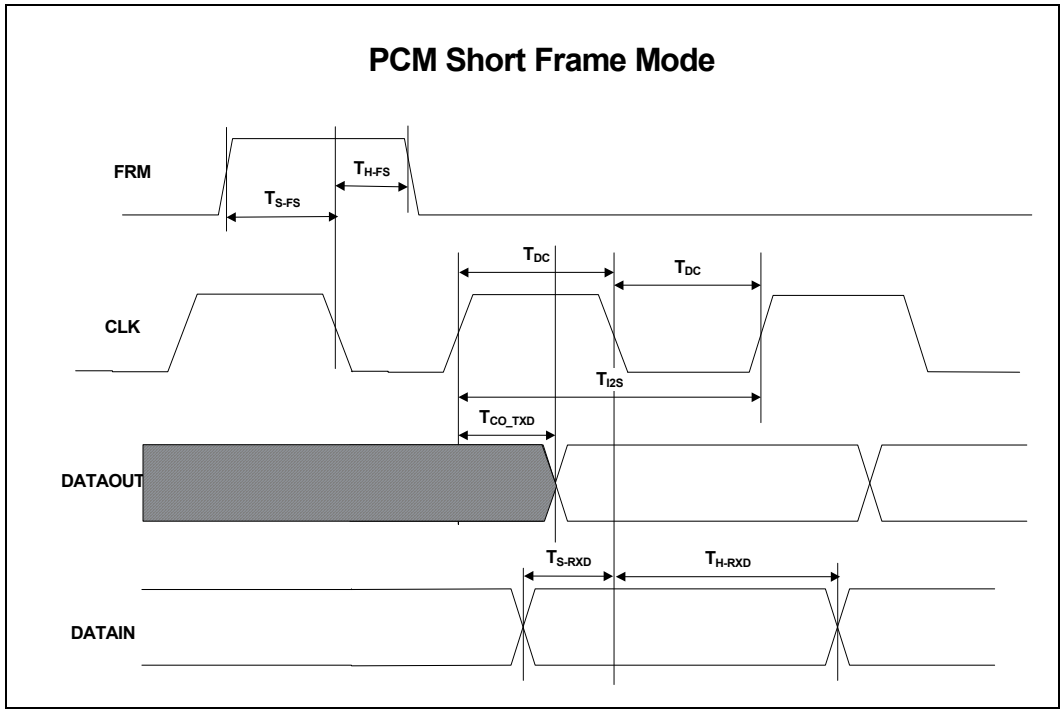

**Figure 64. I²S Slave Port Timings in PCM Long Frame Mode**

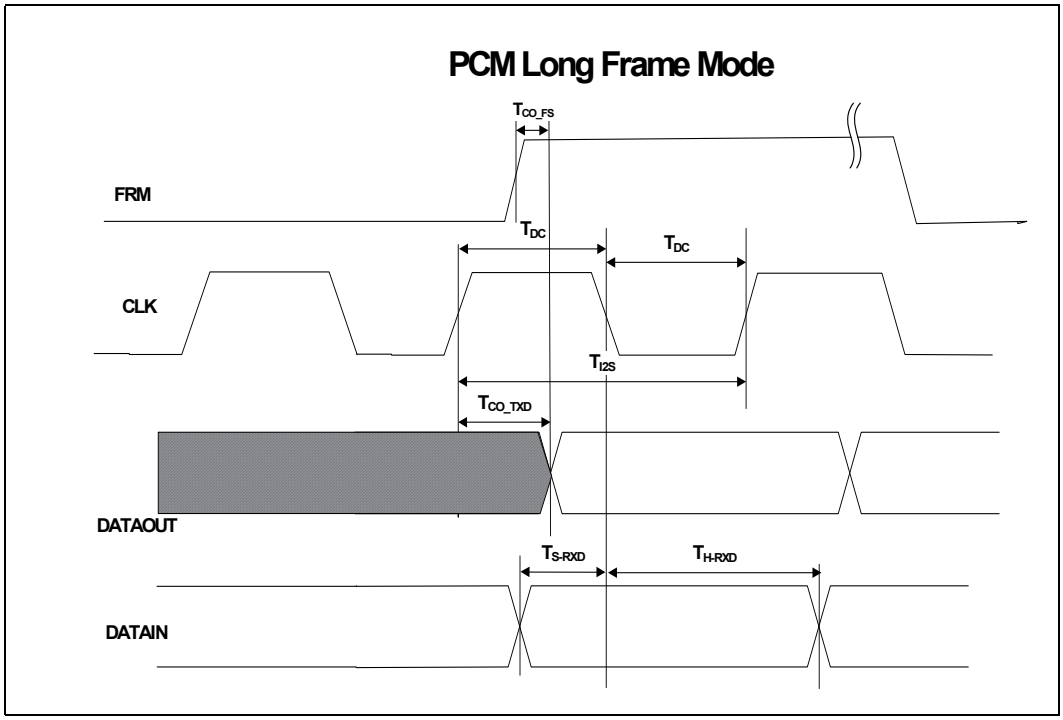
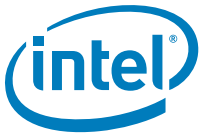


## 9.6.16.2 I²S Master Mode AC Specification

**Table 137. I²S Master Mode AC Timing**

| Symbol | Parameter | Min. | Max. | Units | Figure |
|---|---|---|---|---|---|
| $T_{DC}$ | Clock Duty Cycle | 45 | 55 | % | |
| $T_{I2S}$ | Clock Frequency | | 12.5 | MHz | |
| $T_{S-RXD}$ | Setup for DATAIN with respect to the CLK active edge | 10 | – | ns | |
| $T_{H-RXD}$ | Hold for DATAIN with respect to the CLK active edge | 10 | – | ns | |
| $T_{CO\_TXD}$ | $T_{CO}$ of DATAOUT with respect to CLK active edge at the SoC | – | 10 | ns | |
| $T_{CO-FS}$ | $T_{CO}$ of FRM with respect to CLK at the SoC | | 10 | ns | |



## 9.6.17 PCI Express* AC Specification

**Table 138. PCI Express* Interface Timings**

| Symbol | Parameter | Min | Typ | Max | Unit | Figures | Notes |
|---|---|---|---|---|---|---|---|
| **Transmitter and Receiver Timings** | | | | | | | |
| UI | Unit Interval – PCI Express* Gen 1 (2.5 GT/s) | 399.88 | | 400.12 | ps | | 5 |
| UI | Unit Interval – PCI Express* Gen 2 (5.0 GT/s) | 199.9 | | 200.1 | ps | | 5 |
| $T_{TX-EYE}$ | Minimum Transmission Eye Width | 0.7 | | — | UI | 65 | 1,2 |
| $T_{TX-RISE/Fall}$ (Gen1) | TXP/TXN Rise/Fall time | 0.125 | | | UI | | 1,2 |
| $T_{TX-RISE/Fall}$ (Gen2) | TXP/TXN Rise/Fall time | 0.15 | | | UI | | 1,2 |
| $T_{RX-EYE}$ | Minimum Receiver Eye Width | 0.40 | | — | UI | 66 | 3,4 |

**NOTES:**

1. Specified at the measurement point into a timing and voltage compliance test load and measured over any 250 consecutive TX UIs. (Also refer to the Transmitter compliance eye diagram)
2. A $T_{TX-EYE}$ = 0.70 UI provides for a total sum of deterministic and random jitter budget of $T_{TXJITTER-MAX}$ = 0.30 UI for the Transmitter collected over any 250 consecutive TX UIs. The $T_{TXEYE-MEDIAN-to-MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
3. Specified at the measurement point and measured over any 250 consecutive UIs. The test load documented in the PCI Express* specification 2.0 should be used as the RX device when taking measurements (also refer to the Receiver compliance eye diagram). If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as a reference for the eye diagram.
4. A $T_{RX-EYE}$ = 0.40 UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the Transmitter and interconnect collected any 250 consecutive UIs. The $T_{RX-EYE-MEDIAN-to-MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total 0.6 UI jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as the reference for the eye diagram.
5. Nominal Unit Interval is 400 ps for 2.5 GT/s and 200 ps for 5 GT/s.
6. PCIe Reference clocks follow PCI Express* specification with the exception of edge rate: Max = 8.0 V/ns instead of 4.0 V/ns. There should be no DC termination of the clocks.

**Figure 65. PCI Express* Transmitter Eye**

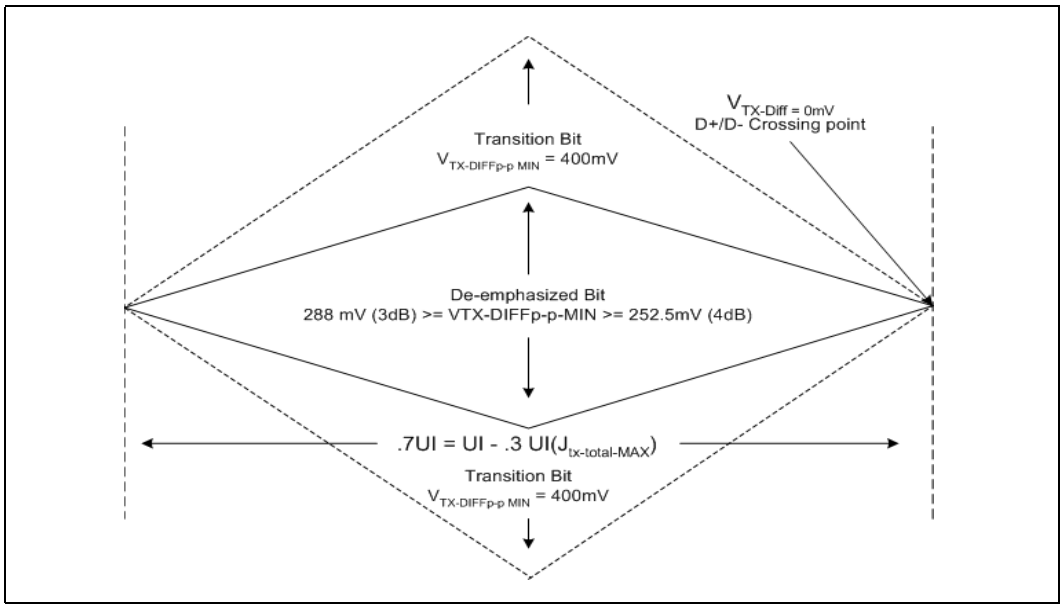


**Figure 66. PCI Express* Receiver Eye**

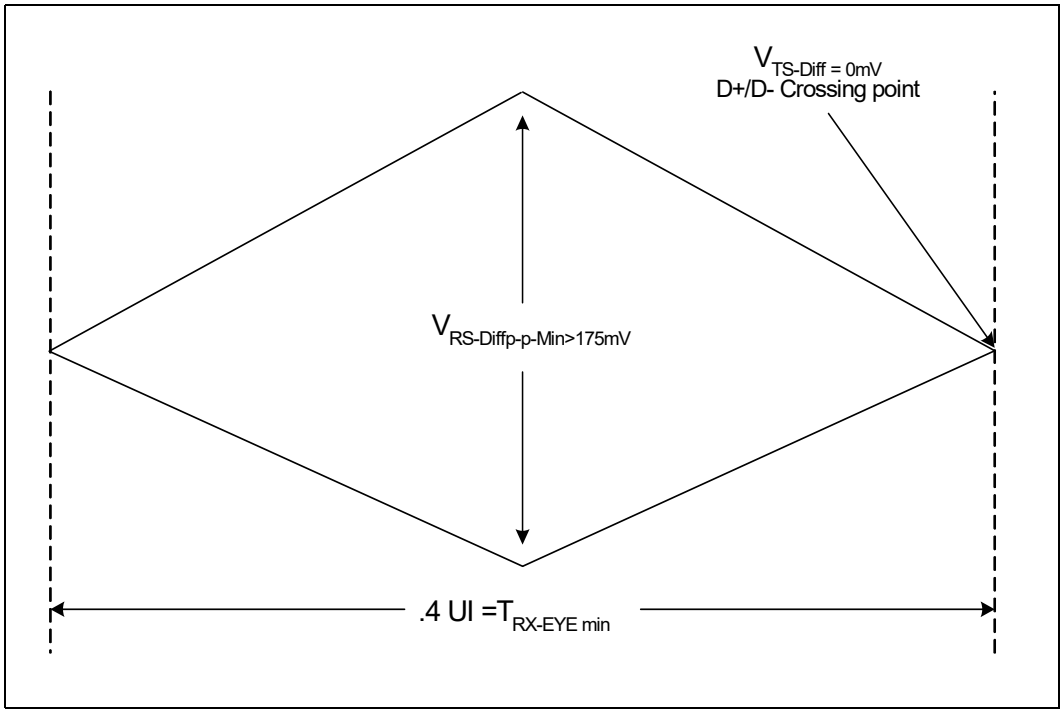
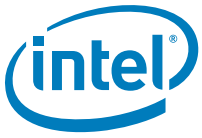




## 9.6.18 PCU - PMC - Suspended Clock AC Specification

### Table 139. SUS Clock Timings

| Symbol | Parameter | Min | Max | Units | Notes | Figure |
|---|---|---|---|---|---|---|
| $f_{susclk}$ | Operating Frequency | 32 | | kHz | 1 | |
| t39 | High time | 9.5 | - | µs | 1 | |
| t39a | Low Time | 9.5 | - | µs | 1 | |

***Note:*** 1. SUSCLK duty cycle can range from 30% minimum to 70% maximum.

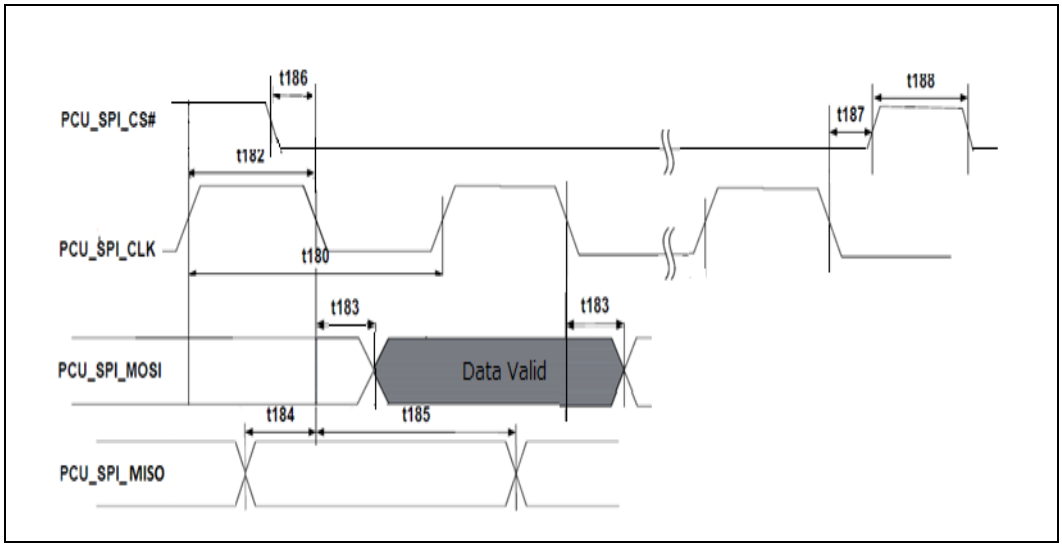
## 9.6.19 PCU - SPI NOR AC Specification

### Table 140. PCU - SPI NOR AC Specification

| Sym | Parameter | Min | Max | Units | Notes |
|---|---|---|---|---|---|
| t180 | Serial Clock Frequency | 20, 33, 50 | | MHz | |
| t182 | SPI Clock duty cycle at Host | 45 | 55 | % | |
| t183 | Tco of PCU_SPI_MOSI with respect to serial clock falling edge at the host | 0 | 5 | ns | |
| t184 | Setup of PCU_SPI_MISO with respect to serial clock falling edge at the host | 11 | - | ns | |
| t185 | Hold of PCU_SPI_MISO with respect to serial clock falling edge at the host | 0 | - | ns | 1, 2, 3 |
| t186 | Setup of PCU_SPI_CS[1:0]# with respect to serial clock falling edge at the host | 12 | - | ns | |
| t187 | Hold of PCU_SPI_CS[1:0]# with respect to serial clock falling edge at the host | 5 | - | ns | |
| t188/t189 | Min Idle (de-assertion) time for PCU_SPI_CLK signals | 32 | - | ns | |
| Trise/Tfall | Rise / Fall time | - | 2 | ns | 1,2 |

**NOTES:**
1. Based on trace length of up to 4” and board impedance of 30–75 Ω Measured from 30–70%.
2. Total maximum, capacitance of 25 pF

Figure 67. SPI NOR Timing



## 9.6.20 PCU - SMBUS AC Specification

**Table 141. SMBUS Clock Signal Timings**

| Symbol | Parameter | Min | Max | Unit | Notes | Figure |
|---|---|---|---|---|---|---|
| $f_{smb}$ | Operating Frequency | 10 | 100 | kHz | | |
| $t_{HIGH}$ | High time | 4.0 | 50 | us | 1 | 68 |
| $t_{Low}$ | Low time | 4.7 | | us | | 68 |
| $t_{RISE}$ | Rise time | | 1000 | ns | | 68 |
| $t_{FALL}$ | Fall time | | 300 | ns | | 68 |

1. The maximum high time ($t_{HIGH}$ Max) provides a simple method for devices to detect bus idle conditions.

**Table 142. SMBus Timing**

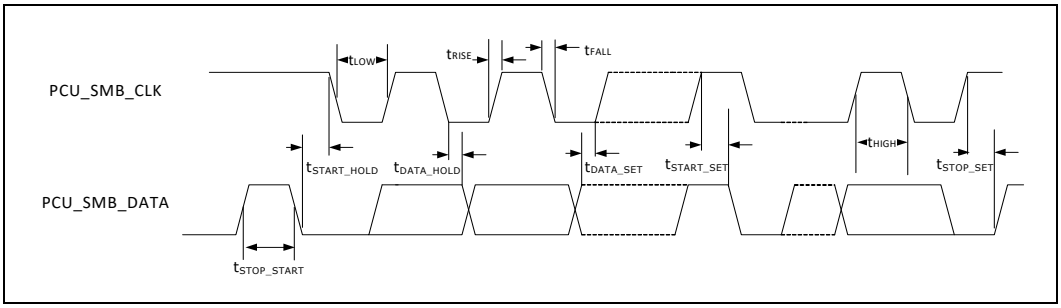
| Sym | Parameter | Min | Max | Units | Notes | Figure |
|---|---|---|---|---|---|---|
| $t_{STOP\_START}$ | Bus Tree Time Between Stop and Start Condition | 4.7 | — | µs | | 69 |
| $t_{START\_HOLD}$ | Hold Time after (repeated) Start Condition. After this period, the first clock is generated. | 4.0 | — | µs | | 69 |
| $t_{START\_SET}$ | Repeated Start Condition Setup Time | 4.7 | — | µs | | 69 |
| $t_{STOP\_SET}$ | Stop Condition Setup Time | 4.0 | — | µs | | 69 |
| $t_{DATA\_HOLD}$ | Data Hold Time | 0 | — | ns | 1 | 69 |
| $t_{DATA\_SET}$ | Data Setup Time | 250 | — | ns | | 69 |

### Table 142. SMBus Timing

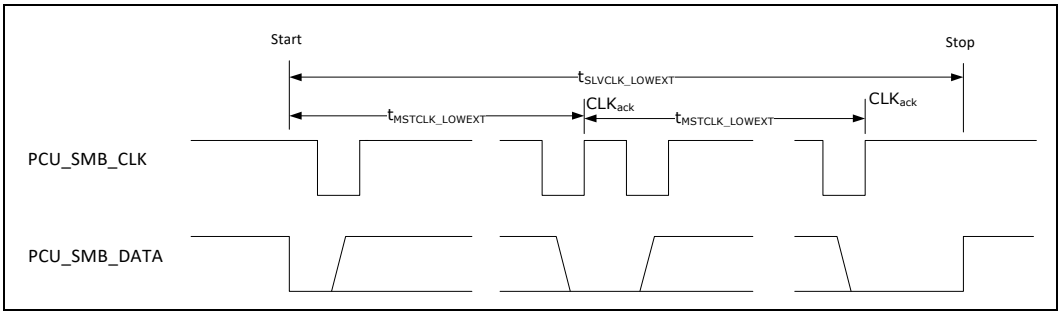
| Sym | Parameter | Min | Max | Units | Notes | Figure |
|---|---|---|---|---|---|---|
| $t_{DEV\_TO}$ | Device Time Out | 25 | 35 | ms | 2 | |
| $t_{SLVCLK\_LOWEXT}$ | Cumulative Clock Low Extend Time (slave device) | — | 25 | ms | 3 | 69 |
| $t_{MSTCLK\_LOWEXT}$ | Cumulative Clock Low Extend Time (master device) | — | 10 | ms | 4 | 69 |

1. tDATA_HOLD has a minimum timing for I2C of 0 ns, while the minimum timing for SMBus is 300 ns.
2. A device will timeout when any clock low exceeds this value.
3. tSLVCLK_LOWEXT is the cumulative time a slave device is allowed to extend the clock cycles in one message from the initial start to stop. If a slave device exceeds this time, it is expected to release both its clock and data lines and reset itself.
4. tMSTCLK_LOWEXT is the cumulative time a master device is allowed to extend its clock cycles within each byte of a message as defined from start-to-ack, ack-to-ack or ack-to-stop.

### Figure 68. SMBus Transaction



### Figure 69. SMBus Timeout



## 9.6.21 PCU - iLB - LPC AC Specification

**Table 143. LPC AC Specifications (with loop back from ILB_LPC_CLK[0] to ILB_LPC_CLK[1])**

| Sym | Parameter | Min | Max | Units | Notes | Fig |
|---|---|---|---|---|---|---|
| $T_{CO}$ | ILB_LPC_AD[3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ Valid Delay from ILB_LPC_CLK[1] Rising | 2 | 14 | ns | | 73 |
| $T_{EN\_AD}$ | ILB_LPC_AD[3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ Output Enable Delay from ILB_LPC_CLK[1] Rising | 2 | | ns | | 74 |
| $T_{FD\_AD}$ | ILB_LPC_AD[3:0] Float Delay from ILB_LPC_CLK[1] Rising | | 28 | ns | | 75 |
| $T_{SU\_AD}$ | ILB_LPC_AD[3:0] Setup Time to ILB_LPC_CLK[1] Rising | 7 | | ns | | 76 |
| $T_{HD\_AD}$ | ILB_LPC_AD[3:0] Hold Time from ILB_LPC_CLK[1] Rising | 0 | | ns | | 76 |
| $T_{lpc}$ | ILB_LPC_CLK[1:0] Duty Cycle | 35 | 65 | % | 1 | |

**NOTE:**
1. High time is measured from 0.75 x PCU_1P8_G3. Low time is measured from 0.35 x PCU_1P8_G3
2. The load capacitance used for the LPC timing parameters is 30 pF
3. VT is 1/2 of LPC IO voltage

**Figure 70. Valid Delay from Rising Clock Edge**

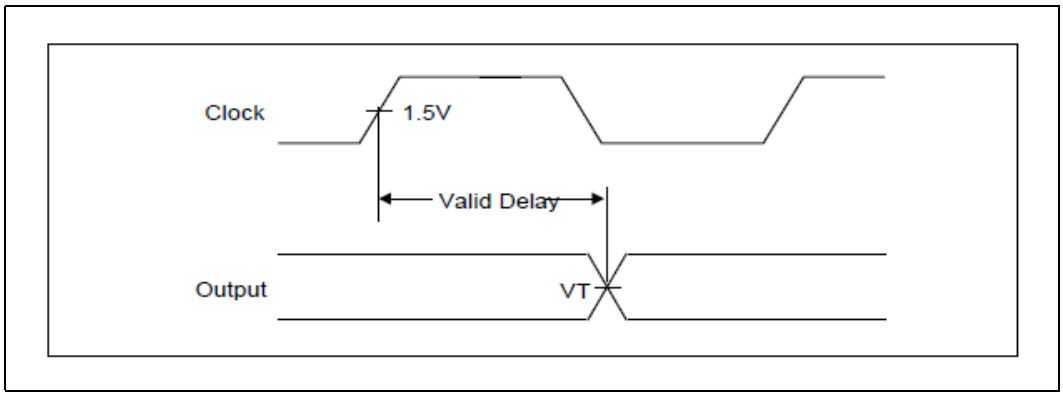


**Figure 71. Output Enable Delay**

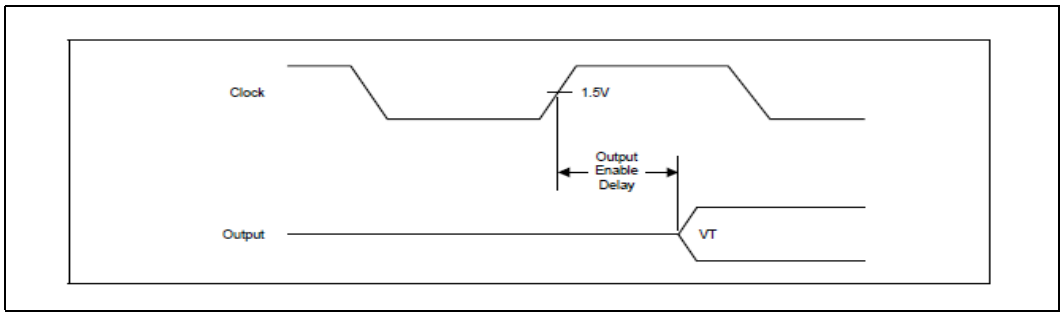

**Figure 72. Float Delay**

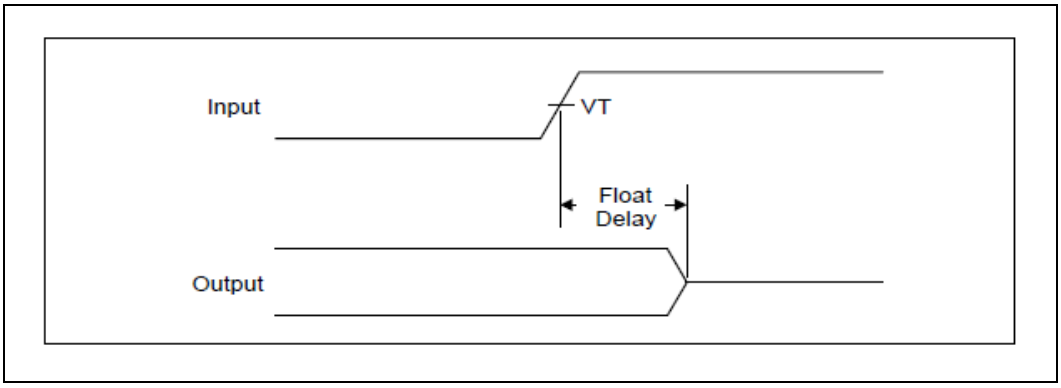

**Figure 73. Setup and Hold Times**

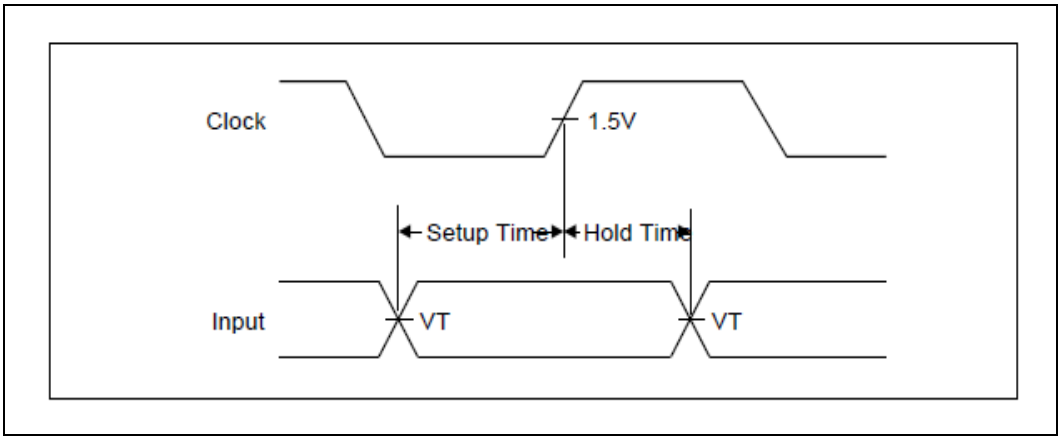


## 9.6.22 SIO - I²C AC Specifications

### 9.6.22.1 I²C Fast/Standard Mode Electrical Specification

**Table 144. I²C Fast/Standard Mode AC Specifications (Sheet 1 of 2)**

| Symbol | Parameter | Standard-Mode | | Fast-Mode | | Fast-Mode Plus | | Units | Notes | Figure |
|---|---|---|---|---|---|---|---|---|---|---|
| | | Min. | Max. | Min. | Max. | Min. | Max. | | | |
| $f_{SCL}$ | I²C_CLK clock frequency | 0 | 100 | 0 | 400 | 0 | 1000 | kHz | | |
| $t_{HD:STA}$ | Hold time (repeated) START condition. After this period, the first clock pulse is generated | 4.0 | – | 0.6 | – | 0.26 | – | µs | | 74 |
| $t_{LOW}$ | LOW period of the I²C_CLK clock | 4.7 | – | 1.3 | – | 0.5 | – | µs | | 74 |
| $t_{HIGH}$ | HIGH period of the I²C_CLK clock | 4.0 | – | 0.6 | – | 0.26 | – | µs | | 74 |

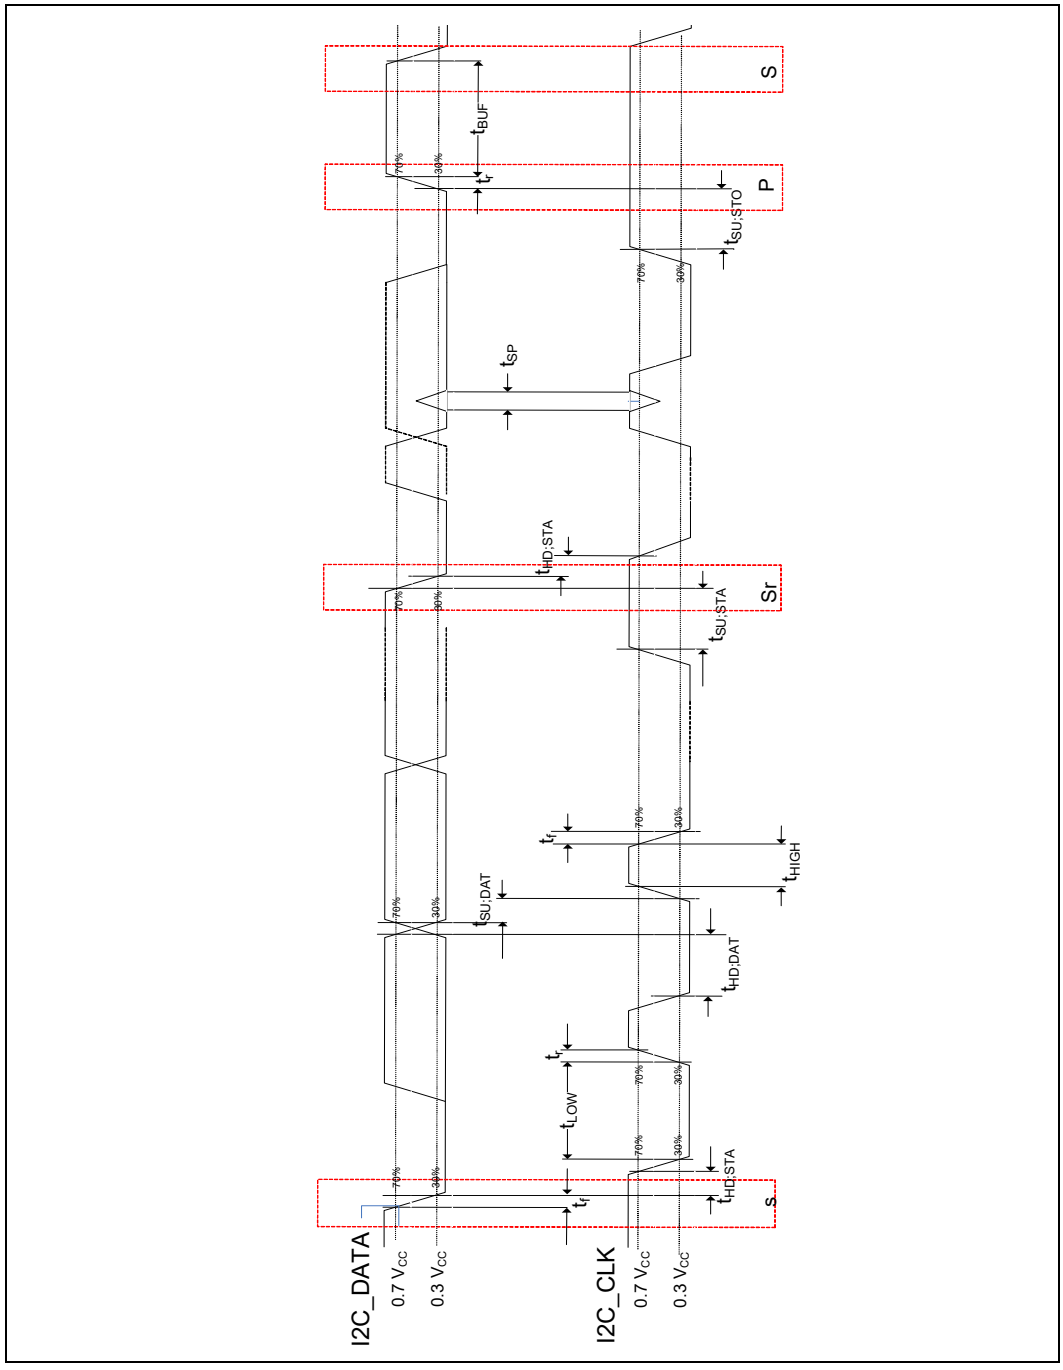
## Table 144. I²C Fast/Standard Mode AC Specifications (Sheet 2 of 2)

| Symbol | Parameter | Standard-Mode | | Fast-Mode | | Fast-Mode Plus | | Units | Notes | Figure |
|---|---|---|---|---|---|---|---|---|---|---|
| | | Min. | Max. | Min. | Max. | Min. | Max. | | | |
| $t_{SU:STA}$ | Set-up time for a repeated START condition | 4.7 | – | 0.6 | – | 0.26 | – | µs | | 74 |
| $t_{HD:DAT}$ | Data hold time: I²C-bus devices | 0 | – | 0 | – | 0 | – | ns | | 74 |
| $t_{SU:DAT}$ | Data set-up time | 250 | – | 100 | – | 50 | – | ns | 1 | 74 |
| $t_r$ | Rise time of both I²C_DATA and I²C_CLK signals | – | 1000 | $20 + 0.1C_b$ (5) | 300 | – | 120 | ns | 2, 3 | 74 |
| $t_f$ | Fall time of both I²C_DATA and I²C_CLK signals | 1 | 300 | 1 | 300 | 1 | 120 | ns | 5 | 74 |
| $t_{SU:STO}$ | Set-up time for STOP condition | 4.0 | – | 0.6 | – | 0.26 | - | µs | | 74 |
| $t_{BUF}$ | Bus free time between a STOP and START condition | 4.7 | – | 1.3 | – | 0.5 | – | µs | | |
| $C_b$ | Capacitive load for each bus line | – | 130 | – | 130 | - | - | pF | | |
| $V_{nL}$ | Noise margin at the LOW level for each connected device (including hysteresis) | $0.1 V_{DD}$ | – | $0.1 V_{DD}$ | – | $0.1 V_{DD}$ | – | V | | |
| $V_{nH}$ | Noise margin at the HIGH level for each connected device (including hysteresis) | $0.2 V_{DD}$ | – | $0.2 V_{DD}$ | – | $0.2 V_{DD}$ | – | V | | |

**NOTES:**

1. A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement tSU; DAT ³ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the I2C_CLK signal. If such a device does stretch the LOW period of the I2C_CLK signal, it must output the next data bit to the I2C_DATA line tr max + tSU; DAT = 1000 + 250 = 1250 ns (according to the Standard-mode I2C-bus specification) before the I2C_CLK line is released
2. Cb = total capacitance of one bus line in pF.
3. No Active current source PU on I2C_CLK signals. Rise time is based upon the Pull-up resistor mentioned in the Platform Design Guide.
4. The maximum tHD;DAT could be 3.45 ms and 0.9 ms for Standard-mode and Fast-mode, but must be less than the maximum of tVD;DAT or tVD;ACK by a transition time. This maximum must only be met if the device does not stretch the LOW period (tLOW) of the I2C_CLK signal. If the clock stretches the I2C_CLK, the data must be valid by the set-up time before it releases the clock.
5. Specification deviates from the minimum time compared to Industrial specification.

**Figure 74. Definition of Timing for F/S-Mode Devices on $I^2C$ Bus**

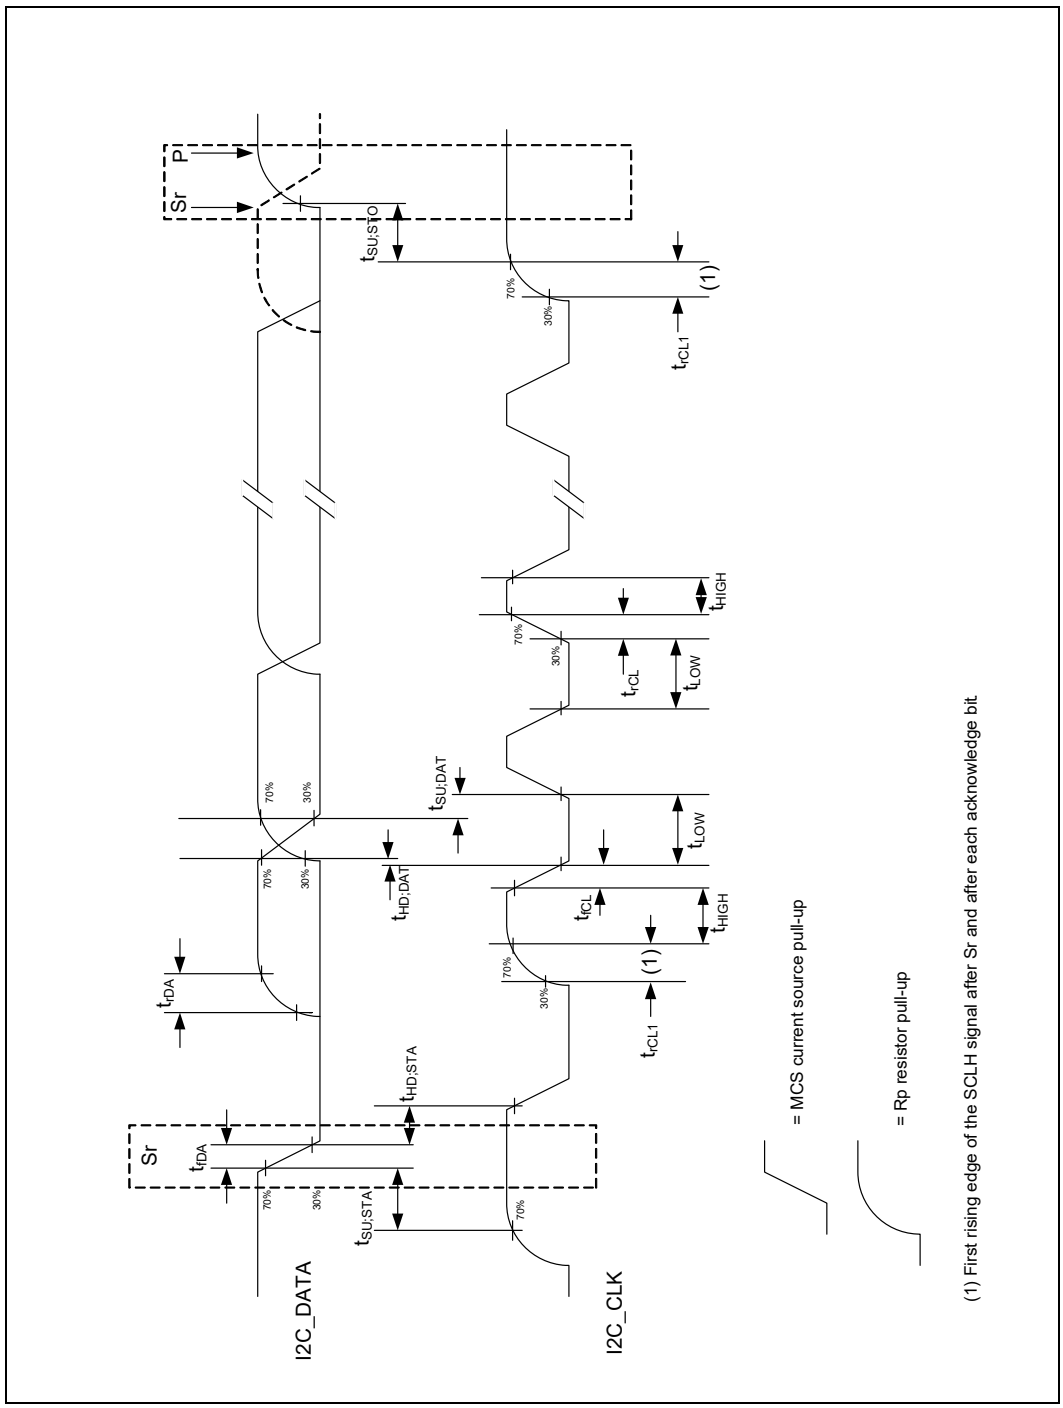


### 9.6.22.2 I²C High Speed Mode Electrical Specification

**Table 145. AC Specification for High Speed Mode I²C—Bus Devices**

| Symbol | Parameter | $C_b$ = 100 pF (max) | | Units | Figure |
|---|---|---|---|---|---|
| | | Min. | Max. | | |
| $f_{SCL}$ | I²C_CLK clock frequency | 0 | 1.7 | MHz | |
| $t_{SU}$:STA | Set-Up time for a repeated START condition | 160 | – | ns | |
| $t_{HD}$:STA | Hold time (repeated) START condition. | 160 | – | ns | |
| $t_{LOW}$ | LOW period of the I²C_CLK clock | 160 | – | ns | |
| $t_{HIGH}$ | HIGH period of the I²C_CLK clock | 60 | – | ns | |
| $t_{HD}$:DAT | Data hold time: I²C-bus devices | 0 | – | ns | |
| $t_{SU}$:DAT | Data set-up time | 10 | – | ns | |
| $t_r$ CL | Rise time of I²C_CLK signals | 10 | 40 | ns | |
| $t_f$ CL | Fall time of I²C_CLK signals | 1 | 40 | ns | |
| $t_r$CL1 | Rise time of I²C_CLK signal after a repeated START condition and after an acknowledge bit | 10 | 40 | ns | |
| $t_r$ DA | Rise time of I²C_DATA signals | 10 | 80 | ns | |
| $t_f$ DA | Fall time of I²C_DATA signals | 1 | 80 | ns | |
| $t_{SU:}$STO | Set-up time for STOP condition | 160 | – | ns | |
| $V_{nL}$ | Noise margin at the LOW level for each connected device (including hysteresis) | 0.1 $V_{DD}$ | – | V | |
| $V_{NH}$ | Noise margin at the HIGH level for each connected device (including hysteresis) | 0.2 $V_{DD}$ | – | V | |

**Figure 75. Definition of Timing for High Speed-Mode Devices on I²C Bus**



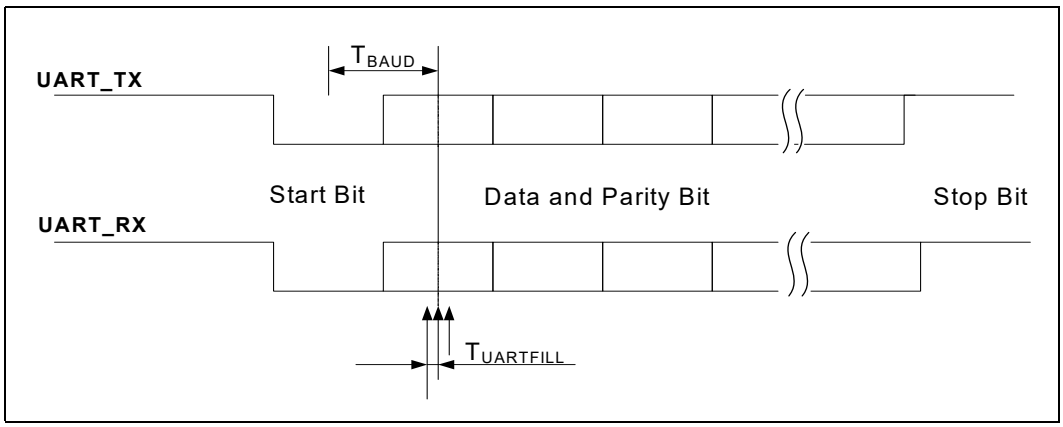
## 9.6.23 SIO - UART AC Specification

### Table 146. UART AC Specification

| Symbol | Parameter | Min. | Max. | Unit | Notes |
|---|---|---|---|---|---|
| $T_{RISE}$ | Maximum Rise Time | 2.5 | 5 | ns | 1, 2 |
| $T_{FALL}$ | Maximum Fall Time | 2.5 | 5 | ns | 1, 2 |
| $T_{UARTFIL}$ | UART Sampling Filter Period | 20 | | ns | 3 |

**NOTES:**
1. Based on total trace length of 1-4", Total maximum, capacitance of 27 pF and board impedance of 30–75Ω.
2. Measured from 10–90%.
3. Each bit including start and stop bit is sampled three times at center of a bit at an interval of 20 ns (minimum). If three sampled values do not agree, then UART noise error is generated.

### Figure 76. UART Timing Diagram



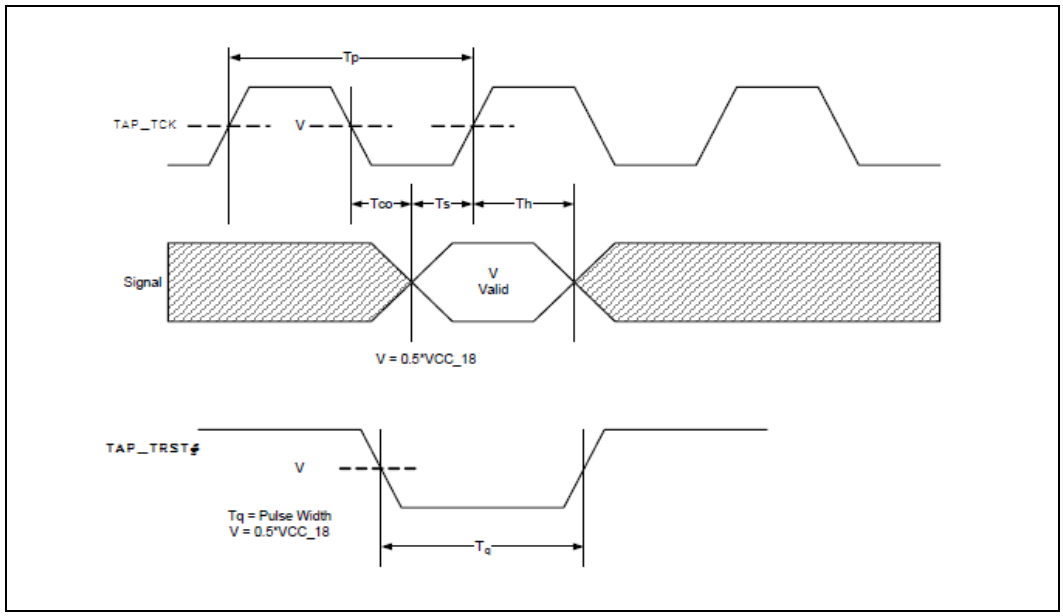
## 9.6.24 JTAG AC Specification

### Table 147. JTAG AC Specification

| T# Parameter | Min | Max | Unit | Figure | Notes |
|---|---|---|---|---|---|
| $T_P$:TAP_TCK Period | 15 | | ns | | 66 MHz |
| $T_{CL}$:TAP_TCK Clock Low Time | 0.4 * $T_{JC}$ | | ns | | |
| $T_{CH}$:TAP_TCK Clock High Time | 0.4 * $T_{JC}$ | | ns | | |
| $T_{SU}$:TAP_TDI, TAP_TMS Setup Time | 11 | | ns | 78 | |
| $T_H$: TAP_TDI, TAP_TMS Hold Time | 5 | | ns | 78 | |
| $T_{CO}$: TAP_TCK falling to TAP_TDO output valid | | 11 | ns | 78 | |
| $T_{CO}$: TAP_TCK falling to TAP_TDO output high impedance | | 11 | ns | | |
| $T_{18}$: TAP_TRST# assert time | 2 | | ns | 79 | |

**NOTES:**
1. Unless otherwise noted, all specifications in this table apply to all SoC frequencies.
2. Not 100% tested. Specified by design characterization.
3. It is recommended that TAP_TMS be asserted while TAP_TRST# is being deasserted.
4. Board JTAG signal skew max = ±500 ps.

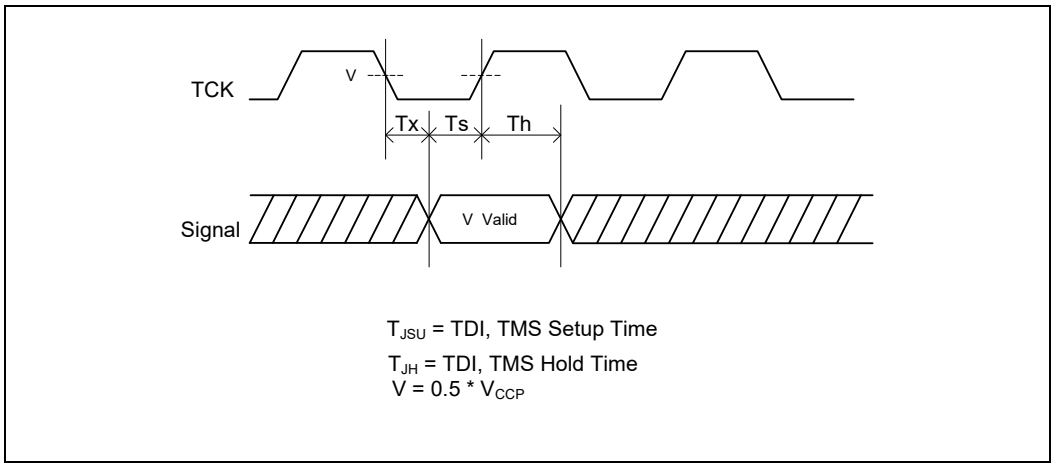
## Figure 77. JTAG Timing Diagram



## Table 148. Boundary Scan AC Specification

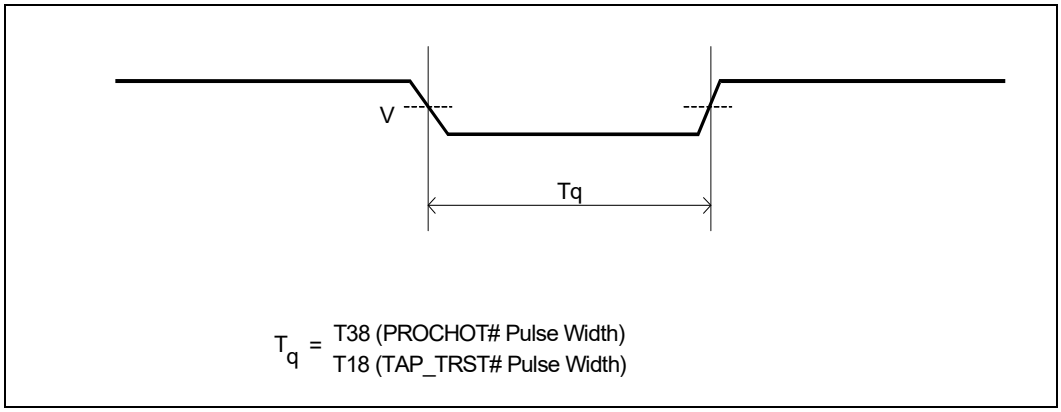
| T# Parameter | Min | Max | Unit | Notes |
|---|---|---|---|---|
| Boundary scan all non test output/float delay | 0.5 | 15 | ns | Referenced to the falling edge of $T_{CK}$ |
| Boundary scan all non test input setup | 10 | | ns | Referenced to the falling edge of $T_{CK}$ |
| Boundary scan all non test input hold | 13 | | µs | Referenced to the falling edge of $T_{CK}$ |

**Figure 78. TAP Valid Delay Timing Waveform**



Refer to Table 88, Table 89, Table 90 for TAP Signal Group DC specifications and Table 147 for TAP Signal Group AC specifications.

**Figure 79. Test Reset (TAP_TRST#), Async GTL Input and PROCHOT# Timing Waveform**



## 9.6.25 General AC Timing Diagrams

Note that the measurement of the differential waveform according to these diagrams would have to be made directly at the load at the end of the line. In a real system, this is not possible because the end of the line is at the input pad of the SoC silicon.

§

# 10 Ballout and Package Information

The SoC comes in a **25 mm X 27 mm** Flip-Chip Ball Grid Array (FCBGA) package and consists of a silicon die mounted face down on an organic substrate populated with 1170 solder balls on the bottom side. Capacitors may be placed in the area surrounding the die. Because the die-side capacitors are electrically conductive, and only slightly shorter than the die height, care should be taken to avoid contacting the capacitors with electrically conductive materials. Doing so may short the capacitors and possibly damage the device or render it inactive.

The use of an insulating material between the capacitors and any thermal solution should be considered to prevent capacitor shorting. An exclusion, or keep out zone, surrounds the die and capacitors, and identifies the contact area for the package. Care should be taken to avoid contact with the package inside this area.

Refer to the *Bay Trail SoC Thermal and Mechanical Design Guide* for details on package mechanical dimensions and tolerance, as well as other key package attributes.

## 10.1 SoC Attributes

- Package parameters: 25 mm X 27 mm
- Ball Count:1170

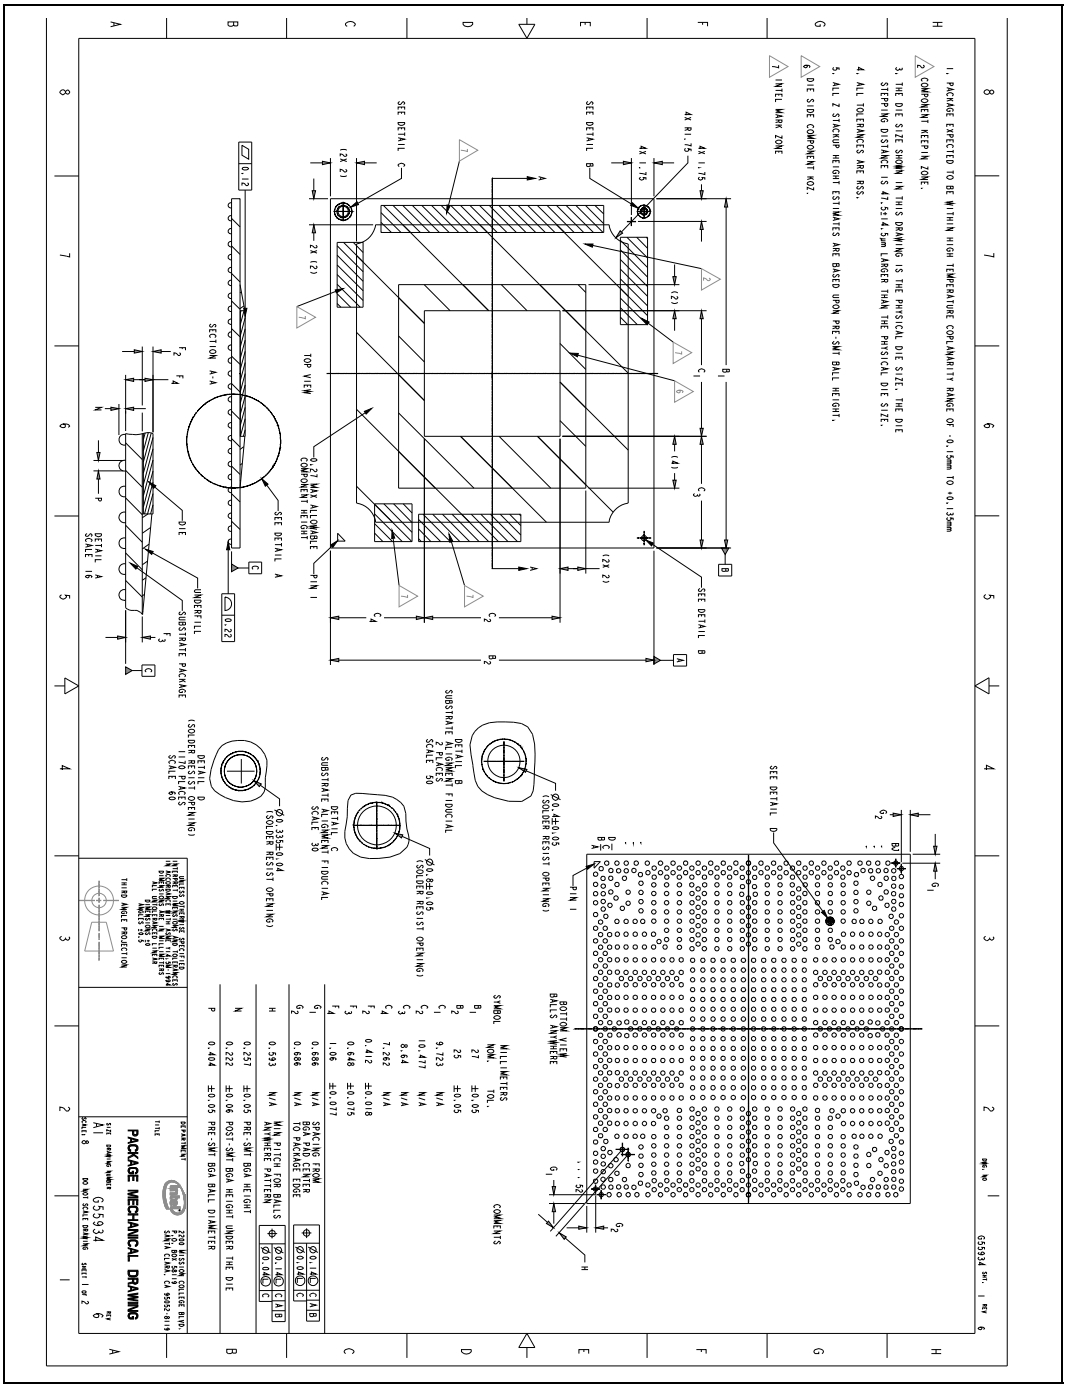
All Units: mm

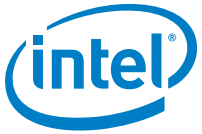
Tolerances if not specified:

- .X: ± 0.1
- .XX: ± 0.05
- Angles: ± 1.0 degrees

## 10.2 Package Diagrams

### Figure 89. Package Mechanical Drawing





## 10.3 Ball Name and Function by Location

Many I/O's are configurable GPIO's. These I/O's are multiplexed with other signals in the ball list. This table matches names and locations of every ball with all possible multiplexed signals (denoted as GPIO Functions). Configurable GPIO's default to function 0 during power on and may not match the ball name. BIOS (platform firmware) is responsible for enabling the platform specific configuration. Please see your BIOS vendor for details.

***Note:*** The X & Y locations in Table 146 are measured in microns from the center of the package.

**Table 149. Ball Listing by Location with GPIO Muxed Functions (Sheet 1 of 48)**

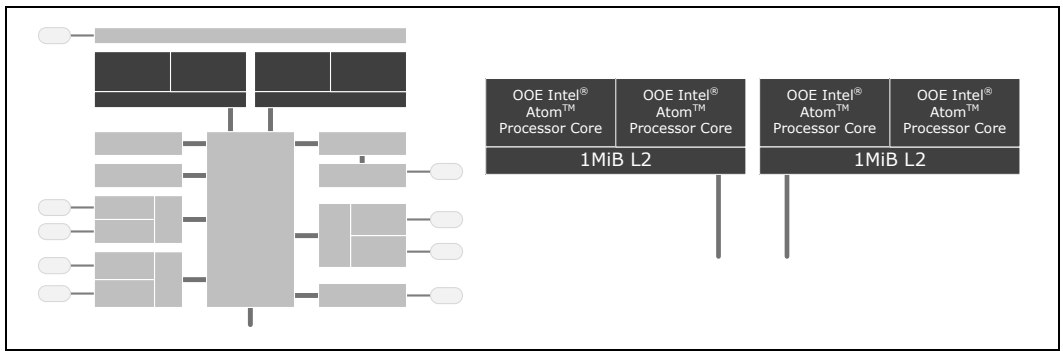
# 11 Processor Core

Up to four out-of-order execution processor cores are supported, each dual core module supports up to 1 MiB of L2 cache.



## 11.1 Features

- Single, Dual or Quad Out-of-Order Execution (OOE) processor cores
- Primary 32 KiB, 8-way L1 instruction cache and 24 KiB, 6-way L1 write-back data cache
- Cores are grouped into dual-core modules: modules share a 1 MiB, 16-way L2 cache (2 MiB total for Quad Core)
  - Dual core SKU's use 512 KiB per core. Each core has a dedicated link to memory.
- L1 caches has Parity Protection and L2 cache has ECC Protection
- Intel® Streaming SIMD Extensions 4.1 and 4.2 (SSE4.1 and SSE4.2), which include new instructions for media and for fast XML parsing
- Intel® 64 architecture
- Support for IA 32-bit
- Support for Intel® VT-x
- Support for Intel® Carry-Less Multiplication Instruction (PCLMULQDQ)
- Support for a Digital Random Number Generator (via RDRAND instruction)
- Supports C0, C1, C6
- Thermal management support via Intel® Thermal Monitor (TM1 and TM2)
- Uses Power Aware Interrupt Routing (PAIR)
- Uses 22 nm process technology
- Real Time Instruction Trace for debug

- Supports RTIT

***Note:*** Intel® Hyper-Threading Technology is not supported.

## 11.1.1 Intel® Virtualization Technology (Intel® VT)

Intel® Virtualization Technology (Intel® VT) makes a single system appear as multiple independent systems to software. This allows multiple, independent operating systems to run simultaneously on a single system. Intel® VT comprises technology components to support virtualization of platforms based on Intel architecture microprocessors and chipsets. Intel® Virtualization Technology for IA-32, Intel® 64 and Intel® Architecture (Intel® VT-x) added hardware support in the processor to improve the virtualization performance and robustness.

Intel® VT-x specifications and functional descriptions are included in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B* and is available at: http://www.intel.com/products/processor/manuals/index.htm

Other Intel® VT documents can be referenced at: http://www.intel.com/technology/virtualization/index.htm

### 11.1.1.1 Intel® VT-x Objectives

- Robust: VMMs no longer need to use paravirtualization or binary translation. This means that they will be able to run off-the-shelf OSs and applications without any special steps.
- Enhanced: Intel® VT enables VMMs to run 64-bit guest operating systems on IA x86 processors.
- More reliable: Due to the hardware support, VMMs can now be smaller, less complex, and more efficient. This improves reliability and availability and reduces the potential for software conflicts.
- More secure: The use of hardware transitions in the VMM strengthens the isolation of VMs and further prevents corruption of one VM from affecting others on the same system. Intel® VT-x provides hardware acceleration for virtualization of IA platforms. Virtual Machine Monitor (VMM) can use Intel® VT-x features to provide improved reliable virtualized platform.

#### 11.1.1.1.1 Intel® VT-x Features

- Extended Page Tables (EPT)
  - EPT is hardware assisted page table physical memory virtualization
  - Support guest VM execution in unpaged protected mode or in real-address mode
  - It eliminates VM exits from guest OS to the VMM for shadow page-table maintenance
- Virtual Processor IDs (VPID)

  - A VM Virtual Processor ID is used to tag processor core hardware structures (such as TLBs) to allow a logic processor to cache information (such as TLBs) for multiple linear address spaces
  - This avoids flushes on VM transitions to give a lower-cost VM transition time and an overall reduction in virtualization overhead
- Guest Preemption Timer
  - Mechanism for a VMM to preempt the execution of a guest OS VM after an amount of time specified by the VMM. The VMM sets a timer value before entering a guest.
  - The feature aids VMM developers in flexibility and Quality of Service (QoS) guarantees flexibility in guest VM scheduling and building Quality of Service (QoS) schemes
- Descriptor-Table Exiting
  - Descriptor-table exiting allows a VMM to protect a guest OS from internal (malicious software based) attack by preventing relocation of key system data structures like IDT (interrupt descriptor table), GDT (global descriptor table), LDT (local descriptor table), and TSS (task segment selector)
  - A VMM using this feature can intercept (by a VM exit) attempts to relocate these data structures and prevent them from being tampered by malicious software
- VM Functions
  - A VM function is an operation provided by the processor that can be invoked using the VMFUNC instruction from guest VM without a VM exit
  - A VM function to perform EPTP switching is supported and allows guest VM to load a new value for the EPT pointer, thereby establishing a different EPT paging structure hierarchy

## 11.1.2 Security and Cryptography Technologies

### 11.1.2.1 Advanced Encryption Standard New Instructions (AES-NI)

The processor supports Advanced Encryption Standard New Instructions (AES-NI) that are a set of Single Instruction Multiple Data (SIMD) instructions that enable fast and secure data encryption and decryption based on the Advanced Encryption Standard (AES). AES-NI are valuable for a wide range of cryptographic applications, for example: applications that perform bulk encryption/decryption, authentication, random number generation, and authenticated encryption. AES is broadly accepted as the standard for both government and industry applications, and is widely deployed in various protocols.

AES-NI consists of six Intel® SSE instructions. Four instructions, namely AESENC, AESENCLAST, AESDEC, and AESDELAST facilitate high performance AES encryption and decryption. The other two, AESIMC and AESKEYGENASSIST, support the AES key expansion procedure. Together, these instructions provide a full hardware for support AES, offering security, high performance, and a great deal of flexibility.

#### 11.1.2.2 PCLMULQDQ Instruction

The processor supports the carry-less multiplication instruction, PCLMULQDQ. PCLMULQDQ is a Single Instruction Multiple Data (SIMD) instruction that computes the 128-bit carry-less multiplication of two, 64-bit operands without generating and propagating carries. Carry-less multiplication is an essential processing component of several cryptographic systems and standards. Hence, accelerating carry-less multiplication can significantly contribute to achieving high speed secure computing and communication.

#### 11.1.2.3 Digital Random Number Generator

The processor introduces a software visible digital random number generation mechanism supported by a high quality entropy source. This capability is available to programmers through the new RDRAND instruction. The resultant random number generation capability is designed to comply with existing industry standards (ANSI X9.82 and NIST SP 800-90).

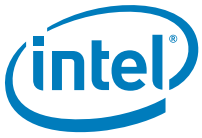
Some possible uses of the new RDRAND instruction include cryptographic key generation as used in a variety of applications including communication, digital signatures, secure storage, etc.

### 11.1.3 Power Aware Interrupt Routing

PAIR is an improvement in H/W routing of "redirectable" interrupts. Each core power-state is considered in the routing selection to reduce the power or performance impact of interrupts. System BIOS configures the routing algorithm, e.g. fixed-priority, rotating, hash, or PAIR, during setup via non-architectural register. The PAIR algorithm can be biased to optimize for power or performance and the largest gains will be seen in systems with high interrupt rates.

## 11.2 Platform Identification and CPUID

In addition to verifying the processor signature, the intended processor platform type must be determined to properly target the microcode update. The intended processor platform type is determined by reading bits [52:50] of the IA32_PLATFORM_ID register, (MSR 17h) within the processor. This is a 64-bit register that must be read using the RDMSR instruction. The 3 Platform Id bits, when read as a binary coded decimal (BCD) number, indicate the bit position in the microcode update header's Processor Flags field that is asSoCiated with the installed processor.



Executing the CPUID instruction with EAX=1 will provide the following information.

| EAX | Field description |
|---|---|
| [31:28] | Reserved |
| [27:20] | Extended Family value |
| [19:16] | Extended Model value |
| [15:13] | Reserved |
| [12] | Processor Type Bit |
| [11:8] | Family value |
| [7:4] | Model value |
| [3:0] | Stepping ID Value |

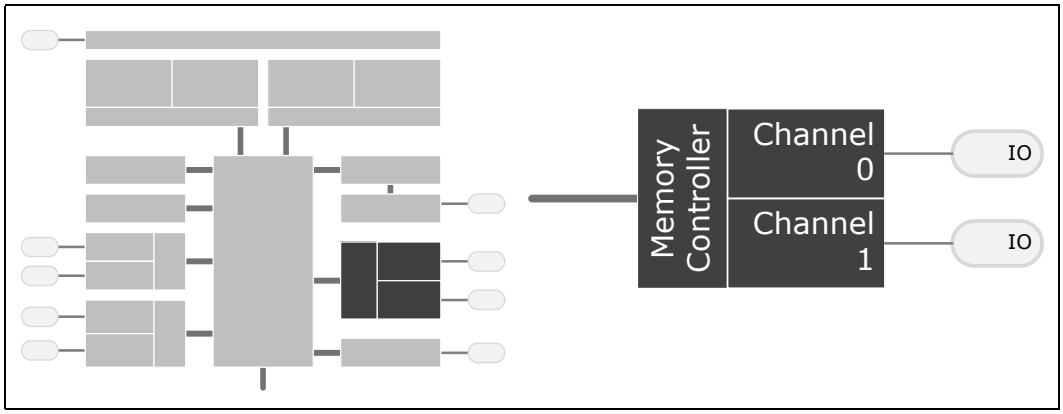
For more details on using the RDRAND instruction refer to Intel® Advanced Vector Extensions Programming Reference.

§

# 12 System Memory Controller

The system memory controller supports DDR3L protocol with up to two 64-bit wide dual rank channels at data rates up to 1333 MT/s. ECC is also available on a single channel.

***Note:*** The memory data rate is fixed for each SKU. For example, a SKU that supports 1333 MT/s will only run at 1333 MT/s, nothing lower. For single channel use cases, Channel 0 must be used.

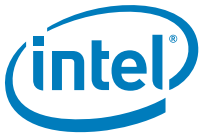


## 12.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in Chapter 9, "Electrical Specifications"
- **Description**: A brief explanation of the signal's function



### Table 150. Memory Channel 0 DDR3L Signals (Sheet 1 of 2)

| Signal Name | Direction Type | Description |
|---|---|---|
| **DRAM0_CKP[2,0]**<br>**DRAM0_CKN[2,0]** | O<br>DDR3 | **SDRAM and inverted Differential Clock:** (1 pair per Rank)<br>The differential clock pair is used to latch the command into DRAM. Each pair corresponds to one rank on DRAM side. |
| **DRAM0_CS[2,0]#** | O<br>DDR3 | **Chip Select:** (1 per Rank). Used to qualify the command on the command bus for a particular rank. |
| **DRAM0_CKE[2,0]** | O<br>DDR3 | **Clock Enable:** (power management)<br>It is used during DRAM power up/power down and Self refresh.<br>*Note: DDR3L uses only DRAM0_CKE[2,0]. DRAM0_CKE[1,3] are not being used for DDR3L.* |
| **DRAM0_MA[15:0]** | O<br>DDR3 | **Memory Address:** Memory address bus for writing data to memory and reading data from memory. These signals follow common clock protocol w.r.t. DRAM0_CKN, DRAM0_CKP pairs |
| **DRAM0_BS[2:0]** | O<br>DDR3 | **Bank Select:** These signals define which banks are selected within each DRAM rank |
| **DRAM0_RAS#** | O<br>DDR3 | **Row Address Select:** Used with DRAM0_CAS# and DRAM0_WE# (along with DRAM0_CS#) to define the DRAM Commands |
| **DRAM0_CAS#** | O<br>DDR3 | **Column Address Select:** Used with DRAM0_RAS# and DRAM0_WE# (along with DRAM0_CS#) to define the DRAM Commands |
| **DRAM0_WE#** | O<br>DDR3 | **Write Enable Control Signal:** Used with DRAM0_WE# and DRAM0_CAS# (along with control signal, DRAM0_CS#) to define the DRAM Commands. |
| **DRAM0_DQ[63:0]** | I/O<br>DDR3 | **Data Lines:** Data signal interface to the DRAM data bus |
| **DRAM0_DM[7:0]** | O<br>DDR3 | **Data Mask:** DM is an output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of DQS. |
| **DRAM0_DQSP[7:0]**<br>**DRAM0_DQSN[7:0]** | I/O<br>DDR3 | **Data Strobes:** The data is captured at the crossing point of each 'P' and its compliment 'N' during read and write transactions.<br>For reads, the strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window. |
| **DRAM0_ODT[2,0]** | O<br>DDR3 | **On Die Termination:** ODT signal going to DRAM in order to turn ON the DRAM ODT during Write. |

### Table 150. Memory Channel 0 DDR3L Signals (Sheet 2 of 2)

| Signal Name | Direction Type | Description |
|---|---|---|
| **DRAM_RCOMP[2]** | O Analog | **Resistor Compensation:** This signal needs to be terminated to VSS on board (refer to platform design guide for resistor value). This external resistor termination scheme is used for Resistor compensation of DRAM ODT strength. |
| **DRAM_RCOMP[1]** | O Analog | **Resistor Compensation:** This signal needs to be terminated to VSS on board (refer to platform design guide for resistor value). This external resistor termination scheme is used for Resistor compensation of DQ buffers |
| **DRAM_RCOMP[0]** | O Analog | **Resistor Compensation:** This signal needs to be terminated to VSS on board (refer to platform design guide for resistor value). This external resistor termination scheme is used for Resistor compensation of CMD buffers. |
| **DRAM_VREF** | I Analog | **Reference Voltage:** DRAM interface Reference Voltage |
| **DRAM_CORE_PWROK** | I Asynchronous CMOS | **Core Power OK:** This signal indicates the status of the DRAM Core power supply (power on in S0). |
| **DRAM_VDD_S4_PWROK** | I Asynchronous CMOS | **VDD Power OK:** Asserted once the VRM is settled. Used primarily in the DRAM PHY to determine S3 state. |
| **DRAM0_DRAMRST#** | O | **DRAM Reset:** This signal is used to reset DRAM devices. |
| **ICLK_DRAM_TERM [1:0]** | I/O | Pull-down to VSS through an 100kOhm 1% resistor. |

### Table 151. Memory Channel 1 DDR3L Signals (Sheet 1 of 2)

| Signal Name | Direction Type | Description |
|---|---|---|
| **DRAM1_CKP[2,0]**<br>**DRAM1_CKN[2,0]** | O DDR3 | **SDRAM and inverted Differential Clock:** (1 pair per Rank)<br>The differential clock pair is used to latch the command into DRAM. Each pair corresponds to one rank on DRAM side. |
| **DRAM1_CS[2,0]#** | O DDR3 | **Chip Select:** (1 per Rank). Used to qualify the command on the command bus for a particular rank. |
| **DRAM1_CKE[2,0]** | O DDR3 | **Clock Enable:** (power management)<br>It is used during DRAM power up/power down and Self refresh.<br>*Note: DDR3L uses only DRAM1_CKE[0,2]. DRAM1_CKE[1,3] are not being used for DDR3L.* |

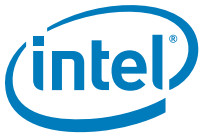


**Table 151. Memory Channel 1 DDR3L Signals (Sheet 2 of 2)**

| Signal Name | Direction Type | Description |
|---|---|---|
| **DRAM1_MA[15:0]** | O DDR3 | **Memory Address:** Memory address bus for writing data to memory and reading data from memory. These signals follow common clock protocol relative to DRAM1_CKN, DRAM1_CKP pairs |
| **DRAM1_BS[2:0]** | O DDR3 | **Bank Select:** These signals define which banks are selected within each DRAM rank |
| **DRAM1_RAS#** | O DDR3 | **Row Address Select:** Used with DRAM1_CAS# and DRAM1_WE# (along with DRAM1_CS#) to define the DRAM Commands |
| **DRAM1_CAS#** | O DDR3 | **Column Address Select:** Used with DRAM1_RAS# and DRAM1_WE# (along with DRAM1_CS#) to define the DRAM Commands |
| **DRAM1_WE#** | O DDR3 | **Write Enable Control Signal:** Used with DRAM1_WE# and DRAM1_CAS# (along with control signal, DRAM1_CS#) to define the DRAM Commands. |
| **DRAM1_DQ[63:0]** | I/O DDR3 | **Data Lines:** Data signal interface to the DRAM data bus. |
| **DRAM1_DM[7:0]** | O DDR3 | **Data Mask:** DM is an output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of DQS. |
| **DRAM1_DQSP[7:0]**<br>**DRAM1_DQSN[7:0]** | I/O DDR3 | **Data Strobes:** The data is captured at the crossing point of DRAM1_DQSP[7:0] and its compliment 'N' during read and write transactions.<br>For reads, the strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window. |
| **DRAM1_ODT[2,0]** | O DDR3 | **On Die Termination:** ODT signal going to DRAM in order to turn ON the DRAM ODT during Write. |
| **DRAM1_DRAMRST#** | O | **Reset DRAM:** This signal can be used to reset DRAM devices. |

## 12.1.1 ECC Support

The system memory controller supports ECC. When ECC is enabled, only Memory Channel 0 will be active. Memory Channel 1 will be disabled and used for the ECC data signals. Signals on Memory Channel 1 not used for ECC will be tri-stated. The table below shows the details on the muxing relationship between the ECC signals and the Memory Channel 1 signals.

***Note:*** Although ECC and non-ECC SO-DIMM's share the same socket, ECC SO-DIMMs are not pinout compatible with standard, non-ECC SO-DIMMs.

**Table 152. ECC Signals and Memory Channel 1 Signal Muxing**

| Memory Channel 1 Signal Names | Ball # | Signal Names when ECC is Enabled |
|---|---|---|
| DRAM1_DQ[56] | AM52 | DRAM0_ECC_DQ[0] |
| DRAM1_DQ[57] | AL51 | DRAM0_ECC_DQ[1] |
| DRAM1_DQ[58] | AG53 | DRAM0_ECC_DQ[2] |
| DRAM1_DQ[59] | AG51 | DRAM0_ECC_DQ[3] |
| DRAM1_DQ[60] | AL53 | DRAM0_ECC_DQ[4] |
| DRAM1_DQ[61] | AK51 | DRAM0_ECC_DQ[5] |
| DRAM1_DQ[62] | AF52 | DRAM0_ECC_DQ[6] |
| DRAM1_DQ[63] | AF51 | DRAM0_ECC_DQ[7] |
| DRAM1_DM[7] | AK52 | DRAM0_ECC_DM |
| DRAM1_DQSP[7] | AH52 | DRAM0_ECC_DQSP |
| DRAM1_DQSN[7] | AJ51 | DRAM0_ECC_DQSN |

**Table 153. ECC Signals**

| Signal Name | Direction Type | Description |
|---|---|---|
| **DRAM0_ECC_DQ[7:0]** | I/O DDR3 | **ECC Check Data Bits** *These are muxed with channel 1.* |
| **DRAM0_ECC_DM** | O DDR3 | **ECC Data Mask:** DM is an optional output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of ECC_DQS. *This signal is muxed with channel 1 and may not be needed.* |
| **DRAM0_ECC_DQSP** **DRAM0_ECC_DQSN** | I/O DDR3 | **ECC Data Strobes:** The data is captured at the crossing point the 'P' and its compliment 'N' during read and write transactions. For reads, the strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window. *These are muxed with channel 1.* |

## 12.2 Features

The system memory controller supports the following DDR3L DRAM technologies, Data Transfer Rates, SO-DIMM Modules and other features:

- DDR3L Data Transfer Rates (Fixed per SKU): 1066MT/s (Theoretical Maximum Bandwidth: 8.5 GB/s per channel) or 1333MT/s (Theoretical Maximum Bandwidth: 10.6 GB/s per channel)
- DDR3L SDRAM's (1.35 V DRAM interface I/Os, including DDR3L-RS)
- DDR3L DRAM Device Technology

  - — Standard 1Gb, 2Gb and 4Gb technologies and addressing
  - — Read latency 5, 6, 7, 8, 9, 10, 11
  - — Write latency 5, 6, 7, 8
- DDR3L SO-DIMM Modules (unbuffered)
  - — Raw Card B = 1 rank of x8 SDRAM
  - — Raw Card C = 1 rank of x16 SDRAM
  - — Raw Card F = 2 ranks of x8 SDRAM
  - — ECC Raw Card C = 1 rank of x8 SDRAM
  - — ECC Raw Card D = 2 ranks of x8 SDRAM
  - — No mixed Raw Card support
  - — Contact your Intel representative for platform supportable memory configurations and limitations based on layout and firmware initialization (MRC) requirements
- Support Trunk Clock Gating
- Supports up to two 64-bit channels
  - — Channel 0 only for single channel configuration
- ECC support for 64-bit data bus
- Support early SR exit
- Support slow power down

### 12.2.1 System Memory Technology Support

**Table 154. Supported DDR3L DRAM Devices**

| DRAM Density | Data Width | Banks | Bank Address | Row Address | Column Address | Page Size |
|---|---|---|---|---|---|---|
| 1Gb | x8 | 8 | BA[2:0] | A[13:0] | A[9:0] | 1KB |
| 2Gb | x8 | 8 | BA[2:0] | A[14:0] | A[9:0] | 1KB |
| 4Gb | x8 | 8 | BA[2:0] | A[15:0] | A[9:0] | 1KB |
| 2Gb | x16 | 8 | BA[2:0] | A[13:0] | A[9:0] | 2KB |

**Table 155. Supported DDR3L Memory Size Per Rank**

| Memory Size/ Rank | DRAM Chips/ Rank | DRAM Chip Density | DRAM Chip Data Width | Page Size @ 64-bit Data Bus |
|---|---|---|---|---|
| 1GB | 8 | 1Gb | x8 | 8KB = 1KB * 8 chips |

### Table 155. Supported DDR3L Memory Size Per Rank

| Memory Size/ Rank | DRAM Chips/ Rank | DRAM Chip Density | DRAM Chip Data Width | Page Size @ 64-bit Data Bus |
|---|---|---|---|---|
| 2GB | 8 | 2Gb | x8 | 8KB = 1KB * 8 chips |
| 4GB | 8 | 4Gb | x8 | 8KB = 1KB * 8 chips |
| 1GB | 4 | 2Gb | x16 | 8KB = 2KB * 4 chips |

### Table 156. Supported DDR3L ECC Memory Size Per Rank

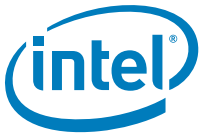
| Memory Size/ Rank | DRAM Chips/ Rank | DRAM Chip Density | DRAM Chip Data Width | Page Size @ 64-bit Data Bus |
|---|---|---|---|---|
| 2GB | 8 | 2Gb | x8 | 8KB = 1KB * 8 chips |
| 4GB | 8 | 4Gb | x8 | 8KB = 1KB * 8 chips |

### Table 157. Supported DDR3L SO-DIMM Size

| DRAM Chip Density | Module Size | # of chips needed | DRAM Chip Data Width | Data Bus Width | # of Ranks needed | # of chips /rank |
|---|---|---|---|---|---|---|
| 1Gbit | 2GB | 16 | x8 | x64 | 2 | 8 |
| 2Gbit | 1GB | 4 | x16 | x64 | 1 | 4 |
| 2Gbit | 2GB | 8 (9 w/ECC) | x8 | x64 | 1 | 8 |
| 2Gbit | 4GB | 16 (18 w/ECC) | x8 | x64 | 2 | 8 |
| 4Gbit | 4GB | 8 (9 w/ECC) | x8 | x64 | 1 | 8 |
| 4Gbit | 8GB | 16 (18 w/ECC) | x8 | x64 | 2 | 8 |

The frequency of system memory is fixed based on SKU. Timing parameters (CAS latency or CL + AL for DDR3, tRAS, tRCD, tRP) must be programmed to match within a channel (Contact your Intel field representative for more information on memory reference code (MRC)). The controller supports these configurations:

- Supports 1 SO-DIMM per channel.
- Each SO-DIMM can have 1 or 2 ranks.
- If a SO-DIMM has two ranks, then both ranks must be symmetrical (same chip width, same chip density, and same total memory size per rank).
- For dual channel population, the two channels must be populated symmetrically (chip width, density, ranks).
- The maximum total memory supported by the SoC is 8GB. Contact your Intel representative for guidelines on the specific SO-DIMM Raw cards supported.



## 12.3 System Memory Controller (D-Unit) Message Registers

### Table 158. Summary of Memory Controller Message Bus Registers—Port 0x01

| Offset | Register Name (Register Symbol) | Default Value |
|---|---|---|

## 12.3.1 DRP—Offset 0h

DRAM Rank Population

### Access Method

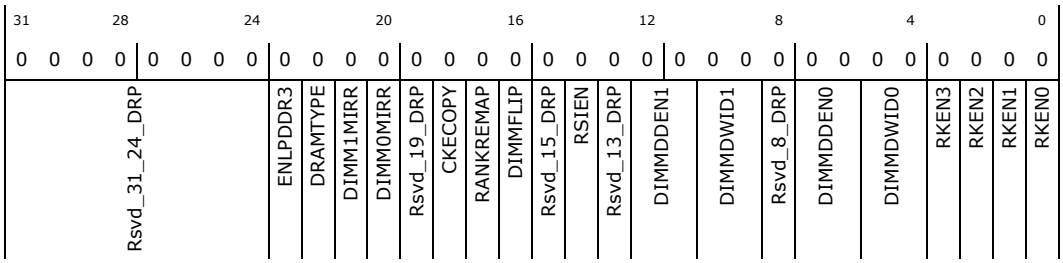
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 0h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h RO | **Rsvd_31_24_DRP:** Reserved |
| 23 | 0h RW/P/L | **ENLPDDR3:** Enable LPDDR3 Mode 0 - LPDDR2 1 - LPDDR3 Note: This bit is functional only when DRP.DRAMTYPE is set to LPDDR2 |
| 22 | 0h RW/P/L | **DRAMTYPE:** DRAM Type 0 - DDR3 1 - LPDDR2 |
| 21 | 0h RW/P/L | **DIMM1MIRR:** Address mapping to DIMM1 is mirrored. BIOS writes value defined in SPD Byte 63. Used as indication to Punit to flip MRS opcode to 2nd rank on DIMM1. This bit has no functional impact on Dunit. 0 - Standard 1 - Mirrored |
| 20 | 0h RW/P/L | **DIMM0MIRR:** Address mapping to DIMM0 is mirrored. BIOS writes value defined in SPD Byte 63. Used as indication to Punit to flip MRS opcode to 2nd rank on DIMM0. This bit has no functional impact on Dunit. 0 - Standard 1 - Mirrored |
| 19 | 0h RO | **Rsvd_19_DRP:** Reserved |
| 18 | 0h RW/P/L | **CKECOPY:** Used for doubling CKE. 0 - no CKE copy 1 - Copy CKE[0] to CKE[1] and CKE[2] to CKE[3] Note: CKE to DDRIO also depends upon RANKREMAP and state of CA Training. |
| 17 | 0h RW/P/L | **RANKREMAP:** Enables mapping logical rank to physical rank. 0 - no rank remap 1 - rank is remapped If (rank[0] is enabled) Map rank[1] to rank[2] Else (If rank[0] is disabled) Map rank[3:2] to rank[1:0] |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0h<br>RW/P/L | **DIMMFLIP:** DIMM Flip Required. BIOS must set this bit to 1 if the total size of DIMM1 is greater than the total size of DIMM0. DIMM Flipping simplifies rank decoding in dual-DIMM configuration when the DIMMs are not equal in size by mapping the low addresses to the larger DIMM. |
| 15 | 0h<br>RO | **Rsvd_15_DRP:** Reserved |
| 14 | 0h<br>RW/P/L | **RSIEN:** Rank Select Interleave Enable. 0 - Rank Select Interleave Disabled 1 - Rank Select Interleave Enabled Note: Rank select interleave enable should be set the same for both the Dunit and Bunit. |
| 13 | 0h<br>RO | **Rsvd_13_DRP:** Reserved |
| 12:11 | 0h<br>RW/P/L | **DIMMDDEN1:** DIMM 1 Device Density. This sets the density of the DRAM devices populated in DIMM 1 (Rank 0 and Rank 1). 00 - 1Gbit 01 - 2Gbit 10 - 4Gbit 11 - 8Gbit |
| 10:9 | 0h<br>RW/P/L | **DIMMDWID1:** DIMM 1 Device Width. Indicates the width of the DRAM devices populated in DIMM 1 (Rank 0 and Rank 1). 00 - x8 01 - x16 10 - x32 11 - Reserved |
| 8 | 0h<br>RO | **Rsvd_8_DRP:** Reserved |
| 7:6 | 0h<br>RW/P/L | **DIMMDDEN0:** DIMM 0 Device Density. This sets the density of the DRAM devices populated in DIMM 0 (Rank 0 and Rank 1). 00 - 1Gbit 01 - 2Gbit 10 - 4Gbit 11 - 8Gbit |
| 5:4 | 0h<br>RW/P/L | **DIMMDWID0:** DIMM 0 Device Width. Indicates the width of the DRAM devices populated in DIMM 0 (Rank 0 and Rank 1). 00 - x8 01 - x16 10 - x32 11 - Reserved |
| 3 | 0h<br>RW/P/L | **RKEN3:** DIMM 1, Rank 1 Enabled. Should be set to 1 when DIMM1 is populated and has 2 ranks to enable the use of this rank. Otherwise, must be set to 0. |
| 2 | 0h<br>RW/P/L | **RKEN2:** DIMM 1, Rank 0 Enabled. Should be set to 1 when DIMM1 is populated to enable the use of this rank. Otherwise, must be set to 0. |
| 1 | 0h<br>RW/P/L | **RKEN1:** DIMM 0, Rank 1 Enabled. Should be set to 1 when DIMM0 is populated and has 2 ranks to enable the use of this rank. Otherwise, must be set to 0. |
| 0 | 0h<br>RW/P/L | **RKEN0:** DIMM 0, Rank 0 Enabled. Should be set to 1 when DIMM0 is populated to enable the use of this rank. Otherwise, must be set to 0. |

### 12.3.2 DTR0—Offset 1h

DRAM Timing Register 0

#### Access Method

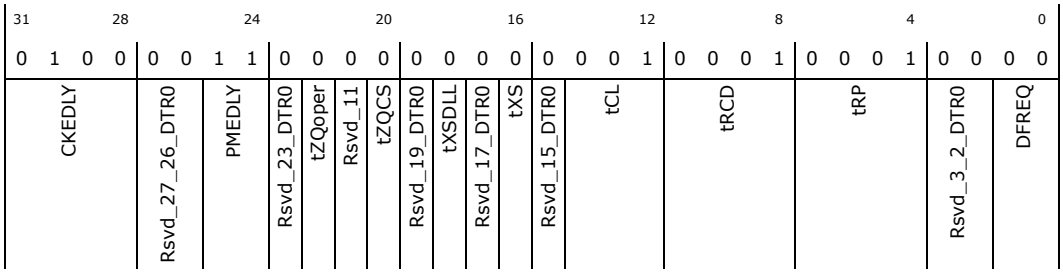
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 1h

**Op Codes:**

h - Read, h - Write

**Default:** 43001110h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 4h<br>RW | **CKEDLY:** Additional delay between CK/CKB start and SRX command. This delay is needed for clock to stabilize to meet JEDEC requirements. Delay is CKEDLY multiples of 256 DRAM Clocks. 0ns to 9,600ns (DDR3-800) 0ns to 7,200ns (DDR3-1066) |
| 27:26 | 0h<br>RO | **Rsvd_27_26_DTR0:** Reserved |
| 25:24 | 3h<br>RW | **PMEDLY:** The delay, in DRAM clocks, between SR Entry command and Power-Mode message to DDRIO. 0h - 6 DRAM Clocks 1h - 8 DRAM Clocks 2h - 10 DRAM Clocks 3h - 12 DRAM Clocks |
| 23 | 0h<br>RO | **Rsvd_23_DTR0:** Reserved |
| 22 | 0h<br>RW | **tZQoper:** The delay, in DRAM clocks, between ZQC-Long command to any command. Note: ZQCL command during DRAM Init flow requires longer latency which is controlled be BIOS. 0h - 256 DRAM Clocks 1h - 384 DRAM Clocks |
| 21 | 0h<br>RO | **Rsvd_11:** Reserved |
| 20 | 0h<br>RW | **tZQCS:** The delay, in DRAM clocks, between a ZQC-Short command to any command. 0h - 64 DRAM Clocks 1h - 96 DRAM Clocks |
| 19 | 0h<br>RO | **Rsvd_19_DTR0:** Reserved |
| 18 | 0h<br>RW | **tXSDLL:** The delay, in DRAM clocks, between SRX command to any command requiring locked DLL. Only ZQCL can be sent before tXSDLL is done. 0h - tXS + 256 DRAM Clocks 1h - tXS + 384 DRAM Clocks |
| 17 | 0h<br>RO | **Rsvd_17_DTR0:** Reserved |
| 16 | 0h<br>RW | **tXS:** The delay, in DRAM clocks, between SRX command to command not requiring locked DLL. The Dunit can send a ZQCL command after tXS. JEDEC defines MAX(5CK, tRFC(min)+10ns) so both values take safety margin. 0h - 256 DRAM Clocks 1h - 384 DRAM Clocks |
| 15 | 0h<br>RO | **Rsvd_15_DTR0:** Reserved |
| 14:12 | 1h<br>RW | **tCL:** CAS Latency. Specifies the delay, in DRAM clocks, between the issue of a RD command and the return of valid data on the DQ bus. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800, 1066. LPDDR2-800) 2h - 7 DRAM Clocks (DDR3-1066, 1333) 3h - 8 DRAM Clocks (DDR3-1066, 1333, 1600. LPDDR2-1066) 4h - 9 DRAM Clocks (DDR3-1333, 1600) 5h - 10 DRAM Clocks (DDR3-1333, 1600. LPDDR3-1333) 6h - 11 DRAM Clocks (DDR3-1600) 7h - Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:8 | 1h<br>RW | **tRCD:** Activate (RAS) to CAS Delay. Specifies the delay, in DRAM clocks, between an ACT command and a RD/WR command to the same bank. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800, 1066. LPDDR2-800) 2h - 7 DRAM Clocks (DDR3-1066, 1333) 3h - 8 DRAM Clocks (DDR3-1066, 1333, 1600. LPDDR2-800, 1066) 4h - 9 DRAM Clocks (DDR3-1333, 1600) 5h - 10 DRAM Clocks (DDR3-1333, 1600. LPDDR2-800, 1066. LPDDR3-1333) 6h - 11 DRAM Clocks (DDR3-1600) 7h - 12 DRAM Clocks (LPDDR3-1333) 8h - 13 DRAM Clocks (LPDDR2-1066) 9h - 14 DRAM Clocks Ah - 15 DRAM Clocks Bh - 16 DRAM Clocks (LPDDR3-1333) Others - Reserved |
| 7:4 | 1h<br>RW | **tRP:** Precharge to Activate Delay. Specifies the delay, in DRAM clocks, between a PRE command and an ACT command to the same bank. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800, 1066. LPDDR2-800) 2h - 7 DRAM Clocks (DDR3-1066, 1333) 3h - 8 DRAM Clocks (DDR3-1066, 1333, 1600. LPDDR2-800, 1066) 4h - 9 DRAM Clocks (DDR3-1333, 1600) 5h - 10 DRAM Clocks (DDR3-1333, 1600. LPDDR2-800, 1066. LPDDR3-1333) 6h - 11 DRAM Clocks (DDR3-1600) 7h - 12 DRAM Clocks (LPDDR3-1333) 8h - 13 DRAM Clocks (LPDDR2-1066) 9h - 14 DRAM Clocks Ah - 15 DRAM Clocks Bh - 16 DRAM Clocks (LPDDR3-1333) Others - Reserved |
| 3:2 | 0h<br>RO | **Rsvd_3_2_DTR0:** Reserved |
| 1:0 | 0h<br>RW | **DFREQ:** DRAM Frequency. Specifies the DDR3 frequency used by Dunit for computing proper cycle to cycle timings. Note: This configuration has no impact on the actual DRAM clock. 0h - DDR3-800 1h - DDR3-1066 2h - DDR3-1333 3h - DDR3-1600 |

## 12.3.3 DTR1 (DTR1)—Offset 2h

DRAM Timing Register 1

### Access Method

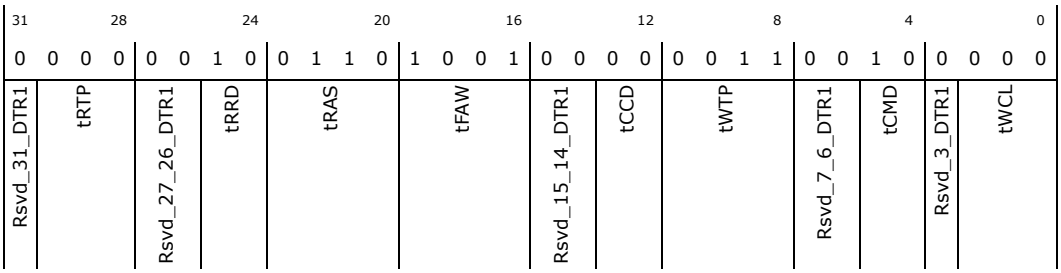
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 2h

**Op Codes:**

h - Read, h - Write

**Default:** 02690320h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RO | **Rsvd_31_DTR1:** Reserved |
| 30:28 | 0h<br>RW | **tRTP:** Read to Precharge Delay. The minimal delay between RD command and PRE command to same bank. 00 - 4 DRAM Clocks (DDR3-800 DDR3-1066) 01 - 5 DRAM Clocks (DDR3-1333) 10 - 6 DRAM Clocks (DDR3-1600) 11 - 7 DRAM Clocks |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27:26 | 0h<br>RO | **Rsvd_27_26_DTR1:** Reserved |
| 25:24 | 2h<br>RW | **tRRD:** Row Activation to Row Activation Delay. The minimal time interval between 2 ACT commands to any bank in the same DRAM device. Limits peak current profile. 00 - 4 DRAM Clocks (1KB page DDR3-800, 1066, 1333) (2KB page DDR3-800, LPDDR2-800) 01 - 5 DRAM Clocks (1KB page DDR3-1600) (2KB page DDR3-1333) 10 - 6 DRAM Clocks (2KB page DDR3-1066, 1600. LPDDR3-1333) 11 - 7 DRAM Clocks |
| 23:20 | 6h<br>RW | **tRAS:** Row Activation Period. The minimal delay, in DRAM clocks, between ACT command and PRE command to same bank. At least equal to tRCD + tCWL + tCCD + tWR 0h -14 DRAM Clocks. 0h - Reserved 1h - 15 DRAM Clocks (DDR3-800) 2h - 16 DRAM Clocks 3h - 17 DRAM Clocks (LPDRR2-800) 4h - 18 DRAM Clocks 5h - 19 DRAM Clocks 6h - 20 DRAM Clocks (DDR3-1066) 7h - 21 DRAM Clocks 8h - 22 DRAM Clocks 9h - 23 DRAM Clocks (LPDRR2-1066) Ah - 24 DRAM Clocks (DDR3-1333) Bh - 25 DRAM Clocks Ch - 26 DRAM Clocks Dh - 27 DRAM Clocks Eh - 28 DRAM Clocks (DDR3-1600. LPDRR3-1333) Fh - 29 DRAM Clocks |
| 19:16 | 9h<br>RW | **tFAW:** Four Bank Activation Window. A rolling time-frame, in which a maximum of 4 ACT commands (per rank) can be sent. Limits peak current profile. 0h - Reserved 1h - Reserved 2h - 14 DRAM Clocks 3h - 16 DRAM Clocks (1KB page DDR3-800) 4h - 18 DRAM Clocks 5h - 20 DRAM Clocks (2KB page DDR3-800) (1KB page DDR3-1066, 1333. LPDDR2-800) 6h - 22 DRAM Clocks 7h - 24 DRAM Clocks (1KB page DDR3-1600) 8h - 26 DRAM Clocks 9h - 28 DRAM Clocks (2KB page DDR3-1066. LPDDR2-1066) Ah - 30 DRAM Clocks (2KB page DDR3-1333) Bh - 32 DRAM Clocks (2KB page DDR3-1600) Ch - 34 DRAM Clocks (LPDDR3-1333) Others - Reserved |
| 15:14 | 0h<br>RO | **Rsvd_15_14_DTR1:** Reserved |
| 13:12 | 0h<br>RW | **tCCD:** CAS to CAS delay. The minimum delay, in DRAM clocks, between 2 RD/WR commands. 0h - 4 DRAM Clocks: Functional mode. (DDR3-800, 1066, 1333, 1600) (LPDDR2-800, 1066) (LPDDR3-1333) 1h - 12 DRAM Clocks: DFX stretch mode (x2) 2h - 18 DRAM Clocks: DFX stretch mode (x4) 3h - Reserved |
| 11:8 | 3h<br>RW | **tWTP:** Write to Prechange. The minimum delay, in DRAM clocks, between a WR command and a PRE command to the same bank. Value should be computed as 4 + tWCL + tWR. 0h - 14 DRAM Clocks (LPDRR2-800) 1h - 15 DRAM Clocks (DDR3-800) 2h - 16 DRAM Clocks 3h - 17 DRAM Clocks (LPDDR2-1066) 4h - 18 DRAM Clocks (DDR3-1066) 5h - 19 DRAM Clocks 6h - 20 DRAM Clocks 7h - 21 DRAM Clocks (DDR3-1333. LPDDR3-1333) 8h - 22 DRAM Clocks 9h - 23 DRAM Clocks Ah - 24 DRAM Clocks (DDR3-1600) Bh - 25 DRAM Clocks Others - Reserved |
| 7:6 | 0h<br>RO | **Rsvd_7_6_DTR1:** Reserved |
| 5:4 | 2h<br>RW | **tCMD:** Command Transport Duration. The time period, in DRAM clocks, that a command occupies the DRAM command bus. 1N is the DDR3 basic requirement. 2N and 3N are extended modes for board signal-integrity. 0h - 1 DRAM Clock (1N) 1h - 2 DRAM Clocks (2N) 2h - 3 DRAM Clocks (3N) |
| 3 | 0h<br>RO | **Rsvd_3_DTR1:** Reserved |
| 2:0 | 0h<br>RW | **tWCL:** CAS Write Latency. The delay, in DRAM clocks, between the internal write command and the availability of the first bit of DRAM input data. 0h - 3 DRAM Clocks (LPDDR2-800) 1h - 4 DRAM Clocks (LPDDR2-1066) 2h - 5 DRAM Clocks (DDR3-800) 3h - 6 DRAM Clocks (DDR3-1066. LPDDR3-1333) 4h - 7 DRAM Clocks (DDR3-1333) 5h - 8 DRAM Clocks (DDR3-1600) Others - Reserved |

## 12.3.4 DTR2—Offset 3h

DRAM Timing Register 2

### Access Method

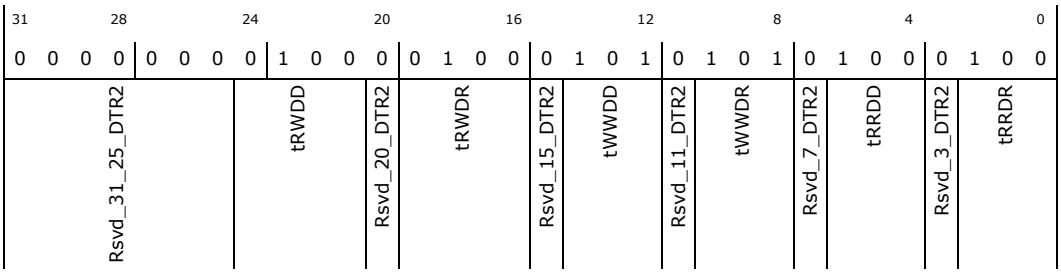
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 3h

**Op Codes:**

h - Read, h - Write

**Default:** 00845544h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0h<br>RO | **Rsvd_31_25_DTR2:** Reserved |
| 24:21 | 4h<br>RW | **tRWDD:** Read to Write DQ delay, different DIMMs 0h - Reserved 1h - 6 DRAM Clocks (DDR3) 2h - 7 DRAM Clocks 3h - 8 DRAM Clocks 4h - 9 DRAM Clocks 5h - 10 DRAM Clocks (LPDDR2-800) 6h - 11 DRAM Clocks (LPDDR2-1066) 7h - 12 DRAM Clocks 8h - 13 DRAM Clocks 9h - 14 DRAM Clocks (LPDDR3-1333) Ah - 15 DRAM Clocks Bh - 16 DRAM Clocks Ch - 17 DRAM Clocks Dh - 18 DRAM Clocks Others - Reserved |

## 12.3.6 DTR4 (DTR4)—Offset 5h

DRAM Timing Register 4

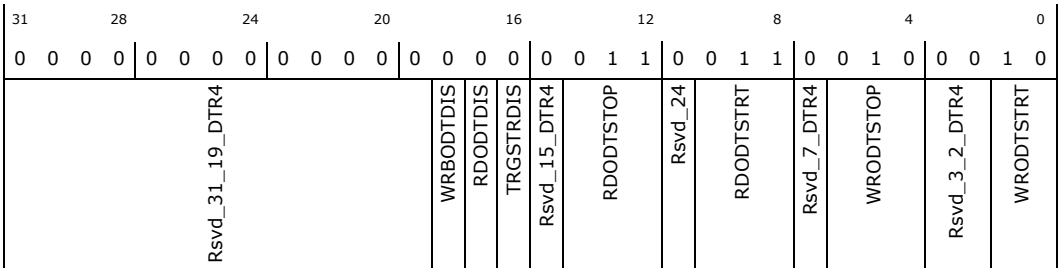
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 5h

**Op Codes:**
h - Read, h - Write

**Default:** 00003322h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RO | **Rsvd_31_19_DTR4:** Reserved |
| 18 | 0h<br>RW | **WRBODTDIS:** Disable Write ODT on non-targeted DIMM. When writing to DIMM A, ODT is asserted to the target rank of DIMM A and also to the low rank of DIMM B. This defeature bit is used to disable ODT assertion to the opposite DIMM during write. |
| 17 | 0h<br>RW | **RDODTDIS:** Disable Read ODT. When reading from DIMM A, ODT is asserted to the low rank of DIMM B. This defeature bit is used to disable ODT assertion during reads. |
| 16 | 0h<br>RW | **TRGSTRDIS:** Write target rank is not stretched. When set, stretched ODT as defined above is not applied to the write target rank and ODT command is asserted for 6 DRAM clocks. Should not be used when ODT is pulled-in. |
| 15 | 0h<br>RO | **Rsvd_15_DTR4:** Reserved |
| 14:12 | 3h<br>RW | **RDODTSTOP:** Read command to ODT de-assert delay Value should be set to: RDODTSTRT+6+(WRODTSTOP-WRODTSTRT) 0h - 6 DRAM Clocks 1h - 7 DRAM Clocks 2h - 8 DRAM Clocks 3h - 9 DRAM Clocks 4h - 10 DRAM Clocks 5h - 11 DRAM Clocks 6h - 12 DRAM Clocks 7h - 13 DRAM Clocks Other - Reserved |
| 11 | 0h<br>RO | **Rsvd_24:** Reserved |
| 10:8 | 3h<br>RW | **RDODTSTRT:** Read command to ODT assert delay. Value should be set to tCMD+tCL-tWCL-ODT_PULLIN, where ODT_PULLIN must have the same value as in WRODTSTRT. 0h - 0 DRAM Clocks 1h - 1 DRAM Clocks 2h - 2 DRAM Clocks 3h - 3 DRAM Clocks 4h - 4 DRAM Clocks 5h - 5 DRAM Clocks Other - Reserved |
| 7 | 0h<br>RO | **Rsvd_7_DTR4:** Reserved |
| 6:4 | 2h<br>RW | **WRODTSTOP:** Write command to ODT de-assert delay. WRODTSTOP 1N 2N 3N 0h WR+6 N/A N/A 1h WR+7 WR+6 N/A 2h WR+8 WR+7 WR+6 3h WR+9 WR+8 WR+7 4h WR+10 WR+9 WR+8 Other Reserved Reserved Reserved |
| 3:2 | 0h<br>RO | **Rsvd_3_2_DTR4:** Reserved |
| 1:0 | 2h<br>RW | **WRODTSTRT:** WR command to ODT assert delay. JEDEC requires ODT to be asserted on the same clock with the WR command. Dunit allows to pull-in by 1 clock in 2N mode and by 1-2 clocks in 3N mode. For most DIMM configurations, this register should be programmed to same value as tCMD. A value of tCMD - ODT_PULLIN can be used according to the table below which shows the ODT command assertion with respect to the WR command assertion. WRODTSTRT 1N 2N 3N 0h WR WR-1 WR-2 1h N/A WR WR-1 2h N/A N/A WR 3h Reserved Reserved Reserved |

## 12.3.7 DPMC0 (DPMC0)—Offset 6h

DRAM Power Management Control 0

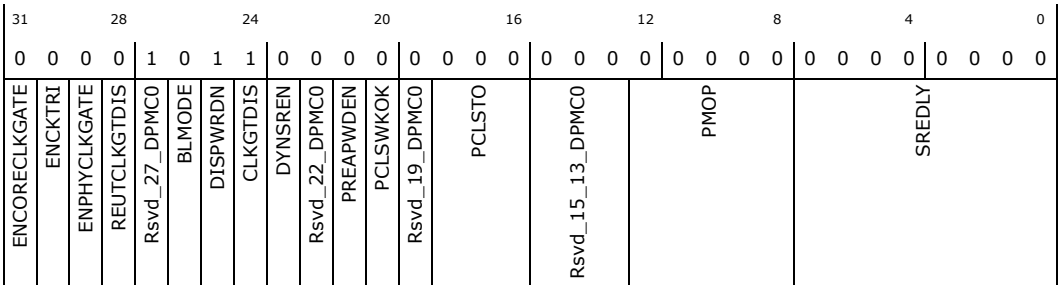
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 6h

**Op Codes:**
h - Read, h - Write

**Default:** 0B000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **ENCORECLKGATE:** Enable Core Clock Gate During SR 0h - Core clock gating is disabled. 1h - Dunit enables the generic_clkreq_fsm during Self Refresh. The Dunit will re-enables the clocks upon Self Refresh exit. |
| 30 | 0h<br>RW | **ENCKTRI:** Enable CK/CKB TriState During PowerDown 0h - Disable CK/CKB Tristate During Powerdown. 1h - Enable CK/CKB Tristate During Powerdown. Note: This is an LPDDR feature only, for DDR3 bit should be set to 0. |
| 29 | 0h<br>RW | **ENPHYCLKGATE:** Enable PHY Clock Gate During SR 0h - PHY clock gating is disabled. 1h - Dunit will drive the dun_cck_clkreq signal low to turn off the 1x and 2x clock trees from the CCK unit to the DDRO PHY during Self Refresh. The Dunit will re-enables the clocks upon Self Refresh exit. |
| 28 | 0h<br>RW | **REUTCLKGTDIS:** REUT Clock Gate Disable 0h - REUT clock is gated when DCO.PMICTL is set to 0. 1h - REUT clock is upgated, overriding the DCO.PMICTL config bit. Note: The DCO.REUTLOCK bit overrides this bit. |
| 27 | 1h<br>RO | **Rsvd_27_DPMC0:** Reserved |
| 26 | 0h<br>RW | **BLMODE:** Burst Length Mode. Selects the DDR3 Burst Length mode: 0h - BL8 Fixed 1h - BL8/BC4 On-the-Fly Note: This bit should be zero for LPDDR2 and LPDDR3. |
| 25 | 1h<br>RW | **DISPWRDN:** Disable Power Down. Setting this bit to 1 will block CKE high-)low transitions. May be used by BIOS during init flow and should be set to 0 for functional mode. 0h - The Dunit dynamically controls the CKE pins to place the DRAM device in power down mode. 1h - The Dunit constantly drives the CKE pins high. |
| 24 | 1h<br>RW | **CLKGTDIS:** Clock Gating Disabled. Setting this bit to 0 allows a large number of internal Dunit clocks to be gated when there is no activity in order to save power. When set to 1, internal clock-gating is disabled. 0h - Enable 1h - Disable |
| 23 | 0h<br>RW | **DYNSREN:** Dynamic Self-Refresh Enable. Setting this bit to 1, enables automatic SR command to DRAM and PM message to DDRIO when the PMI bus is idle, all pending requests have been served and the and PMI status is less than 2, SREDLY has timed-out, and all JEDEC requirements are satisfied. This register may be changed by BIOS/ FW on-the-fly. |
| 22 | 0h<br>RO | **Rsvd_22_DPMC0:** Reserved |
| 21 | 0h<br>RW | **PREAPWDEN:** Send Precharge All Command to a Rank before PD-Enter. Setting this bit to 1 will allow sending a PREA command before PDE command. 0h - Disable 1h - Enable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 20 | 0h<br>RW | **PCLSWKOK:** Wake Allowed for Page Close Timeout. Setting this bit to 1 indicates the Dunit can send DRAM devices a PD-Exit command in order to close single bank if the page timer expired. Note: This bit applies only to cases where at least one other bank in the same rank is open but not timed-out. If all banks in the rank timed-out, a PD-Exit command will be sent regardless of this bit. Must be set to 0 during init/training mode. 0h - Disable 1h - Enable |
| 19 | 0h<br>RO | **Rsvd_19_DPMC0:** Reserved |
| 18:16 | 0h<br>RW | **PCLSTO:** Page Close Timeout Period. Specifies the time frame, in ns, from last access to a DRAM page until that page may be scheduled for closing (by sending a PRE command). 0h - Disable page close timer (init/training) 1h - Immediate page close 2h - 30-60 ns to page close 3h - 60-120 ns to page close 4h - 120-240 ns to page close 5h - 240-480 ns to page close 6h - 480-960 ns to page close 7h - 1-2 s to page close |
| 15:13 | 0h<br>RO | **Rsvd_15_13_DPMC0:** Reserved |
| 12:8 | 0h<br>RW | **PMOP:** SPID Power Mode Opcode. The PM Message ID the Dunit will send to DDRIO on ispid_pm_pm bus after SR Entry command to DRAM. This message defines the DDRIO power-mode during SR period. Value can be changed on-the-fly to allow different power modes (for example, deeper PM for S3 than for C6). Power saving and Entry/Exit latencies are described in the MODMEM HAS. |
| 7:0 | 0h<br>RW | **SREDLY:** Self-Refresh Entry delay. The delay, in core-clocks, between PMI idle (no pending requests and PMI status is less than 2) and SR Entry when Dunit is in Dynamic SR mode. |

## 12.3.8 DPMC1 (DPMC1)—Offset 7h

DRAM Power Management Control 1

### Access Method

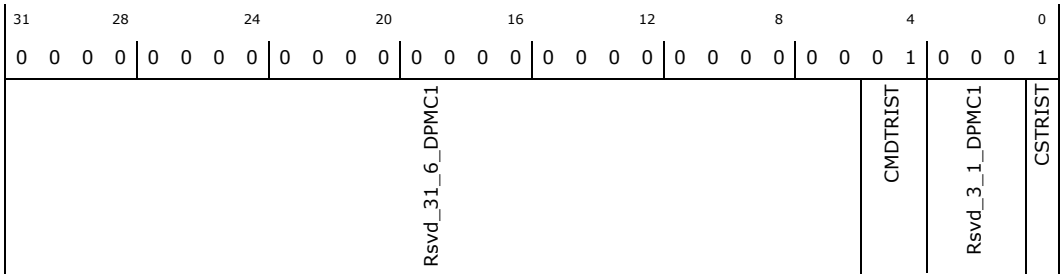
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 7h

**Op Codes:**

h - Read, h - Write

**Default:** 00000011h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0h<br>RO | **Rsvd_31_6_DPMC1:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5:4 | 1h<br>RW | **CMDTRIST:** Tristate Command and Address Bus to DRAM 0h - CMD/ADDR are never tristated. 1h - CMD/ADDR are tristated only when all CKE are low. 2h - CMD/ADDR are tristated when no valid command. 3h - CMD/ADDR are tristated when no valid command but may never be tristated for less than 2 DRAM clocks. This mode is only valid when tCMD is set to 0h (1N mode). |
| 3:1 | 0h<br>RO | **Rsvd_3_1_DPMC1:** Reserved |
| 0 | 1h<br>RW | **CSTRIST:** Tristate Chip-Select 0 - Never tristate. 1 - TriState DRAM CS# pins from SRE to SRX+tXS. Note: DDRIO may tristate during SR so this adds on the boundries. |

## 12.3.9 DRFC (DRFC)—Offset 8h

DRAM Refresh Control

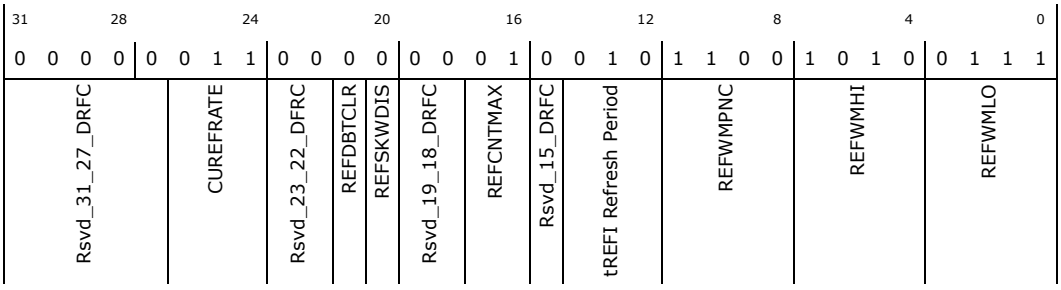
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 8h

**Op Codes:**
h - Read, h - Write

**Default:** 03012CA7h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0h<br>RO | **Rsvd_31_27_DRFC:** Reserved |
| 26:24 | 3h<br>RO | **CUREFRATE:** Current Refresh Rate This value is updated by the Dunit TQ Poll logic after executing a Mode Register Read Command to the DRAM Device Temperature Mode Register (MR4). 0h - 4x tREFI, Low temperature operating limit exceeded 1h - 4x tREFI 2h - 2x tREFI 3h - 1x tREFI ((= 85C) 4h - 0.5x tREFI (LPDDR3) 5h - 0.25x tREFI, do not de-rate AC timing 6h - 0.25x tREFI, de-rate AC timing 7h - 0.25x tREFI, High temperature operating limit exceeded Note: This is an LPDDR feature only. |
| 23:22 | 0h<br>RO | **Rsvd_23_22_DFRC:** Reserved |
| 21 | 0h<br>RW | **REFDBTCLR:** Clear Refresh Debit before SR Entry When this bit is set, if enough REF commands are pulled-in, Dunit will not send additional REF commands before SR Entry. 0h - Disabled 1h - Enabled |
| 20 | 0h<br>RW | **REFSKWDIS:** Refresh counters may be increased in 2 policies - skewed or simultaneously. 0h - counters are updated per rank every 1/4 tREFI period. 1h - all counters are updated every tREFI. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19:18 | 0h<br>RO | **Rsvd_19_18_DRFC:** Reserved |
| 17:16 | 1h<br>RW | **REFCNTMAX:** Refresh Max tREFI Interval. The maximum interval between ant two REF commands per rank. JEDEC allows a maximum of 9 x tREFI intervals. 0h - 6 x tREFI 1h - 7 x tREFI 2h - 8 x tREFI 3h - 9 x tREFI Should not be changed after initial setting. |
| 15 | 0h<br>RO | **Rsvd_15_DRFC:** Reserved |
| 14:12 | 2h<br>RW | **tREFI Refresh Period**: Specifies the average time between sending REF commands to DRAM. The Dunit will guarantee that the average time is met, but maintains a certain degree of flexibility in the exact REF scheduling in order to increase overall performance. 0h - Refresh disabled 1h - Reserved for pre-silicon simulation 2h - 3.9 µs (Extended Temperature Range, 85-95°C) 3h - 7.8 µs (Normal Temperature Range, 0-85°C). |
| 11:8 | Ch<br>RW | **REFWMPNC:** Refresh Panic Watermark. When the refresh debit counter, per rank, is greater than this value, the Dunit will send a REF command even if there are some pending requests and regardless of the PMI status level. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. Value should be greater than, or equal, to REFWMHI. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Postpone 2 REF commands 8h - Postpone 3 REF commands 9h - Postpone 4 REF commands Ah - Postpone 5 REF commands Bh - Postpone 6 REF commands Ch - Postpone 7 REF commands Dh - Postpone 8 REF commands Others - Reserved |
| 7:4 | Ah<br>RW | **REFWMHI:** Refresh High Watermark. When the refresh debit counter, per rank, is greater than this value, the Dunit will send a REF command even if there are some pending requests to the rank but not if the PMI status is equal to 3. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. Value should be greater than, or equal, to REFWMLO. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Postpone 2 REF commands 8h - Postpone 3 REF commands 9h - Postpone 4 REF commands Ah - Postpone 5 REF commands Bh - Postpone 6 REF commands Ch - Postpone 7 REF commands Dh - Postpone 8 REF commands Others - Reserved |
| 3:0 | 7h<br>RW | **REFWMLO:** Opportunistic Refresh Watermark. When the refresh debit counter, per rank, is greater than this value, the Dunit will send a REF command only if there are no pending requests to the rank and the PMI status is less than 3. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Postpone 2 REF commands 8h - Postpone 3 REF commands 9h - Postpone 4 REF commands Ah - Postpone 5 REF commands Bh - Postpone 6 REF commands Ch - Postpone 7 REF commands Dh - Postpone 8 REF commands Others - Reserved |

## 12.3.10 DSCH (DSCH)—Offset 9h

DRAM Scheduler Control

### Access Method

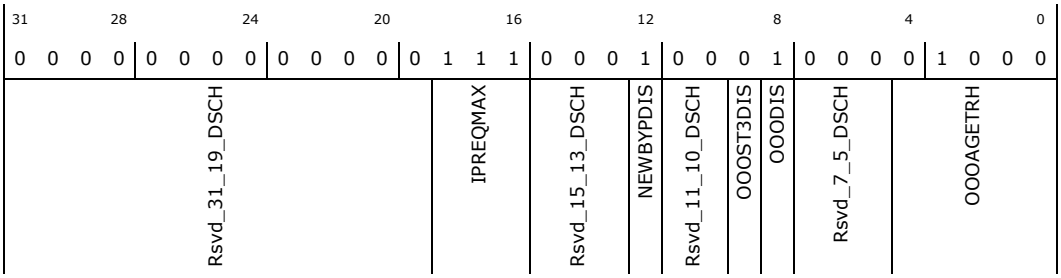
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 9h

**Op Codes:**

h - Read, h - Write

**Default:** 00071108h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RO | **Rsvd_31_19_DSCH:** Reserved |
| 18:16 | 7h<br>RW | **IPREQMAX:** Maximal number of In-Process Requests stored in the Dunit. Number of pending requests = IPREQMAX+1; Value may be changed after init/training when PMI is idle. |
| 15:13 | 0h<br>RO | **Rsvd_15_13_DSCH:** Reserved |
| 12 | 1h<br>RW | **NEWBYPDIS:** Disable New Request Bypass. Setting this bit to 0 will allow a new request to bypass the normal Dunit internal arbiter when there are no pending commands. 0h - Enable New Request Bypass. 1h - Disable New Request Bypass. |
| 11:10 | 0h<br>RO | **Rsvd_11_10_DSCH:** Reserved |
| 9 | 0h<br>RW | **OOOST3DIS:** Out-of-Order Disabled whenPMI status is 3. Valid only if OOODIS is 0; 0 - Remain OOO if status goes up to 3 1 - Disable OOO if status goes to 3 May be changed after init/training flow. |
| 8 | 1h<br>RW | **OOODIS:** Disable Out-of-Order . 0h - OOO enabled. 1h - OOO disabled. Should be disabled during init/training and can be enabled for functional mode. |
| 7:5 | 0h<br>RO | **Rsvd_7_5_DSCH:** Reserved |
| 4:0 | 08h<br>RW | **OOOAGETRH:** Out-of-Order Aging Theshold. Number of PMI requests that can bypass any pending request before OOO will be disabled. This mechanism prevents starvation of pending commands. |

## 12.3.11 DCAL (DCAL)—Offset Ah

DRAM Calibration Control

### Access Method

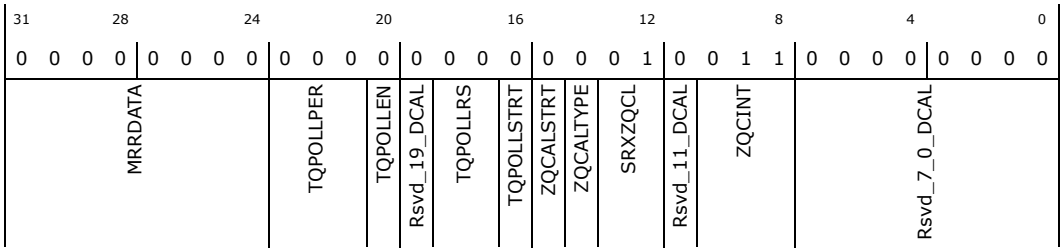
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + Ah

**Op Codes:**

h - Read, h - Write

**Default:** 00001300h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h<br>RO | **MRRDATA:** MRR Data This field contains the data of the last DRAM Mode Register Read (MRR) issued thru message opcode 68h or from a TQ Poll. It is over-written with each MRR command. Note: This is an LPDDR feature only. |
| 23:21 | 0h<br>RW/P | **TQPOLLPER:** TQ Poll Period 0h - 1 x the current Refresh Period 1h - 2 x the current Refresh Period 2h - 4 x the current Refresh Period 3h - 8 x the current Refresh Period 4h - 16 x the current Refresh Period 5h - 32 x the current Refresh Period 6h - 64 x the current Refresh Period 7h - 128 x the current Refresh Period Note: This is an LPDDR feature only. |
| 20 | 0h<br>RW/P | **TQPOLLEN:** TQ Poll Enable 0 - Disables periodic TQ polling 1 - Enables periodic TQ polling Note: This is an LPDDR feature only. |
| 19 | 0h<br>RO | **Rsvd_19_DCAL:** Reserved |
| 18:17 | 0h<br>RW/P | **TQPOLLRS:** TQ Poll RS This bit selects which rank to poll the LPDDR2 DRAMs internal MR4 register. The assumption is that the temperature will be similar for any rank, and thus polling only a single memory device in the package is sufficient. 00 - Select Rank 0 to poll from 01 - Select Rank 1 to poll from 10 - Select Rank 2 to poll from 11 - Select Rank 3 to poll from Note: This is an LPDDR feature only. |
| 16 | 0h<br>RW/P | **TQPOLLSTRT:** TQ Poll Start Set this bit to 1 to start a TQPoll. This bit will remain a 1 until the TQPoll process is complete, then it will return to 0. 0 - TQ Poll is done 1 - TQ Poll has started and is in progress Note: This is an LPDDR feature only. |
| 15 | 0h<br>RW/P | **ZQCALSTRT:** ZQ Calibration Start Set this bit to 1 to start the ZQ calibration sequence. This bit will remain a 1 until the ZQ calibration is complete, then it will return to 0. 0 - ZQ calibration is done 1 - ZQ calibration has started and is in progress |
| 14 | 0h<br>RW/P | **ZQCALTYPE:** ZQ Calibration Type 0 - Short Calibration 1 - Long Calibration |
| 13:12 | 1h<br>RW/P | **SRXZQCL:** ZQ Calibration Long After SR Exit Control 0h - ZQCL commands after SRX are sent in parallel. 1h - ZQCL commands are sent serially to ranks (not used). 2h - No ZQCL is sent after SR Exit (for Debug only). 3h Reserved. |
| 11 | 0h<br>RO | **Rsvd_11_DCAL:** Reserved |
| 10:8 | 3h<br>RW/P | **ZQCINT:** ZQ Calibration Short Interval. The time interval, in ms, between ZQCS commands to a DRAM device. ZQCS commands are sent to a single DRAM device and commands are distributed and non-overlapping in the interval. 0h - Disabled 1h - 62s (for pre-silicon simulation only) 2h - 31ms 3h - 63ms 4h - 126ms Others - Reserved May be changed on-the-fly in response to thermal events. |
| 7:0 | 0h<br>RO | **Rsvd_7_0_DCAL:** Reserved |

## 12.3.12 DRMC (DRMC)—Offset Bh

DRAM Reset Management Control

### Access Method

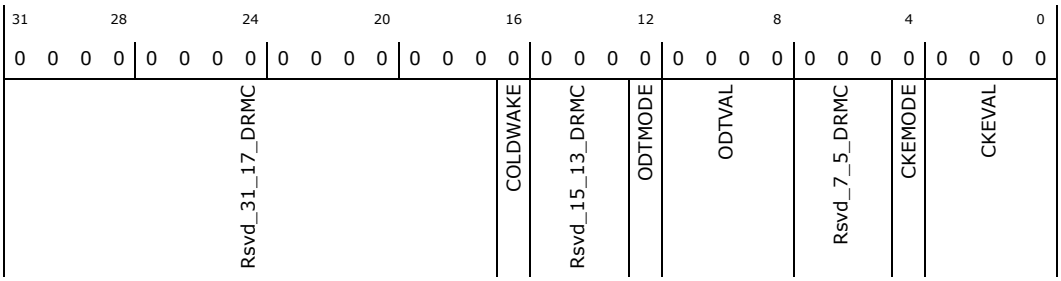
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + Bh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0h<br>RO | **Rsvd_31_17_DRMC:** Reserved |
| 16 | 0h<br>RW | **COLDWAKE:** BIOS should set this bit to 1 before sending WAKE command to Dunit after Cold Reset. For S3 Exit, or any other mode in which the DRAM is in SR, this bit must be set to 0. |
| 15:13 | 0h<br>RO | **Rsvd_15_13_DRMC:** Reserved |
| 12 | 0h<br>RW | **ODTMODE:** ODT Control Mode 0h - Dunit. 1h - SW override. |
| 11:8 | 0h<br>RW | **ODTVAL:** When ODTMODE is set to 1, ODT pins to DRAM are overridden by ODTVAL. Used only during init flow by BIOS. |
| 7:5 | 0h<br>RO | **Rsvd_7_5_DRMC:** Reserved |
| 4 | 0h<br>RW | **CKEMODE:** CKE Control Mode 0h - Dunit. 1h - SW override. |
| 3:0 | 0h<br>RW | **CKEVAL:** When CKEMODE is set to 1, CKE pins to DRAM are overridden by CKEVAL. Used only during init flow by BIOS. |

## 12.3.13 PMSTS (PMSTS)—Offset Ch

Power Management Status

### Access Method

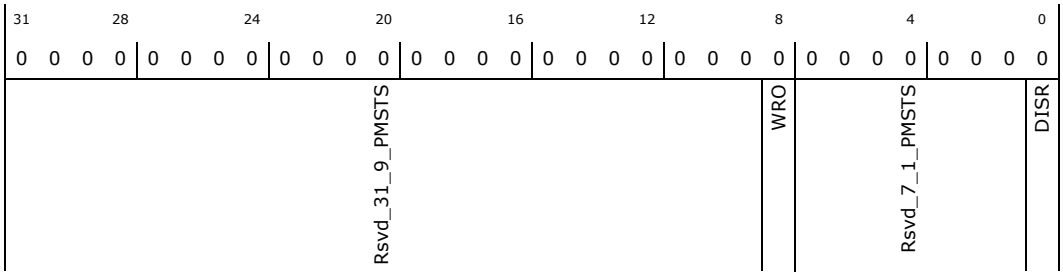
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + Ch

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0h<br>RO | **Rsvd_31_9_PMSTS:** Reserved |
| 8 | 0h<br>RW/P | **WRO:** Warm Reset Occurred. Set by the Punit whenever a Reset Warn is received, and cleared by powergood=0. 0h: No Warm Reset occurred. 1h: Warm Reset occurred. BIOS Requirement. BIOS can check and clear this bit whenever executing POST code. This way BIOS knows that if the bit is set, then DISR indicates whether DRAM entered Self-Refresh. |
| 7:1 | 0h<br>RO | **Rsvd_7_1_PMSTS:** Reserved |
| 0 | 0h<br>RW/P | **DISR:** DRAM In Self-Refresh. Set by Dunit hardware after Channel is placed in self refresh as a result of a Power State or a Reset Warn sequence. Cleared by Dunit hardware before starting Channel 0 self refresh exit sequence initiated by a power management exit. Cleared by the BIOS by writing 1 in a warm reset (Reset# asserted while PWROK is asserted) exit sequence. 0 - DRAM not guaranteed to be in Self-Refresh. 1 - DRAM in Self-Refresh. |

## 12.3.14 DCO (DCO)—Offset Fh

DRAM Control Operation

### Access Method

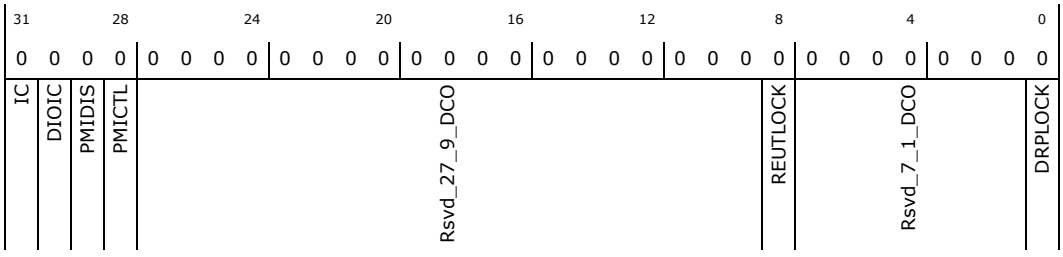
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + Fh

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **IC:** Dunit Initialization Complete. This bit should be set by BIOS after Dunit programming is complete and Dunit is ready to accept PMI requests and perform DRAM maintenance operations. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 30 | 0h<br>RO | **DIOIC:** Status indication that DDRIO initialization is complete. Reflects ospid_init_complete. |
| 29 | 0h<br>RW | **PMIDIS:** Disable PMI interface. When set to 1, Following PMI signals are disabled from both Bunit and REUT: PMI Request Irdy, PMI Request Trdy, PMI DataBD Irdy, PMI DataBD Trdy, PMI DataBD BE, PMI DataDB Irdy, PMI DataDB Trdy |
| 28 | 0h<br>RW | **PMICTL:** PMI Control Select. 0h - PMI is owned by Bunit 1h - PMI is owned by REUT Whenever this bit is toggled, Dunit will flush all pending DRAM requests from previous owner before it accepts requests from new owner. This bit is also used when REUT is disabled in order to gracefully flush pending request and putting DRAM into IDLE state before sending MRS commands in functional mode. |
| 27:9 | 0h<br>RO | **Rsvd_27_9_DCO:** Reserved |
| 8 | 0h<br>RW/P/L | **REUTLOCK:** After this bit is set to 1, all REUT is clock gated and locked and cannot be used. REUTLOCK can be set only once, and will only reset when powergood = 0. |
| 7:1 | 0h<br>RO | **Rsvd_7_1_DCO:** Reserved |
| 0 | 0h<br>RW/P/L | **DRPLOCK:** After this bit is set to 1, all DRP bits are locked and cannot be written again. DRPLOCK can be written only once. DRPLOCK and DRP bit values will only reset when powergood = 0. |

## 12.3.15 DTRC (DTRC)—Offset 10h

DRAM Training Control

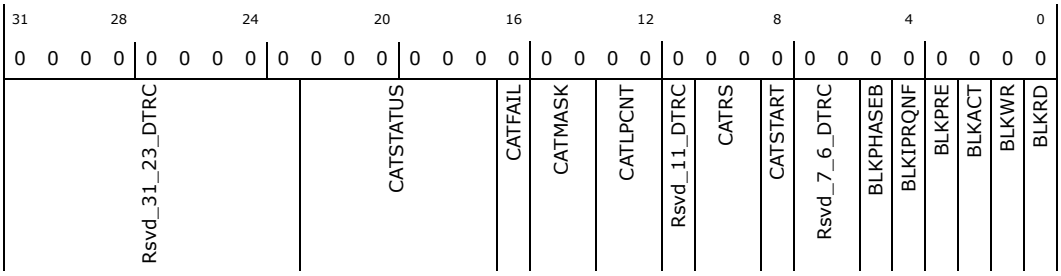
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 10h

**Op Codes:**
h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0h<br>RO | **Rsvd_31_23_DTRC:** Reserved |
| 22:17 | 0h<br>RO | **CATSTATUS:** CA Training Status |
| 16 | 0h<br>RO | **CATFAIL:** CA Training Fail 0 - No mismatch between CA and DQ 1 - Mismatch between CA and DQ |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0h RW/L | **CATMASK:** Command/Address Training Mask Mask data for comparison. 0h - No Mask 1h - Mask out data from byte[1] and byte[4] 2h - Mask out data from upper 32bits 3h - Mask both bytes and upper 32bits |
| 13:12 | 0h RW/L | **CATLPCNT:** Command/Address Training Loop Count |
| 11 | 0h RO | **Rsvd_11_DTRC:** Reserved |
| 10:9 | 0h RW/L | **CATRS:** Command/Address Training Rank Select 0h - Rank 0 (DIMM0) is selected 1h - Rank 1 (DIMM0) is selected 2h - Rank 2 (DIMM1) is selected 3h - Rank 3 (DIMM1) is selected |
| 8 | 0h RW/P/L | **CATSTART:** Command/Address Training Start Set this bit to 1 to start CA training. This bit will remain a 1 until CA training is complete, then it will return to 0. 0 - CA Training is done 1 - CA Training has started and is in progress Note: This is an LPDDR feature only. |
| 7:6 | 0h RO | **Rsvd_7_6_DTRC:** Reserved |
| 5 | 0h RW/L | **BLKPHASEB:** Block All PhaseB Commands. Dunit operates at coreclock which is half the frequency of the DRAM clock. When this bit is set, only one command can be scheduled each coreclock. This bit may be used for DFX applications. |
| 4 | 0h RW/L | **BLKIPRQNF:** Block all IP Requests until Queue is Full. When this bit is set to 1, all Dunit are stalled until the IP pool is full. This bit is self-clearing, and once asserted, writing 0 has no impact. The IPREQ pool is only reopened when the number of pending requests reaches DSCH.IPREQMAX+1. |
| 3 | 0h RW/L | **BLKPRE:** Block Precharge Commands to DRAM 0 - No Block 1 - Block |
| 2 | 0h RW/L | **BLKACT:** Block Activate Commands to DRAM 0 - No Block 1 - Block |
| 1 | 0h RW/L | **BLKWR:** Block Write Commands to DRAM 0 - No Block 1 - Block |
| 0 | 0h RW/L | **BLKRD:** Block Read Commands to DRAM 0 - No Block 1 - Block |

## 12.3.16 DCBR (DCBR)—Offset 12h

DRAM CB Register

### Access Method

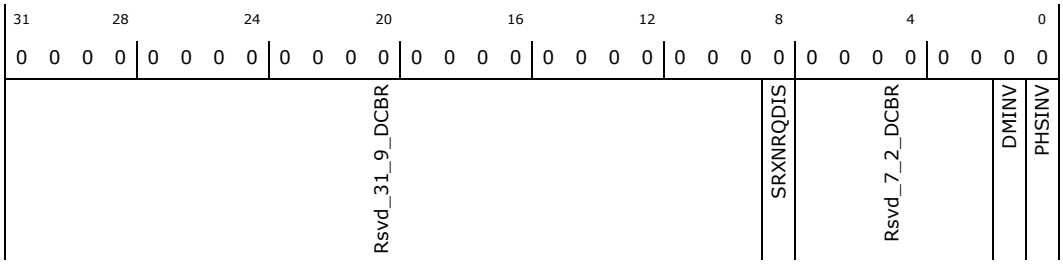
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 12h

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0h<br>RO | **Rsvd_31_9_DCBR:** Reserved |
| 8 | 0h<br>RW | **SRXNRQDIS:** Disable Accepting Requests During Self Refresh Exit 0 - Load PMI requests to Dunit in SR Exit tXSDLL and ZQCoper period 1 - Load PMI requests only after tXSDLL and ZQCoper are complete |
| 7:2 | 0h<br>RO | **Rsvd_7_2_DCBR:** Reserved |
| 1 | 0h<br>RW | **DMINV:** Invert DRAM Data Mask 0 - Do not invert DRAM data mask 1 - Invert DRAM data mask |
| 0 | 0h<br>RW | **PHSINV:** Core/SPID CDC phase control invert. Backup inverter for internal phase indicator in Dunit. |

## 12.3.17 DSTAT (DSTAT)—Offset 20h

Dunit Status

### Access Method

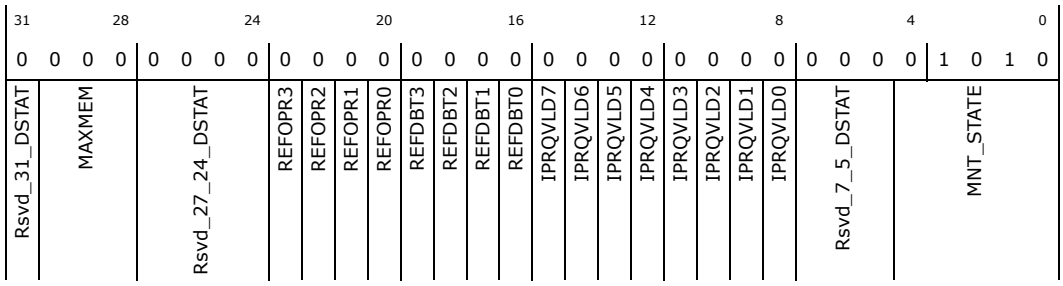
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 20h

**Op Codes:**

h - Read, h - Write

**Default:** 0000000Ah



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RO | **Rsvd_31_DSTAT:** Reserved |
| 30:28 | 0h<br>RO | **MAXMEM:** Reflects the fus_dun_max_supported_memory fuse |
| 27:24 | 0h<br>RO | **Rsvd_27_24_DSTAT:** Reserved |
| 23 | 0h<br>RO | **REFOPR3:** Rank 3 Refresh Dept is greater than DRFC.REFWMLO |
| 22 | 0h<br>RO | **REFOPR2:** Rank 2 Refresh Dept is greater than DRFC.REFWMLO |
| 21 | 0h<br>RO | **REFOPR1:** Rank 1 Refresh Dept is greater than DRFC.REFWMLO |
| 20 | 0h<br>RO | **REFOPR0:** Rank 0 Refresh Dept is greater than DRFC.REFWMLO |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19 | 0h<br>RO | **REFDBT3:** Rank 3 has a Refresh Dept |
| 18 | 0h<br>RO | **REFDBT2:** Rank 2 has a Refresh Dept |
| 17 | 0h<br>RO | **REFDBT1:** Rank 1 has a Refresh Dept |
| 16 | 0h<br>RO | **REFDBT0:** Rank 0 has a Refresh Dept |
| 15 | 0h<br>RO | **IPRQVLD7:** IPREQ Entry 7 contains a valid request. |
| 14 | 0h<br>RO | **IPRQVLD6:** IPREQ Entry 6 contains a valid request. |
| 13 | 0h<br>RO | **IPRQVLD5:** IPREQ Entry 5 contains a valid request. |
| 12 | 0h<br>RO | **IPRQVLD4:** IPREQ Entry 4 contains a valid request. |
| 11 | 0h<br>RO | **IPRQVLD3:** IPREQ Entry 3 contains a valid request. |
| 10 | 0h<br>RO | **IPRQVLD2:** IPREQ Entry 2 contains a valid request. |
| 9 | 0h<br>RO | **IPRQVLD1:** IPREQ Entry 1 contains a valid request. |
| 8 | 0h<br>RO | **IPRQVLD0:** IPREQ Entry 0 contains a valid request. |
| 7:5 | 0h<br>RO | **Rsvd_7_5_DSTAT:** Reserved |
| 4:0 | 0Ah<br>RO | **MNT_STATE:** Dunit Maintenance Internal State |

## 12.3.18 PGTBL (PGTBL)—Offset 21h

DRAM Page Table Status

### Access Method

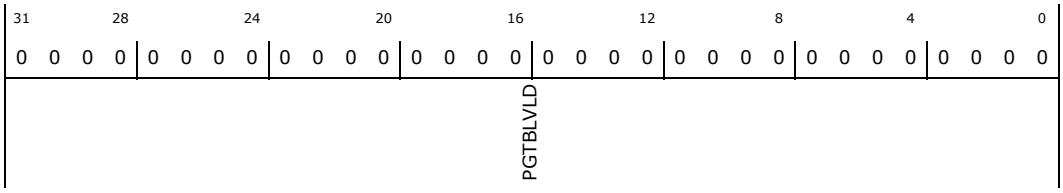
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 21h

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RO | **PGTBLVLD:** Reflects the open page table entries (4 Ranks x 8 Banks) |

## 12.3.19 MISRCCCLR (MISRCCCLR)—Offset 31h

MISR CMD/CTRL Clear

### Access Method

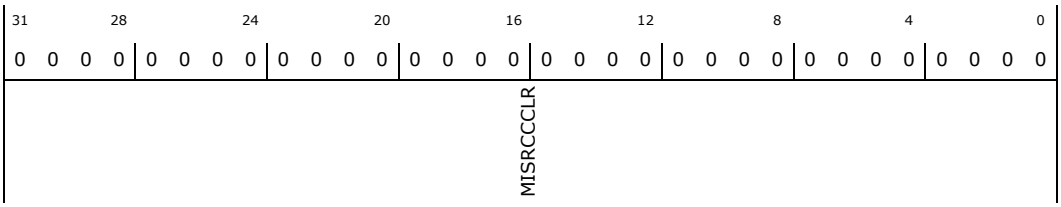
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 31h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>WO | **MISRCCCLR (MISRCCCLR):** Writing any value to this address will reset the MISRCC Signature register value to all Fs. |

## 12.3.20 MISRDDCLR (MISRDDCLR)—Offset 32h

MISR DM/DQ Clear

### Access Method

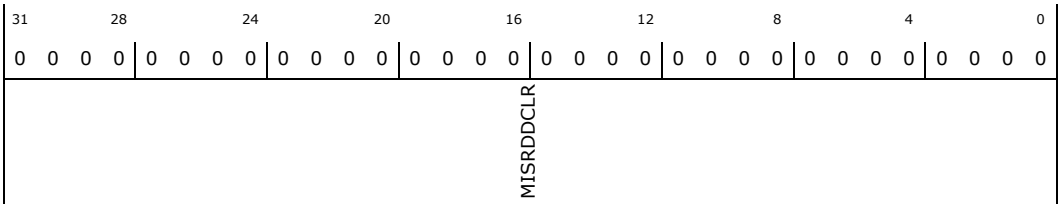
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 32h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>WO | **MISRDDCLR (MISRDDCLR):** Writing any value to this address will reset the MISRDD Signature register value to all Fs. |

## 12.3.21 MISRCCSIG (MISRCCSIG)—Offset 34h

MISR CMD/CTRL Signature

### Access Method

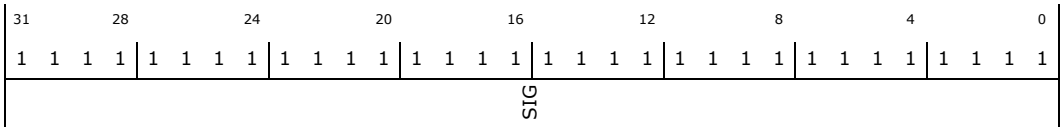
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 34h

**Op Codes:**

h - Read, h - Write

**Default:** FFFFFFFFh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | FFFFFFFFh RO | **SIG:** MISR Signature: CMD/CTRL |

## 12.3.22 MISRDDSIG (MISRDDSIG)—Offset 35h

MISR DM/DQ Signature

### Access Method

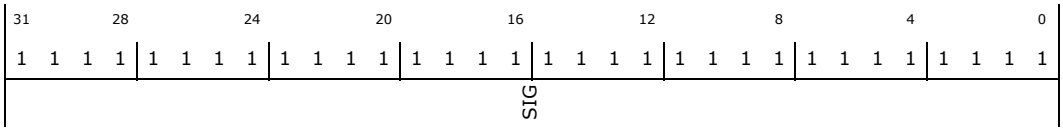
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 35h

**Op Codes:**

h - Read, h - Write

**Default:** FFFFFFFFh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | FFFFFFFFh RO | **SIG:** MISR Signature: DM/DQ |

## 12.3.23 MISRECCSIG (MISRECCSIG)—Offset 37h

MISR ECC Signature

### Access Method

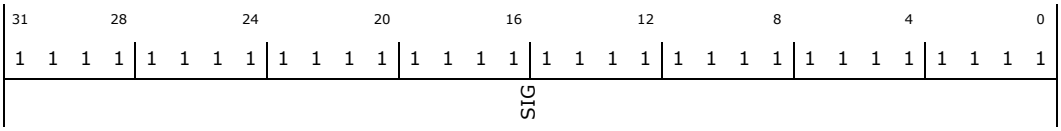
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 37h

**Op Codes:**

h - Read, h - Write

**Default:** FFFFFFFFh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | FFFFFFFFh<br>RO | **SIG:** MISR Signature ECC |

## 12.3.24 SSKPD0 (SSKPD0)—Offset 4Ah

Sticky Scratchpad 0

### Access Method

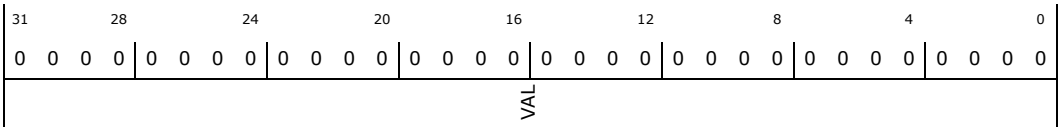
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 4Ah

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW/P | **VAL:** General Purpose Scratchpad. May be used for BIOS for data storage. Value is preserved in warm-reset. |

## 12.3.25 SSKPD1—Offset 4Bh

Sticky Scratchpad 1

### Access Method

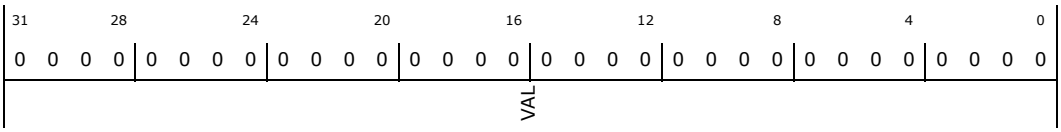
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 4Bh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW/P | **VAL:** General Purpose Scratchpad. May be used for BIOS for data storage. Value is preserved in warm-reset. |

## 12.3.26 BONUS0 (BONUS0)—Offset 50h

Bonus Register 0

### Access Method

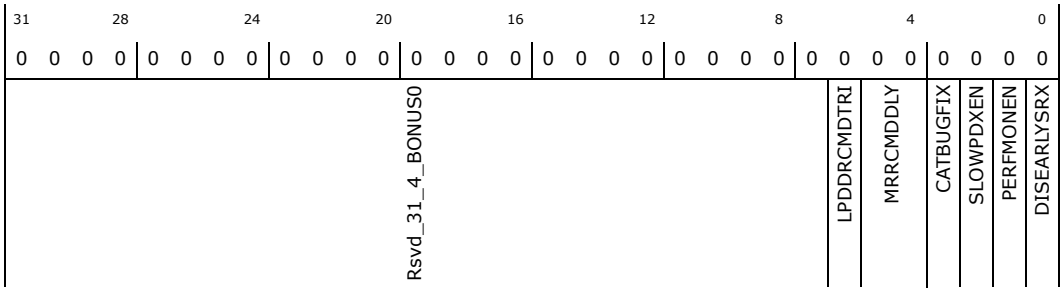
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 50h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0h<br>RO | **Rsvd_31_7_BONUS0 (Rsvd_31_4_BONUS0):** Reserved |
| 6 | 0h<br>RW | **LPDDRCMDTRI:** Enable LPDDR CMD Tri-Stating |
| 5:4 | 0h<br>RW | **MRRCMDDLY:** Adding addtional delay on MRR followed by read and write command |
| 3 | 0h<br>RW | **CATBUGFIX:** This is a defeature bit for CA training and should be set to 0 for normal operation. |
| 2 | 0h<br>RW | **SLOWPDXEN:** This bit is for enabling slow powerdown exit. |
| 1 | 0h<br>RW | **PERFMONEN:** This bit is for enabling performance monitor. |
| 0 | 0h<br>RW | **DISEARLYSRX:** This bit is for enabling early SR exit. |

## 12.3.27 BONUS1—Offset 51h

Bonus Register 1

### Access Method

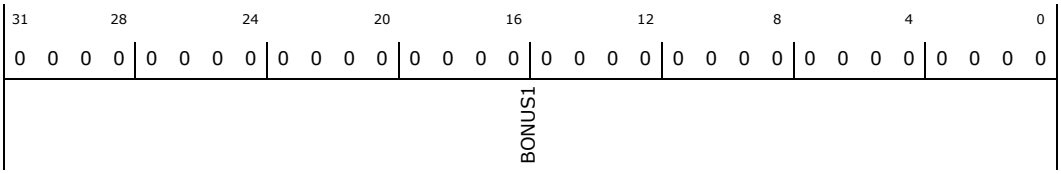
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 51h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BONUS1:** Bonus Register 1 (This register is reserved for ECO). |

## 12.3.28 DECCCTRL (DECCCTRL)—Offset 60h

DECC Control Register

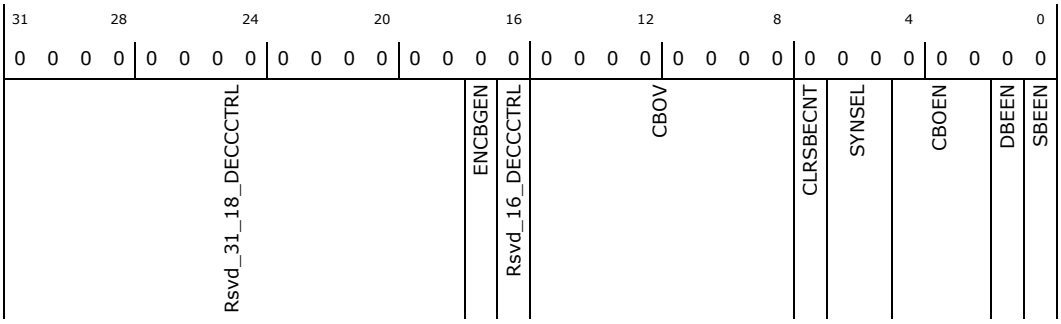
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 60h

**Op Codes:**
h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0h<br>RO | **Rsvd_31_18_DECCCTRL:** Reserved |
| 17 | 0h<br>RW | **ENCBGEN:** DFx: Enable Generation of ECC check bits 0 - Disable check bit generation 1 - Enable check bit generation |
| 16 | 0b<br>RO | **Rsvd_16_DECCCTRL:** Reserved |
| 15:8 | 00h<br>RW | **CBOV:** DFx: Check Bit Override (Host Defined Value) |
| 7 | 00h<br>RW | **CLRSBECNT:** DFx: Clear SERR counter 0 - Allow single bit error count to increment 1 - Clear single bit error count |
| 6:5 | 00h<br>RW | **SYNSEL:** DFx: Select syndrome bits from 256b read data path. 0h - Selects syndrome bits from read data [63:0] 1h - Selects syndrome bits from read data [127:64] 2h - Selects syndrome bits from read data [191:128] 3h - Selects syndrome bits from read data [255:192] |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4:2 | 000h<br>RW | **CBOEN:** DFx: Enable Check Bit Override on 256b write data path 0xx Host generated check bits disabled. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Assert Host generated check bits on write data [63:0] 5h - Assert Host generated check bits on write data [127:64] 6h - Assert Host generated check bits on write data [191:128] 7h - Assert Host generated check bits on write data [255:192] |
| 1 | 0h<br>RW | **DBEEN:** Enable Double Bit Error Detect 0 - Disable double bit error detect 1 - Enable double bit error detect |
| 0 | 0h<br>RW | **SBEEN:** Enable Single Bit Error Detect and Correct 0 - Disable single bit error detect and correct 1 - Enable single bit error detect and correct |

## 12.3.29 DECCSBECNT (DECCSBECNT)—Offset 62h

DECC Single Bit Error Count Register

### Access Method

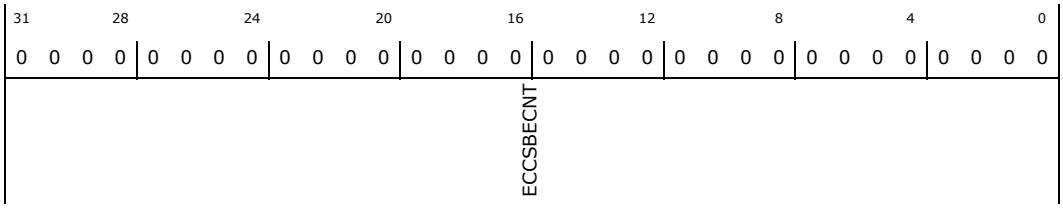
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 62h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RO | **ECCSBECNT:** ECC Single Bit Error Count Write a 1 to the CLRSBECNT bit in the DECCCTRL register to clear this register |

## 12.3.30 DFUSESTAT (DFUSESTAT)—Offset 70h

Dunit fuse status register

### Access Method

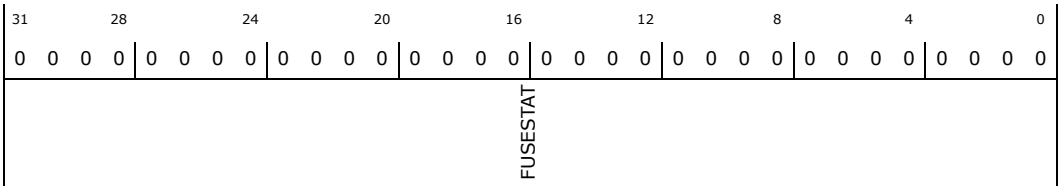
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 70h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RO | **FUSESTAT:** Dunit fuse bits are captured into this register and is available for read [0] fus_dun_ecc_dis. [3:1] fus_dun_max_supporte_memory[2:0]. [5:4] fus_dun_max_devden[1:0] [6] fus_dun_dimm2_dis [7] fus_dun_rank2_dis [8] fus_dun_ooo_dis [9] fus_dun_memx8_dis [10] fus_dun_memx16_dis [11] fus_dun_bc4_dis [12] fus_dun_1n_dis [13] fus_dun_dq_scrambler_dis [15:14] Rsvd [16] fus_dun_32bit_dram_ifc [31:17] Rsvd |

## 12.3.31 DSCRMSEED (DSCRMSEED)—Offset 80h

Dynamic data scrambler seed register ERRATA Reading this register returns the bit fields in reverse order SCRMSEED[31:14], 13'h0, SCRMDIS[0]

### Access Method

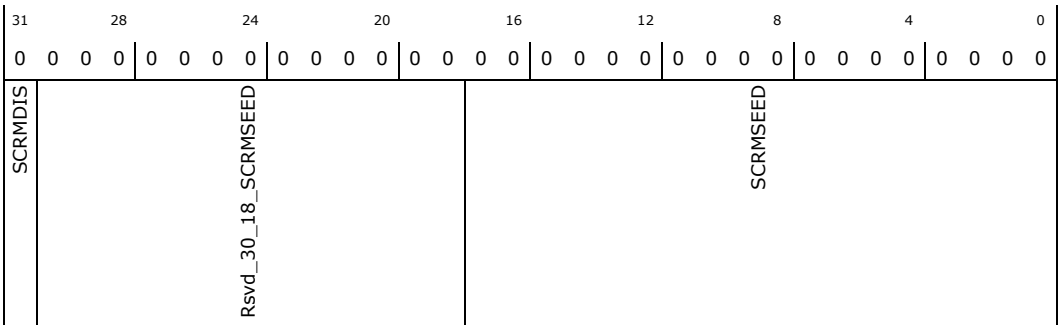
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 80h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **SCRMDIS:** Scrambler Disable 0 - Enables scrambler 1 - Disables scrambler Note: This bit has no impact with Scrambler is disabled by fuse |
| 30:18 | 0h<br>RO | **Rsvd_30_18_SCRMSEED:** Reserved |
| 17:0 | 0h<br>RW | **SCRMSEED:** Holds 18 bit scrambler seed value used to feed into LFSR array matrix. |

## 12.3.32 DSCRMLO (DSCRMLO)—Offset 81h

Dynamic data scrambler pattern low register.

### Access Method

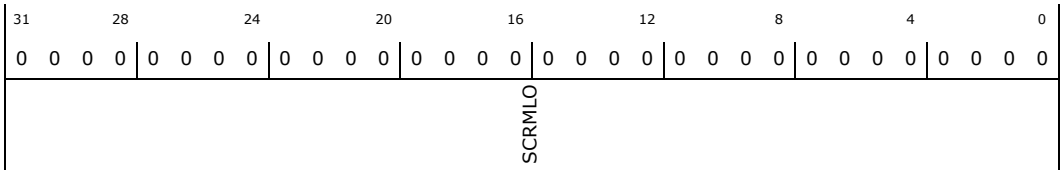
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 81h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SCRMLO:** Holds 31:0 bits of scrambler parrem value used to XOR with LFSR array output. |

## 12.3.33 DSCRMHI (DSCRMHI)—Offset 82h

Dynamic data scrambler pattern high register.

### Access Method

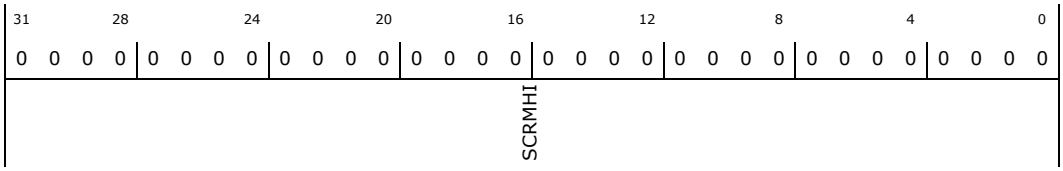
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + 82h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SCRMHI:** Holds 63:32 bits of scrambler parrem value used to XOR with LFSR array output. |

## 12.3.34 PMSEL0 (PMSEL0)—Offset E0h

Performance Monitor Event Select 0

### Access Method

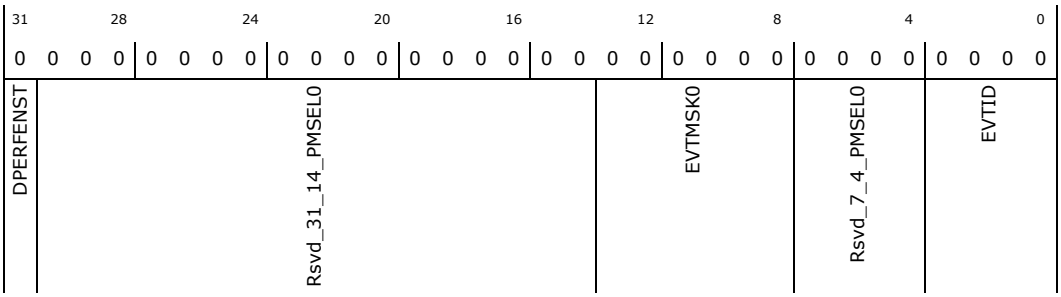
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + E0h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RO | **DPERFENST:** Dunit Perfmon Enable Status. Reflects DFX Perfmon enable. 0 - Dunit perfmon is disabled. 1 - Dunit perfmon is enabled |
| 30:14 | 0h<br>RO | **Rsvd_31_14_PMSEL0:** Reserved |
| 13:8 | 0h<br>RW | **EVTMSK0:** Event Mask |
| 7:4 | 0h<br>RO | **Rsvd_7_4_PMSEL0:** Reserved |
| 3:0 | 0h<br>RW | **EVTID:** Event ID |

## 12.3.35 PMSEL1 (PMSEL1)—Offset E1h

Performance Monitor Event Select 1

### Access Method

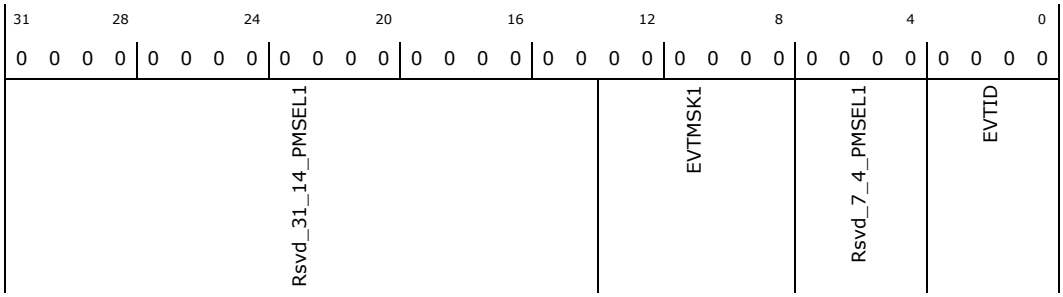
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + E1h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0h<br>RO | **Rsvd_31_14_PMSEL1:** Reserved |
| 13:8 | 0h<br>RW | **EVTMSK1:** Event Mask |
| 7:4 | 0h<br>RO | **Rsvd_7_4_PMSEL1:** Reserved |
| 3:0 | 0h<br>RW | **EVTID:** Event ID |

## 12.3.36 PMSEL2—Offset E2h

Performance Monitor Event Select 2

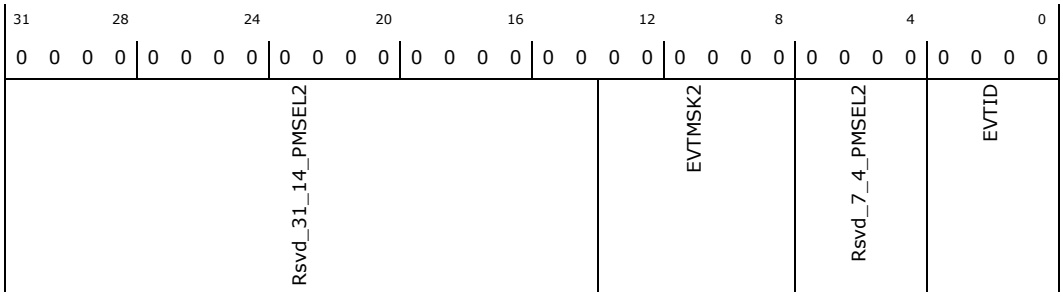
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + E2h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0h<br>RO | **Rsvd_31_14_PMSEL2:** Reserved |
| 13:8 | 0h<br>RW | **EVTMSK2:** Event Mask |
| 7:4 | 0h<br>RO | **Rsvd_7_4_PMSEL2:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0h<br>RW | **EVTID:** Event ID |

## 12.3.37 PMSEL3—Offset E3h

Performance Monitor Event Select 3

### Access Method

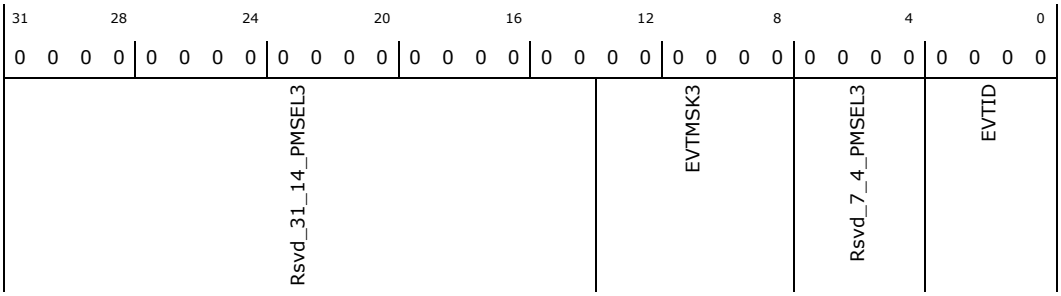
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + E3h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0h<br>RO | **Rsvd_31_14_PMSEL3:** Reserved |
| 13:8 | 0h<br>RW | **EVTMSK3:** Event Mask |
| 7:4 | 0h<br>RO | **Rsvd_7_4_PMSEL3:** Reserved |
| 3:0 | 0h<br>RW | **EVTID:** Event ID |

## 12.3.38 PMAUXMAX (PMAUXMAX)—Offset E8h

Performance Monitor Address Limit High

### Access Method

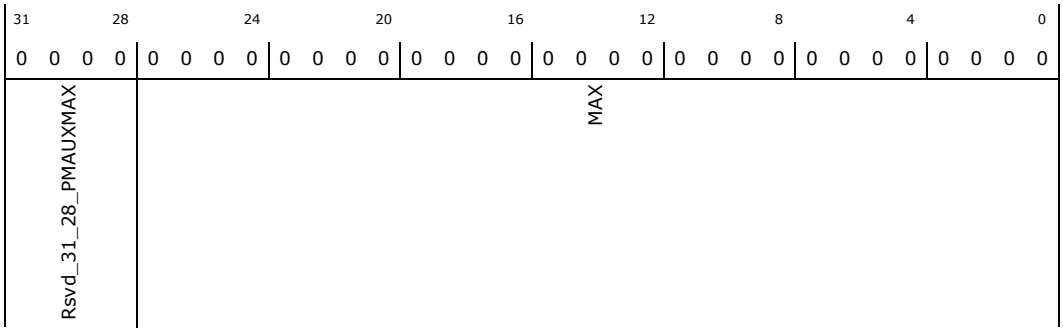
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + E8h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RO | **Rsvd_31_28_PMAUXMAX:** Reserved |
| 27:0 | 0h<br>RW | **MAX:** Maximal address or maximal latency count. When PMSEL0.EVTID == Ch, this register should be initialized to 0h and at the end of the test bits [11:0] will contain the max latency. When PMSEL0/1/2.EVTID == 5h, this register should be initialized to the highest address the Perfmon test will cover. Bits [27:0] of this register correspond to the physical address bits [32:8]. |

## 12.3.39 PMAUXMIN—Offset E9h

Performance Monitor Address Limit Low

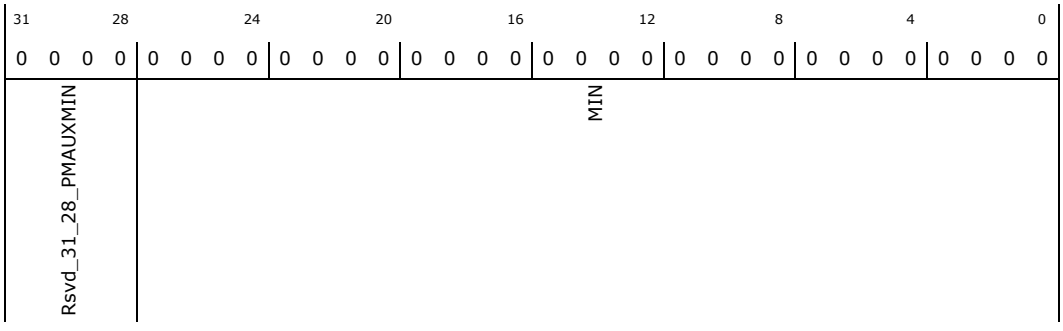
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + E9h

**Op Codes:**
h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RO | **Rsvd_31_28_PMAUXMIN:** Reserved |
| 27:0 | 0h<br>RW | **MIN:** Minimal address or minimal latency count. When PMSEL0.EVTID == Ch, this register should be initialized to FFFh and at the end of the test bits [11:0] will contain the min latency. When PMSEL0/1/2.EVTID == 5h, this register should be initialized to the lowest address the Perfmon test will cover. Bits [27:0] of this register correspond to the physical address bits [32:8]. |

## 12.3.40 PMAUX (PMAUX)—Offset EAh

Performance Monitor Aux

### Access Method

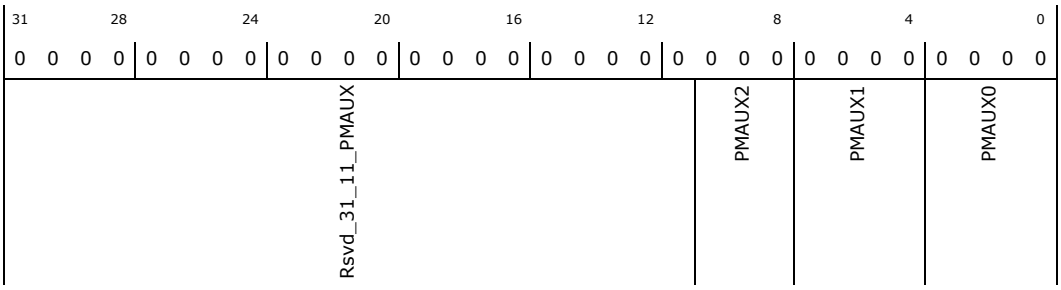
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x01] + EAh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:11 | 0h<br>RO | **Rsvd_31_11_PMAUX:** Reserved |
| 10:8 | 0h<br>RW | **PMAUX2:** Additional mask and configuration. See Perfmon Guide. |
| 7:4 | 0h<br>RW | **PMAUX1:** Additional mask and configuration. See Perfmon Guide. |
| 3:0 | 0h<br>RW | **PMAUX0:** Additional mask and configuration. See Perfmon Guide. |

# 13 SoC Transaction Router

The SoC Transaction Router is a central hub that routes transactions between the CPU cores, graphics controller, IO and the memory controller. In general, it handles:

- CPU Core Interface: Requests for CPU Core-initiated memory and IO read and write operations and processor-initiated message-signaled interrupt transactions
- Device MMIO and PCI configuration routing
- Buffering and memory arbitration
- PCI Config and MMIO accesses to host device (0/0/0)

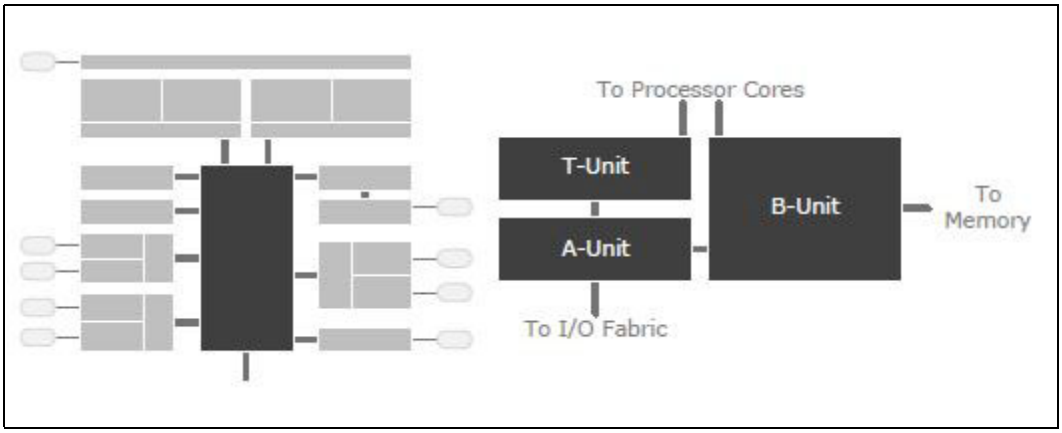


**Figure 90. Soc Transaction Router Register Map**

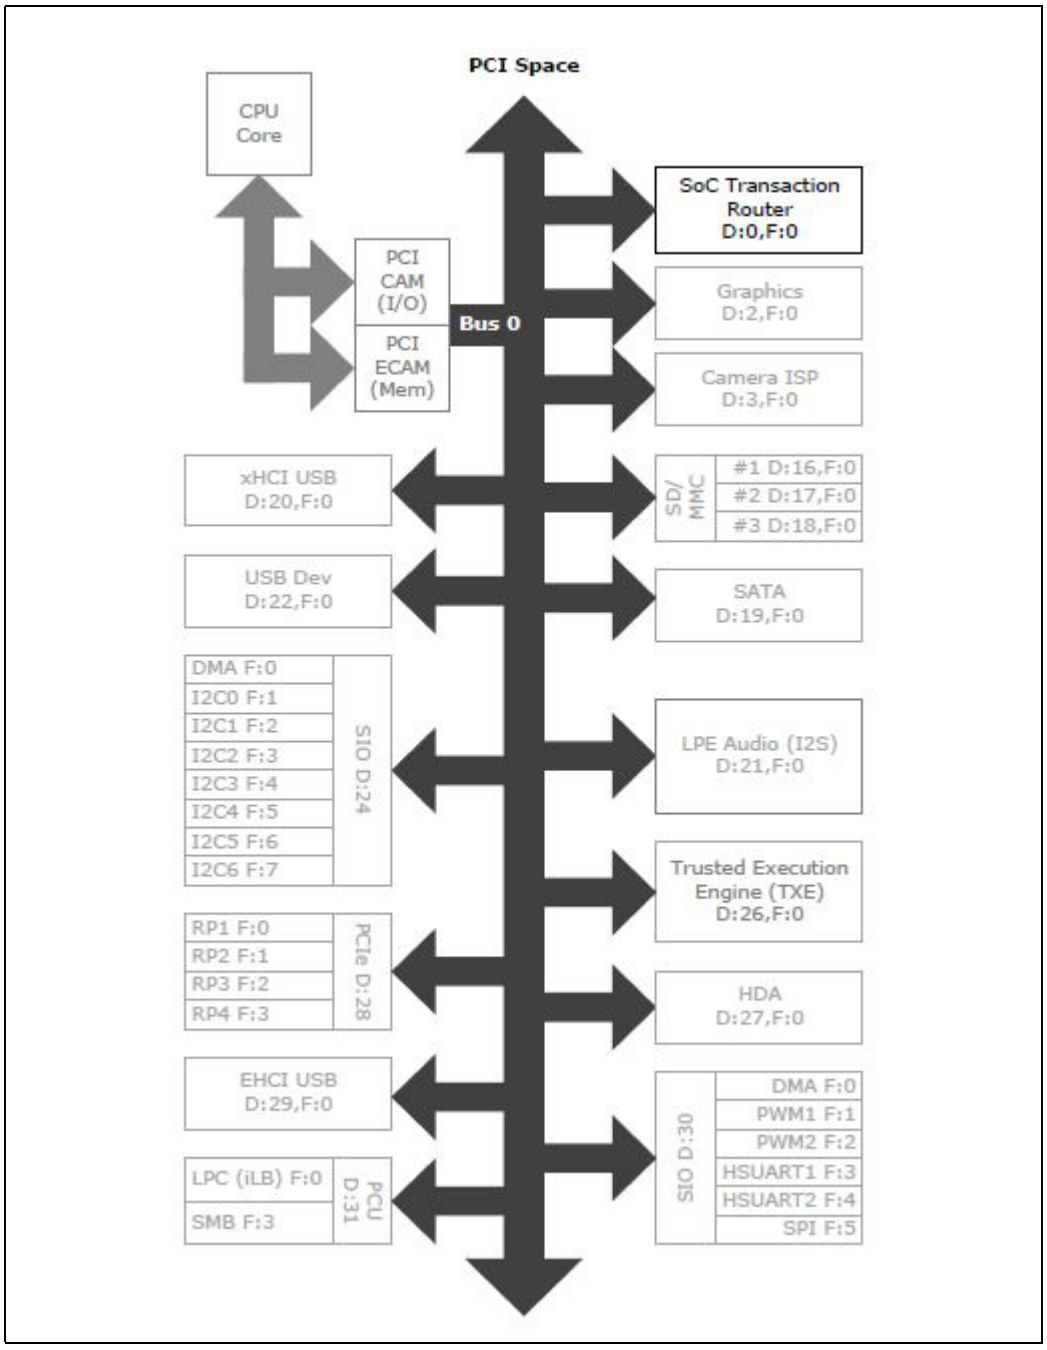


§

## 13.1 Transaction Router A-Unit Message Registers

### Table 159. Summary of A-Unit Message Bus Registers—Port 0x00

| Offset | Register Name (Register Symbol) | Default Value |
|---|---|---|
| 10–10h | "ACF8—Offset 10h" on page 324 | 00000000h |
| 52–52h | "ADBGERRLOG—Offset 52h" on page 325 | 00000000h |

### 13.1.1 ACF8—Offset 10h

A-Unit Configuration CF8 Value (ACF8) The A-Unit CF8 (PCI Configuration Address Register) is made available for save/restore purposes. This register is saved and restored by the Punit during S0iX transitions in order to ensure proper handling of a possible subsequent CFC transaction after returning from standby or hibernate state. This is carried over from Aunit implementation in LNC.

#### Access Method

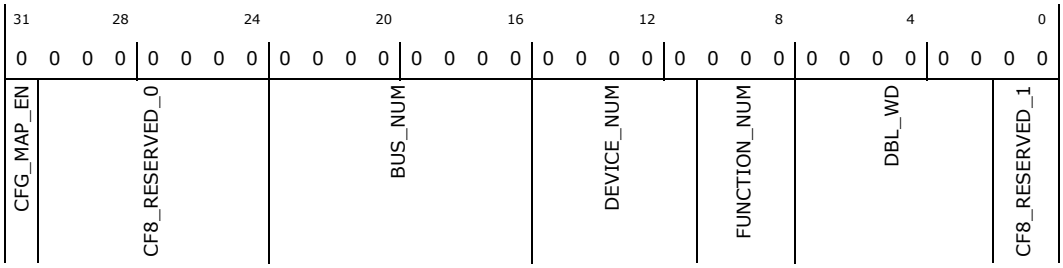
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x00] + 10h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h RW | **CFG_MAP_EN:** Configuration Space Mapping Enable: This bit enables Configuration Space mapping. The value set by full-dword writes to I/O address CF8 |
| 30:24 | 0h RW | **CF8_RESERVED_0:** Reserved. The value set by full-dword writes to I/O address CF8 |
| 23:16 | 0h RW | **BUS_NUM:** Bus Number: This is the target Bus Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 15:11 | 0h RW | **DEVICE_NUM:** Device Number: This is the target Device Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 10:8 | 0h RW | **FUNCTION_NUM:** Function Number: This is the target Function Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 7:2 | 0h RW | **DBL_WD:** Double Word: This is the target dword of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 1:0 | 0h RW | **CF8_RESERVED_1:** Reserved. This field should be always set to 2'b00. The value set by full-dword writes to I/O address CF8 |

## 13.2 SoC Transaction Router PCI Config Access IO Registers

SoC Transaction Router PCI Config Access IO Registers

### Table 160. Summary of PCI Configuration Space Access I/O Registers

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| CF8–CF8h | 1 | "ACF8—Offset CF8h" on page 327 | 00000000h |
| CFC–CFFh | 4 | "ACFC—Offset CFCh" on page 328 | 00000000h |

### 13.2.1 ACF8—Offset CF8h

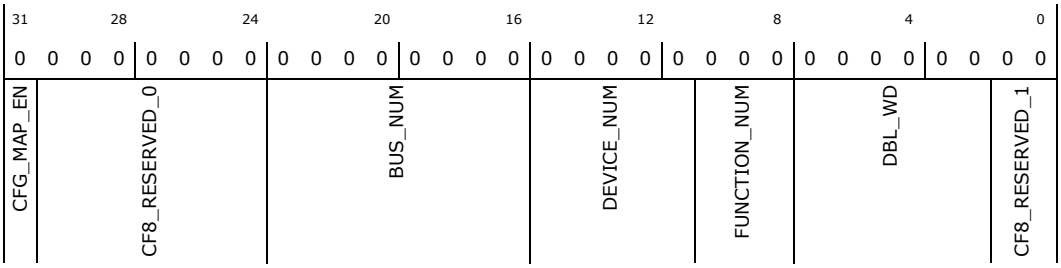
A-Unit Configuration CF8 Value (ACF8) The A-Unit CF8 (PCI Configuration Address Register) is made available for save/restore purposes. This register is saved and restored by the Punit during S0iX transitions in order to ensure proper handling of a possible subsequent CFC transaction after returning from standby or hibernate state. This is carried over from Aunit implementation in LNC.

#### Access Method

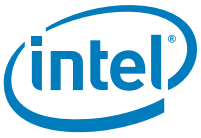
**Type:** I/O Register
(Size: 32 bits)

**Offset:** CF8h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **CFG_MAP_EN:** Configuration Space Mapping Enable: This bit enables Configuration Space mapping. The value set by full-dword writes to I/O address CF8 |
| 30:24 | 0h<br>RW | **CF8_RESERVED_0:** Reserved. The value set by full-dword writes to I/O address CF8 |
| 23:16 | 0h<br>RW | **BUS_NUM:** Bus Number: This is the target Bus Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 15:11 | 0h<br>RW | **DEVICE_NUM:** Device Number: This is the target Device Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 10:8 | 0h<br>RW | **FUNCTION_NUM:** Function Number: This is the target Function Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 7:2 | 0h<br>RW | **DBL_WD:** Double Word: This is the target dword of the resulting Configuration request. The value set by full-dword writes to I/O address CF8 |
| 1:0 | 0h<br>RW | **CF8_RESERVED_1:** Reserved. This field should be always set to 2'b00. The value set by full-dword writes to I/O address CF8 |



## 13.2.2 ACFC—Offset CFCh

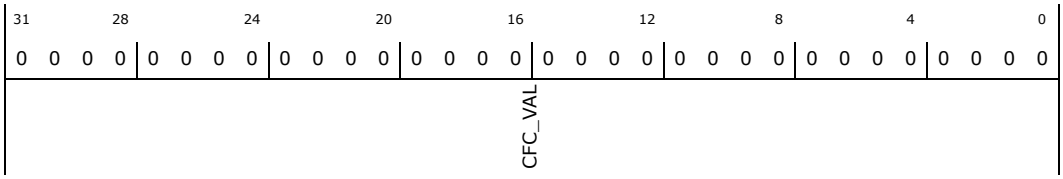
A-Unit Configuration CFC Value (ACFC) The A-Unit CFC (PCI Configuration Data Port).

### Access Method

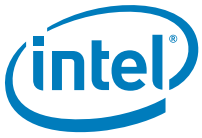
**Type:** I/O Register
(Size: 32 bits)

**Offset:** CFCh

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CFC_VAL:** CFC Value: The value set by full-dword writes to I/O address CFC |



## 13.3 Transaction Router B-Unit Message Registers

### Table 161. Summary of B-Unit Message Bus Registers—Port 0x03

| Offset | Register Name (Register Symbol) | Default Value |
|---|---|---|
| 8–8h | "BBANKMASK—Offset 8h" on page 330 | 0000000Eh |
| 9–9h | "BROWMASK—Offset 9h" on page 331 | 00FFFFFEh |
| A–Ah | "BRANKMASK—Offset Ah" on page 332 | 00000004h |
| 1A–1Ah | "BIMRDATA—Offset 1Ah" on page 333 | 00000000h |
| 1B–1Bh | "BPMRVCTL—Offset 1Bh" on page 334 | 00000000h |
| 23–23h | "BNOCACHE—Offset 23h" on page 335 | 00000000h |
| 24–24h | "BNOCACHECTL—Offset 24h" on page 336 | 00000000h |
| 25–25h | "BMBOUND—Offset 25h" on page 337 | 40000000h |
| 26–26h | "BMBOUND_HI—Offset 26h" on page 337 | 80000000h |
| 27–27h | "BECREG—Offset 27h" on page 338 | 00000000h |
| 2E–2Eh | "BSMMRRL—Offset 2Eh" on page 339 | 00000000h |
| 2F–2Fh | "BSMMRRH—Offset 2Fh" on page 340 | 00000000h |
| 30–30h | "BC0AHASHCFG—Offset 30h" on page 340 | 00000000h |
| 3E–3Eh | "BTHCTRL—Offset 3Eh" on page 342 | 00000001h |
| 3F–3Fh | "BTHMASK—Offset 3Fh" on page 343 | FFFFFFFFh |

### 13.3.1 BBANKMASK—Offset 8h

BUnit Bank Mask (BBANKMASK) The BBANKMASK register is used by the address-aware scheduling mechanism to determine the bit location of the bank bits within a 35 bit addresses. Bits 23:0 of this register are mapped to bits 35:12 of the addresses in the Bunit tag store PnP: The defaultBank mask is assuming static map select which is not available on VLV2. By default hash map is enabled for bank calculation so the default value should be set to 0 according to the HAS.

#### Access Method

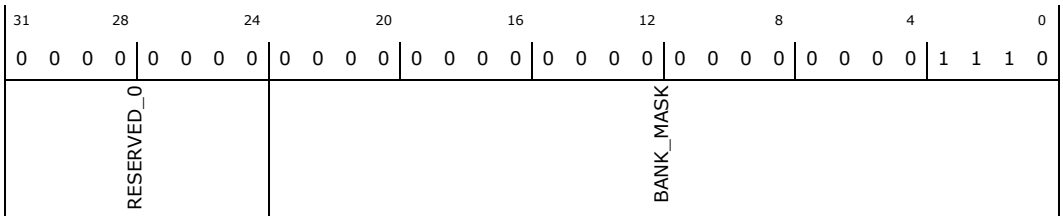
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 8h

**Op Codes:**

h - Read, h - Write

**Default:** 0000000Eh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RESERVED_0:** Reserved |
| 23:0 | 0eh<br>RW | **BANK_MASK:** Bank_mask: Bit mask that corresponds to the location of the bank bits within bits 35:12 of a system address |

## 13.3.2 BROWMASK—Offset 9h

BUnit Row Mask (BROWMASK) The BROWMASK register is used by the address-aware scheduling mechanism to determine the bit location of the row bits within a 35 bit addresses. Bits 23:0 of this register are mapped to bits 35:12 of the addresses in the Bunit tag store

### Access Method

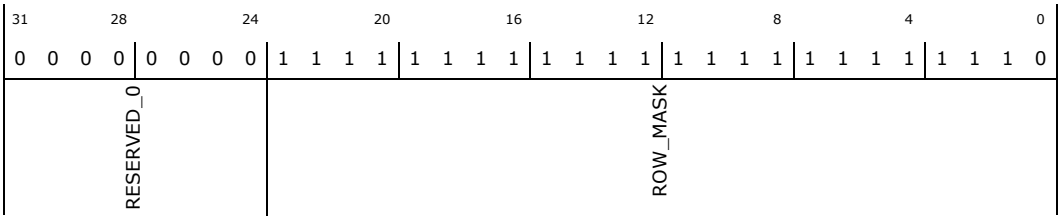
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 9h

**Op Codes:**

h - Read, h - Write

**Default:** 00FFFFFEh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RESERVED_0:** Reserved |
| 23:0 | fffffeh<br>RW | **ROW_MASK:** Row_mask: Bit mask that corresponds to the location of the row bits within bits 35:12 of a system address PnP: Value for perf and powerperf based on drp DIMMDEN0 8Gbit and x16 device which points to column in dunit HAS with rank size 4GB and width x16 (Set all the bits except column bits and we push all the bits up by 1 for system address which makes the mask from bit 14 to bit 34 of system address, hence the value 7ffffc). But VLV will support only 2 ranks so change it to 3ffffc PnP: Set the appropriate value from the Range based on rank density and device width of dram (Note: For 32Bit interfaces, for each of these, simply right shift the corresp option by 1) |

## 13.3.3 BRANKMASK—Offset Ah

BUnit Rank Mask (BRANKMASK) The BRANKMASK register is used by the address-aware scheduling mechanism to determine the bit location of the rank bits within a 35 bit addresses. Bits 9:0 of this register are mapped to bits 35:26 of the addresses in the Bunit tag store

### Access Method

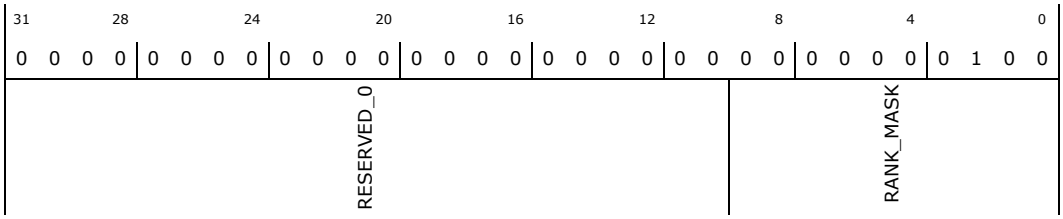
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + Ah

**Op Codes:**

h - Read, h - Write

**Default:** 00000004h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 00h<br>RO | **RESERVED_0:** Reserved |
| 9:0 | 04h<br>RW | **RANK_MASK:** Rank_mask: Bit mask that corresponds to the location of the rank bits within bits 35:26 of a system address PnP:Set the rankmask from the range based on the rank density and device width of dram used |

## 13.3.4 BIMRDATA—Offset 1Ah

BUnit Protected Memory Region Data Value

### Access Method

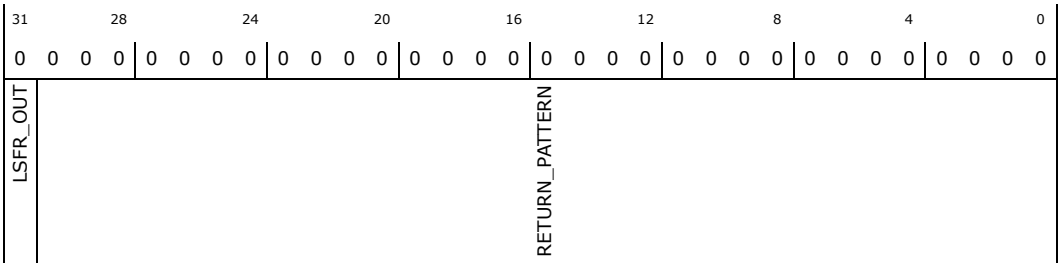
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 1Ah

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **LSFR_OUT:** Return LFSR Output on Range Violation : When set, the BUnit will return a stamped-down version of the output of an LFSR register instead of the data from the data return portion of this register. |
| 30:0 | 0h<br>RW | **RETURN_PATTERN:** Data Return Pattern for disallowed operations (DataPattern): This 31-bit value will be repeated along the 256-bit data bus and returned to any agent that has performed an access to the restricted access region. |

## 13.3.5 BPMRVCTL—Offset 1Bh

BUnit Protected Memory Range Violation Control

### Access Method

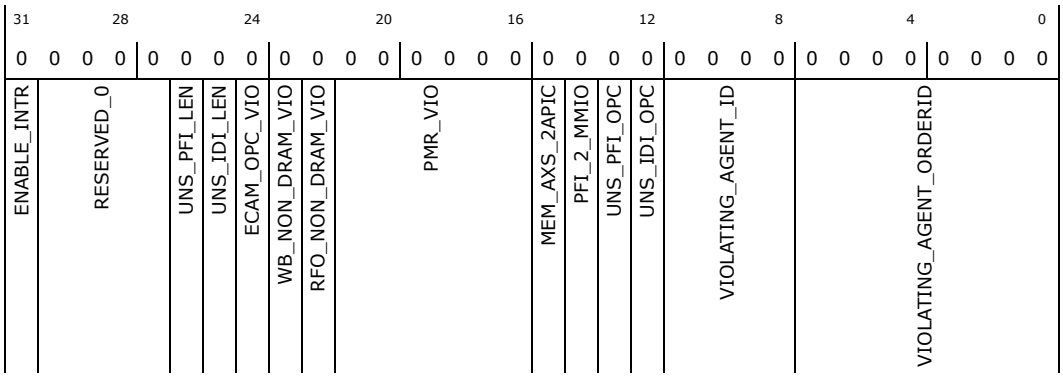
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 1Bh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **ENABLE_INTR:** Enable Interrupt on Protected Memory Region Violation (EnablePMRInt): When set, the BUnit will latch violation information into this register and send an interrupt request (opcode 0x70) to the PUnit. This bit is cleared upon triggering and must be reset by software in order to trigger again. Memory protection is maintained even while the interrupt/capture mechanism is disabled. It is used to enable software debug of IMR errors, and is not expected to be used in end-user systems |
| 30:27 | 0h<br>RO | **RESERVED_0:** Reserved |
| 26 | 0b<br>RO | **UNS_PFI_LEN:** Unsupported PFI length. |
| 25 | 0b<br>RO | **UNS_IDI_LEN:** Unsupported IDI length. |
| 24 | 0b<br>RO | **ECAM_OPC_VIO:** ECAM opcode is not PRD or WIL. |
| 23 | 0b<br>RO | **WB_NON_DRAM_VIO:** IDI WB is not to DRAM space. |
| 22 | 0b<br>RO | **RFO_NON_DRAM_VIO:** IDI RFO is not to DRAM space. |
| 21:16 | 0h<br>RO | **PMR_VIO:** Protected Memory Range Violation : This 6-bit value indicates which region was last violated when the interrupt is enabled.. |
| 15 | 0h<br>RO | **MEM_AXS_2APIC:** Memory Access to APIC region from a PFI Agent |
| 14 | 0h<br>RO | **PFI_2_MMIO:** MMIO Access from a PFI Agent |
| 13 | 0h<br>RO | **UNS_PFI_OPC:** Unsupported PFI Request Opcode |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 0h<br>RO | **UNS_IDI_OPC:** Unsupported IDI Request Opcode |
| 11:8 | 0h<br>RO | **VIOLATING_AGENT_ID:** Protect Asset Access Violation Agent ID: This 4-bit value indicates which agent caused the last access violation if the interrupt is enabled. The Agent ID values are assigned starting with the IDI Attach Points first followed by the PFI Agents. For a configuration using 1 IDI Attach point the IDI Attach Point Agent ID would be 0 and the PFI Agent IDs would start at 1. For 2 IDI Attach Points the IDI Attach Points values would be 0 or 1 and the PFI Agent IDs would start at 2. |
| 7:0 | 0h<br>RO | **VIOLATING_AGENT_ORDERID:** Protect Asset Access Violation Order ID: This value indicates the Order ID of the agent that caused the last access violation, if the interrupt is enabled. If access violation was from an IDI attach point this field latches the LPID. |

## 13.3.6 BNOCACHE—Offset 23h

BUnit Non-Cached Region (BNOCACHE) This register defines a region of memory that, when DMA devices behind PFI agents perform an access (whether snooped or not), will not cause an IDI snoop.

### Access Method

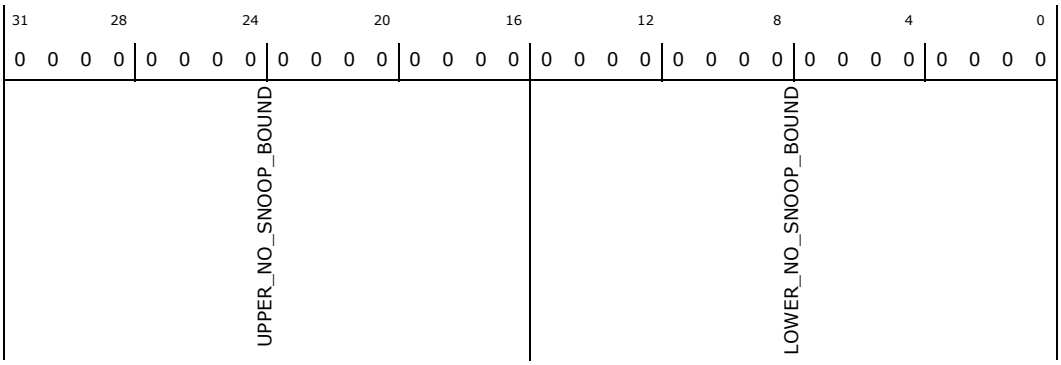
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 23h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **UPPER_NO_SNOOP_BOUND:** Upper Bound (UpperNoSnoopBound): These bits are compared with bits 35:20 of the incoming address to determine the upper 1MB aligned value of the non-snoop range when EnableNoSnoop is set. |
| 15:0 | 0000h<br>RW | **LOWER_NO_SNOOP_BOUND:** Lower Bound (LowerNoSnoopBound): These bits are compared with bits 35:20 of the incoming address to determine the lower 1MB aligned value of the protected range when EnableNoSnoop is set. |

## 13.3.7 BNOCACHECTL—Offset 24h

BUnit Non-Cached Region (BNOCACHECTL)

### Access Method

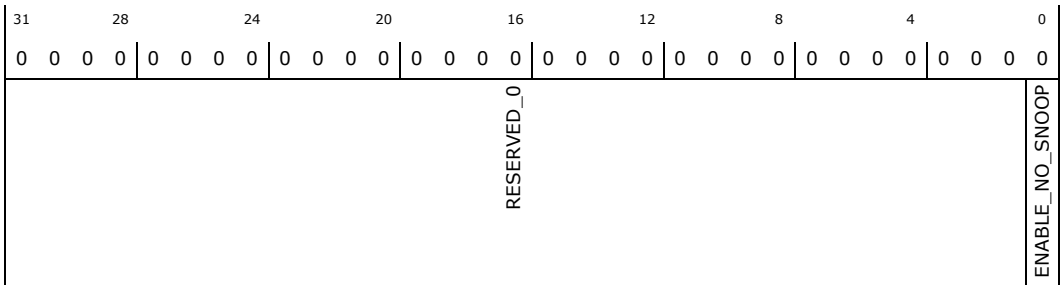
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 24h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0000h<br>RO | **RESERVED_0:** Reserved |
| 0 | 0h<br>RW | **ENABLE_NO_SNOOP:** Enabled (EnableNoSnoop): When set, Bunit compares bits 35:20 incoming addresses to Upper and Lower NoSnoop Bounds to see if the transaction should be prevented from issuing a processor snoop operation |

## 13.3.8 BMBOUND—Offset 25h

Bunit Memory/IO Boundary Register

### Access Method

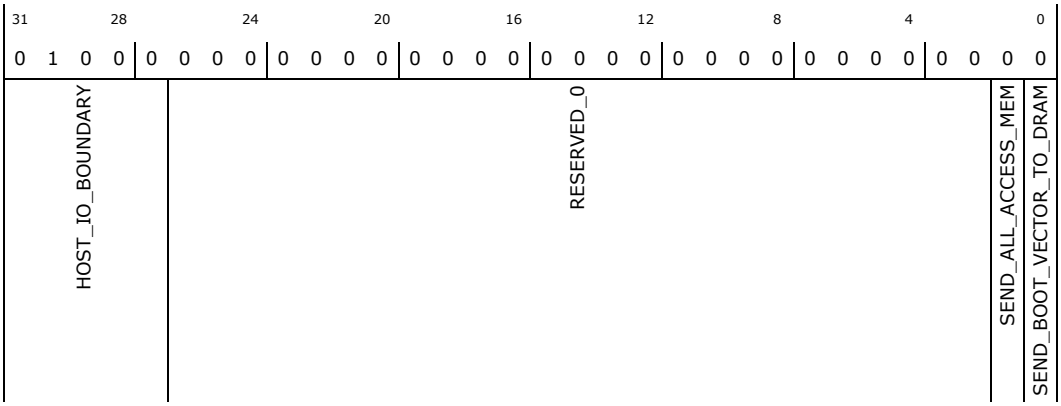
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 25h

**Op Codes:**

h - Read, h - Write

**Default:** 40000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 008h<br>RW | **HOST_IO_BOUNDARY:** Host IO Boundary: Bits 31:27 are compared with incoming Host Memory Request addresses to understand whether the associated transactions should be routed to memory space (DRAM) or IO space. The Host IO Boundary starts at this address and continues up to the 4GB address, 0xFFFF_FFFF. |
| 26:2 | 0000000h<br>RO | **RESERVED_0:** Reserved |
| 1 | 0h<br>RW | **SEND_ALL_ACCESS_MEM:** Send All Accesses to Memory: When set, all accesses will be sent to memory, regardless of address. |
| 0 | 0h<br>RW | **SEND_BOOT_VECTOR_TO_DRAM:** When set accesses from 0xFFFF0000-0xFFFFFFFF will be sent to memory regardless of the Host IO Boundary setting. |

## 13.3.9 BMBOUND_HI—Offset 26h

Bunit Memory/IO HI Boundary Register

### Access Method

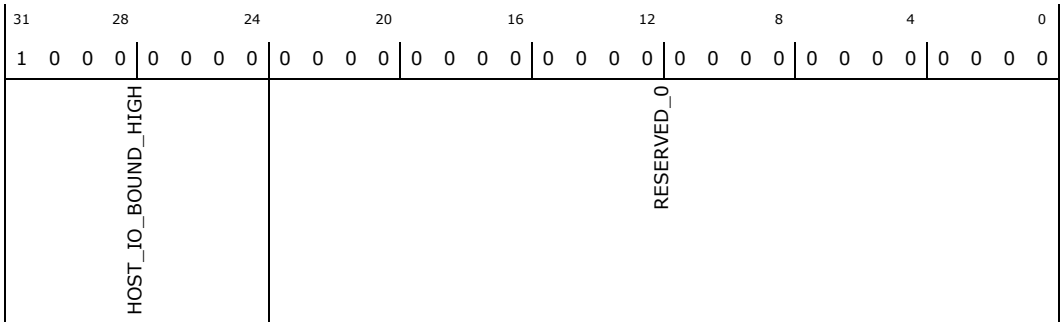
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 26h

**Op Codes:**

h - Read, h - Write

**Default:** 80000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 80h<br>RW | **HOST_IO_BOUND_HIGH:** Host IO Boundary High: Bits 31:24 are compared with bits 35:28 of incoming addresses of all memory accesses above 4GB to understand whether the associated transactions should be routed to memory space (Bunit) or IO space (Aunit). If bits 35:28 of the address are greater than or equal to the Host IO Boundary High register field, then the transaction is routed to the MMIO space. |
| 23:0 | 0000000h<br>RO | **RESERVED_0:** Reserved |

## 13.3.10 BECREG—Offset 27h

Bunit Extended Configuration Space Config

### Access Method

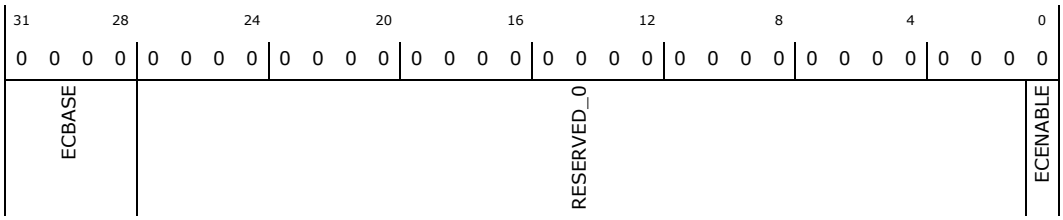
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 27h

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RW | **ECBASE:** EC Boundary (ECBase): Describes bits [31:28] of the range being used to access memory-mapped configuration space through the AUnit. |
| 27:1 | 0000000h<br>RO | **RESERVED_0:** Reserved |
| 0 | 0h<br>RW | **ECENABLE:** EC Enable (ECEnable): When set, causes the ECBase range to be compared to incoming Host Memory Request addresses. If bits [35:28] of a Memory access match the ECBase value, then a posted memory operation is treated as a non-posted operation by the T-unit and A-unit. Additionally, a Memory Write to Configuration Space will be serialized by T-unit and A-unit hardware as Non-Posted Writes |

## 13.3.11 BSMMRRL—Offset 2Eh

Bunit System Management Range Register Low The SMM space is used to protect BIOS or other embedded code from corruption by the operating system. As such, the ranges below only should be set to cover memory space that is mapped into DRAM.

### Access Method

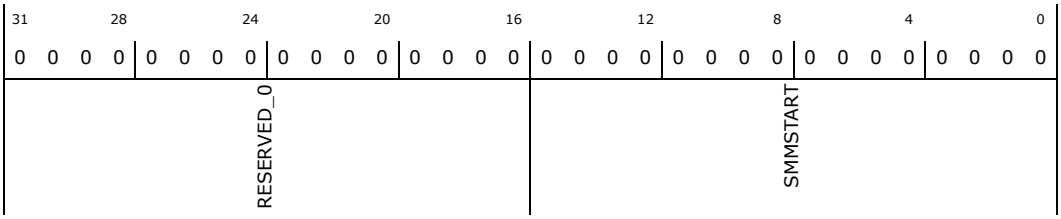
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 2Eh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 000h RO | **RESERVED_0:** Reserved |
| 15:0 | 000h RW | **SMMSTART:** Lower Bound (SMMStart): These bits are compared with bits 35:20 of the incoming address to determine the lower 1MB aligned value of the protected range. |

## 13.3.12 BSMMRRH—Offset 2Fh

Bunit System Management Range Register Hi The SMM space is used to protect BIOS or other embedded code from corruption by the operating system. As such, the ranges below only should be set to cover memory space that is mapped into DRAM.

### Access Method

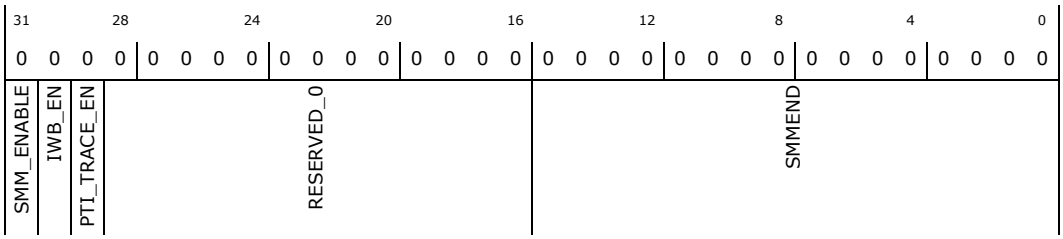
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 2Fh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **SMM_ENABLE:** SMM Enable: Enables the error checking for the System Management region. |
| 30 | 0h<br>RW | **IWB_EN:** Enables IWB |
| 29 | 0h<br>RW | **PTI_TRACE_EN:** PTI Trace Enable: Enables snooping of transactions to the SMM region by PTI tracing agents. This bit should be set for VISA Lites so matches/hits to SMM region can be viewed. |
| 28:16 | 000h<br>RO | **RESERVED_0:** Reserved |
| 15:0 | 000h<br>RW | **SMMEND:** Upper Bound (SMMEnd): These bits are compared with bits 35:20 of the incoming address to determine the upper 1MB aligned value of the protected range . |

## 13.3.13 BC0AHASHCFG—Offset 30h

The Bunit Address Hash Configuration register can be used to enable a hashing function for specifying the bank and rank bits used by the Dunit. When this Address Hashing function is enabled the Bunit Bank Mask and Rank Mask configuration registers should be disabled by writing it with all 0s.

### Access Method

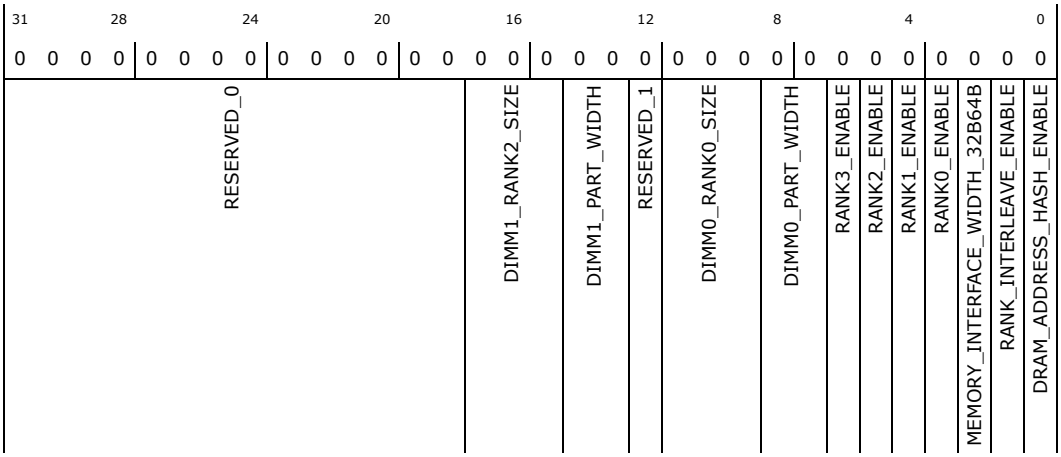
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 30h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0h<br>RO | **RESERVED_0:** Reserved |
| 17:15 | 0h<br>RW | **DIMM1_RANK2_SIZE:** Configures the memory size of the ranks used by the address hash function for DIMM1. Note: If the Dunit DIMM Flip bit is set to 1 this field is the rank size for DIMM0. 0h = 128MB 1h = 256MB 2h = 512MB 3h = 1GB 4h = 2GB 5h = 4GB 6h = 8GB 7h = Reserved |
| 14:13 | 0h<br>RW | **DIMM1_PART_WIDTH:** Note: If the Dunit DIMM Flip bit is set to 1 this field is the part width for DIMM0. 0h: 8-bit 1h: 16-bit 2h: 32-bit 3h: Reserved |
| 12 | 0h<br>RO | **RESERVED_1:** Reserved |
| 11:9 | 0h<br>RW | **DIMM0_RANK0_SIZE:** Configures the memory size of the ranks used by the address hash function for DIMM0. Note: If Dunit DIMM Flip bit is set to 1 this field is the rank size for DIMM1. 0h = 128MB 1h = 256MB 2h = 512MB 3h = 1GB 4h = 2GB 5h = 4GB 6h = 8GB 7h= Reserved // PnP: Set based on how ranks are populated. Assuming RANK0,1 on DIMM0 are used. |
| 8:7 | 0h<br>RW | **DIMM0_PART_WIDTH:** Note: If the Dunit DIMM Flip bit is set to 1 this field is the part width for DIMM1. // PnP: Set based on how ranks are populated. Assuming x16 0h: 8-bit 1h: 16-bit 2h: 32-bit 3h: Reserved |
| 6 | 0h<br>RW | **RANK3_ENABLE:** When set Rank3 for DIMM1 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 1. |
| 5 | 0h<br>RW | **RANK2_ENABLE:** When set Rank2 for DIMM1 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 0. |
| 4 | 0h<br>RW | **RANK1_ENABLE:** When set Rank1 for DIMM0 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 3. |
| 3 | 0h<br>RW | **RANK0_ENABLE:** When set Rank0 for DIMM0 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 2. |
| 2 | 0h<br>RW | **MEMORY_INTERFACE_WIDTH_32B64B:** When set to 1: Configures the hashing function for 64b memory interface. When set to 0: Configures the hashing function for 32b memory interface. |
| 1 | 0h<br>RW | **RANK_INTERLEAVE_ENABLE:** When Set to 1: Enables hashing function to be used for Dunit Rank Select bits. When Set to 0: Disable the hashing function to be used for Dunit Rank Select bits. PnP: This has to match the RSIEN in DRP register in Dunit |
| 0 | 0h<br>RW | **DRAM_ADDRESS_HASH_ENABLE:** When Set to 1: Enables hashing function to be used for Dunit Bank and Rank Select bits. When Set to 0: Disable the hashing function to be used for Dunit Bank and Rank Select bits. When disabled the Dunit Bank and Rank select bits are specified using BBANKMASK And BRANKMASK configuration registers. |

## 13.3.14 BTHCTRL—Offset 3Eh

BUnit Throttling Control (BTHCTRL)

### Access Method

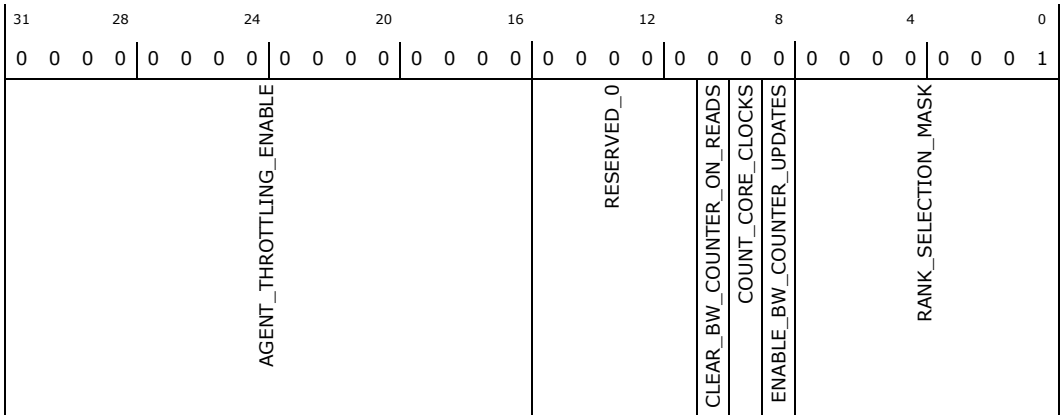
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 3Eh

**Op Codes:**

h - Read, h - Write

**Default:** 00000001h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **AGENT_THROTTLING_ENABLE:** Agent[15:0] Throttling Enable: Setting a bit in the 16 bit vector allows the BUnit to be configured to throttle Agents 0 to 15 requests in extreme conditions. /PnP: Leaving the Value for Power as ffff but will likely result in very low perf due to lower bandwidth. |
| 15:11 | 0h<br>RO | **RESERVED_0:** Reserved |
| 10 | 0h<br>RW | **CLEAR_BW_COUNTER_ON_READS:** When set clears the Bandwidth Counter when read. |
| 9 | 0h<br>RW | **COUNT_CORE_CLOCKS:** Count Core Clocks (CountCoreClocks): Debug feature used to cause the Bunit to send bandwidth usage updates based upon 1024 core-clock periods, rather than 1024 us periods. In addition, the values reported during bandwidth counter updates will represent 32-byte quantities transferred, instead of 8k byte quantities. |
| 8 | 0h<br>RW | **ENABLE_BW_COUNTER_UPDATES:** Enable Bandwidth Counter Updates (EnableBWCounterUpdates): The bandwidth counters always count the reads and writes to even and odd ranks. When updates are enabled, the Bunit will send an update message to the Punit roughly every millisecond with the current values contained in the bandwidth counters. When the message is sent, the counters are reset. When EnableBWCounterUpdates bit is clear, the counters will be reset only by the Clear Bandwidth Counters message. |
| 7:0 | 01h<br>RW | **RANK_SELECTION_MASK:** Rank Selection Mask (RankPickMask): Bit mask compared to bits [35:28] of the incoming addresses to determine whether that address maps to Rank 'A' or to Rank 'B' PnP: Needs to match RANKMASK reg Note: Dunit RANK Hashing implemented for VLV XORs several address bits to create the Rank Select. Therefore this register no longer selects the actual Rank address of the request. Recommendation is to set this value to 0 and only use EVEN BW Counters in BBWC to determine total memory bandwidth. |

## 13.3.15 BTHMASK—Offset 3Fh

Bunit Throttling Masks (BTHMASK) The BTHMASK register contains the fields that control BUnit throttling of transactions to DRAM. If any channel is throttled 100%, by its field being set to all zeroes, then a system deadlock is possible.

### Access Method

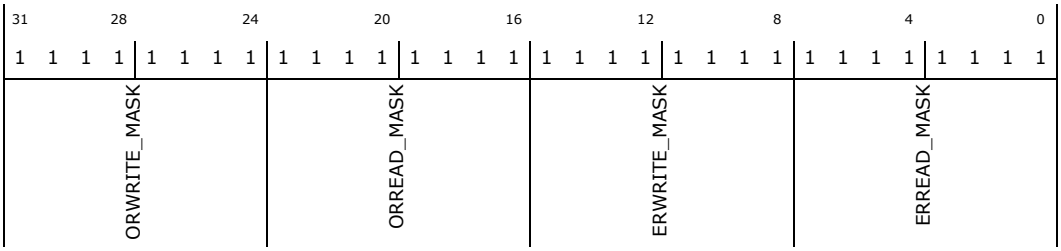
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x03] + 3Fh

**Op Codes:**

h - Read, h - Write

**Default:** FFFFFFFFh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | FFh<br>RW | **ORWRITE_MASK:** Odd Ranks Write Mask (ORWriteMask): The Odd Rank Write mask is an eight bit value that determines the 1us time slices during which write transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration. |
| 23:16 | FFh<br>RW | **ORREAD_MASK:** Odd Ranks Read Mask (ORReadMask): The Odd Rank Read mask is an eight bit value that determines the 1us time slices during which read transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration. |
| 15:8 | FFh<br>RW | **ERWRITE_MASK:** Even Rank Write Mask (ERWriteMask): The Even Rank Write mask is an eight bit value that determines the 1us time slices during which write transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration. |
| 7:0 | FFh<br>RW | **ERREAD_MASK:** Even Rank Read Mask (ERReadMask): The Even Rank Read mask is an eight bit value that determines the 1us time slices during which read transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration. |

## 13.4 Transaction Router C-Unit PCI Registers

### Table 162. Summary of C-Unit PCI Configuration Registers—0/0/0

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| 0–0h | 1 | "CUNIT_REG_DEVICEID—Offset 0h" on page 344 | 00008086h |
| 4–4h | 1 | "CUNIT_CFG_REG_PCISTATUS—Offset 4h" on page 345 | 00000007h |
| 8–8h | 1 | "CUNIT_CFG_REG_CLASSCODE—Offset 8h" on page 346 | 06000000h |
| C–Ch | 1 | "CUNIT_CFG_REG_HDR_TYPE—Offset Ch" on page 347 | 00000000h |
| 2C–2Ch | 1 | "CUNIT_CFG_REG_STRAP_SSID—Offset 2Ch" on page 347 | 00000000h |
| D0–D3h | 4 | "CUNIT_MSG_CTRL_REG—Offset D0h" on page 348 | 00000000h |
| D4–D4h | 1 | "CUNIT_MSG_DATA_REG—Offset D4h" on page 348 | 00000000h |
| D8–D8h | 1 | "CUNIT_MSG_CTRL_REG_EXT—Offset D8h" on page 349 | 00000000h |
| F8–F8h | 1 | "CUNIT_MSG_CTRL_REG_EXT—Offset D8h" on page 349 | 00000000h |

### 13.4.1 CUNIT_REG_DEVICEID—Offset 0h

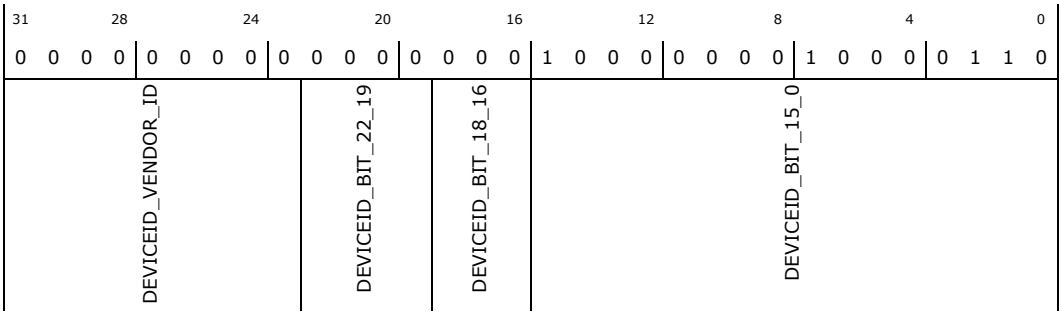
CUnit Configuration Register Device ID/Vendor ID. Device ID and Vendor ID Strapped in from top level. Reset value to strapDID[15:3],fuse[2:0], 16'h8086 these bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3

#### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 0h

**Default:** 00008086h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0h<br>RW | **DEVICEID_VENDOR_ID:** Device ID and Vendor ID bit [15:7] are strapped in from top level. These bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3. for VLV/VLV2, final setting of this field is from SETIDVALUE message, while for TNG it uses the strapped setting. For all SOC's, the RDL defalut is set to the strapped setting in that SOC. Please refer to the SoC documentation to determine the proper Device ID for the chip. |
| 22:19 | 0h<br>RO | **DEVICEID_bit_22_19 (DEVICEID_BIT_22_19):** Device ID [6:3] Hardwired in the design. SETIDVALUE message will not re-write this field. RDL default is set to the strapped value |
| 18:16 | 0h<br>RO | **DEVICEID_bit_18_16 (DEVICEID_BIT_18_16):** Device ID [2:0]. Strapped in from top level and tied to fuses to determine product SKU. SETIDVALUE message will not re-write this field. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 8086h<br>RO | **DEVICEID_bit_15_0 (DEVICEID_BIT_15_0):** Hardwired |

## 13.4.2 CUNIT_CFG_REG_PCISTATUS—Offset 4h

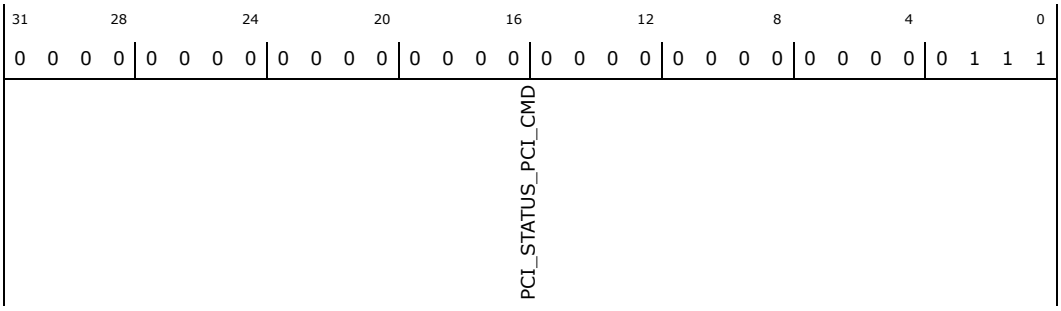
CUnit Configuration Register Device ID/Vendor ID

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 4h

**Default:** 00000007h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000007h<br>RO | **PCI_STATUS_PCI_CMD:** PCI Status and PCI Command. Hardwired to 32'h00000007 |

## 13.4.3 CUNIT_CFG_REG_CLASSCODE—Offset 8h

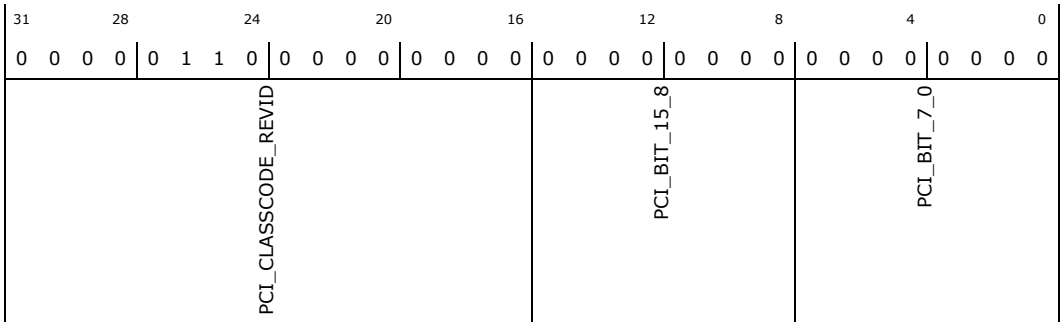
CUnit Configuration register Header Type and Master Latency Time

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 8h

**Default:** 06000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0600h<br>RO | **PCI_CLASSCODE_REVID:** PCI Class Code |
| 15:8 | 00h<br>RO | **PCI_BIT_15_8:** Hardwired to 8'h00 |
| 7:0 | 0h<br>RW | **PCI_BIT_7_0:** PCI revision ID. these bits can be re-written from SETIDVALUE message 1st DW data byte 0 |

## 13.4.4 CUNIT_CFG_REG_HDR_TYPE—Offset Ch

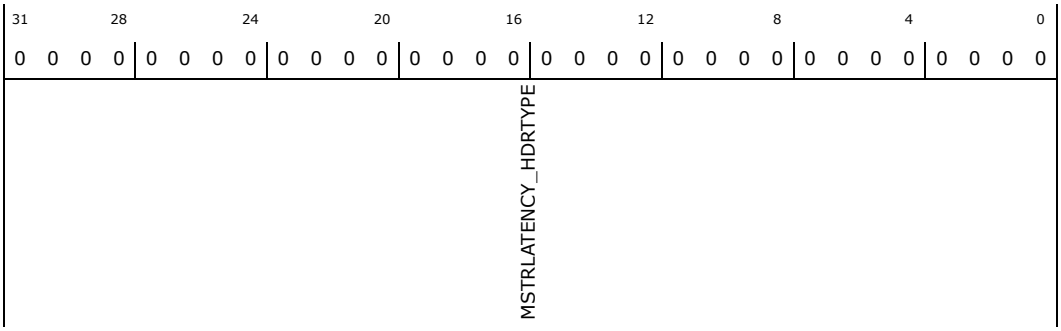
CUnit Configuration Register Device ID/Vendor ID

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + Ch

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **MSTRLATENCY_HDRTYPE:** Master Latency Timer and Header Type hardwired to 0 |

## 13.4.5 CUNIT_CFG_REG_STRAP_SSID—Offset 2Ch

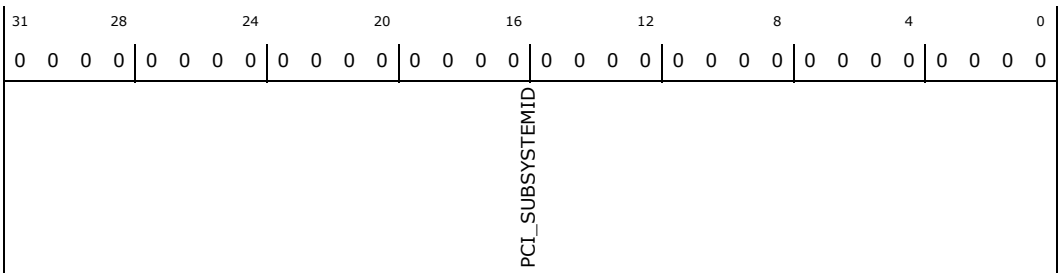
CUnit Configuration Register Device ID/Vendor ID

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + 2Ch

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **PCI_SUBSYSTEMID:** PCI Subsystem ID passed in from top-level straps strapSSID[31:0] |

## 13.4.6 CUNIT_MSG_CTRL_REG—Offset D0h

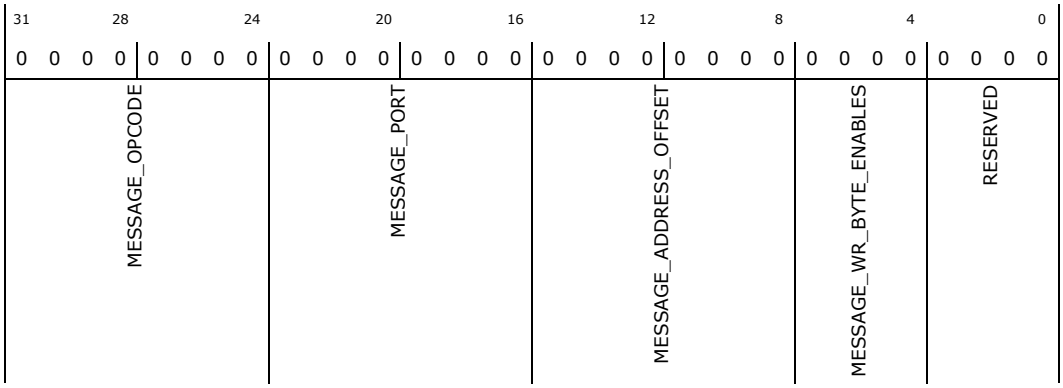
Message Control Register (MCR) - provides the message bus command fields. A write to this register issues a message on the Message Network with the fields specified by the write data. All byte enables must be enabled when writing this register. The physical registers reside in the target unit. This register does not reside in the Cunit.

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + D0h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>WO | **MESSAGE_OPCODE:** Opcode for message to be sent out on message network |
| 23:16 | 00h<br>WO | **MESSAGE_PORT:** Destination PortID for message to be sent out on message network |
| 15:8 | 00h<br>WO | **MESSAGE_ADDRESS_OFFSET:** Address offset for message to be sent out on message network |
| 7:4 | 0h<br>WO | **MESSAGE_WR_BYTE_ENABLES:** Active high byte enables which enable each of the corresponding bytes in the MDR when high. |
| 3:0 | 00h<br>WO | **RESERVED:** Reserved |

## 13.4.7 CUNIT_MSG_DATA_REG—Offset D4h

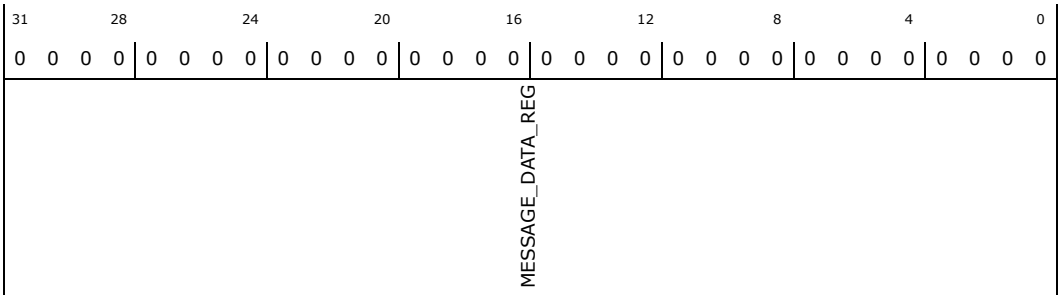
Message Data Register (MDR) - provides the means to specify data to be written or retrieving data that was read during a message operation. For messages with a data payload, MDR must be written with the data to be sent prior to a write to MCR. For messages that return data, MDR contains the data read after the write to MCR completes.

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + D4h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **SIDEBAND_DATA_REG (MESSAGE_DATA_REG):** Sideband Data Register (MDR) |

## 13.4.8 CUNIT_MSG_CTRL_REG_EXT—Offset D8h

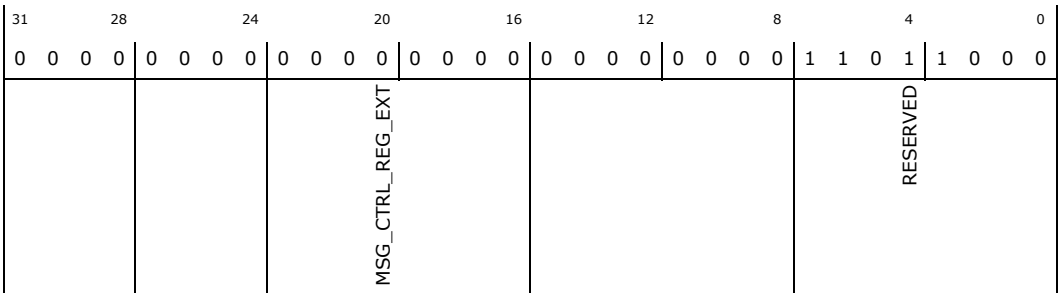
Message Control Register Extension for MCR/MDR provides bits 31:8 of the address/ offset for sideband transactions that require it. Must be written before MCR. Returns to '0 after MCR is written.

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] +D8h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 000000<br>RW | MSG_CTRL_REG_EXT: Message Control Register Extension for MCR/MDR |
| 7:0 | 00h<br>R0 | RESERVED: Reserved |

## 13.4.9 CUNIT_MANUFACTURING_ID—Offset F8h

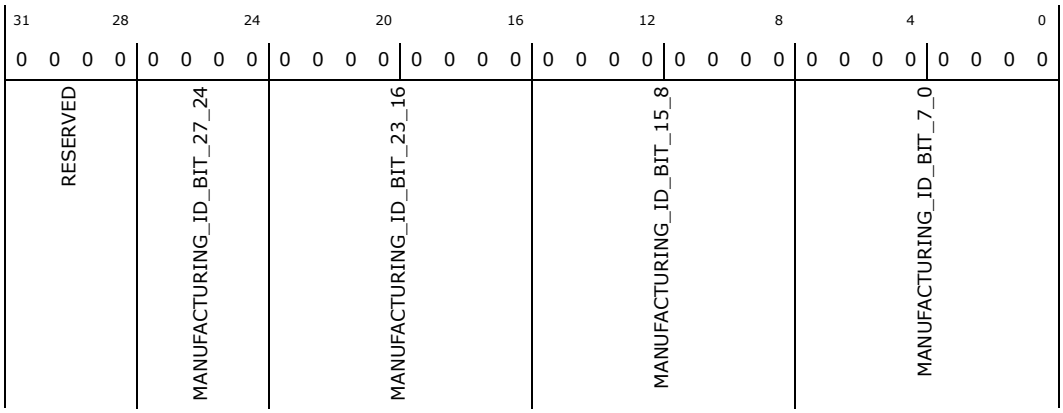
CUnit Manufacturing ID Register

### Access Method

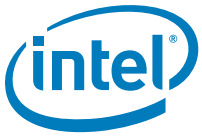
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:0, F:0] + F8h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RW | **RESERVED:** Reserved, these bits can be re-written frmo SETIDVALUE message 2nd DW data byte 3 upper nibble |
| 27:24 | 0h<br>RW | **MANUFACTURING_ID_BIT_27_24:** Dot Portion of Process, these bits can be re-written from SETIDVALUE message 2nd DW data byte 3 lower nibble |
| 23:16 | 0h<br>RW | **MANUFACTURING_ID_BIT_23_16:** Process Portion of Process ID, these bits can be re-written from SETIDVALUE message 2nd DW data byte 0 |
| 15:8 | 0h<br>RW | **MANUFACTURING_ID_BIT_15_8:** Manufacturing ID (MID), these bits can be re-written from SETIDVALUE message 2nd DW data byte 1 |
| 7:0 | 0h<br>RW | **MANUFACTURING_ID_BIT_7_0:** Manufacturing Stepping ID (MSID), these bits can be re-written from SETIDVALUE message 2nd DW data byte 2 |



## 13.5 Transaction Router C-Unit Message Registers

### Table 163. Summary of C-Unit Message Bus Registers—Port 0x08

| Offset | Register Name (Register Symbol) | Default Value |
|---|---|---|
| 0–0h | "CUNIT_REG_DEVICEID—Offset 0h" on page 352 | 00008086h |
| 1–1h | "CUNIT_CFG_REG_PCISTATUS—Offset 1h" on page 353 | 00000007h |
| 2–2h | "CUNIT_CFG_REG_CLASSCODE—Offset 2h" on page 353 | 06000000h |
| 3–3h | "CUNIT_CFG_REG_HDR_TYPE—Offset 3h" on page 354 | 00000000h |
| B–Bh | "CUNIT_CFG_REG_STRAP_SSID—Offset Bh" on page 355 | 00000000h |
| 3E–3Eh | "CUNIT_MANUFACTURING_ID—Offset 3Eh" on page 356 | 00000000h |

### 13.5.1 CUNIT_REG_DEVICEID—Offset 0h

CUnit Configuration Register Device ID/Vendor ID. Device ID and Vendor ID Strapped in from top level. Reset value to strapDID[15:3],fuse[2:0], 16'h8086 these bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3

#### Access Method

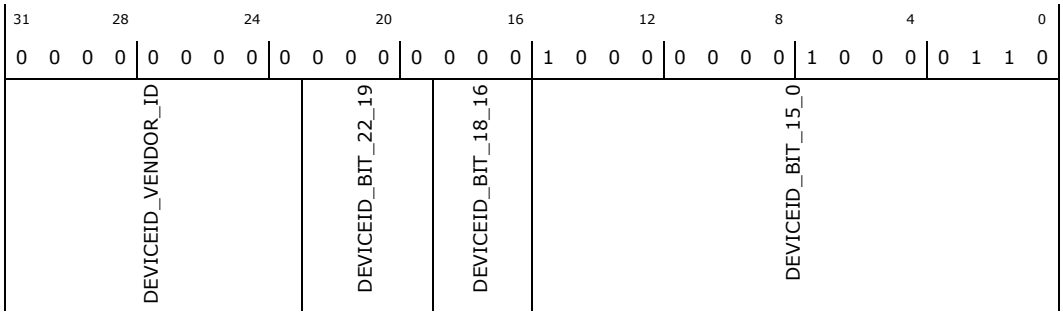
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x08] + 0h

**Op Codes:**

h - Read, h - Write

**Default:** 00008086h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0h<br>RW | **DEVICEID_VENDOR_ID:** Device ID and Vendor ID bit [15:7] are strapped in from top level. These bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3. for VLV/VLV2, final setting of this field is from SETIDVALUE message, while for TNG it uses the strapped setting. For all SOC's, the RDL defalut is set to the strapped setting in that SOC. Please refer to the SoC documentation to determine the proper Device ID for the chip. |
| 22:19 | 0h<br>RO | **DEVICEID_bit_22_19 (DEVICEID_BIT_22_19):** Device ID [6:3] Hardwired in the design. SETIDVALUE message will not re-write this field. RDL default is set to the strapped value |
| 18:16 | 0h<br>RO | **DEVICEID_bit_18_16 (DEVICEID_BIT_18_16):** Device ID [2:0]. Strapped in from top level and tied to fuses to determine product SKU. SETIDVALUE message will not re-write this field. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 8086h<br>RO | **DEVICEID_bit_15_0 (DEVICEID_BIT_15_0):** Hardwired |

## 13.5.2 CUNIT_CFG_REG_PCISTATUS—Offset 1h

CUnit Configuration Register Device ID/Vendor ID

### Access Method

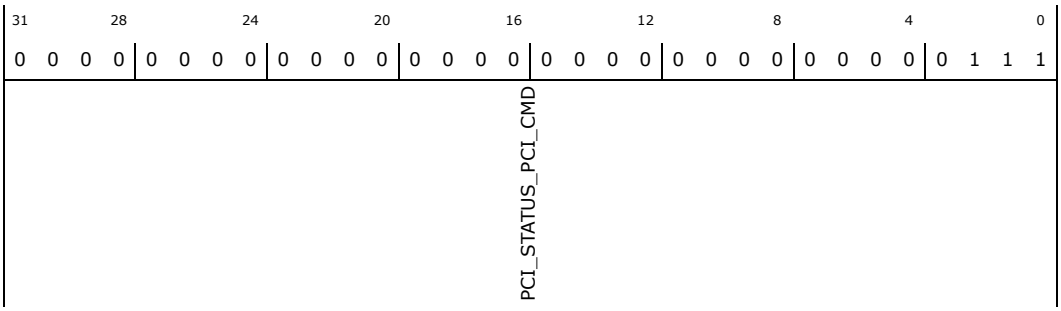
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x08] + 1h

**Op Codes:**

h - Read, h - Write

**Default:** 00000007h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000007h<br>RO | **PCI_STATUS_PCI_CMD:** PCI Status and PCI Command. Hardwired to 32'h00000007 |

## 13.5.3 CUNIT_CFG_REG_CLASSCODE—Offset 2h

CUnit Configuration register Header Type and Master Latency Time

### Access Method

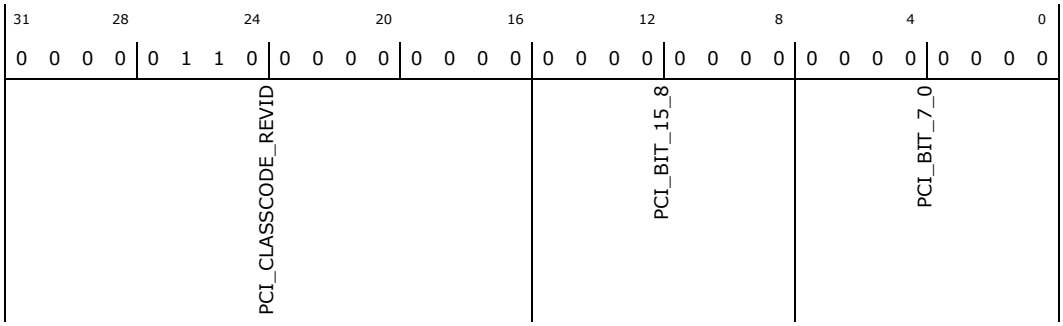
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x08] + 2h

**Op Codes:**

h - Read, h - Write

**Default:** 06000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0600h<br>RO | **PCI_CLASSCODE_REVID:** PCI Class Code |
| 15:8 | 00h<br>RO | **PCI_BIT_15_8:** Hardwired to 8'h00 |
| 7:0 | 0h<br>RW | **PCI_BIT_7_0:** PCI revision ID. these bits can be re-written from SETIDVALUE message 1st DW data byte 0 |

## 13.5.4 CUNIT_CFG_REG_HDR_TYPE—Offset 3h

CUnit Configuration Register Device ID/Vendor ID

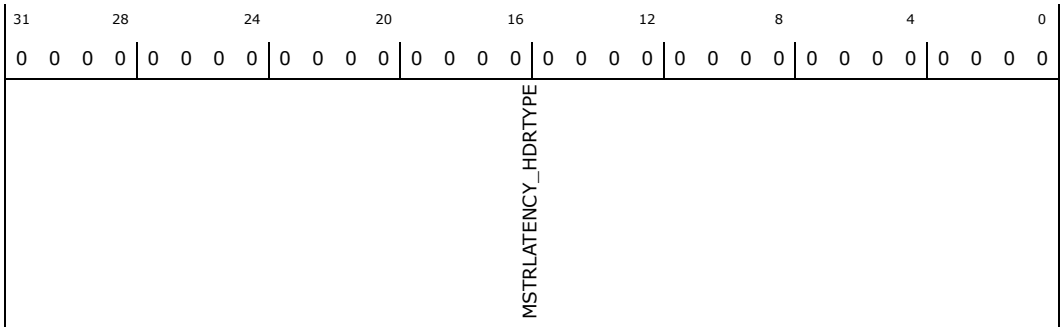
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x08] + 3h

**Op Codes:**
h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **MSTRLATENCY_HDRTYPE:** Master Latency Timer and Header Type hardwired to 0 |

## 13.5.5 CUNIT_CFG_REG_STRAP_SSID—Offset Bh

CUnit Configuration Register Device ID/Vendor ID

### Access Method

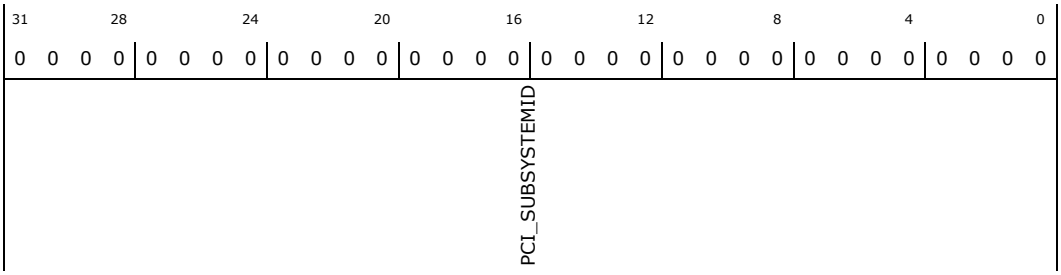
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x08] + Bh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **PCI_SUBSYSTEMID:** PCI Subsystem ID passed in from top-level straps<br>strapSSID[31:0] |

## 13.5.6 CUNIT_MANUFACTURING_ID—Offset 3Eh

CUnit Manufacturing ID Register

### Access Method

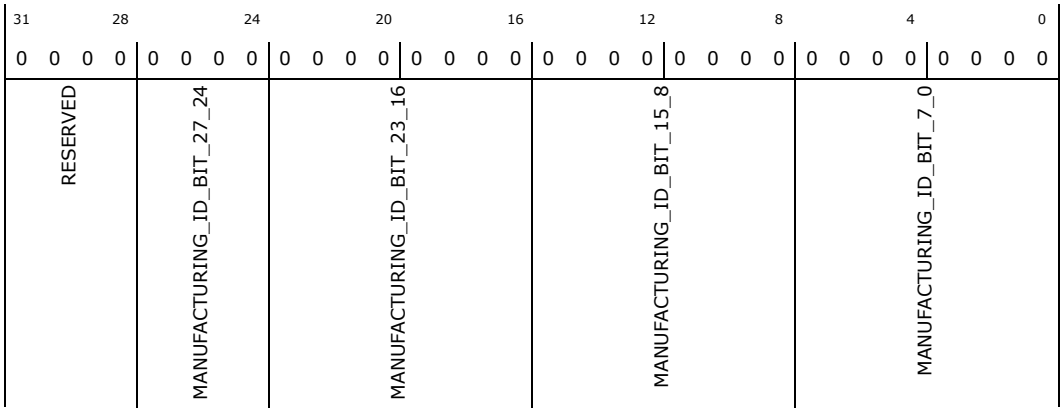
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x08] + 3Eh

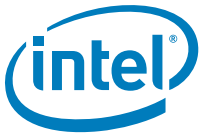
**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RW | **RESERVED:** Reserved, these bits can be re-written frmo SETIDVALUE message 2nd DW data byte 3 upper nibble |
| 27:24 | 0h<br>RW | **MANUFACTURING_ID_BIT_27_24:** Dot Portion of Process, these bits can be re-written from SETIDVALUE message 2nd DW data byte 3 lower nibble |
| 23:16 | 0h<br>RW | **MANUFACTURING_ID_BIT_23_16:** Process Portion of Process ID, these bits can be re-written from SETIDVALUE message 2nd DW data byte 0 |
| 15:8 | 0h<br>RW | **MANUFACTURING_ID_BIT_15_8:** Manufacturing ID (MID), these bits can be re-written from SETIDVALUE message 2nd DW data byte 1 |
| 7:0 | 0h<br>RW | **MANUFACTURING_ID_BIT_7_0:** Manufacturing Stepping ID (MSID), these bits can be re-written from SETIDVALUE message 2nd DW data byte 2 |



## 13.6 Transaction Router P-Unit Message Registers

### Table 164. Summary of Transaction Router P-Unit Message Bus Registers—Port 0x04

| Offset | Register Name (Register Symbol) | Default Value |
|---|---|---|
| 1–1h | "THERMAL_SOC_TRIGGER—Offset 1h" on page 358 | 00000000h |
| 2–2h | "CPU_POWER_BUDGET_CONTROL—Offset 2h" on page 360 | 00000000h |
| 3–3h | "SOC_POWER_BUDGET_CONTROL—Offset 3h" on page 361 | 00000000h |
| 4–4h | "TURBO_SOC_OVERRIDE—Offset 4h" on page 361 | 00000000h |
| 5–5h | "BIOS_RESET_CPL—Offset 5h" on page 362 | 00000000h |
| 6–6h | "BIOS_CONFIG—Offset 6h" on page 363 | 00000000h |
| 1D–1Dh | "BIOSCFG_IPDEVTYPE—Offset 1Dh" on page 364 | 00000000h |
| 1E–1Eh | "PUNIT_S0i2_PREWAKE—Offset 1Eh" on page 364 | 00000000h |
| 1F–1Fh | "PUNIT_S0i3_PREWAKE—Offset 1Fh" on page 365 | 00000000h |
| 32–32h | "VEDSSPM0—Offset 32h" on page 365 | 03000003h |
| 33–33h | "VEDSSPM1—Offset 33h" on page 366 | 00000000h |

### 13.6.1 THERMAL_SOC_TRIGGER—Offset 1h

Driver Software (like Burst Mode Governor) may use this register to indicate TSKIN violation.

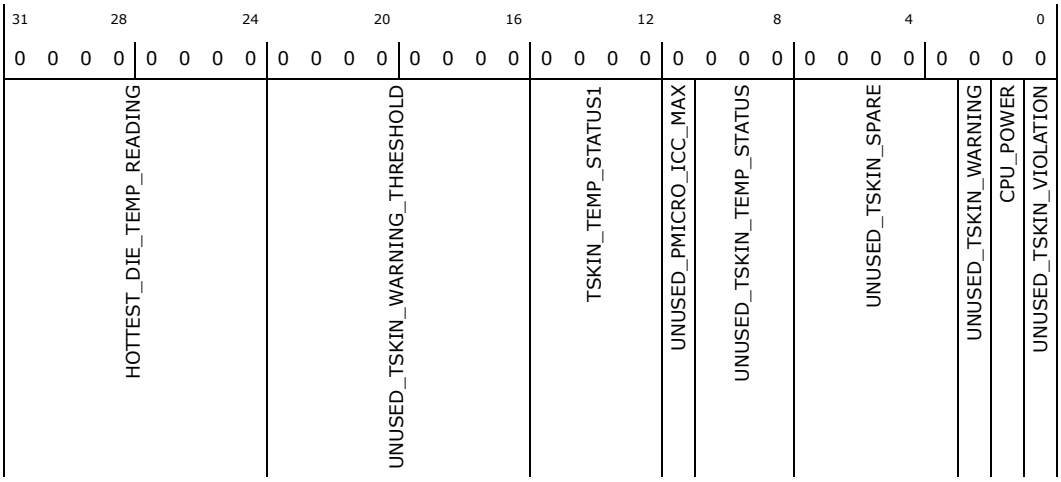
#### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 1h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h<br>RW | **HOTTEST_DIE_TEMP_READING:** Stores the hottest DTS sample of all thermal sensors in the CPU+SOC. |
| 23:16 | 0h<br>RW | **UNUSED_TSKIN_WARNING_THRESHOLD:** THIS FIELD IS UNUSED IN VLV/TNG. For platforms which implement a Tskin temperature sensor, this field can be used to specify the temperature limit above which TSKIN_WARNING will be set and Turbo operation will be disabled in the SOC. |
| 15:12 | 0h<br>RW | **TSKIN_TEMP_STATUS1:** THIS FIELD IS UNUSED IN VLV/TNG. For platforms which implement a Tskin temperature sensor, this field can be used to report the TSKIN temperature value for use by Punit firmware. |
| 11 | 0h<br>RO | **UNUSED_PMICRO_ICC_MAX:** THIS FIELD IS UNUSED IN VLV/TNG. Bit 11 is used indicate a Vcc Icc max condition. It is driven by the firmware when it gets a SVID update indicating a icc max hot condition. The firmware drives it back low when the hot condition is resolved when it gets a SVID update. |
| 10:8 | 0h<br>RW | **UNUSED_TSKIN_TEMP_STATUS:** THIS FIELD IS UNUSED IN VLV/TNG. For platforms which implement a Tskin temperature sensor, this field can be used to report the TSKIN temperature value for use by Punit firmware. |
| 7:3 | 0h<br>RW | **UNUSED_TSKIN_SPARE:** THIS FIELD IS UNUSED IN VLV/TNG. Spare for future tskin related controls |
| 2 | 0h<br>RW | **UNUSED_TSKIN_WARNING:** THIS FIELD IS UNUSED IN VLV/TNG. Early warning flag for TSKIN to be set by SCU, PUnit or platform driver to take early action to reduce power consumption...When asserted Punit will disable Turbo range of operation for CPU and GPU and limit operation to Guaranteed frequency. For systems which provide TSkin temperature punit may set this bit if Tskin exceeds TSKIN_WARNING_THRESHOLD...0 - Tskin warning is not triggered..1 - Tskin warning is triggered and CPU/GPU operation should be limited to Guaranteed frequencies. |
| 1 | 0h<br>RW | **CPU_POWER:** Reserved. |
| 0 | 0h<br>RW | **UNUSED_TSKIN_VIOLATION:** THIS FIELD IS UNUSED IN VLV/TNG. This bit can be set by the SOC or PUnit firmware to indicate that the system thermals are exceeding the TSkin spec. Setting this bit will trigger any enabled CPU thermal throttling mechanisms to take effect. Thermal throttling will remain active until this bit is cleared. For systems which provide TSkin temperature punit may set this bit if Tskin exceeds TSKIN_THROTTLE_THRESHOLD...0 tskin is not violated..1 trigger thermal throttling mechanisms to reduce platform temperature.. |

## 13.6.2 CPU_POWER_BUDGET_CONTROL—Offset 2h

TDP power budget utilization/budget for SOC; This register requires SAI security restriction.

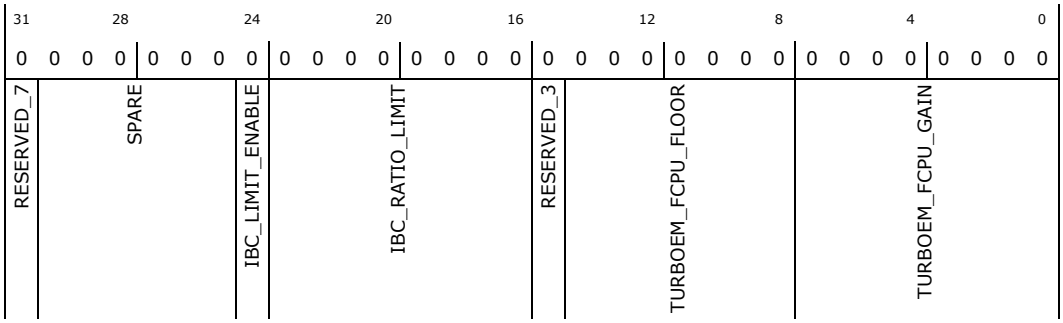
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 2h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RO | **RESERVED_7:** reserved |
| 30:25 | 0h<br>RW | **SPARE:** Reserved. |
| 24 | 0h<br>RW | **IBC_LIMIT_ENABLE:** Enables IBC IA Pstate Limiting control. When set, the CPU frequency will be limited according to IBC_RATIO_LIMIT. |
| 23:16 | 0h<br>RW | **IBC_RATIO_LIMIT:** IBC IA Pstate Limiting control for GFX driver to limit the max CPU frequency (bounded by TURBOEM_FCPU_FLOOR and MAX_RATIO_1C). Will only take effect if IBC_LIMIT_ENABLE is set. The CPU ratio is limited to this ratio if Turbo is enabled in the system. Default value of 0 is mapped to MAX_RATIO_1C. Value of 1 is mapped to RATIO 1, etc. |
| 15 | 0h<br>RW | **RESERVED_3:** reserved |
| 14:8 | 0h<br>RW | **TURBOEM_FCPU_FLOOR:** Specifies the target ratio floor when the PL1 proportional controller or IBC_RATIO_LIMIT is in effect. Default value of 0 is mapped to GUAR_RATIO. Value of 1 is mapped to RATIO 1, etc. Note that values lower than LFM_RATIO may be clipped by hardware to LFM_RATIO. |
| 7:0 | 0h<br>RW | **TURBOEM_FCPU_GAIN:** Specifies the scaling factor for PL1 proportional controller to map CPU energy budget to ratio limit during Energy Management Turbo Mode. Target ratio = LFM_RATIO + energy_credit / (gain+1) |

## 13.6.3 SOC_POWER_BUDGET_CONTROL—Offset 3h

Energy Credit available for SOC Turbo

### Access Method

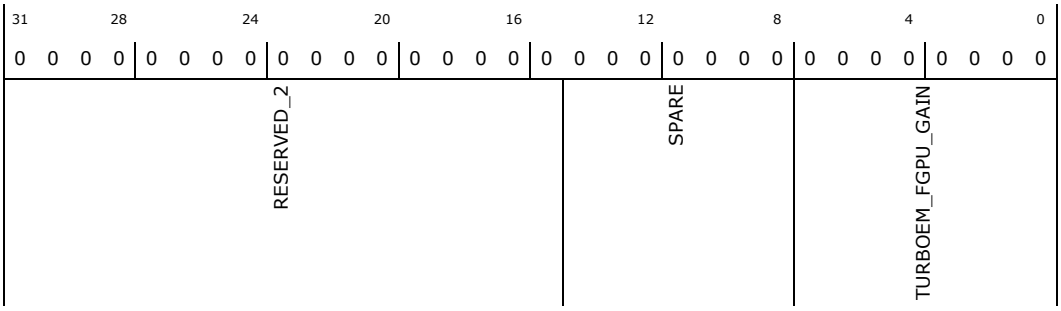
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 3h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 0h<br>RO | **RESERVED_3 (RESERVED_2):** reserved |
| 14:8 | 0h<br>RO | **SPARE:** reserved |
| 7:0 | 0h<br>RW | **TURBOEM_FGPU_GAIN (TURBOEM_FGPU_GAIN):** Specifies the scaling factor for PL1 proportional controller to map GFX energy budget to ratio limit during Energy Management Turbo Mode. Target ratio = RPn + energy_credit / (gain+1) |

## 13.6.4 TURBO_SOC_OVERRIDE—Offset 4h

Override CPU-SOC TDP sharing configuration in PKG_TURBO_CFG1; This register requires SAI security restriction.

### Access Method

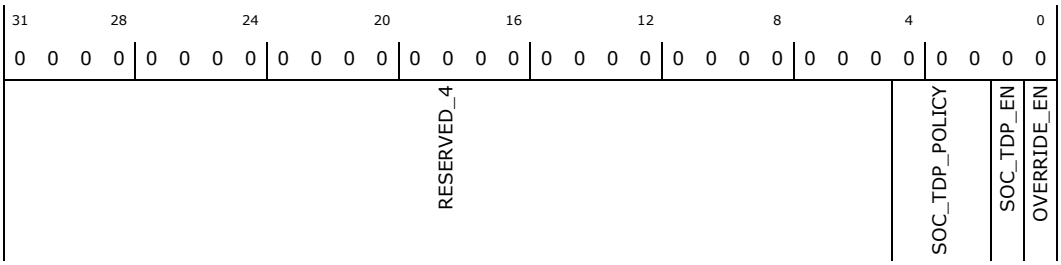
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 4h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0h<br>RO | **RESERVED_4:** reserved |
| 4:2 | 0h<br>RW | **SOC_TDP_POLICY:** Overrides PKG_TURBO_CFG1[SOC_TDP_POLICY]. Refer PKG_TURBO_CFG1 register description for more info...Device Driver software may use this register to dynamically adjust power sharing configuration between CPU and SOC |
| 1 | 0h<br>RW | **SOC_TDP_EN:** Overrides PKG_TURBO_CFG1[SOC_TDP_EN]. Refer to PKG_TURBO_CFG1 register description for more info. ..Device Driver software may use this register to dynamically adjust power sharing configuration between CPU and SOC |
| 0 | 0h<br>RW | **OVERRIDE_EN:** Allows fields in this register to override corresponding Turbo MSR fields. |

## 13.6.5 BIOS_RESET_CPL—Offset 5h

BIOS Reset Complete.

### Access Method

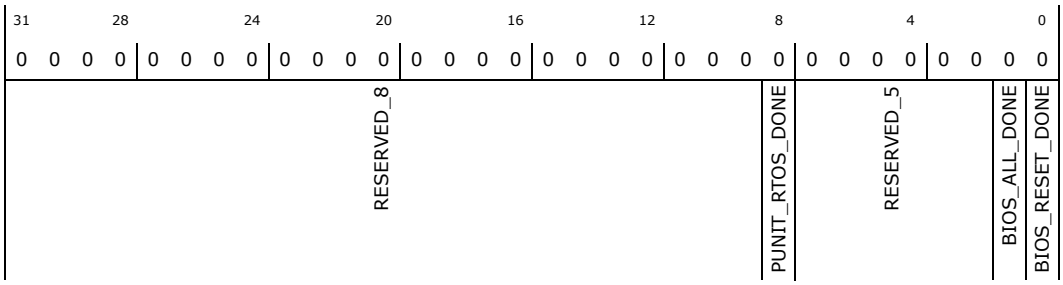
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 5h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0h<br>RO | **RESERVED_9 (RESERVED_8):** reserved |
| 8 | 0h<br>RW | **PUNIT_RTOS_DONE:** Punit will set this bit once firmware initialization of all tasks is completed. Simulation may poll this bit to hold-off code execution until Punit has safely initialized. |
| 7:2 | 0h<br>RW | **RESERVED_5:** Reserved |
| 1 | 0h<br>RW | **BIOS_ALL_DONE:** This bit indicates to the P unit that it can execute its periodic tasks. |
| 0 | 0h<br>RW | **BIOS_RESET_DONE:** This bit indicates to the P unit that the Patch loading is completed and the firmware can restart execution. Firmware will poll on this bit to be set. Note: This bit must be sticky once set and can only be cleared by a core reset. |

## 13.6.6 BIOS_CONFIG—Offset 6h

Punit-BIOS controls

### Access Method

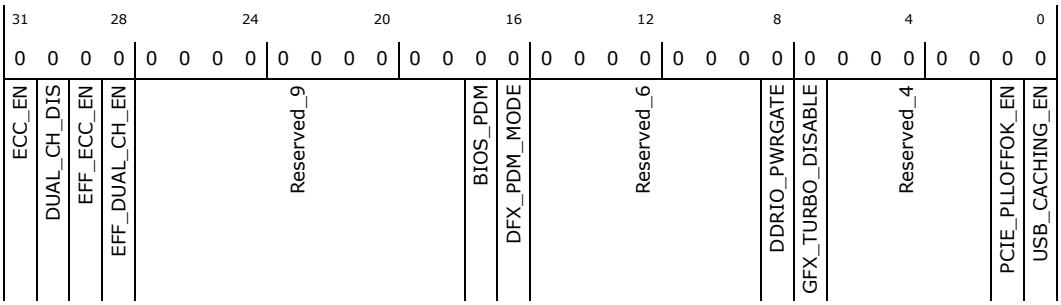
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 6h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **ECC_EN:** Setting this bit allows using a fused Dual Channel part as a single channel part with the second Channel being used for ECC. |
| 30 | 0h<br>RW | **DUAL_CH_DIS:** Setting this bit allows using a fused Dual Channel part as a single Channel part. |
| 29 | 0h<br>RW | **EFF_ECC_EN:** Effective ECC Status bit indicating if ECC is enabled(1) or disabled(0) based on the Fuse and the Downbin bit |
| 28 | 0h<br>RW | **EFF_DUAL_CH_EN:** Effective Dual Channel Status bit indicating if Dual Channel is enabled(1) or Single Channel is enabled(0) |
| 27:18 | 0h<br>RW | **Reserved_9:** Unused, reserved for future use. |
| 17 | 0h<br>RW | **DFX_POWERGATING (BIOS_PDM):** 0: Power Save Mode- Powergate DFX for power savings 1: PERF_MODE or PDM_MODE: Leave DFX blocks powered up BIOS must always set this bit before BIOS_RESET_CPL[1:0] bits are set. BYT-M and BYT-D segments leave DFX Powered up. BYT-T segments provide user option to leave DFX powered up or powered down. BIOS can change the DFX_Powergating bit to 0 to powergate DFX. |
| 16 | 0h<br>RW | **DFX_PDM_MODE:** This bit has effect only when DFX_Powergating (bit 17) is set. 0: PERF_MODE: Access to Performance Counters for SOCHAPs, Memory Traffic etc. 1: PDM_MODE: Memory BW counts not available but PDM debug messages are available |
| 15:9 | 0h<br>RW | **Reserved_6:** Reserved |
| 8 | 0h<br>RW | **DDRIO_PWRGATE:** Firmware sets bit 8 by default to disable ddrio powergating in S0i3. If BIOS writes to this BYTE, it must set bit 8 to avoid clobbering firmware update. DDRIO_PWRGATE is not supported on VLV. This bit is relevant only for SKUs supporting S0i3. |
| 7 | 0h<br>RW | **GFX_TURBO_DISABLE:** Setting this bit will disable GFX TURBO, even if the Fuses enable it. Setting this bit is not recommended for VLV |
| 6:2 | 0h<br>RW | **Reserved_4:** Unused, reserved for future use. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0h<br>RW | **PCIE_PLLOFFOK_EN:** When set, P unit will inform PCIE when the last core is entering and when the first core is exiting PC7 so that PCIE can turn off PLL |
| 0 | 0h<br>RW | **USB_CACHING_EN:** When set, P unit will inform USB when the last core is entering and first core is exiting PC7 so that USB caching can be enabled. BIOS will set this bit in synch with USB caching enable/disable setting. P unit will do the above handshake if the bit is set, or will skip the handshake if the bit is not set. |

## 13.6.7 BIOSCFG_IPDEVTYPE—Offset 1Dh

This Punit Register controls the Device type during boot for IPS

### Access Method

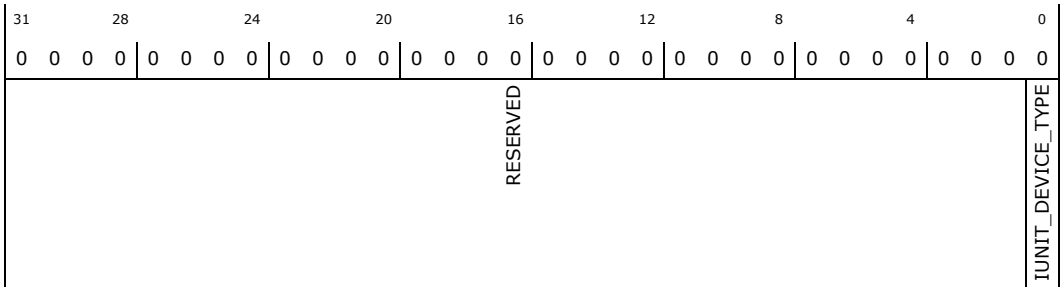
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 1Dh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0h<br>RW | **RESERVED:** Reserved bits for future use |
| 0 | 0h<br>RW | **IUNIT_DEVICE_TYPE:** IUNIT is by default Device3 type. By setting this bit the device type of IUNIT changes to Device2. |

## 13.6.8 PUNIT_S0i2_PREWAKE—Offset 1Eh

SB register for pre-wake periods for S0i2

### Access Method

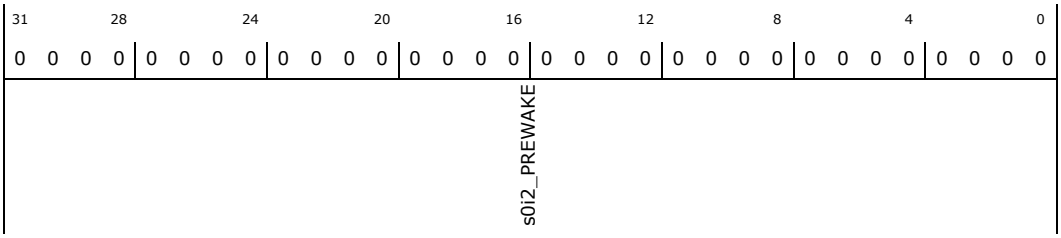
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 1Eh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **s0i2_PREWAKE:** BIOS or OS can program this register with a pre-wake value in Guaranteed MCLKs to hide some of the exit latency from S0i2 state to S0 state. P unit will subtract this value from the actual deadline programmed by the OS when requesting for a timer wake. |

## 13.6.9 PUNIT_S0i3_PREWAKE—Offset 1Fh

BIOS or OS can program this register with a pre-wake value in Guaranteed MCLKs to hide some of the exit latency from S0i3 state to S0 state. P unit will subtract this value from the actual deadline programmed by the OS when requesting for a timer wake.

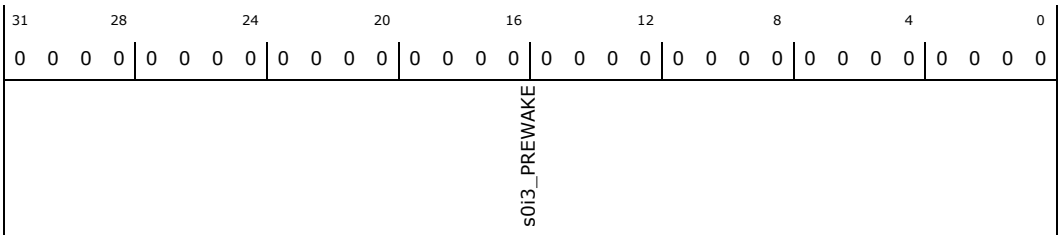
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 1Fh

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **s0i3_PREWAKE:** S0i3 Prewake Deadline |

## 13.6.10 VEDSSPM0—Offset 32h

Subsystem Config/Status for VED

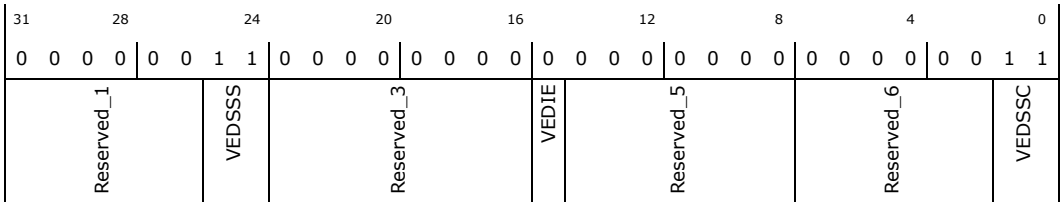
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 32h

**Op Codes:**
h - Read, h - Write

**Default:** 03000003h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0h<br>RO | **Reserved_1:** Reserved |
| 25:24 | 3h<br>RO | **VEDSSS:** 0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Video Decode Engine.Driver is expected to poll for the power up status before accessing the IP. |
| 23:16 | 0h<br>RO | **Reserved_3:** Reserved |
| 15 | 0h<br>RW | **VEDIE:** VED Power Up Interrupt Enable |
| 14:8 | 0h<br>RO | **Reserved_5:** Reserved |
| 7:2 | 0h<br>RO | **Reserved_6:** Reserved |
| 1:0 | 3h<br>RW | **VEDSSC:** 0x03 indicates powered off state, 0x00 indicates powered on state. Driver will write this field to register field to request power up or power down for the Video Decode Engine. |

## 13.6.11 VEDSSPM1—Offset 33h

Subsystem Px for Ved

### Access Method

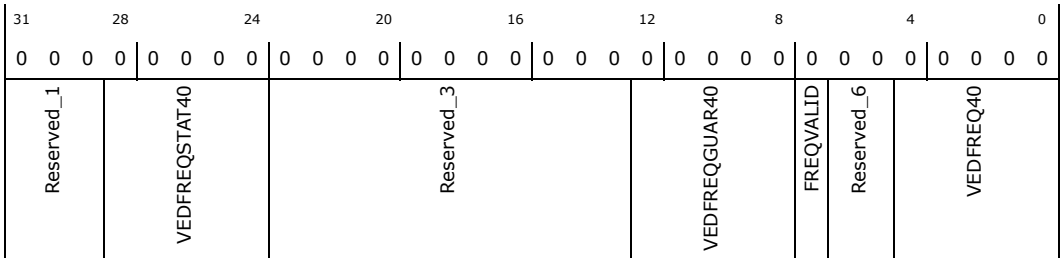
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 33h

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0h<br>RO | **Reserved_1:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28:24 | 0h<br>RO | **VEDFREQSTAT40:** VED Frequency Status |
| 23:13 | 0h<br>RO | **Reserved_3:** Reserved |
| 12:8 | 0h<br>RW | **VEDFREQGUAR40:** VED Guaranteed Frequency- Place holder for future use. |
| 7 | 0h<br>RW | **FREQVALID:** if and only if this bit is set the freq requested in the FREQ field will be looked at by the Punit and will clear this field once the freq status is updated |
| 6:5 | 0h<br>RO | **Reserved_6:** Reserved |
| 4:0 | 0h<br>RW | **VEDFREQ40:** VED driver requested Frequency |

## 13.6.12 DSPSSPM—Offset 36h

Subsystem Config/Status for Display

### Access Method

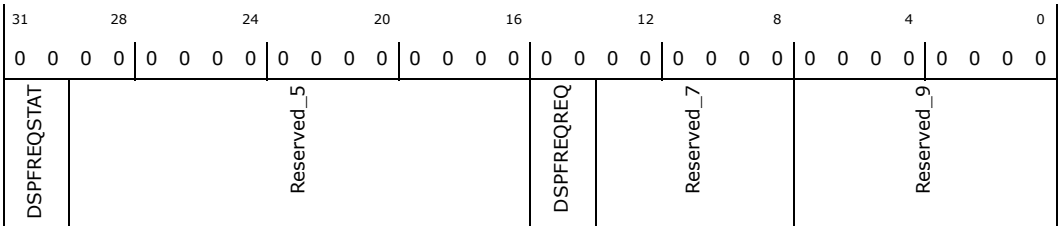
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 36h

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0h<br>RO | **DSPFREQSTAT:** Display frequency status |
| 29:16 | 0h<br>RO | **Reserved_5:** Reserved |
| 15:14 | 0h<br>RW | **DSPFREQREQ:** Display frequency request |
| 13:8 | 0h<br>RO | **Reserved_7:** Reserved |
| 7:0 | 0h<br>RO | **Reserved_9:** Reserved |

## 13.6.13 ISPSSPM0—Offset 39h

Subsystem Config/Status for ISP

### Access Method

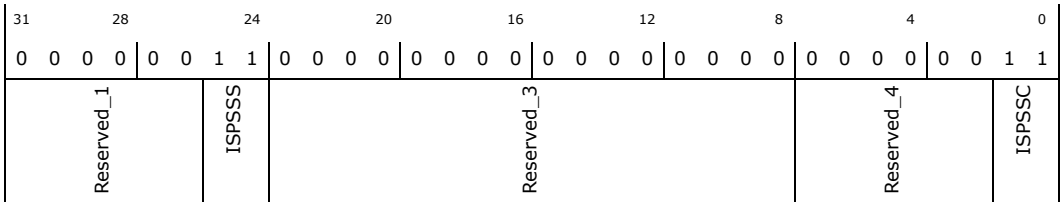
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 39h

**Op Codes:**

h - Read, h - Write

**Default:** 03000003h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0h<br>RO | **Reserved_1:** Reserved |
| 25:24 | 3h<br>RO | **ISPSSS:** ISP Subsystem Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Camera .Driver is expected to poll for the power up status before accessing the IP. |
| 23:8 | 0h<br>RO | **Reserved_3:** Reserved |
| 7:2 | 0h<br>RO | **Reserved_4:** Reserved |
| 1:0 | 3h<br>RW | **ISPSSC:** ISP SubsystemControl- 0x03 indicates powered off state, 0x00 indicates powered on state. Driver will write this field to register field to request power up or power down for the Camera IP. |

## 13.6.14 ISPSSPM1—Offset 3Ah

Subsystem Px for ISP

### Access Method

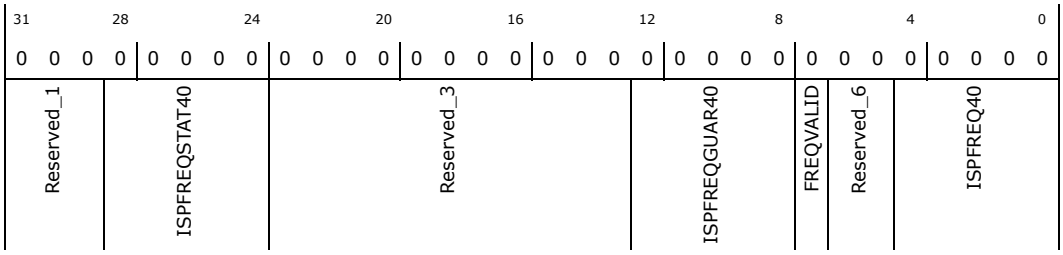
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 3Ah

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0h<br>RO | **Reserved_1:** Reserved |
| 28:24 | 0h<br>RO | **ISPFREQSTAT40:** ISP Frequency Status |
| 23:13 | 0h<br>RO | **Reserved_3:** Reserved |
| 12:8 | 0h<br>RW | **ISPFREQGUAR40:** ISP Guaranteed Frequency |
| 7 | 0h<br>RW | **FREQVALID:** if and only if this bit is set the freq requested in the FREQ field will be looked at by the Punit and will clear this field once the freq status is updated |
| 6:5 | 0h<br>RO | **Reserved_6:** Reserved |
| 4:0 | 0h<br>RW | **ISPFREQ40:** ISP driver requested Frequency |

## 13.6.15 MIOSSPM—Offset 3Bh

Subsystem Config/Status for MIO

### Access Method

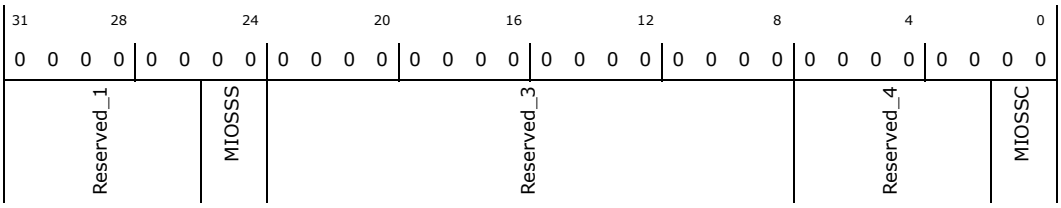
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 3Bh

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:26 | 0h<br>RO | **Reserved_1:** Reserved |
| 25:24 | 0h<br>RO | **MIOSSS:** MIO Subsystem Status Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the MIPI IO .Driver is expected to poll for the power up status before accessing the IP. |
| 23:8 | 0h<br>RO | **Reserved_3:** Reserved |
| 7:2 | 0h<br>RO | **Reserved_4:** Reserved |
| 1:0 | 0h<br>RW | **MIOSSC:** MIO (CSI) SubsystemControl- 0x03 indicates powered off state, 0x00 indicates powered on state. Driver will write this field to register field to request power up or power down for the MIPI controller. Note the implementation does not actually power gate, but will turn off the clock trunks and apply reset to MIO . |

## 13.6.16 PWRGT_CNT_CTRL—Offset 60h

Active Power Gate Control Register;This register indicates the configuration of the voltage islands for the various blocks that the P unit controls. This register is updated by the software driver to request power up / power down of the various sub systems like the graphics, display et all. Each island is controlled by a 2-bit field. 00 -- no clock or power gating, 01 -- clock gating, 10 -- reset and 11 -- power gating.(Encoding is as follows: subsys 0 RENder, 1 media, 3 -Display, DPIO :subsystem 5 Common lane, subs 6-9 TX, subs 10-11 RX)

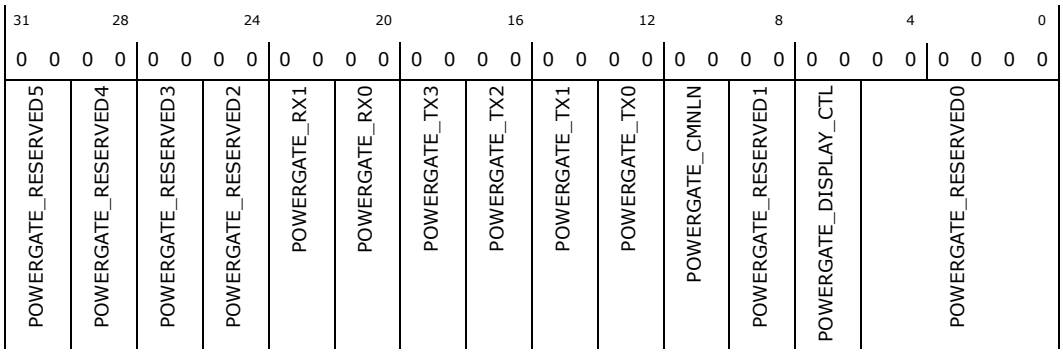
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 60h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0h<br>RW | **POWERGATE_RESERVED5:** Reserved |
| 29:28 | 0h<br>RW | **POWERGATE_RESERVED4:** Reserved |
| 27:26 | 0h<br>RW | **POWERGATE_RESERVED3:** Reserved |
| 25:24 | 0h<br>RW | **POWERGATE_RESERVED2:** Reserved |
| 23:22 | 0h<br>RW | **POWERGATE_RX1:** Active power gate control for RX lane 0x03 indicates powered off state, 0x00 indicates powered on state |
| 21:20 | 0h<br>RW | **POWERGATE_RX0:** Active power gate control for RX lane 0x03 indicates powered off state, 0x00 indicates powered on state |
| 19:18 | 0h<br>RW | **POWERGATE_TX3:** Active power gate control for TX lane 0x03 indicates powered off state, 0x00 indicates powered on state |
| 17:16 | 0h<br>RW | **POWERGATE_TX2:** Active power gate control for TX lane 0x03 indicates powered off state, 0x00 indicates powered on state |
| 15:14 | 0h<br>RW | **POWERGATE_TX1:** Active power gate control for TX lane 0x03 indicates powered off state, 0x00 indicates powered on state |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 13:12 | 0h<br>RW | **POWERGATE_TX0:** Active power gate control for TX lane 0x03 indicates powered off state, 0x00 indicates powered on state |
| 11:10 | 0h<br>RW | **POWERGATE_CMNLN:** Active power gate control for common lane 0x03 indicates powered off state, 0x00 indicates powered on state. Driver will write this field to register field to request power up or power down for the DPIO common lane. Note that before powering up the TX/RX subsystems for DPIO, from a power down state, CMNLN reset (POWERGATE_CMNLN) must be cycled |
| 9:8 | 0h<br>RW | **POWERGATE_RESERVED1:** Reserved |
| 7:6 | 0h<br>RW | **POWERGATE_DISPLAY_CTL:** Active power gate control for display, DPIO0x03 indicates powered off state, 0x00 indicates powered on state. Driver will write this field to register field to request power up or power down for the Display Controller |
| 5:0 | 0h<br>RW | **POWERGATE_RESERVED0:** Reserved |

## 13.6.17 PWRGT_STATUS—Offset 61h

Power Gate Status;This register indicates the status of the voltage islands for the various blocks that the P unit controls. This register is updated by the firmware after servicing request from driver to power up / power down of the various islands. Each island is controlled by a 2-bit field. 00 -- no clock or power gating, 01 -- clock gating, 10 -- reset and 11 -- power gating.(Encoding is as follows: subsys 0 RENder, 1 media, 3 -Display, DPIO :subsystem 5 Common lane, subs 6-9 TX, subs 10-11 RX)

### Access Method

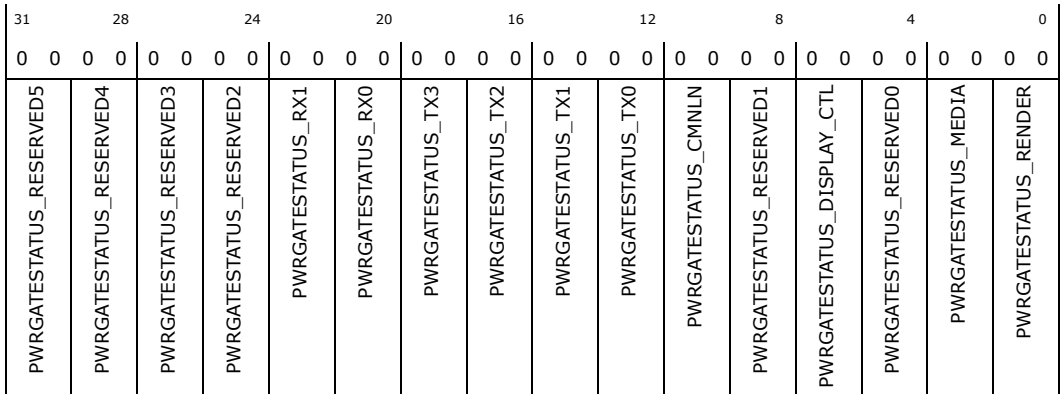
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 61h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0h<br>RW | **PWRGATESTATUS_RESERVED5:** Reserved |
| 29:28 | 0h<br>RW | **PWRGATESTATUS_RESERVED4:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27:26 | 0h<br>RW | **PWRGATESTATUS_RESERVED3:** Reserved |
| 25:24 | 0h<br>RW | **PWRGATESTATUS_RESERVED2:** Reserved |
| 23:22 | 0h<br>RW | **PWRGATESTATUS_RX1:** Power gate status for RX. Status0x03 indicates powered off state, 0x00 indicates powered on state. |
| 21:20 | 0h<br>RW | **PWRGATESTATUS_RX0:** Power gate status for RX. Status0x03 indicates powered off state, 0x00 indicates powered on state. |
| 19:18 | 0h<br>RW | **PWRGATESTATUS_TX3:** Power gate status for TX. Status0x03 indicates powered off state, 0x00 indicates powered on state. |
| 17:16 | 0h<br>RW | **PWRGATESTATUS_TX2:** Power gate status for TX. Status0x03 indicates powered off state, 0x00 indicates powered on state. |
| 15:14 | 0h<br>RW | **PWRGATESTATUS_TX1:** Power gate status for TX. Status0x03 indicates powered off state, 0x00 indicates powered on state. |
| 13:12 | 0h<br>RW | **PWRGATESTATUS_TX0:** Power gate status for TX Status0x03 indicates powered off state, 0x00 indicates powered on state. |
| 11:10 | 0h<br>RW | **PWRGATESTATUS_CMNLN:** Power gate status for common lane. Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the DPIO common lane |
| 9:8 | 0h<br>RW | **PWRGATESTATUS_RESERVED1:** Reserved |
| 7:6 | 0h<br>RW | **PWRGATESTATUS_DISPLAY_CTL:** Power gate status for display, Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Display controller .Driver is expected to poll for the power up status before accessing the IP. |
| 5:4 | 0h<br>RW | **PWRGATESTATUS_RESERVED0:** Reserved |
| 3:2 | 0h<br>RW | **PWRGATESTATUS_MEDIA:** Power gate status for media Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Media IP. The request for power up or power down for media are hardware triggered. |
| 1:0 | 0h<br>RW | **PWRGATESTATUS_RENDER:** Power gate status for RENder - Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Render engine. The request for power up or power down for Render are hardware triggered. |

## 13.6.18 PWRGT_INTREN—Offset 62h

Power Gate Interrupt enable;This register indicates the interrupt enables for the power islands for the various blocks that the P unit controls. The software driver sets this bit to trigger an interrupt when the particular subsystem is brought back to D0. There is one bit for each of the subsystem . At reset/powerup, all IE comes up as 0, indicating interrupts are not enabled. (Encoding is as follows: subsys 0 RENder, 1 media, 3 - Display, no control hook for DPIO)

### Access Method

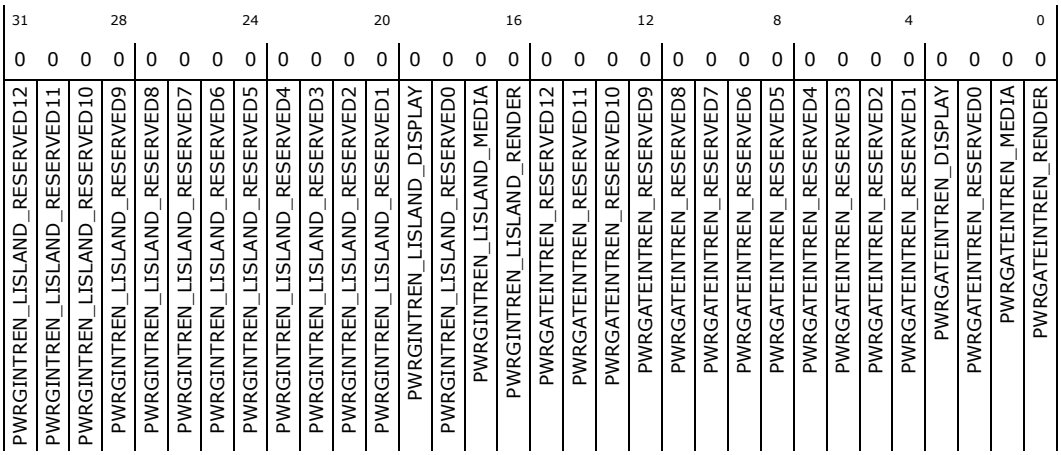
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 62h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0h<br>RW | **PWRGINTREN_LISLAND_RESERVED12:** Reserved |
| 30 | 0h<br>RW | **PWRGINTREN_LISLAND_RESERVED11:** Reserved |

| 0 | 0h<br>RW | **PWRGATEINTREN_RENDER:** power gate interrupt status for RENder |

## 13.6.19 CPU_SOFT_STRAPS—Offset 7Ch

Register for BIOS software configurable CPU Power on Reset Configuration. This register survives CPU-only reset and SOC Warm reset. BIOS can access is register using CFC/CF8 mechanism. Accessible through MSG Bus Port 04h.

### Access Method

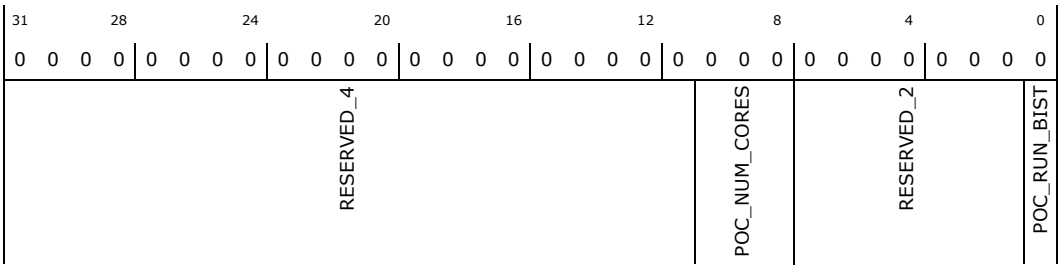
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 7Ch

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:11 | 0h<br>RO | **RESERVED_4:** Reserved |
| 10:8 | 0h<br>RW | **POC_NUM_CORES:** Core defeature via BIOS...000b Do not defeature IA cores...001b Only 1 Logical Core is active...010b Only 2 Logical Cores are active...011b Only 3 Logical Cores are active...1xxb Reserved (for 8 Core config).. ..Exposed to CPU microcode as CLPU_CR_RESOLVED_CORE_VECTOR, CLPU_CR_RESOLVED_CORE_VECTOR and CLPU_CR_WHO_AM_I via RESET_CONFIG_CW (CPU PMlink space)... ..Punit will determine the RESOLVED_CORE_VECTOR based on the table in HSD Issue 1214773... |
| 7:1 | 0h<br>RO | **RESERVED_2:** Reserved |
| 0 | 0h<br>RW | **POC_RUN_BIST:** Writing a 1 will cause the CPU microcode to execute BIST on the L2$ at CPU reset deassertion (CPU only reset or Warm Reset). |

## 13.6.20 PTMC—Offset 80h

Programmable Thermtrip Management Control

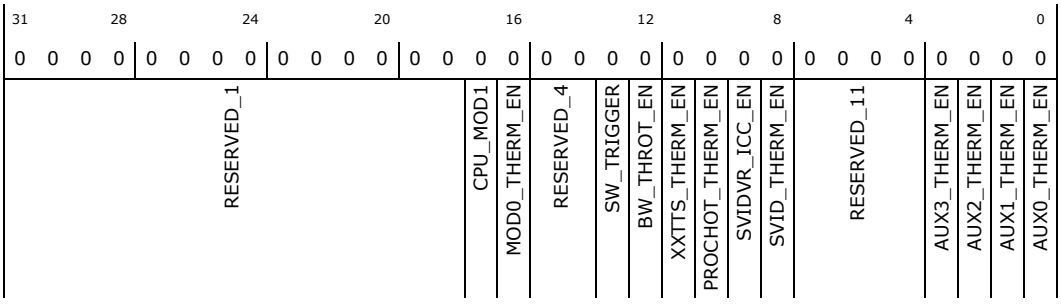
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 80h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0h<br>RO | **RESERVED_1:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17 | 0h<br>RW | **CPU_MOD1:** CPU Module1: Indicates CPU Module0 can trigger thermal event |
| 16 | 0h<br>RW | **MOD0_THERM_EN:** CPU Module0: Indicates CPU Module0 can trigger thermal event |
| 15:14 | 0h<br>RO | **RESERVED_4:** Reserved |
| 13 | 0h<br>RW | **SW_TRIGGER:** Indicates Software can program SWT register to initiate thermal event |
| 12 | 0h<br>RW | **BW_THROT_EN:** Indicates excess memory bandwidth can trigger a thermal event |
| 11 | 0h<br>RW | **XXTTS_THERM_EN:** XXTTS (Reserved): Indicates Thermal Sensor from platform can trigger thermal event (Not supported in Valleyview) |
| 10 | 0h<br>RW | **PROCHOT_THERM_EN:** XXPROCHOT: Inidicates a Platform Prochot can cause thermal event |
| 9 | 0h<br>RW | **SVIDVR_ICC_EN:** Indicates the VR Icc Max can cause thermal event...The trip is triggered for both Vcc and Vnn |
| 8 | 0h<br>RW | **SVID_THERM_EN:** sVID(VR_Icc_Max/VR_Hot): Indicates VR status bits can cause thermal event |
| 7:4 | 0h<br>RO | **RESERVED_11:** Reserved |
| 3 | 0h<br>RW | **AUX3_THERM_EN:** AUX3: Indicates AUX3 (Hot Trip) can initiate a thermal event |
| 2 | 0h<br>RW | **AUX2_THERM_EN:** AUX2: Indicates AUX2 can intiate a thermal event |
| 1 | 0h<br>RW | **AUX1_THERM_EN:** AUX1: Indicates AUX1 can initiate a thermal event |
| 0 | 0h<br>RW | **AUX0_THERM_EN:** AUX0: Indicates AUX0 can initiate a thermal event |

## 13.6.21 TTR0—Offset 81h

Rank 0 Bandwidth Trip Thresholds

### Access Method

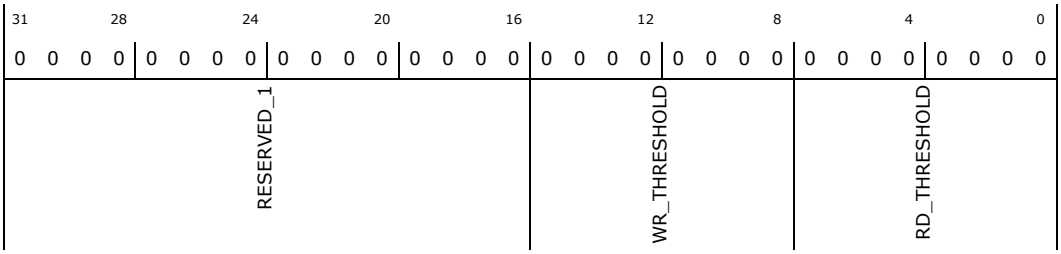
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 81h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RESERVED_1:** Reserved |
| 15:8 | 0h<br>RW | **WR_THRESHOLD:** Write Threshhold (W): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Write count from the event counters when there is no external thermal sensor configured for DRAM protection. |
| 7:0 | 0h<br>RW | **RD_THRESHOLD:** Read Threshhold (R): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Read count from the event counters when there is no external thermal sensor configured for DRAM protection |

## 13.6.22 TTR1—Offset 82h

Rank 1 Bandwidth Trip Thresholds

### Access Method

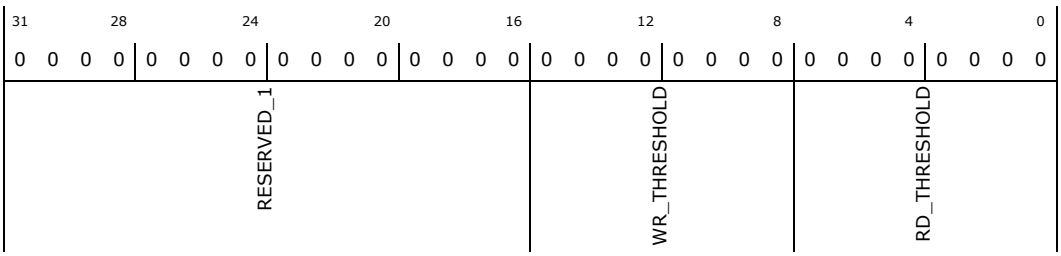
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 82h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RESERVED_1:** Reserved |
| 15:8 | 0h<br>RW | **WR_THRESHOLD:** Write Threshhold (W): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Write count from the event counters when there is no external thermal sensor configured for DRAM protection. |
| 7:0 | 0h<br>RW | **RD_THRESHOLD:** Read Threshhold (R): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Read count from the event counters when there is no external thermal sensor configured for DRAM protection |

## 13.6.23 TTS—Offset 83h

VLV Bandwidth Trip Thresholds

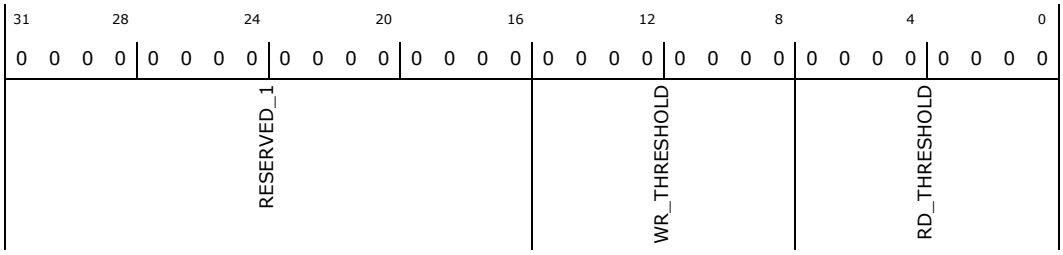
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 83h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RESERVED_1:** Reserved |
| 15:8 | 0h<br>RW | **WR_THRESHOLD:** Write Threshold: Indicates a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Write count FOR BOTH RANKS from the event counters when there is no iternal thermal sensor configured for VLV protection. |
| 7:0 | 0h<br>RW | **RD_THRESHOLD:** Read Threshold: Same as Write Threshold but for Reads from BOTH RANKS. |

## 13.6.24 TELB—Offset 84h

Thermal Enforcement Limits for Bandwidth Trips

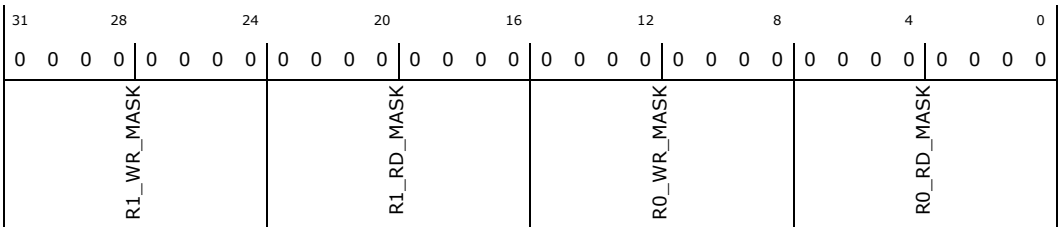
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 84h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h<br>RW | **R1_WR_MASK:** Rank 1 Write Mask: Mask writes to Rank1 |
| 23:16 | 0h<br>RW | **R1_RD_MASK:** Rank 1 Read Mask: Mask reads to Rank1 |
| 15:8 | 0h<br>RW | **R0_WR_MASK:** Rank 0 Write Mask: Mask writes to Rank0 |
| 7:0 | 0h<br>RW | **R0_RD_MASK:** Rank 0 Read Mask: Mask reads to Rank0 |

## 13.6.25 TELT—Offset 85h

Thermal Enforcement Limits for Thermal Trips

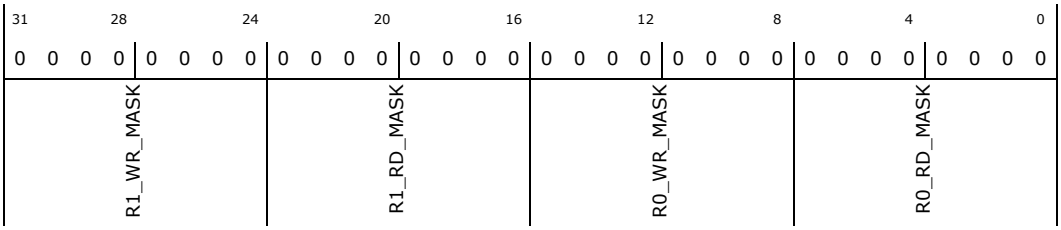
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 85h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h<br>RW | **R1_WR_MASK:** Rank 1 Write Mask: Mask writes to Rank1 |
| 23:16 | 0h<br>RW | **R1_RD_MASK:** Rank 1 Read Mask: Mask reads to Rank1 |
| 15:8 | 0h<br>RW | **R0_WR_MASK:** Rank 0 Write Mask: Mask writes to Rank0 |
| 7:0 | 0h<br>RW | **R0_RD_MASK:** Rank 0 Read Mask: Mask reads to Rank0 |

## 13.6.26 TQPR—Offset 86h

Thermal Trip TQ Poll Rate Register - This register identifies the rate of TQ poll in LPDDR2 memory.

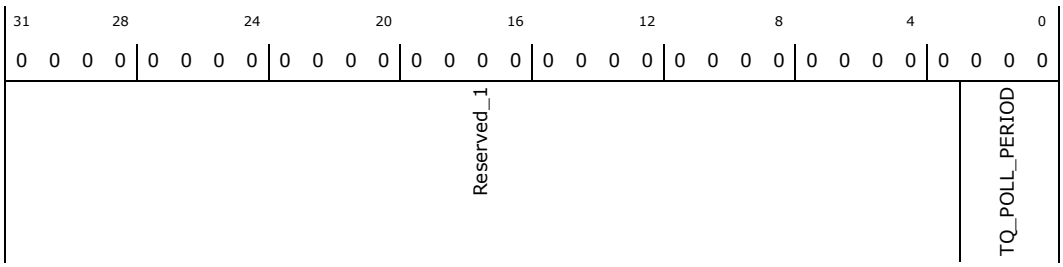
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 86h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0h<br>RW | **Reserved_1:** Reserved |
| 2:0 | 0h<br>RW | **TQ_POLL_PERIOD:** Def TQ Poll Period: This sets the frequency by which the Dunit polls the DRAM mode register MR4 to determine required refresh rate when thermal event occurs. ..000 1 x the current Refresh Period ..001 2 x the current Refresh Period ..010 4 x the current Refresh Period ..011 8 x the current Refresh Period ..100 16 x the current Refresh Period ..101 32 x the current Refresh Period ..110 64 x the current Refresh Period ..111 128 x the current Refresh Period.. |

## 13.6.27 GFXT—Offset 88h

GFX Thermals Control - This register is used to enable clock (On clocks) throttling.

### Access Method

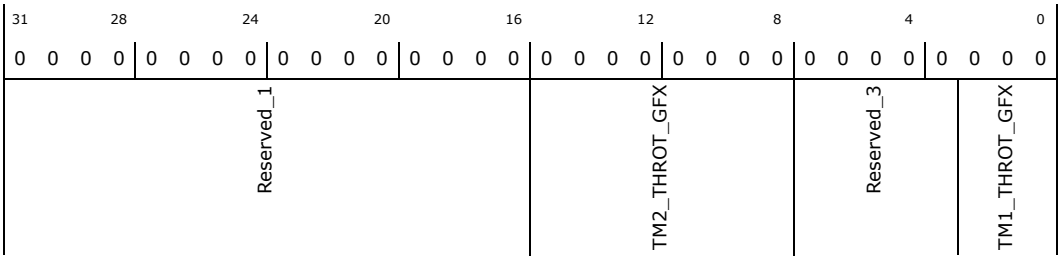
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 88h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **TM2_THROT_GFX:** TM2 Control for GFX |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |
| 2:0 | 0h<br>RW | **TM1_THROT_GFX:** TM1 Throttling for GFx..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.28 VEDT—Offset 89h

VED Thermals Control - This register is used to enable clock (On clocks) throttling.

### Access Method

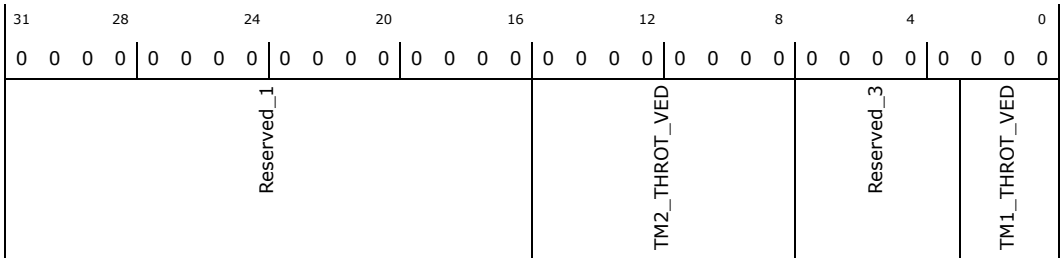
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 89h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **TM2_THROT_VED:** TM2 Control for VED |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |
| 2:0 | 0h<br>RW | **TM1_THROT_VED:** TM1 Throttling for Ved..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.29 ISPT—Offset 8Ch

ISP Thermals Control - This register is used to enable clock (On clocks) throttling.

### Access Method

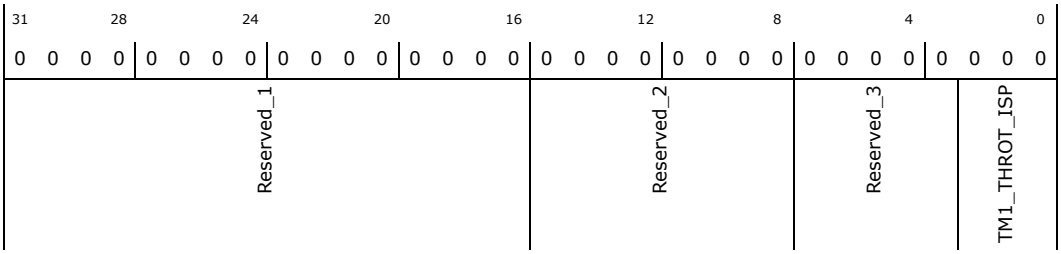
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 8Ch

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **Reserved_2:** Reserved |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |
| 2:0 | 0h<br>RW | **TM1_THROT_ISP:** TM1 Throttling for ISP..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.30 DTSC—Offset B0h

Digital Thermal Sensor Control

### Access Method

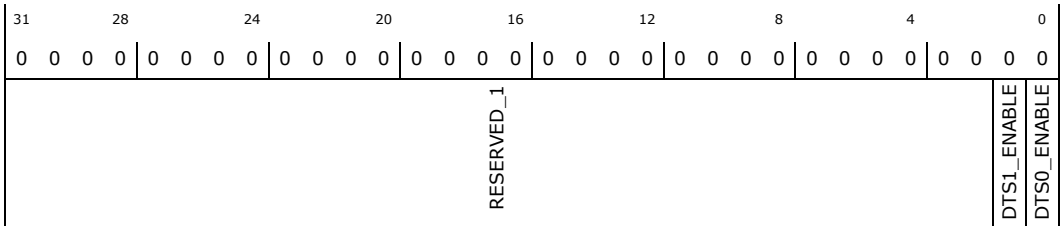
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B0h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0h<br>RO | **RESERVED_1:** Reserved |
| 1 | 0h<br>RW | **DTS1_ENABLE:** DTS 1 Enable (DTSE1): When set, enables power to DTS 1 |
| 0 | 0h<br>RW | **DTS0_ENABLE:** DTS 0 Enable (DTSE0): When set, enables power to DTS 0 |

## 13.6.31 TRR—Offset B1h

Thermometer Read register

### Access Method

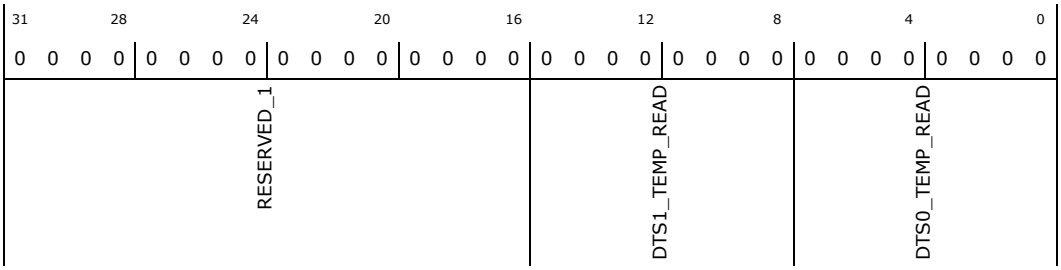
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B1h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RESERVED_1:** Reserved |
| 15:8 | 0h<br>RO | **DTS1_TEMP_READ:** DTS1 Temperature Reading(DTSTR1): Temperature reading from DTS1. This value is only valid after DTS1 is enabled |
| 7:0 | 0h<br>RO | **DTS0_TEMP_READ:** DTS0 Temperature Reading(DTSTR0): Temperature reading from DTS0. This value is only valid after DTS0 is enabled |

## 13.6.32 PTPS—Offset B2h

Programmable trip Point settings

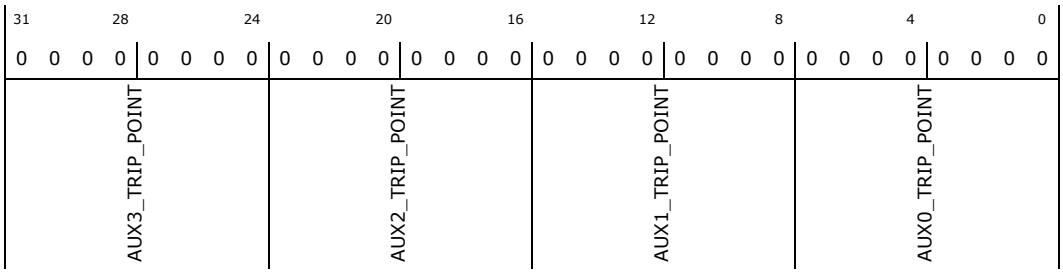
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B2h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h<br>RW | **AUX3_TRIP_POINT:** Aux3 Trip Point Setting |
| 23:16 | 0h<br>RW | **AUX2_TRIP_POINT:** Aux2 Trip Point Setting |
| 15:8 | 0h<br>RW | **AUX1_TRIP_POINT:** Aux1 Trip Point Setting |
| 7:0 | 0h<br>RW | **AUX0_TRIP_POINT:** Aux0 Trip Point Setting |

## 13.6.33 PTTS—Offset B3h

Programmable Thermal trip Status

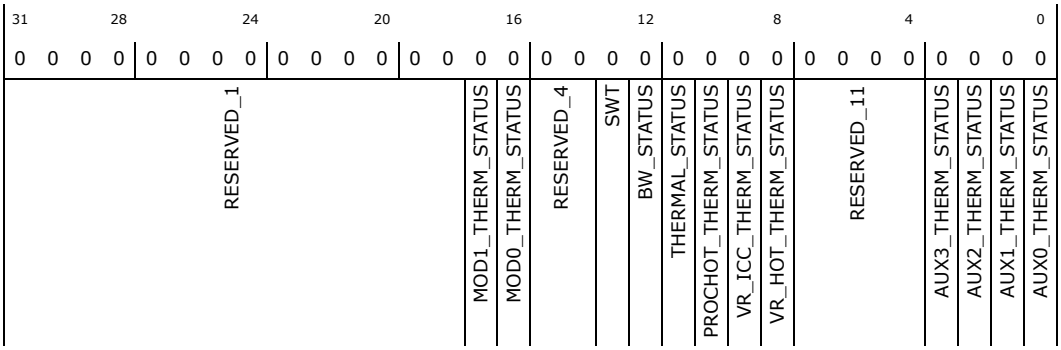
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B3h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0h<br>RO | **RESERVED_1:** Reserved |
| 17 | 0h<br>RO | **MOD1_THERM_STATUS:** CPU Module1: CPU Module 1 Trip Status |
| 16 | 0h<br>RO | **MOD0_THERM_STATUS:** CPU Module0: CPU Module 0 Trip Status |
| 15:14 | 0h<br>RO | **RESERVED_4:** Reserved |
| 13 | 0h<br>RO | **SWT:** Status to indicate that SW initiated a thermal event |
| 12 | 0h<br>RO | **BW_STATUS:** BW status |
| 11 | 0h<br>RO | **THERMAL_STATUS:** XXTTS (Reserved): Platform Thermal Sensor Status |
| 10 | 0h<br>RO | **PROCHOT_THERM_STATUS:** XXPROCHOT: Platform Prochot Status |
| 9 | 0h<br>RO | **VR_ICC_THERM_STATUS:** VR_Icc_Max: VR Icc Max Thermal Status |
| 8 | 0h<br>RO | **VR_HOT_THERM_STATUS:** VR_Hot: VR Hot Thermal Status |
| 7:4 | 0h<br>RO | **RESERVED_11:** Reserved |
| 3 | 0h<br>RO | **AUX3_THERM_STATUS:** AUX3: SoC PROCHOT/AUX3 Thermtrip Status |
| 2 | 0h<br>RO | **AUX2_THERM_STATUS:** AUX2: AUX2 Thermal Trip Status |
| 1 | 0h<br>RO | **AUX1_THERM_STATUS:** AUX1: AUX2 Thermal Trip Status |
| 0 | 0h<br>RO | **AUX0_THERM_STATUS:** AUX0: AUX2 Thermal Trip Status |

## 13.6.34 PTTSS—Offset B4h

Programmable Thermal trip Sticky Status (NOTE: 1. Sticky status register is cleared by writing a 1 to it by software)

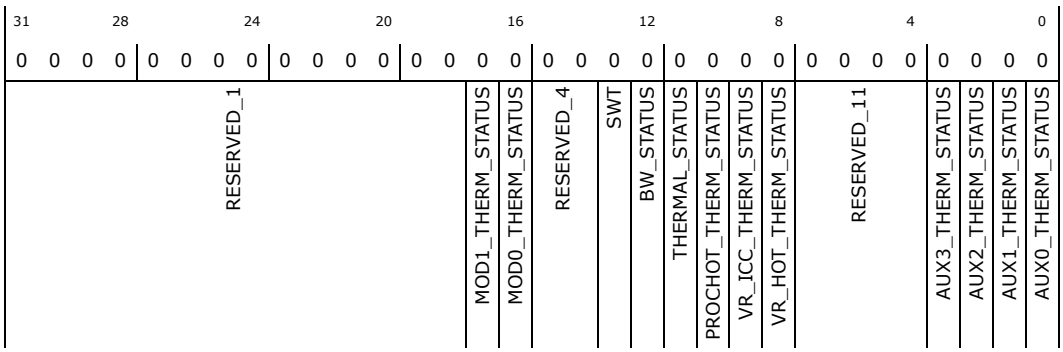
### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B4h

**Op Codes:**
h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0h<br>RO | **RESERVED_1:** Reserved |
| 17 | 0h<br>RW | **MOD1_THERM_STATUS:** CPU Module1: CPU Module 1 Trip Status |
| 16 | 0h<br>RW | **MOD0_THERM_STATUS:** CPU Module0: CPU Module 0 Trip Status |
| 15:14 | 0h<br>RO | **RESERVED_4:** Reserved |
| 13 | 0h<br>RO | **SWT:** Status to indicate that SW initiated a thermal event |
| 12 | 0h<br>RO | **BW_STATUS:** BW status |
| 11 | 0h<br>RO | **THERMAL_STATUS:** XXTTS (Reserved): Platform Thermal Sensor Status |
| 10 | 0h<br>RW | **PROCHOT_THERM_STATUS:** XXPROCHOT: Platform Prochot Status |
| 9 | 0h<br>RW | **VR_ICC_THERM_STATUS:** VR_Icc_Max: VR Icc Max Thermal Status |
| 8 | 0h<br>RW | **VR_HOT_THERM_STATUS:** VR_Hot: VR Hot Thermal Status |
| 7:4 | 0h<br>RO | **RESERVED_11:** Reserved |
| 3 | 0h<br>RW | **AUX3_THERM_STATUS:** AUX3: SoC PROCHOT/AUX3 Thermtrip Status |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0h<br>RW | **AUX2_THERM_STATUS:** AUX2: AUX2 Thermal Trip Status |
| 1 | 0h<br>RW | **AUX1_THERM_STATUS:** AUX1: AUX2 Thermal Trip Status |
| 0 | 0h<br>RW | **AUX0_THERM_STATUS:** AUX0: AUX2 Thermal Trip Status |

## 13.6.35 TE_AUX0—Offset B5h

Thermal Event Aux0

### Access Method

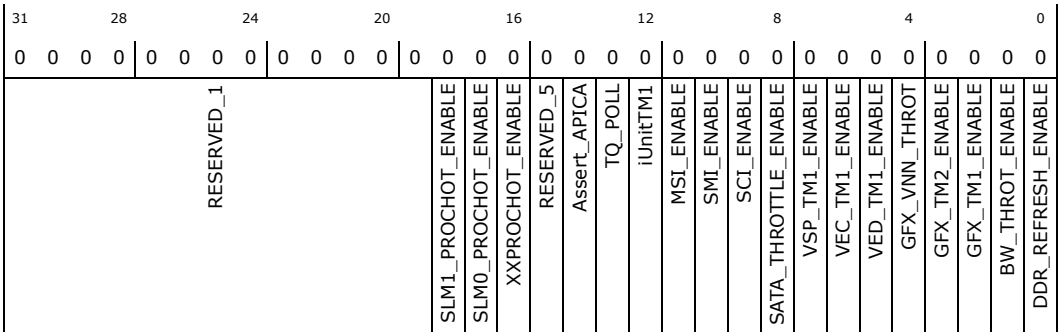
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B5h

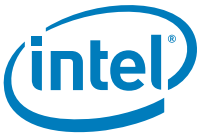
**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RO | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15 | 0h<br>RO | **RESERVED_5:** Reserved |
| 14 | 0h<br>RW | **Assert_APICA:** Assert_APICA Enable |
| 13 | 0h<br>RW | **TQ_POLL:** TQ Poll rate Increase |
| 12 | 0h<br>RW | **iUnitTM1:** iUnit TM1 |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7 | 0h<br>RW | **VSP_TM1_ENABLE:** VSP TM1 Enable |
| 6 | 0h<br>RW | **VEC_TM1_ENABLE:** VEC TM1 Enable |
| 5 | 0h<br>RW | **VED_TM1_ENABLE:** VED TM1 Enable |
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |
| 2 | 0h<br>RW | **GFX_TM1_ENABLE:** GFX TM1 Enable.... |
| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.36 TE_AUX1—Offset B6h

Thermal Event Aux1

### Access Method

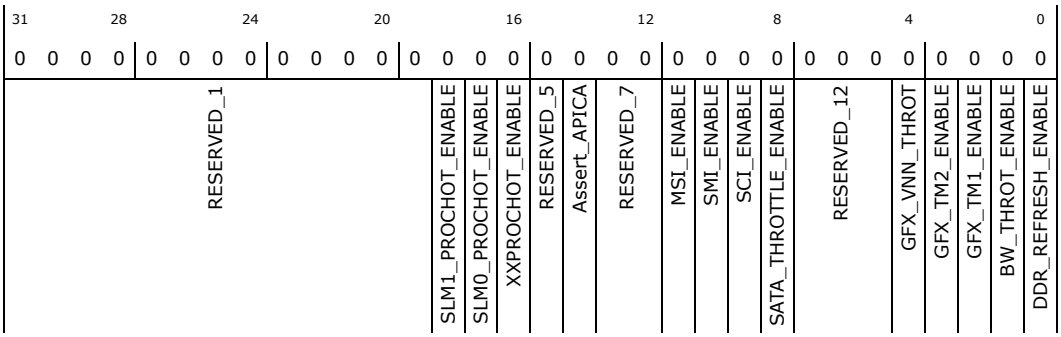
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B6h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15 | 0h<br>RW | **RESERVED_5:** Reserved |
| 14 | 0h<br>RW | **Assert_APICA:** Assert_APICA Enable |
| 13:12 | 0h<br>RW | **RESERVED_7:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7:5 | 0h<br>RO | **RESERVED_12:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |
| 2 | 0h<br>RW | **GFX_TM1_ENABLE:** GFX TM1 Enable.... |
| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.37 TE_AUX2—Offset B7h

Thermal Event Aux2

### Access Method

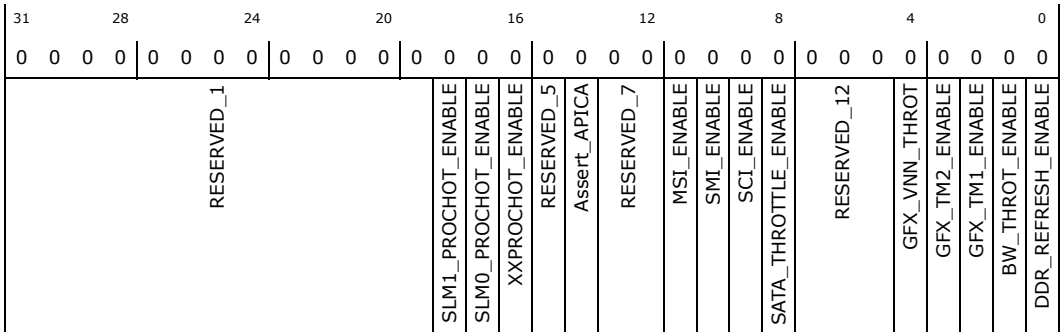
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B7h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15 | 0h<br>RW | **RESERVED_5:** Reserved |
| 14 | 0h<br>RW | **Assert_APICA:** Assert_APICA Enable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 13:12 | 0h<br>RW | **RESERVED_7:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |

## 13.6.38 TE_AUX3—Offset B8h

Thermal Event Aux3

### Access Method

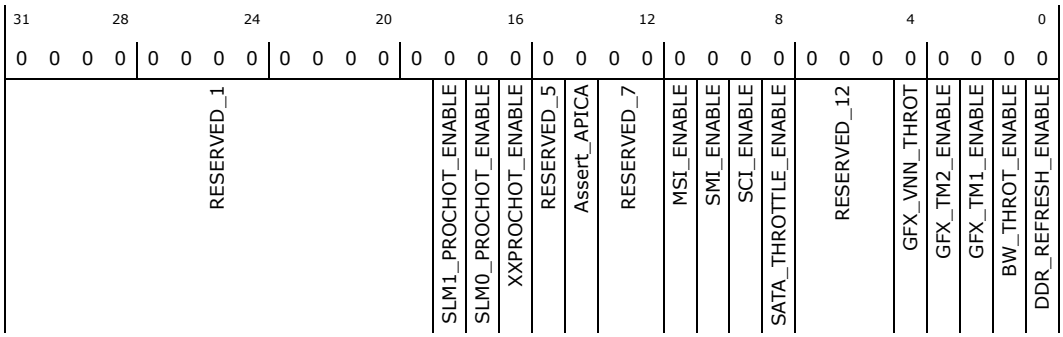
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B8h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15 | 0h<br>RW | **RESERVED_5:** Reserved |
| 14 | 0h<br>RW | **Assert_APICA:** Assert_APICA Enable |
| 13:12 | 0h<br>RW | **RESERVED_7:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |

| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.39 TTE_VRIccMax—Offset B9h

Thermal Trip Event VR_Icc_MAX

### Access Method

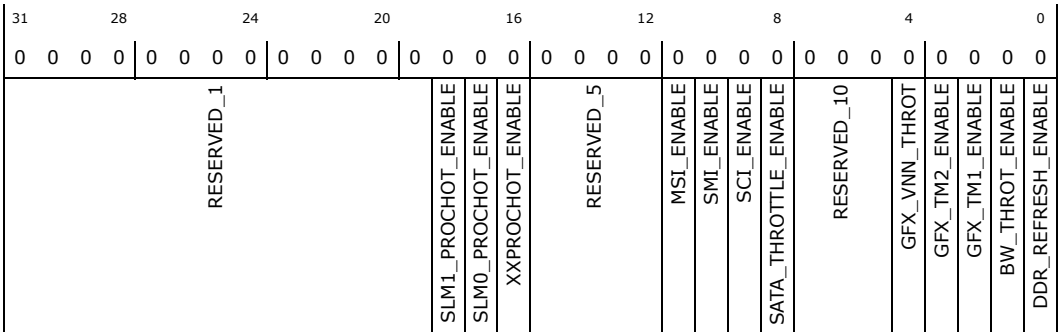
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + B9h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15:12 | 0h<br>RW | **RESERVED_5:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |

| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.40 TTE_VRHot—Offset BAh

Thermal Trip Event VR_Hot

### Access Method

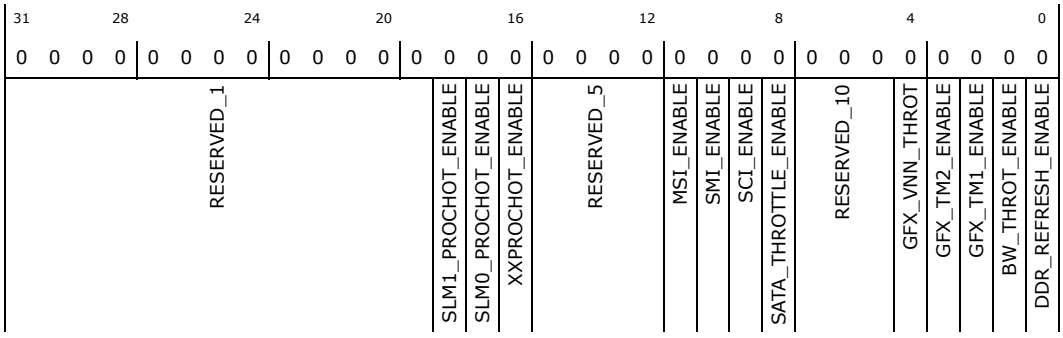
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + BAh

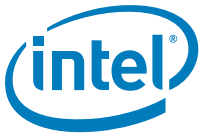
**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |

| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.41 TTE_XXPROCHOT—Offset BBh

Thermal Trip Event XXPROCHOT

### Access Method

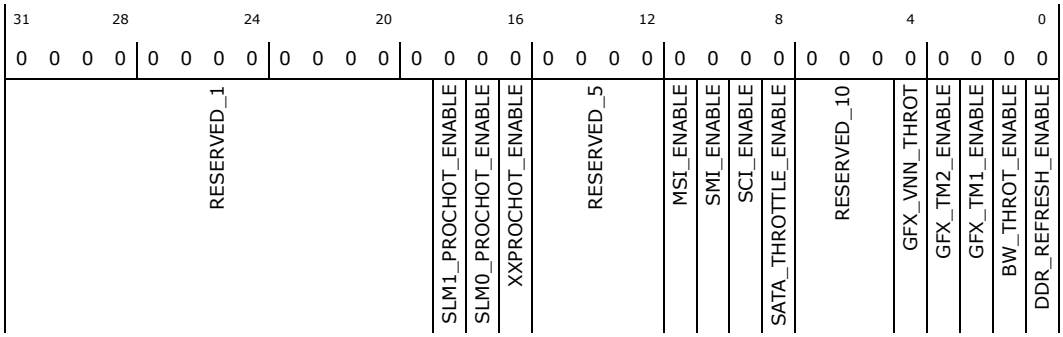
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + BBh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15:12 | 0h<br>RW | **RESERVED_5:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7:5 | 0h<br>RO | **RESERVED_10:** Reserved |
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |

| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.42 TTE_SLM0—Offset BCh

Thermal Trip Event SLM0

### Access Method

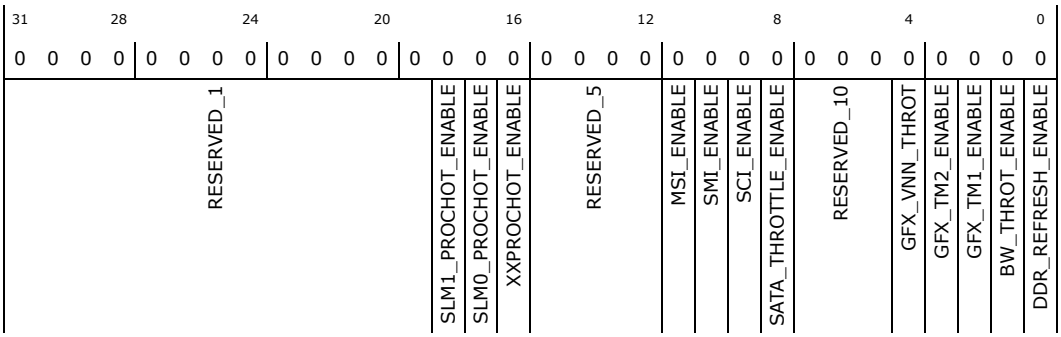
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + BCh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15:12 | 0h<br>RW | **RESERVED_5:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7:5 | 0h<br>RO | **RESERVED_10:** Reserved |
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0h<br>RW | **GFX_TM1_ENABLE:** GFX TM1 Enable.... |
| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.43 TTE_SLM1—Offset BDh

Thermal Trip Event SLM1

### Access Method

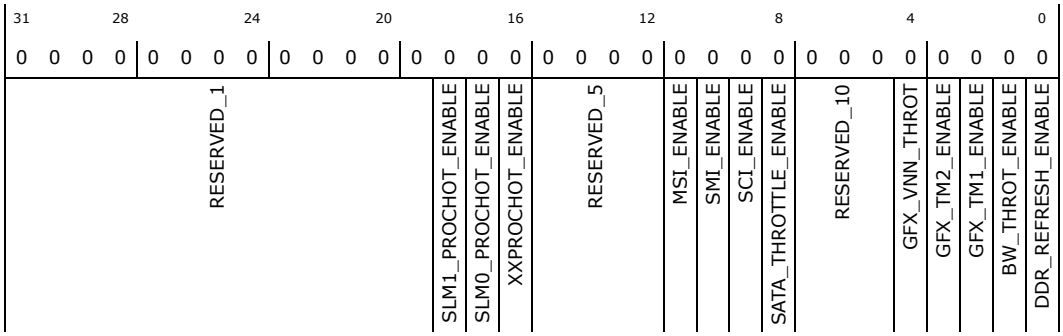
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + BDh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15:12 | 0h<br>RW | **RESERVED_5:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7:5 | 0h<br>RO | **RESERVED_10:** Reserved |
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |
| 2 | 0h<br>RW | **GFX_TM1_ENABLE:** GFX TM1 Enable.... |
| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.44 BWTE—Offset BEh

Band width Trip Event

### Access Method

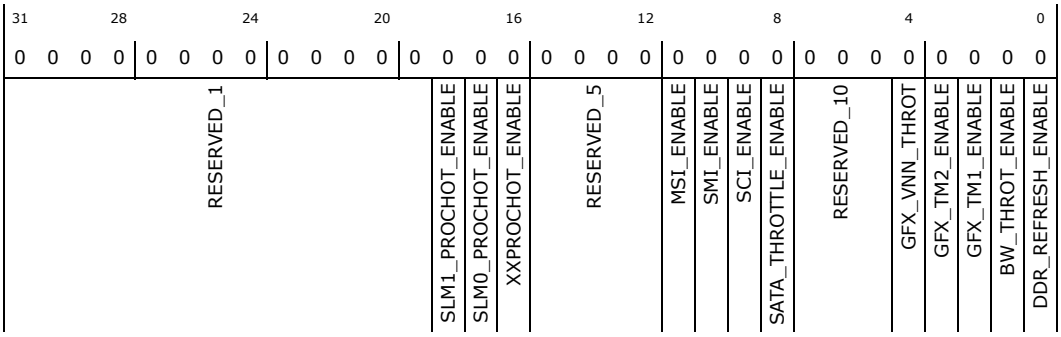
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + BEh

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RW | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0h<br>RW | **RESERVED_5:** Reserved |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7:5 | 0h<br>RO | **RESERVED_10:** Reserved |
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |
| 2 | 0h<br>RW | **GFX_TM1_ENABLE:** GFX TM1 Enable.... |
| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.45 TTE_SWT—Offset BFh

Thermal trip event for software initiated thermal event

### Access Method

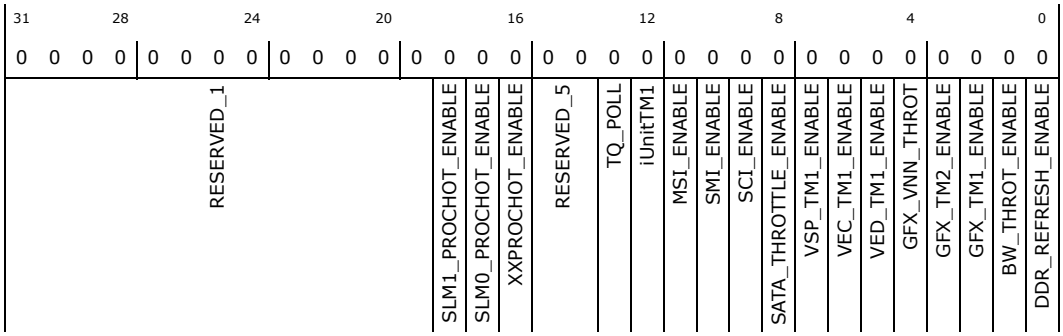
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + BFh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0h<br>RO | **RESERVED_1:** Reserved |
| 18 | 0h<br>RW | **SLM1_PROCHOT_ENABLE:** SLM1 PROCHOT Enable(Reserved for VLV) |
| 17 | 0h<br>RW | **SLM0_PROCHOT_ENABLE:** SLM0 PROCHOT Enable |
| 16 | 0h<br>RW | **XXPROCHOT_ENABLE:** XXPROCHOT Note: Unless in debug mode enable XXPROCHOT with caution because XXPROCHOT feedsback into SoC via the Bi-Directional IO and could cause XXPROCHOT to trip as well |
| 15:14 | 0h<br>RO | **RESERVED_5:** Reserved |
| 13 | 0h<br>RW | **TQ_POLL:** TQ Poll rate Increase |
| 12 | 0h<br>RW | **iUnitTM1:** iUnit TM1 |
| 11 | 0h<br>RW | **MSI_ENABLE:** MSI Enable |
| 10 | 0h<br>RW | **SMI_ENABLE:** SMI Enable |
| 9 | 0h<br>RW | **SCI_ENABLE:** SCI Enable |
| 8 | 0h<br>RW | **SATA_THROTTLE_ENABLE:** SATA Throttle Enable |
| 7 | 0h<br>RW | **VSP_TM1_ENABLE:** VSP TM1 Enable |

| 5 | 0h<br>RW | **VED_TM1_ENABLE:** VED TM1 Enable |
| 4 | 0h<br>RW | **GFX_VNN_THROT:** Graphics Vnn Throttle (Reserved for VLV) |
| 3 | 0h<br>RW | **GFX_TM2_ENABLE:** GFX TM2 Enable.... |
| 2 | 0h<br>RW | **GFX_TM1_ENABLE:** GFX TM1 Enable.... |
| 1 | 0h<br>RW | **BW_THROT_ENABLE:** BW throttle Enable |
| 0 | 0h<br>RW | **DDR_REFRESH_ENABLE:** DDR 2X refresh Enable |

## 13.6.46 PUNIT_GPU_EC—Offset D1h

Punit GPU Energy Counter Register

### Access Method

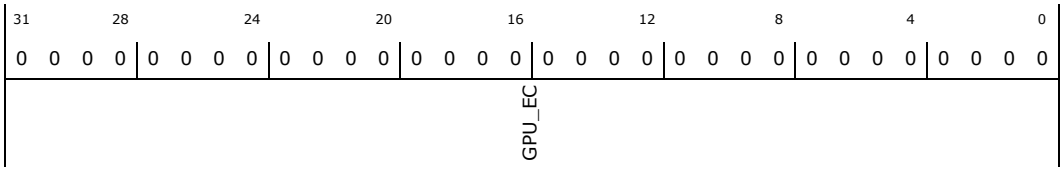
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + D1h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **GPU_EC:** GPU Energy Counter Information |

## 13.6.47 PUNIT_GPU_EC_VIRUS—Offset D2h

Punit GPU Energy Counter Virus Register

### Access Method

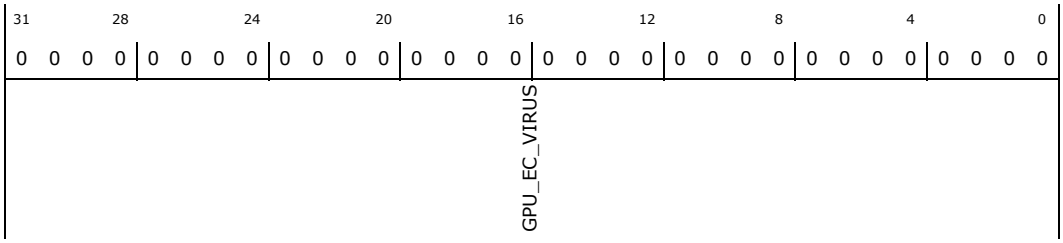
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + D2h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0h<br>RW | **GPU_EC_VIRUS:** Initialized to the Virus count value of GPU_EC. |

## 13.6.48 PUNIT_GPU_LFM—Offset D3h

Punit GPU LFM Register

### Access Method

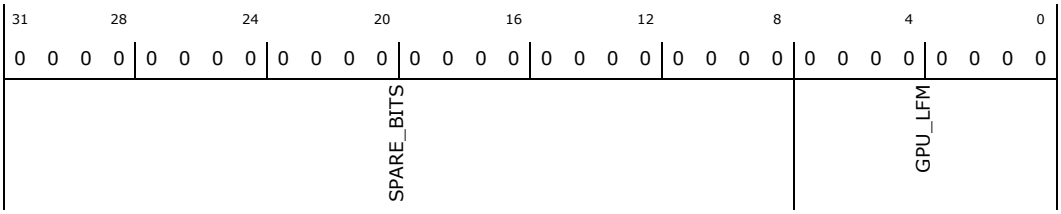
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + D3h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0h<br>RW | **SPARE_BITS:** Bits to be used in future |
| 7:0 | 0h<br>RW | **GPU_LFM:** Lowest supported GFX frequency. |

## 13.6.49 PUNIT_GPU_FREQ_REQ—Offset D4h

Punit GPU Frequency Request Register

### Access Method

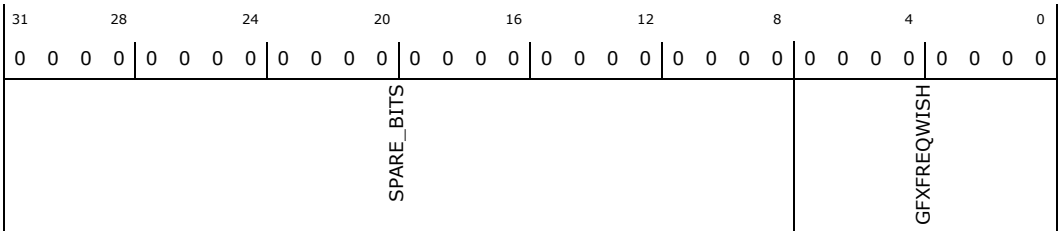
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + D4h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0h<br>RW | **SPARE_BITS:** Bits to be used in future |
| 7:0 | 0h<br>RW | **GFXFREQWISH:** Doorbell Register, Frequency Encoding for Frequency Requested in GFX Reg used by Render. For actual frequency encoding please refer Graphics HAS |

## 13.6.50 PUNIT_GPU_FREQ_STS—Offset D8h

Punit GPU Frequency Status Register

### Access Method

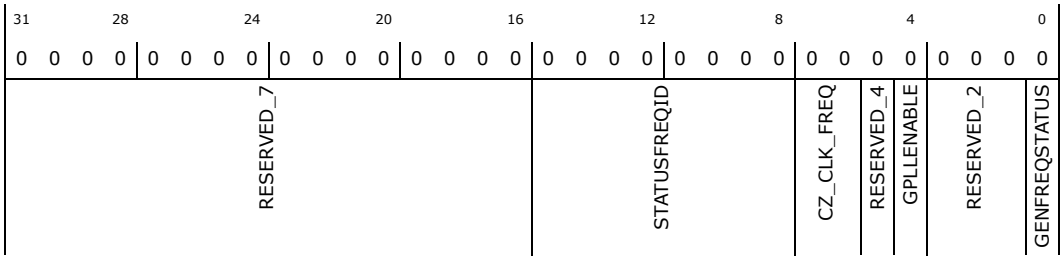
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + D8h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RESERVED_7:** Reserved for future use |
| 15:8 | 0h<br>RO | **STATUSFREQID:** Frequency Encoding for the Frequency Reached |
| 7:6 | 0h<br>RO | **CZ_CLK_FREQ:** CZ clock Freq encoding is as follows: 00 = 800, 01=1066, 10=1333, 11=Invalid |
| 5 | 0h<br>RO | **RESERVED_4:** Reserved for future use |
| 4 | 0h<br>RO | **GPLLENABLE:** 0=graphics clocks not from GPLL...1=graphics clocks from GPLL... |
| 3:1 | 0h<br>RO | **RESERVED_2:** Reserved for future use |
| 0 | 0h<br>RO | **GENFREQSTATUS:** Status Register bit to be optionally used by Graphics Driver. This bit Indicates that frequency change is in progress |

## 13.6.51 DPTF_TELB—Offset 108h

Thermal Enforcement Limits for Bandwidth Trips. Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE4

### Access Method

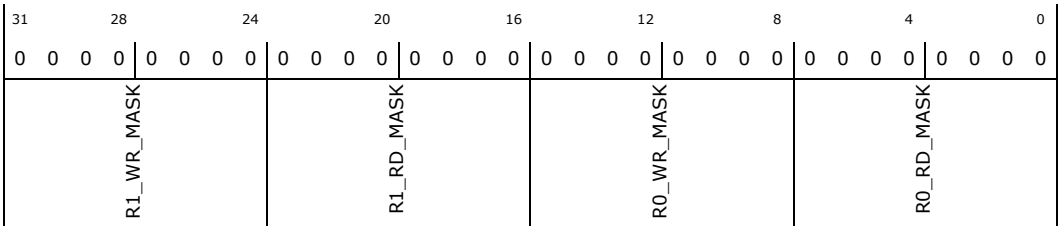
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 108h

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0h<br>RW | **R1_WR_MASK:** Rank 1 Write Mask: Mask writes to Rank1 |
| 23:16 | 0h<br>RW | **R1_RD_MASK:** Rank 1 Read Mask: Mask reads to Rank1 |
| 15:8 | 0h<br>RW | **R0_WR_MASK:** Rank 0 Write Mask: Mask writes to Rank0 |
| 7:0 | 0h<br>RW | **R0_RD_MASK:** Rank 0 Read Mask: Mask reads to Rank0 |

## 13.6.52 DPTF_GFXT—Offset 109h

GFX Thermals Control - This register is used to enable clock (On clocks) throttling.Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE5

### Access Method

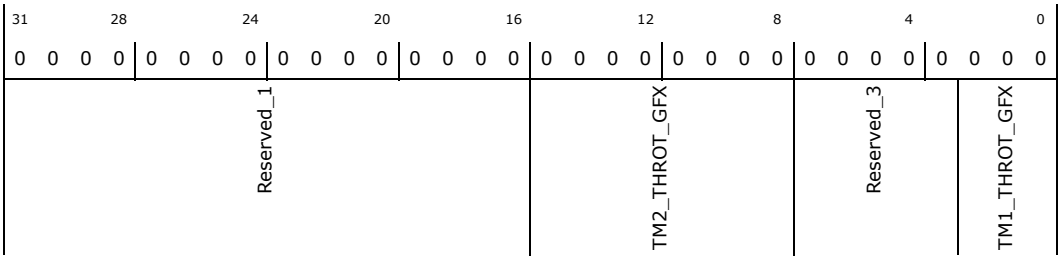
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 109h

**Op Codes:**

h - Read, h - Write

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **TM2_THROT_GFX:** TM2 Control for GFX |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0h<br>RW | **TM1_THROT_GFX:** TM1 Throttling for GFx..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.53 DPTF_VEDT—Offset 10Ah

VED Thermals Control - This register is used to enable clock (On clocks) throttling.Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE6

### Access Method

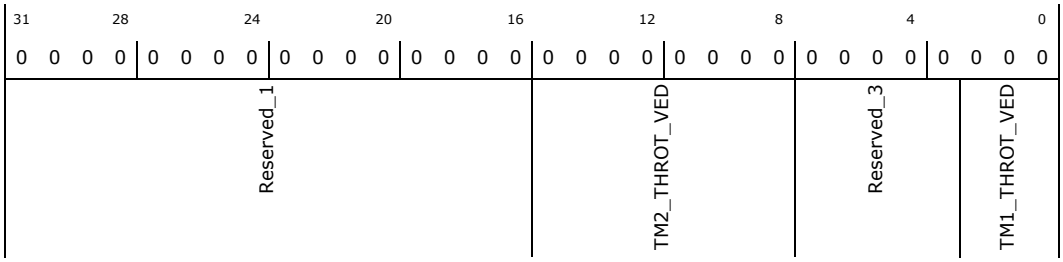
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 10Ah

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **TM2_THROT_VED:** TM2 Control for VED |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |
| 2:0 | 0h<br>RW | **TM1_THROT_VED:** TM1 Throttling for Ved..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.54 DPTF_VECT—Offset 10Bh

VEC Thermals Control - This register is used to enable clock (On clocks) throttling.Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE7

### Access Method

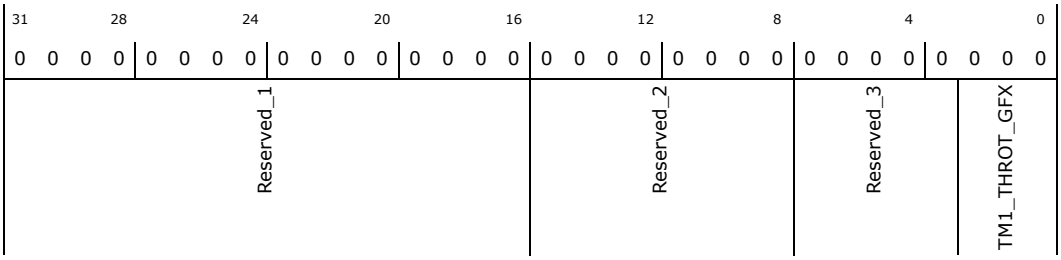
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 10Bh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **Reserved_2:** Reserved |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |
| 2:0 | 0h<br>RW | **TM1_THROT_GFX:** TM1 Throttling for Vec..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.55 DPTF_VSPT—Offset 10Ch

VSP Thermals Control - This register is used to enable clock (On clocks) throttling.Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE8

### Access Method

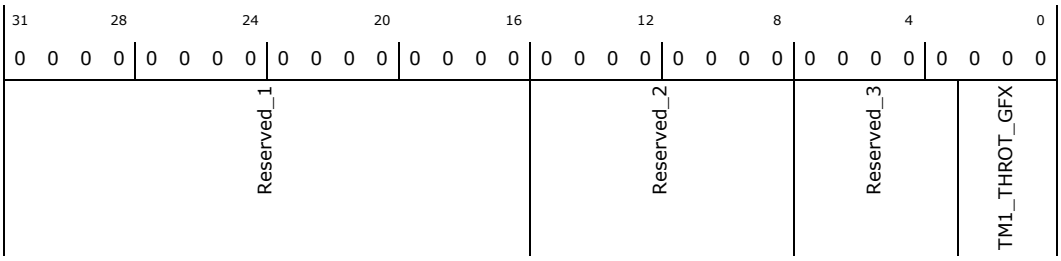
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 10Ch

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |
| 15:8 | 0h<br>RW | **Reserved_2:** Reserved |
| 7:3 | 0h<br>RW | **Reserved_3:** Reserved for future use |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0h<br>RW | **TM1_THROT_GFX:** TM1 Throttling for Vsp..3 b000: No Throttle..3 b001: 12.5% Throttle..3 b010: 25% Throttle..3 b011: 37.5% Throttle..3 b100: 50% Throttle..3 b101: 67.5% Throttle..3 b110: 75% Throttle..3 b111: 87.5% Throttle.. |

## 13.6.56 DPTF_ISPT—Offset 10Dh

ISP Thermals Control - This register is used to enable clock (On clocks) throttling.Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE9

### Access Method

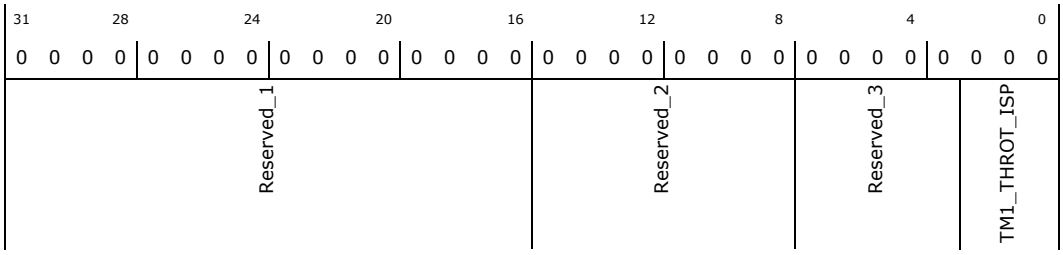
**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x04] + 10Dh

**Op Codes:**

h - Read, h - Write

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0h<br>RW | **Reserved_1:** Resered for future use |

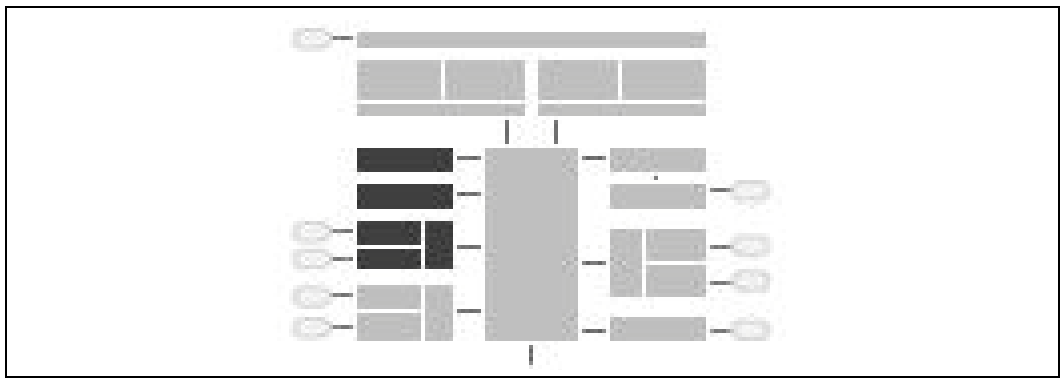
# 14 Graphics, Video and Display

This section provides an overview of Graphics, Video and Display features of the SoC.

This chapter and all contents in it are not applicable to E3805 SKU.



## 14.1 Features

The key features of the individual blocks are as follows:

- Refreshed seventh generation Intel graphics core with four Execution Units (EUs)
  - 3D graphics hardware acceleration including support for DirectX*11, OCL 1.2, OGL ES Halti/2.0/1.1, OGL 3.2
  - Video decode hardware acceleration including support for H.264, MPEG2, MVC, VC-1, WMV9, JPEG/MJPEG and VP8 formats
  - Video encode hardware acceleration including support for H.264 and MPEG2
  - Display controller, incorporating the display planes, pipes and physical interfaces
  - Four planes available per pipe - 1x Primary, 2x Video Sprite and 1x Cursor- plus a single legacy VGA plane
  - A single Analog Display physical interface, implementing VGA support
  - Two multi-purpose Digital Display Interface (DDI) PHYs implementing HDMI, DVI, DisplayPort (DP) or Embedded DisplayPort (eDP) support

## 14.2 SoC Graphics Display

The Processor Graphics controller display pipe can be broken down into three components:

- Display Planes
- Display Pipes
- Display Physical Interfaces

A display plane is a single displayed surface in memory and contains one image (desktop, cursor, overlay). It is the portion of the display hardware logic that defines the format and location of a rectangular region of memory that can be displayed on a display output device and delivers that data to a display pipe. This is clocked by the Core Display Clock.

### 14.2.1 Primary Planes A and B

Planes A and B are the main display planes and are associated with Pipes A and B respectively. Each plane supports per-pixel alpha blending.

### 14.2.2 Video Sprite Planes A, B, C and D

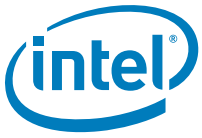
Video Sprite Planes A, B, C and D are planes optimized for video decode. Planes A and B are associated with Pipe A and Planes C and D are associated with Pipe B.

### 14.2.3 Cursors A and B

Cursors A and B are small, fixed-sized planes dedicated for mouse cursor acceleration, and are associated with Planes A and B respectively.

### 14.2.4 VGA

VGA is used for boot, safe mode, legacy games, etc. It can be changed by an application without OS/driver notification, due to legacy requirements.



## 14.3 Display Pipes

The display pipe blends and synchronizes pixel data received from one or more display planes and adds the timing of the display output device upon which the image is displayed.

The display pipes A and B operate independently of each other at the rate of one pixel per clock. They can attach to any of the display interfaces.

## 14.4 Display Physical Interfaces

The display physical interfaces consist of output logic and pins that transmit the display data to the associated encoding logic and send the data to the display device. These interfaces can be subdivided into analog (VGA) and digital (DisplayPort*, Embedded DisplayPort*, DVI and HDMI*) interfaces.

### 14.4.1 Analog Display Physical Interface

The analog port provides a RGB signal output along with a HSYNC and VSYNC signal. There is an associated Display Data Channel (DDC) signal pair dedicated to the analog port. The intended target device is for a monitor with a VGA connector. Display devices such as LCD panels with analog inputs may work satisfactorily but no functionality is added to the signals to enhance that capability.

#### 14.4.1.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function.

**Table 165. Analog Display Interface Signals**

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **VGA_BLUE** | O VVGA_GPIO | **Blue Analog Video Output:** This signal is a VGA Analog video output from the internal color palette DAC. |
| **VGA_GREEN** | O VVGA_GPIO | **Green Analog Video Output:** This signal is a VGA Analog video output from the internal color palette DAC. |
| **VGA_RED** | O VVGA_GPIO | **Red Analog Video Output:** This signal is a VGA Analog video output from the internal color palette DAC. |
| **VGA_HSYNC** | O VVGA_GPIO | **VGA Horizontal Synchronization:** This signal is used as the horizontal sync (polarity is programmable) or "sync interval". |

**Table 165. Analog Display Interface Signals**

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **VGA_VSYNC** | O VVGA_GPIO | **VGA Vertical Synchronization:** This signal is used as the horizontal sync (polarity is programmable) or "sync interval". |
| **VGA_DDCCLK** | I/O VVGA_GPIO | **VGA DDC Clock:** EDID support for an external VGA display |
| **VGA_DDCDATA** | I/O VVGA_GPIO | **VGA DDC Data:** EDID support for an external VGA display |
| **VGA_IREF** | I | **Resistor Set:** Set point resistor for the internal color palette DAC. A 357ohm+/-0.5% precision resistor is required between VGA_IREF and motherboard ground. |
| **VGA_IRTN** | O | This signal is the complement video signal output from the internal color palette DAC channels and this signal connects directly to the ground plane of the board. |
| **LPC_RCOMP** | - | VGA Impedance Compensation. |

### 14.4.1.2 Features

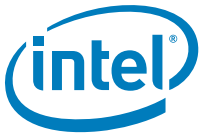
Table 166 lists the characteristics of the analog port.

**Table 166. Analog Port Characteristics**

| Signal | Port Characteristics | Support |
|---|---|---|
| RGB | Voltage range | 0.7 Vp-p nominal only |
| | CRT/Monitor sense | Analog compare |
| | Analog copy protection | No |
| | Sync on green | No |
| HSYNC VSYNC | Voltage | 3.3 V |
| | Enable/Disable | Port control |
| | Polarity adjust | VGA or port control |
| | Composite sync support | No |
| | Special flat panel sync | No |
| | Stereo sync | No |
| DDC | Voltage | External buffered to 5 V |
| | Control | Through GPIO interface |

#### 14.4.1.2.1 Integrated RAMDAC

The display function contains a RAM-based Digital-to-Analog Converter (RAMDAC) that transforms the digital data from the graphics and video subsystems to analog data for the VGA monitor. The SoC integrated 320 MHz RAMDAC supports resolutions up to 2560x1600 at 60 Hz. Three 8-bit DACs provide the R, G, and B signals to the monitor.



#### 14.4.1.2.2 Sync Signals

HSYNC and VSYNC signals are digital and conform to TTL signal levels at the connector. Since these levels cannot be generated internal to the device, external level shifting buffers are required. These signals can be polarity adjusted and individually disabled in one of the two possible states. The sync signals should power up disabled in the high state. No composite sync or special flat panel sync support are included.

#### 14.4.1.2.3 VESA/VGA Mode

VESA/VGA mode provides compatibility for pre-existing software that set the display mode using the VGA CRTC registers. Timings are generated based on the VGA register values and the timing generator registers are not used.

#### 14.4.1.2.4 Display Data Channel (DDC)

DDC is a standard defined by VESA. Its purpose is to allow communication between the host system and display. Both configuration and control information can be exchanged allowing plug-and-play systems to be realized. Support for DDC 1 and 2 is implemented. The SoC uses the VGA_DDCCLK and VGA_DDCDATA signals to communicate with the analog monitor. The SoC does not generate these signals at 5 V so external pull-up resistors and level shifting circuitry should be implemented on the board.

## 14.4.2 Digital Display Interfaces

### 14.4.2.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

**Table 167. Display Physical Interfaces Signal Names (Sheet 1 of 2)**

| Signal Name | Direction | Description | |
|---|---|---|---|
| | | HDMI / DVI | DP / eDP |
| DDI[1,0]_TXP[0]<br>DDI[1,0]_TXP[1]<br>DDI[1,0]_TXP[2]<br>DDI[1,0]_TXP[3] | O | **Ports 1,0: Transmit Signals** | |

### 14.4.2.2 Features

### 14.4.2.3 High Definition Multimedia Interface

The High-Definition Multimedia Interface (HDMI) is provided for transmitting digital audio and video signals from DVD players, set-top boxes and other audiovisual sources to television sets, projectors and other video displays. It can carry high quality multi-

channel audio data and all standard and high-definition consumer electronics video formats. HDMI display interface connecting the SoC and display devices utilizes transition minimized differential signaling (TMDS) to carry audiovisual information through the same HDMI cable.

HDMI includes three separate communications channels: TMDS, DDC, and the optional CEC (consumer electronics control) (not supported by the SoC). As shown in Figure 91 the HDMI cable carries four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA DDC. The DDC is used by an HDMI Source to determine the capabilities and characteristics of the sink.

Audio, video and auxiliary (control/status) data is transmitted across the three TMDS data channels. The video pixel clock is transmitted on the TMDS clock channel and is used by the receiver for data recovery on the three data channels. The digital display data signals driven natively through the SoC are AC coupled and needs level shifting to convert the AC coupled signals to the HDMI compliant digital signals.

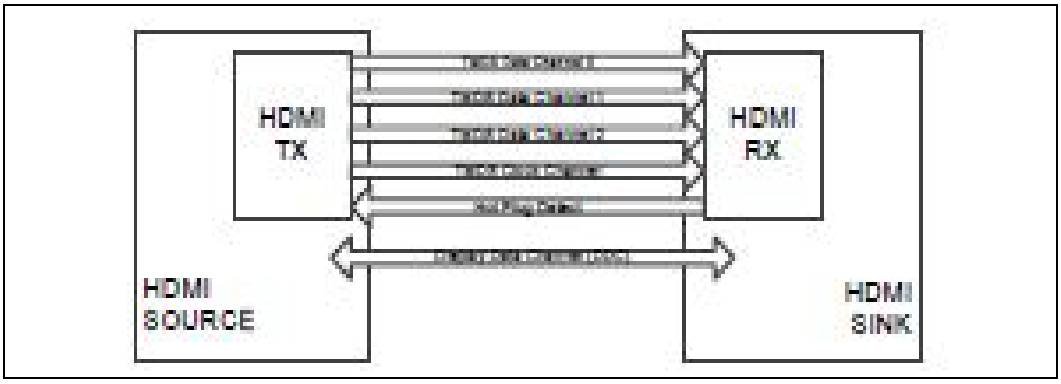
The SoC HDMI interface is designed as per the High-Definition Multimedia Interface Specification 1.4. The SoC supports High-Definition Multimedia Interface Compliance Test Specification 1.4.

#### 14.4.2.3.1 Stereoscopic Support on HDMI

SoC display supports HDMI 1.4 3D video formats. If the HDMI panel is detected to support 3D video format then the SW driver will program Pipe2dB for the correct pipe timing parameters.

The left and right frames can be loaded from independent frame buffers in the main memory. Depending on the input S3D format, the display controller can be enabled do perform frame repositioning, image scaling, line interleaving.

**Figure 91. HDMI Overview**



### 14.4.2.4 Digital Video Interface (DVI)

The Digital Ports can be configured to drive DVI-D. DVI uses TMDS for transmitting data from the transmitter to the receiver which is similar to the HDMI protocol but without the audio and CEC. Refer to the HDMI section for more information on the

signals and data transmission. To drive DVI-I through the back panel the VGA DDC signals are connected along with the digital data and clock signals from one of the Digital Ports. When a system has support for a DVI-I port, then either VGA or the DVI-D through a single DVI-I connector can be driven but not both simultaneously.

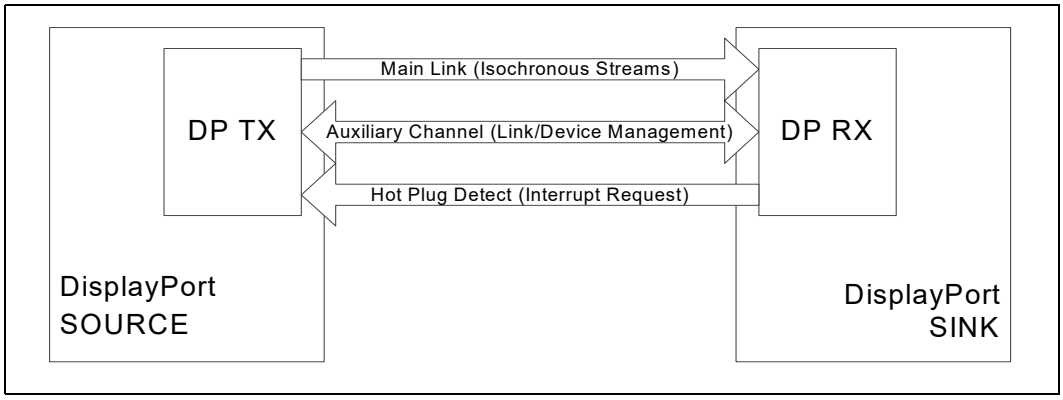
#### 14.4.2.5 Display Port

Display Port is a digital communication interface that utilizes differential signalling to achieve a high bandwidth bus interface designed to support connections between PCs and monitors, projectors, and TV displays. Display Port is also suitable for display connections between consumer electronics devices such as high definition optical disc players, set top boxes, and TV displays.

A Display Port consists of a Main Link, Auxiliary channel, and a Hot Plug Detect signal. The Main Link is a uni-directional, high-bandwidth, and low latency channel used for transport of isochronous data streams such as uncompressed video and audio. The Auxiliary Channel (AUX CH) is a half-duplex bidirectional channel used for link management and device control. The Hot Plug Detect (HPD) signal serves as an interrupt request for the sink device.

The SoC supports DisplayPort Standard Version 1.1.

**Figure 92. DisplayPort* Overview**

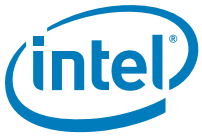


#### 14.4.2.6 Embedded DisplayPort (eDP)

Embedded DisplayPort (eDP) is a embedded version of the DisplayPort standard oriented towards applications such as notebook and All-In-One PCs. eDP is supported only on Digital Display Interfaces 0 and/or 1. Like DisplayPort, Embedded DisplayPort also consists of a Main Link, Auxiliary channel, and a optional Hot Plug Detect signal.

Each eDP port can be configured for up-to 4 lanes.

The SoC supports Embedded DisplayPort Standard Version 1.3.



#### 14.4.2.6.1 DisplayPort Auxiliary Channel

A bidirectional AC coupled AUX channel interface replaces the $I^2C$ for EDID read, link management and device control. $I^2C$-to-Aux bridges are required to connect legacy display devices.

#### 14.4.2.6.2 Hot-Plug Detect (HPD)

The SoC supports HPD for Hot-Plug sink events on the HDMI and DisplayPort interfaces.

#### 14.4.2.6.3 Integrated Audio over HDMI and DisplayPort

SoC can support two audio streams on DP/HDMI ports. Each stream can be programmable to either DDI port. HDMI/DP audio streams can be sent with video streams as follows.

LPE mode: In this mode the uncompressed or compressed audio sample buffers are generated either by OS the audio stack or by audio Lower Power Engine (LPE) and stored in system memory.The display controller fetches audio samples from these buffers, forms an SPDIF frame with VUCP and preamble (if needed), then sends out with video packets.

#### 14.4.2.6.4 High-Bandwidth Digital Content Protection (HDCP)

HDCP is the technology for protecting high definition content against unauthorized copy or unreceptive between a source (computer, digital set top boxes, etc.) and the sink (panels, monitor, and TV). The SoC supports HDCP 1.4 for content protection over wired displays (HDMI, DisplayPort and Embedded DisplayPort).

## 14.5 References

- High-Definition Multimedia Interface Specification, Version 1.4
- High-bandwidth Digital Content Protection System, Revision 1.4
- VESA DisplayPort Standard, Version 1.1
- VESA Embedded DisplayPort Standard, Version 1.3

## 14.6 3D Graphics and Video

The SoC implements a derivative of the Generation 7 graphics engine which consists of rendering engine and bit stream encoder/decoder engine. The rendering engine is used for 3D rendering, media compositing and video encoding. The Graphics engine is built around four execution units (EUs).

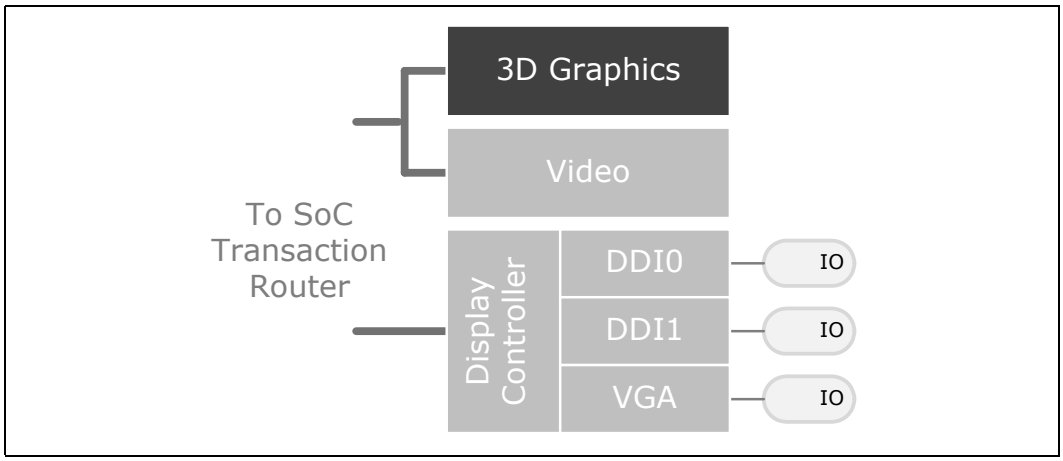


**Figure 93. 3D Graphics Block Diagram**

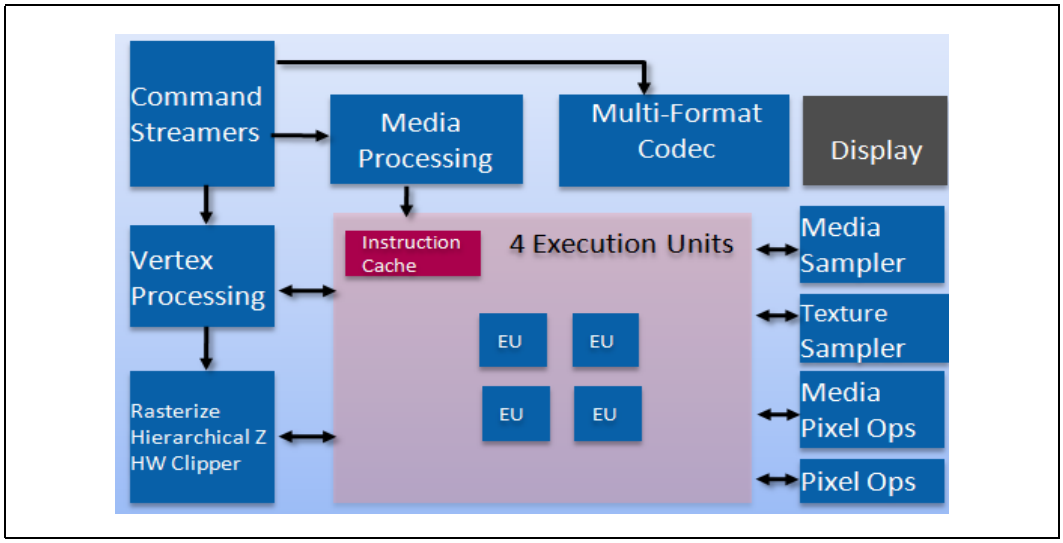
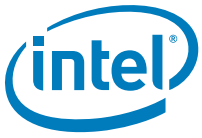


## 14.7 Features

The 3D graphics pipeline architecture simultaneously operates on different primitives or on different portions of the same primitive. All the cores are fully programmable, increasing the versatility of the 3D Engine. The Gen 7.0 3D engine provides the following performance and power-management enhancements:

- Hierarchal-Z
- Video quality enhancements



## 14.7.1 3D Engine Execution Units

- The EUs perform 128-bit wide execution per clock.
- Support SIMD8 instructions for vertex processing and SIMD16 instructions for pixel processing.

## 14.7.2 3D Pipeline

### 14.7.2.1 Vertex Fetch (VF) Stage

The VF stage executes 3DPRIMITIVE commands. Some enhancements have been included to better support legacy D3D APIs as well as SGI OpenGL*.

### 14.7.2.2 Vertex Shader (VS) Stage

The VS stage performs shading of vertices output by the VF function. The VS unit produces an output vertex reference for every input vertex reference received from the VF unit, in the order received.

### 14.7.2.3 Geometry Shader (GS) Stage

The GS stage receives inputs from the VS stage. Compiled application-provided GS programs, specifying an algorithm to convert the vertices of an input object into some output primitives. For example, a GS shader may convert lines of a line strip into polygons representing a corresponding segment of a blade of grass centered on the line. Or it could use adjacency information to detect silhouette edges of triangles and output polygons extruding out from the edges.

### 14.7.2.4 Clip Stage

The Clip stage performs general processing on incoming 3D objects. However, it also includes specialized logic to perform a Clip Test function on incoming objects. The Clip Test optimizes generalized 3D Clipping. The Clip unit examines the position of incoming vertices, and accepts/rejects 3D objects based on its Clip algorithm.

### 14.7.2.5 Strips and Fans (SF) Stage

The SF stage performs setup operations required to rasterize 3D objects. The outputs from the SF stage to the Windower stage contain implementation-specific information required for the rasterization of objects and also supports clipping of primitives to some extent.

### 14.7.2.6 Windower/IZ (WIZ) Stage

The WIZ unit performs an early depth test, which removes failing pixels and eliminates unnecessary processing overhead.

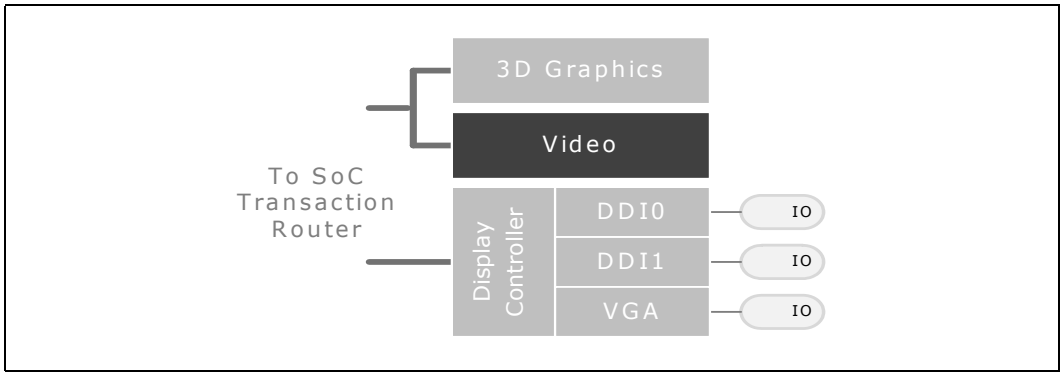
The Windower uses the parameters provided by the SF unit in the object-specific rasterization algorithms. The WIZ unit rasterizes objects into the corresponding set of pixels. The Windower is also capable of performing dithering, whereby the illusion of a higher resolution when using low-bpp channels in color buffers is possible. Color dithering diffuses the sharp color bands seen on smooth-shaded objects.

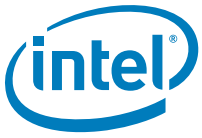
### 14.7.3 Video Engine

The video engine is part of the Intel Processor Graphics for image processing, play-back and transcode of Video applications. Processor Graphics video engine has a dedicated fixed hardware pipe-line for high quality decode and encode of media content. This engine supports Full HW acceleration for decode of H.264, MPEG -2, MVC, VC-1, WMV9, JPEG/MJPEG contents along with encode of H.264 apart from various video processing features. The new Processor Graphics Video engine adds support for processing features such as frame rate conversion, image stabilization and gamut conversion.

## 14.8 VED (Video Encode/Decode)

***Note:*** The video engine is part of the Intel Processor Graphics for image processing, play-back and transcode of Video applications. Processor Graphics video engine has a dedicated fixed hardware pipe-line for high quality decode and encode of media content. SoC Video Encode Decode block incorporates VXD 392 video decode core.





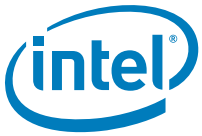
### 14.8.1 Features

The features for the Video decode hardware accelerator in SoC are:

- VED core can be configured on a time division multiplex basis to handle single, dual and multi-stream HD decoding.
- VED provides full hardware acceleration support

**Table 170. Hardware Accelerated Video Decode Codec Support**

| Category | Codec Format |
|---|---|
| Media decode rate | Upto 1080p@60fps and<br>3x 4kx2k @30fps (H.264/JPEG/ MJPEG/MVC/MPEG-2 /WMV9/VC1) |
| Media encode rate | Upto 1080p@60fps and<br>1x 4kx2k @30fps (H.264) |



## 14.9 PCI Configuration Registers

### Table 171. Summary of Graphics, Video and Display PCI Configuration Registers—0/2/0

## 14.9.4 HDR—Offset Ch

Header Type

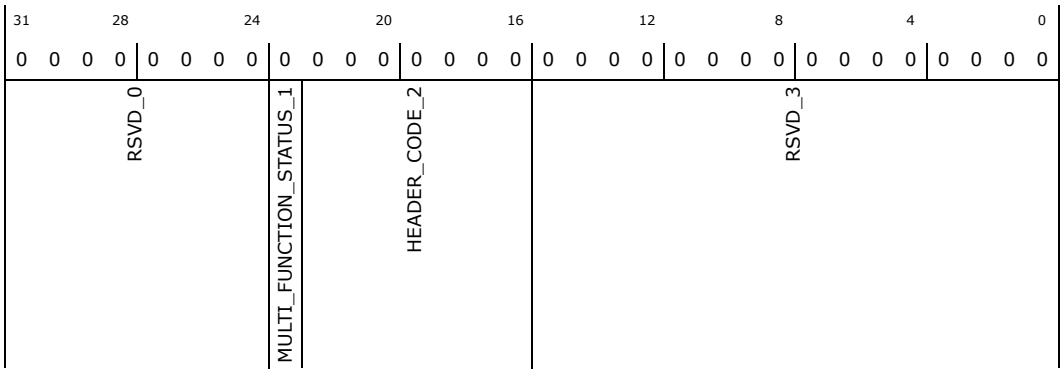
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**HDR:** [B:0, D:2, F:0] + Ch

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **RSVD (RSVD_0):** Reserved |
| 23 | 0b RO | **MULTI_FUNCTION_STATUS (MULTI_FUNCTION_STATUS_1):** MFUNC: Integrated graphics is a single function |
| 22:16 | 00h RO | **HEADER_CODE (HEADER_CODE_2):** HDR: Indicates a type 0 configuration space header format |
| 15:0 | 0000h RO | **RSVD (RSVD_3):** Reserved |

## 14.9.5 GTTMMADR_LSB—Offset 10h

Gfx Memory Mapped Address Range. This is the base address for all memory mapped registers and GTT table. SOXi Context Save/Restore : Yes This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 4 MB combined for MMIO and Global GTT aperture, with 512K of that used by MMIO and 2MB used by GTT. GTTADR will begin at (GTTMMADR + 2 MB) while the MMIO base address will be the same as GTTMMADR. For

the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area. The allocation is for 4MB and the base address is defined by bits [35:22].

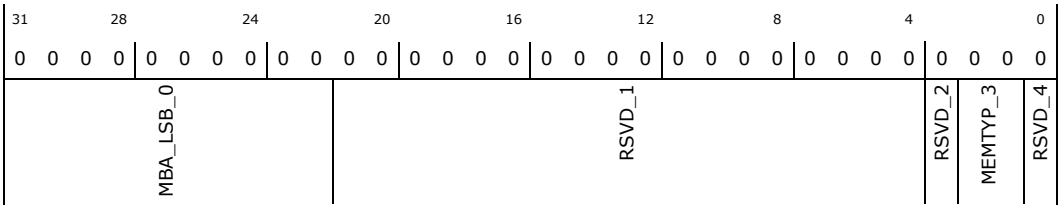
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB:** [B:0, D:2, F:0] + 10h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:22 | 000h RW | **MBA_LSB (MBA_LSB_0):** Memory Base Address (MBA): Set by the OS, these bits correspond to address signals [35:22]. 4MB combined for MMIO and Global GTT table aperture (2MB for MMIO and 2 MB for GTT). |
| 21:4 | 00000h RO | **RSVD (RSVD_1):** RSVD: Hardwired to 0 to indicate at least 4MB address range. |
| 3 | 0b RO | **RSVD (RSVD_2):** Prefetchable Memory (PREFMEM): Hardwired to 0to prevent prefetching. |
| 2:1 | 00b RO | **MEMTYP (MEMTYP_3):** Memory Type (MEMTYP): 00 : To indicate 32 bit base address 01: Reserved 10 : To indicate 64 bit base address 11: Reserved |
| 0 | 0b RO | **RSVD (RSVD_4):** Memory/IO Space (MIOS): Hardwired to 0 to indicate memory space. |

## 14.9.6 GTTMMADR_MSB—Offset 14h

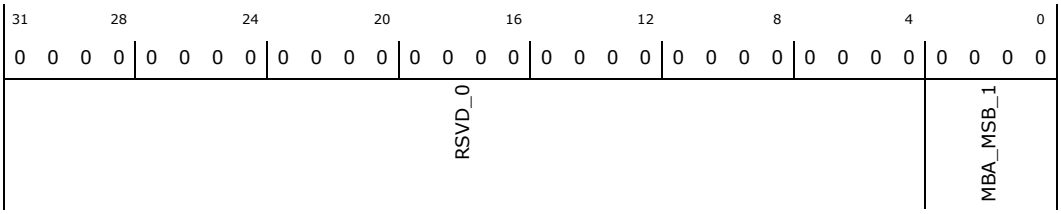
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_MSB:** [B:0, D:2, F:0] + 14h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:4 | 00000000h RO | **RSVD (RSVD_0):** Reserved for Memory Base Address (RSVD): Must be set to 0 since addressing above 64GB is not supported. |
| 3:0 | 0h RO | **MBA_MSB (MBA_MSB_1):** Memory Base Address (MBA): Set by the OS, these bits correspond to address signals [35:22]. 4MB combined for MMIO and Global GTT table aperture (2MB for MMIO and 2 MB for GTT). |

## 14.9.7 GMADR_LSB—Offset 18h

Gfx Aperture location. SOXi Context Save/Restore : Yes GMADR is a Prefetchable range in order to apply USWC attribute (from the processor point of view) to that range. The USWC attribute is used by the processor for write combining. Accesses to this range will be translated to DRAM Physical memory addresses. Fence registers may be used to sub-divide this range and allow tiled surfaces (determined by fence registers). The following sizes are supported : 128MB, 256MB, 512MB. (Determined by the MSAC register)

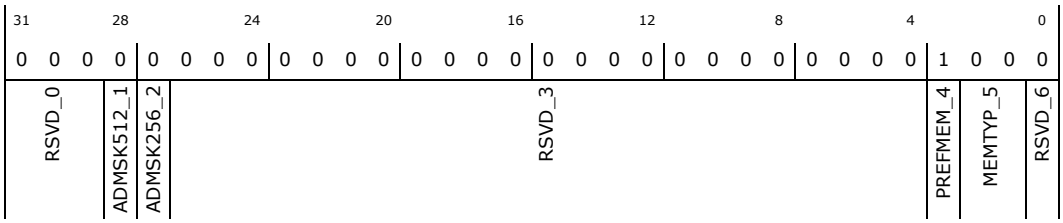
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**GMADR_LSB:** [B:0, D:2, F:0] + 18h

**Power Well:** Core

**Default:** 00000008h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 000b RO | **RSVD (RSVD_0):** Memory Base Address (MBA): Memory Base Address (MBA): Set by the OS, these bits correspond to address signals [35:29]. |
| 28 | 0b RW/L | **ADMSK512 (ADMSK512_1):** 512MB Address Mask (ADMSK512): This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO), depending on the value of MSAC[2:1]. See MSAC (Dev2, Func 0, offset 62h) for details. |
| 27 | 0b RW/L | **ADMSK256 (ADMSK256_2):** 256MB Address Mask (ADMSK256): This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO), depending on the value of MSAC[2:1]. See MSAC (Dev 2, Func 0, offset 62h) for details. |
| 26:4 | 0000000h RO | **RSVD (RSVD_3):** Address Mask (ADM): Hardwired to 0s to indicate at least 128MB address range. |
| 3 | 1b RO | **PREFMEM (PREFMEM_4):** Prefetchable Memory (PREFMEM): Hardwired to 1 to enable prefetching. |
| 2:1 | 00b RO | **MEMTYP (MEMTYP_5):** Memory Type (MEMTYP): 00 : To indicate 32 bit base address 01: Reserved 10 : To indicate 64 bit base address 11: Reserved |
| 0 | 0b RO | **RSVD (RSVD_6):** Memory/IO Space (MIOS): Hardwired to 0 to indicate memory space. |

## 14.9.8 GMADR_MSB—Offset 1Ch

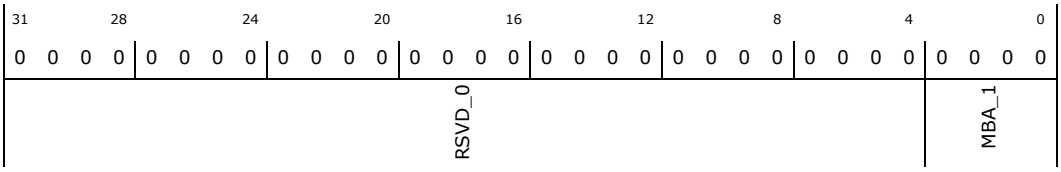
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**GMADR_MSB:** [B:0, D:2, F:0] + 1Ch

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:4 | 0000000h<br>RO | **RSVD (RSVD_0):** Memory Base Address (MBA2): Set by the OS, these bits correspond to address signals [63:36]. |
| 3:0 | 0h<br>RO | **MBA (MBA_1):** Memory Base Address (MBA)Set by the OS, these bits correspond to address signals [35:32] |

## 14.9.9 IOBAR—Offset 20h

I/O Base Address. This is used only by SBIOS. This register is the base address for the MMIO_INDEX and MMIO_DATA registers SOXi Context Save/Restore : Yes NOTE : This was at 14h for CDV. This register provides the Base offset of the I/O registers within Device #2. Access to the 8Bs of IO space is allowed in PM state D0 when IO Enable (PCICMD bit 0) set. Access is disallowed : 1)in PM states D1-D3 or 2)if IO Enable is clear or 3)if Device #2 is turned off or 4)if Internal graphics is disabled thru the fuse or fuse override mechanisms. Note that access to this IO BAR is independent of VGA functionality within Device #2. If accesses to this IO bar is allowed then the GMCH claims all 8, 16 or 32 bit IO cycles from the CPU that falls within the 8B claimed.

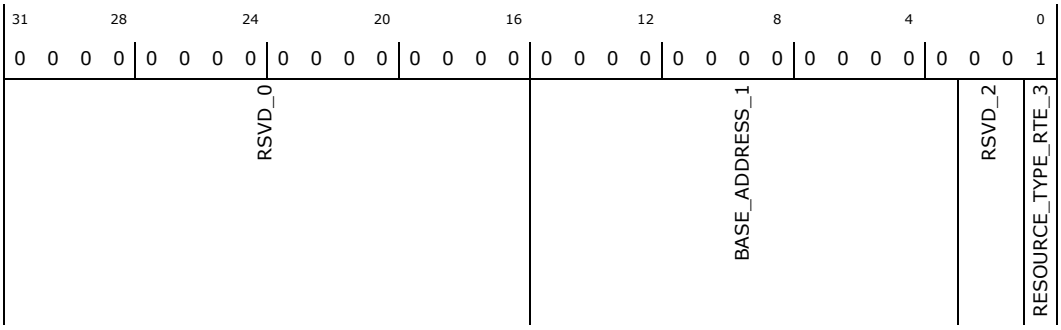
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR:** [B:0, D:2, F:0] + 20h

**Power Well:** Core

**Default:** 00000001h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RO | **RSVD (RSVD_0):** Reserved |
| 15:3 | 0000h RW | **BASE_ADDRESS (BASE_ADDRESS_1):** BA: Set by the OS, these bits correspond to address signals [15:6].IOBAR is to be used for both GTLC register programming and GTT table programming. This is an indirect access method. |
| 2:1 | 00b RO | **RSVD (RSVD_2):** Reserved |
| 0 | 1b RO | **RESOURCE_TYPE_RTE (RESOURCE_TYPE_RTE_3):** Indicates a request for I/O space |

## 14.9.10 SSID_SID—Offset 2Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

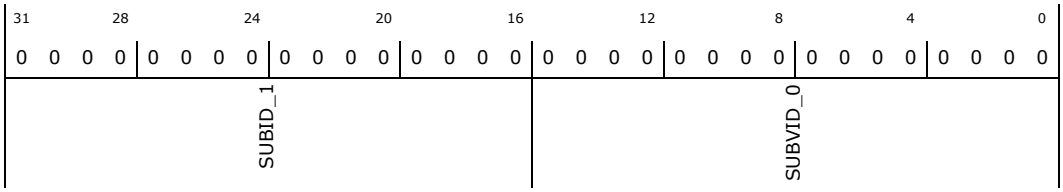
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**SSID_SID:** [B:0, D:2, F:0] + 2Ch

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RW/O | **SUBID (SUBID_1):** This value is used to identify the vendor of the subsystem. This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. |
| 15:0 | 0000h RW/O | **SUBVID (SUBVID_0):** This value is used to identify the vendor of the subsystem. This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. |

## 14.9.11 CAPPOINT—Offset 34h

This register points to a linked list of capabilities implemented by this device.For VV, the capability linked list is expected to be : (Head-34, PMCAP-D0, MSI-90, VID-B0, ..End)Old : (Head-34, PMCAP-D0, MSI-90, AFLC-A4, VID-B0, .. End)

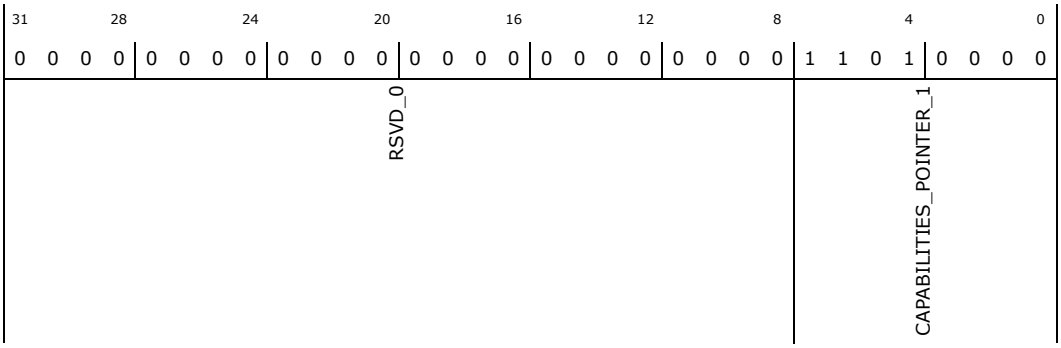
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**CAPPOINT:** [B:0, D:2, F:0] + 34h

**Power Well:** Core

**Default:** 000000D0h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **RSVD (RSVD_0):** Reserved |
| 7:0 | D0h RW/O | **CAPABILITIES_POINTER (CAPABILITIES_POINTER_1):** The first item in the capabilities list is at address D0h (PMCS). This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. |

## 14.9.12 INTRLINE—Offset 3Ch

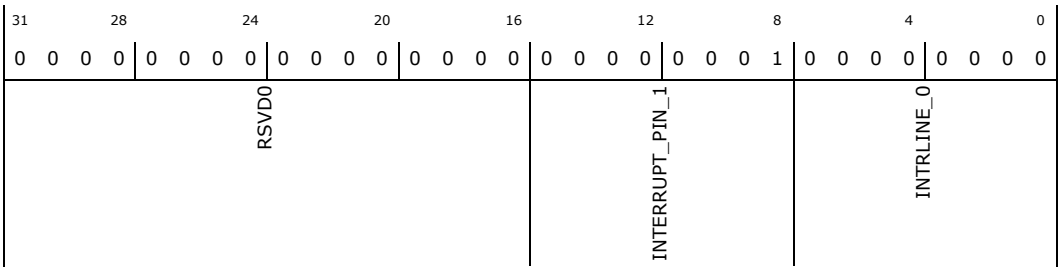
3C - Interrupt. This register is programmed by SBIOS. It is not used by the graphics/display driver. This 8-bit register is used to communicate interrupt line routing information. It is read/write and must be implemented by the device. POST software will write the routing information into this register as it initializes and configures the system. SOXi Context Save/Restore : Yes The value in this register tells which input of the system interrupt controller(s) the device?s interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems to determine priority and vector information. 3D - Interrupt. This register is programmed by SBIOS. It is not used by the graphics/display driver SOXi Context Save/Restore : Not required

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**INTRLINE:** [B:0, D:2, F:0] + 3Ch

**Default:** 00000100h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b RO | **RSVD0:** Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 01h<br>RO | **INTERRUPT_PIN (INTERRUPT_PIN_1):** IPIN: Value indicates which interrupt pin this device uses. This field is hard coded to 1h since Valleyview Device 2 is a single function device. The PCI spec requires that it use INTA#.01h: INTA |
| 7:0 | 00h<br>RW | **INTRLINE (INTRLINE_0):** ILIN: BIOS written value to communicate interrupt line routing information to the device driverUsed to communicate interrupt line routing information. POST software writes the routing information into this register as it initializes and configures the system. The value in this register indicates to which input of the system interrupt controller the device?s interrupt pin is connected. |

## 14.9.13 GGC—Offset 50h

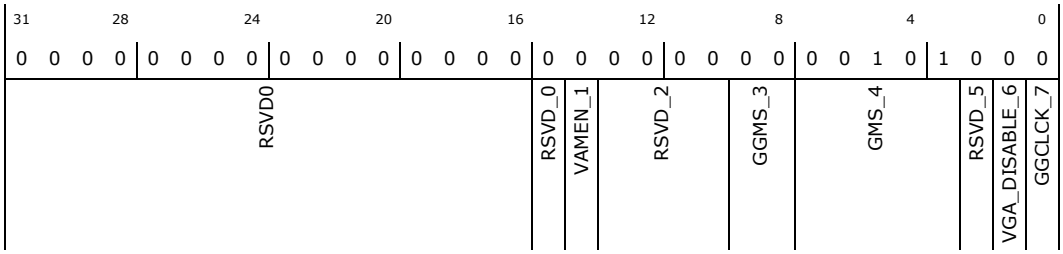
GMCH Graphics Control Register. SOXi Context Save/Restore : Yes Note : CDV supported 64MB maximum. CDV had no GGMS field. Note : CDV had more granularity on the encodings for graphics mode select and only 3 bits.

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**GGC:** [B:0, D:2, F:0] + 50h

**Default:** 00000028h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15 | 0b<br>RO | **RSVD (RSVD_0):** Reserved |
| 14 | 0b<br>RW/L | **VAMEN (VAMEN_1):** Enables the use of the iGFX engines for Versatile Acceleration. 1 - iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. 0 - iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h. |
| 13:10 | 0h<br>RO | **RSVD (RSVD_2):** Reserved |
| 9:8 | 00b<br>RW/L | **GGMS (GGMS_3):** GTT Graphics Memory Size (GGMS): This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM, and BIOS needs to allocate a contiguous memory chunk. Hardware will drive the base of GSM from DSM only using the GSM size programmed in the register. 0h: No memory pre-allocated. GTT cycles (Mem and IO) are not claimed. 1h: 1 MB of memory pre-allocated for GTT. 2h: 2 MB of memory pre-allocated for GTT. 3h: Reserved. All unspecified encodings of this register field are reserved, hardware functionality is not guaranteed if used. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:3 | 00101b RW/L | **GMS (GMS_4):** Graphics Mode Select (GMS). This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0. 0h = 0MB 10h = 512MB 1h = 32MB 2h = 64MB 3h = 96MB 4h = 128MB 5h = 160MB 6h = 192MB 7h = 224MB 8h = 256MB 9h = 288MB Ah = 320MB Bh = 352MB Ch = 384MB Dh = 416MB Eh = 448MB Fh = 480MB Other = Reserved When GMS != 000 (and VD=0): Address[31:0] is compared with VGA memory range. (The VGA memory range is A_0000h to B_FFFFh.). If there is a match and MSE = 1 and MEMRD or MEMWR, the access will route as a Rmdwvgamemen_cr cycle on the RMbus. If the RMbus returns a hit the GVD will select the command. As well, when 0 the GVD will check if scldown3_address[15:0] is one of the VGA IO register range. (The VGA IO range is 03B0h - 03BBh and 03C0h - 03DFh.) If there is a match and IOSE = 1 and the SCL command is either an IORD or IOWR, the GVD will intiate a (VGA) register cycle on the RMbus. If the RMbus returns a hit the GVD will select the command When GMS == 000 : No address compare will occur against VGA memory range or the VGA IO register range. Also, CC[15:8] is changed to 8?h80 from 8'h00 |
| 2 | 0b RO | **RSVD (RSVD_5):** Reserved |
| 1 | 0b RW/L | **VGA_DISABLE (VGA_DISABLE_6):** VGA Disable (VD): 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00. 1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub- Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field pre-allocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override (CAPID0[38] = 1) or via a register (DEVEN[3] = 0). |
| 0 | 0b RW/L | **GGCLCK (GGCLCK_7):** When set to 1b, this bit will lock all bits in this register. |

## 14.9.14 BDSM—Offset 5Ch

This register contains the base address of Graphics Data Stolen DRAM memory. Note : IVB located this register in device 0, 0xB0. Mirrored into device 2, 0x5C.Graphics Stolen Memory is within DRAM space. The base of stolen memory will always be below 4G.

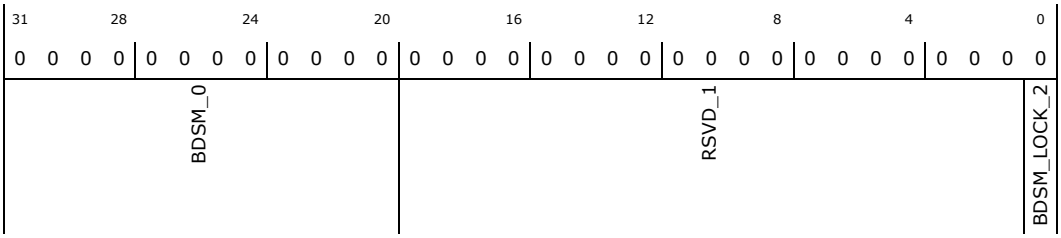
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**BDSM:** [B:0, D:2, F:0] + 5Ch

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 000h RW/L | **BDSM (BDSM_0):** BDSM: BASE_OF_Data_STOLEN_MEMORY. This register contains bits 31 to 20 of the base address of Data stolen DRAM memory. For certain GTLC generated accesses, this base register will be added to the GTLC provided offset address, forming the full physical address for the PFI fabric. This is also used as a base for VGA paged accesses. The display engine also uses the register. Signal : gvd_dsp_cfg_BSM_zcznfwh[31:20]. |
| 19:1 | 00000h RO | **RSVD (RSVD_1):** Reserved |
| 0 | 0b RW/L | **BDSM_LOCK (BDSM_LOCK_2):** This bit will lock all writeable settings in this register, including itself. |

## 14.9.15 MSAC—Offset 60h

This register determines the size of the graphics memory aperture. Only the system BIOS will write this register based on pre- boot address allocation efforts. Graphics may read this register to determine the correct aperture size. System BIOS needs to save this value on boot so that it can reset it correctly during S3 resume. SOXi Context Save/Restore : Yes. The size of the aperture must not be modified by software after its location is written into GMADR (offset 18h).

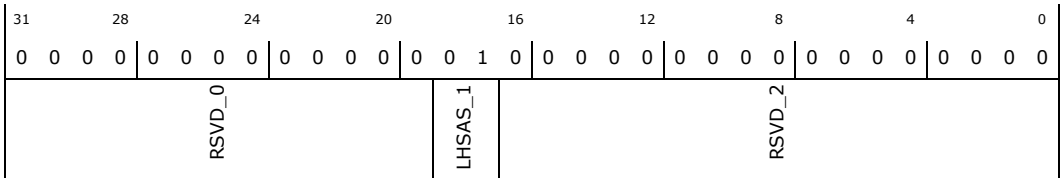
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MSAC:** [B:0, D:2, F:0] + 60h

**Power Well:** Core

**Default:** 00020000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:19 | 0000h RO | **RSVD (RSVD_0):** Reserved |
| 18:17 | 01b RW | **LHSAS (LHSAS_1):** Untrusted Aperture Size (LHSAS): 00 : bits [28:27] of GMADR register are made R/W allowing 128MB of GMADR. 01 : bit [28] of GMADR is made R/W and bit [27] of GMADR is forced to zero allowing 256MB of GMADR. 10 : Illegal programming. 11: bits [28:27] of GMADR register are made Read only and forced to zero, allowing only 512MB of GMADR. |
| 16:0 | 00000h RO | **RSVD (RSVD_2):** Reserved |

## 14.9.16 BGSM—Offset 70h

Base of GTT table in Gfx Stolen Memory SOXi Context Save/Restore : Yes. Note : IVB located this register in device 0, 0xB4. Mirrored into Device 2. The GTT table is located within Graphics Stolen Memory in DRAM space. The base of stolen memory will always be below 4G.

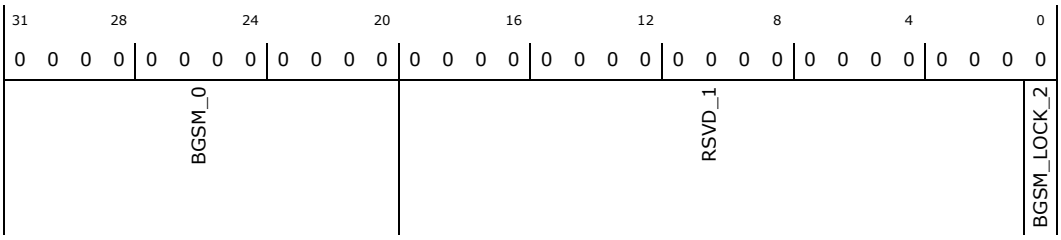
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**BGSM:** [B:0, D:2, F:0] + 70h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 000h RW/L | **BGSM (BGSM_0):** BGSM: Gfx Base of GTT Stolen Memory. This register contains bits 31 to 20 of the base address of GTT Table in stolen DRAM memory. BIOS determines the base of GTT stolen memory by subtracting the GTT graphics stolen memory size (PCI Device 2 offset 50 bits 9:8) from the Graphics Base of Data Stolen Memory (PCI Device 2 offset 5C bits 31:20). Signal : gvd_dsp_Cspgtbladdr_dczfwohdczfwoh[31:20].Note : was 4KB aligned on CDV ie. [31:12] |
| 19:1 | 00000h RO | **RSVD (RSVD_1):** Reserved |
| 0 | 0b RW/L | **BGSM_LOCK (BGSM_LOCK_2):** This bit will lock all writeable settings in this register including itself |

## 14.9.17 PAVPC—Offset 74h

Protected Audio Video Control. Similar to IVB, BIOS will program this register for Valleyview (not the Gfx Driver). SOXi Context Save/Restore : Yes. For Valleyview, device 2 configuration accesses to 0x74 and Gfx MMIO accesses to 0x1082C0 will both alias to the same register. This register will be located within Gunit.WOPCMBASE is derived from : BDSMbase + GMS size - WOPCMSZ. Note : IVB currently derives from : TOLUD + WOPCMSZ

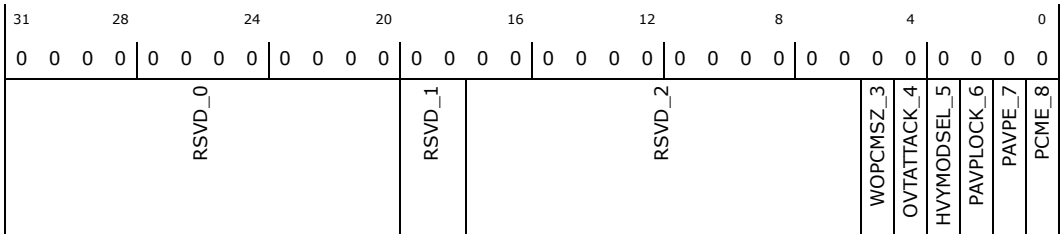
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**PAVPC:** [B:0, D:2, F:0] + 74h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 000h RO | **RSVD (RSVD_0):** Reserved. This field is used to set the base of Protected Content Memory. This corresponds to bits 31:20 of the system memory address range, giving a 1MB granularity. This value MUST be at least 1MB above the base and below the top of stolen memory. This register is locked (becomes read-only) when PAVPLOCK = 1b. |
| 19:18 | 00b RO | **RSVD (RSVD_1):** Reserved. Note : IVB provided 256KB granularity, so these 2 bits were RW to support that size option. However, VV will only support 1MB so Gunit will tie bits 19:18 to '00'. |
| 17:6 | 000h RO | **RSVD (RSVD_2):** Reserved |
| 5 | 0b RO | **WOPCMSZ (WOPCMSZ_3):** 0b ? 1MB Note : IVB had this as a RW bit with value '1' indicating size 256KB support. Since VV only supports 1MB size, this register is RO for VV. These are the only sizes supported for IVB. The IVB is going to run PAVP3 Mode Serpent applications using per-App selection. Therefore, the size chosen should always be 1MB configuration even if Lite mode is chosen using PAVPC register (bit_3 = 0) for PAVP2 Mode Applications. This is because CB^2 code needs to be always loaded, since an App. Which opts for per-App Serpent mode will also execute the CB^2 code). The driver may consider it a BIOS programming error, if PAVPC Serpent Mode is selected with only 256KB of WOPCM size. However PAVPC Lite Mode with 1M WOPCM size is acceptable and not an error, as this may involve per-App selected Serpent Mode. |
| 4 | 0b RW/L | **OVTATTACK (OVTATTACK_4):** Override of Unsolicited Connection State Attack and Terminate. 0b Disable Override. Attack Terminate allowed. 1b Enable Override. Attack Terminate disallowed. This register bit is locked (becomes read-only) when PAVPLOCK = 1b |
| 3 | 0b RW/L | **HVYMODSEL (HVYMODSEL_5):** In IVB, this bit is a care only for PAVP2 mode of operation (and a chicken bit is also set). For IVB PAVP2 mode: 0 : Lite Mode (Non-Serpent Mode) 1: Serpent Mode For PAVP3 mode of operation, this bit_3 is a care, only if the per-App Memory Config is disabled due to the clearing of an additional Chicken bit_9 in IVB Crypto Function Control_1 Reg (@ address 0x320F0h). For chicken bit enabled IVB PAVP3 mode, this one type boot time programming has been replaced by per-Media App. Programming (through the Media Crypto Copy command). Note that IVB PAVP2 or PAVP3 Mode selection is done by programming bit_8 of MFX_MODE ? Video Mode Register. (Note again, that when in PAVP3 Mode, the per-App Memory Config. (Serpent/Lite) feature for enabling, requires the further setting of a global one time chicken bit to be set (bit_9 = ?1/mask_bit_25 = ?1) in the IVB Crypto Function Control_1 Register @ address 0x320F0h). Note : Valleyview does not support PAVP2 mode. Only PAVP3 mode is supported (a superset of PAVP2). |
| 2 | 0b RW/L | **PAVPLOCK (PAVPLOCK_6):** This bit will lock all writeable contents in this register when set(including itself).Only a hw reset can unlock the register again. This Lock bit if PAVP is enabled (PAVPE = 1) |
| 1 | 0b RW/L | **PAVPE (PAVPE_7):** 0: PAVP functionality is disabled. 1: enabled. This register is locked when PAVPLOCK=1 |
| 0 | 0b RW/L | **PCME (PCME_8):** PCME = Protected Content Memory Enable This field enables Protected Content Memory within Graphics Stolen Memory. This memory is the same as the WOPCM area. The size of the WOPCM area is defined by bit_5 of this register. WOPCM is the only remaining flavor of range protected memory. 0: WOPCM protection disabled. 1 : WOPCM protection enabled. This bit must be programmed to 1 when PAVP is enabled. With per-App Memory configuration support in IVB, the range check for the WOPCM memory area should always happen when this bit is set, irrespective of Lite or AES mode programming, or PAVP2 or PAVP3 Mode programming. |

## 14.9.18 MSI_CAPID_MC—Offset 90h

Message Signaled Interrupts Capability ID.SOXi Context Save/Restore : Yes. Message Signaled Control Register. SOXi Context Save/Restore : Yes

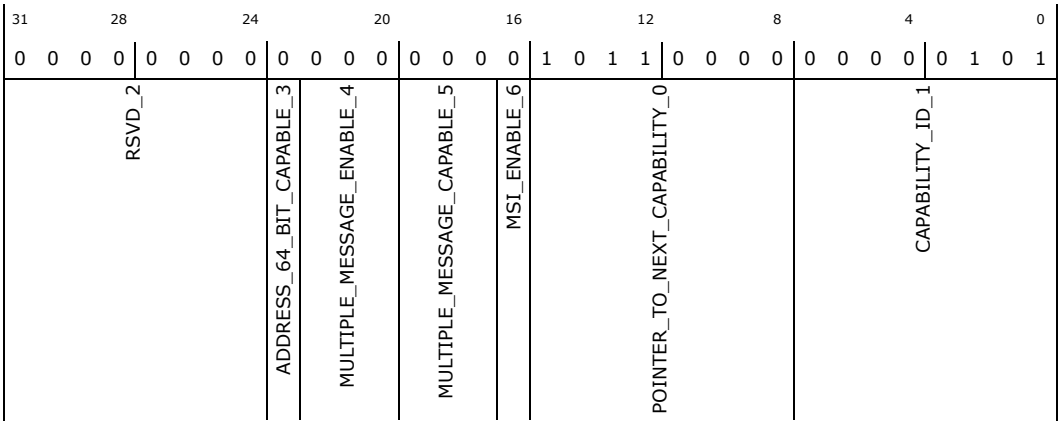
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MSI_CAPID_MC:** [B:0, D:2, F:0] + 90h

**Power Well:** Core

### Default: 0000B005h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RSVD (RSVD_2):** Reserved |
| 23 | 0b<br>RO | **ADDRESS_64_BIT_CAPABLE (ADDRESS_64_BIT_CAPABLE_3):** C64: 32-bit capable only |
| 22:20 | 000b<br>RW | **MULTIPLE_MESSAGE_ENABLE (MULTIPLE_MESSAGE_ENABLE_4):** MME: This field is RW for software compatibility, but only a single message is ever generated. System software programs this field to indicate the actual number of messages allocated to this device. This number will be equal to or less than the number actually requested. The encoding is the same as for the MMC field below. |
| 19:17 | 000b<br>RO | **MULTIPLE_MESSAGE_CAPABLE (MULTIPLE_MESSAGE_CAPABLE_5):** MMC: This device is only single message capable System Software reads this field to determine the number of messages being requested by this device. Value: Number of requests 000: 1. 001- 111: Reserved |
| 16 | 0b<br>RW | **MSI_ENABLE (MSI_ENABLE_6):** MSIE: If set, MSI is enabled and traditional interrupts are not used to generate interrupts. PCICMDSTS.BME must be set for an MSI to be generated. 0 : MSI interrupts are disabled. 1 : MSI interrupts are enabled. Permits sending an MSI interrupt. |
| 15:8 | B0h<br>RW/O | **POINTER_TO_NEXT_CAPABILITY (POINTER_TO_NEXT_CAPABILITY_0):** Points to the next item in the list (B0=VCID support). This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. |
| 7:0 | 05h<br>RO | **CAPABILITY_ID (CAPABILITY_ID_1):** CAPID: Indicates an MSI capability |

## 14.9.19 MA—Offset 94h

Message Address.SOXi Context Save/Restore : Yes

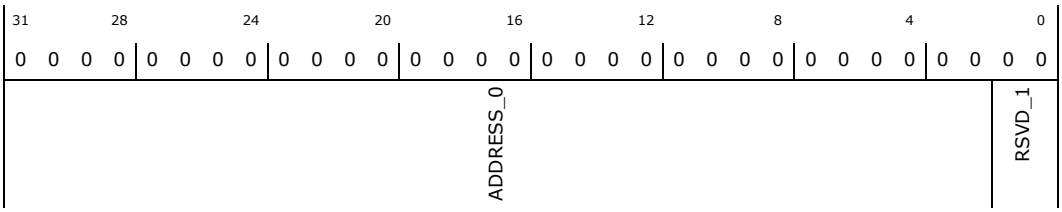
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MA:** [B:0, D:2, F:0] + 94h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h RW | **ADDRESS (ADDRESS_0):** MA: Lower 32-bits of the system specified message address, always DW aligned. When the GVD issues an MSI interrupt as a MEMWR on the SCL, the memory address corresponds to the value of this field |
| 1:0 | 00b RO | **RSVD (RSVD_1):** Reserved |

## 14.9.20 MD—Offset 98h

Message Data.SOXi Context Save/Restore : Yes

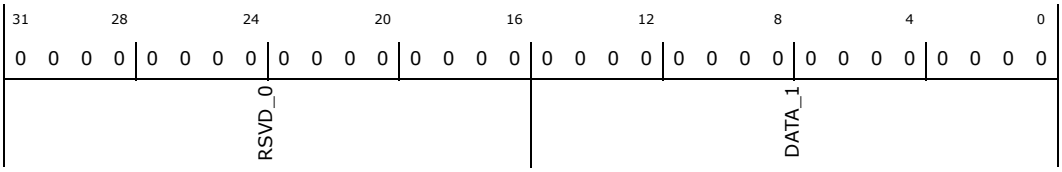
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MD:** [B:0, D:2, F:0] + 98h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RO | **RSVD (RSVD_0):** Reserved |
| 15:0 | 0000h RW | **DATA (DATA_1):** MD: This 16-bit field is programmed by system software. This is forms the lower word of data for the MSI write transaction. |

## 14.9.21 AFLC—Offset A4h

FLR capability advertisement.SOXi Context Save/Restore : Yes

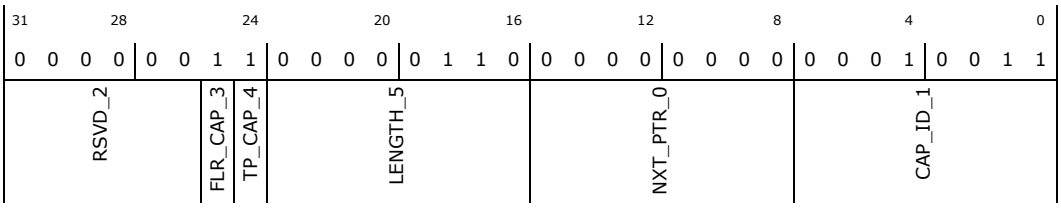
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**AFLC:** [B:0, D:2, F:0] + A4h

**Power Well:** Core

**Default:** 03060013h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:26 | 00h RO | **RSVD (RSVD_2):** Reserved |
| 25 | 1b RO | **FLR_CAP (FLR_CAP_3):** Function Level Reset Capability (FLR_CAP): 0: Function Level Reset is not supported 1: Function Level Reset is supported |
| 24 | 1b RO | **TP_CAP (TP_CAP_4):** Transactions Pending Capability (TP_CAP): 0: Transactions Pending bit is not supported 1: Transactions Pending bit is supported |
| 23:16 | 06h RO | **LENGTH (LENGTH_5):** Advanced Features Structure Length (LENGTH): The Advanced Features Capability structure is 6 bytes long. |
| 15:8 | 00h RW/O | **NXT_PTR (NXT_PTR_0):** Next Pointer (NXT_PTR): Removed FLR capability per HSD 259253. Nulled the next pointer. Points to the next item in the list (B0=Vendor Capabilities ID)This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. Write once so capabilities list can be changed if needed. |
| 7:0 | 13h RO | **CAP_ID (CAP_ID_1):** Capability Identifier (CAP_ID): A value of 13h identifies that this PCI Function is capable of Advanced Features. |

## 14.9.22 AFCTLSTS—Offset A8h

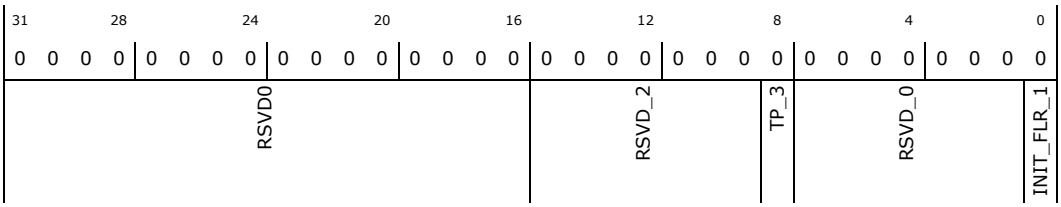
FLR control. Advanced Feature Status.SOXi Context Save/Restore : Not required

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**AFCTLSTS:** [B:0, D:2, F:0] + A8h

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:9 | 00h<br>RO | **RSVD (RSVD_2):** Reserved (RSVD): |
| 8 | 0b<br>RO | **TP (TP_3):** Transaction Pending (TP): 1: The Function has issued one or more non-posted transactions which have not been completed, including non-posted transactions that a target has terminated with Retry. 0: All non-posted transactions have been completed. |
| 7:1 | 00h<br>RO | **RSVD (RSVD_0):** Reserved (RSVD): |
| 0 | 0b<br>RW/1S | **INIT_FLR (INIT_FLR_1):** Initiate Function Level Reset (INIT_FLR): A write of 1b initiates Function Level Reset (FLR). FLR requirements are defined in the PCI Express Base Specification. Registers and state information that do not apply to conventional PCI are exempt from the FLR requirements given there. Once written 1, FLR will be initiated. During FLR, a read will return 1?s since device 2 reads abort. Once FLR completes, hardware will clear the bit to 0. |

## 14.9.23 VCID—Offset B0h

Vendor Capability ID.SOXi Context Save/Restore : Yes

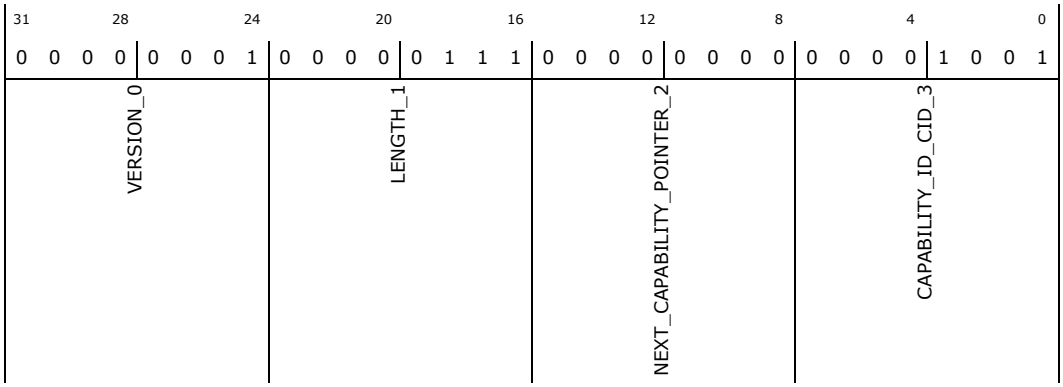
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**VCID:** [B:0, D:2, F:0] + B0h

**Power Well:** Core

### Default: 01070009h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 01h<br>RO | **VERSION (VERSION_0):** VS: Identifies this as the first revision of the CAPID register definition |
| 23:16 | 07h<br>RO | **LENGTH (LENGTH_1):** LEN: this field has the value of 07h to indicate structure length (8 bytes) |
| 15:8 | 00h<br>RW/O | **NEXT_CAPABILITY_POINTER (NEXT_CAPABILITY_POINTER_2):** 00 indicates capability list ends here. This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset.Write-once allowing the capability list to be changed. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 09h<br>RO | **CAPABILITY_ID_CID (CAPABILITY_ID_CID_3):** Identifies this as a vendor dependent capability pointers |

## 14.9.24 VC—Offset B4h

Vendor Capabilities. Any SKU related fuses would be added here.SOXi Context Save/ Restore : Not required

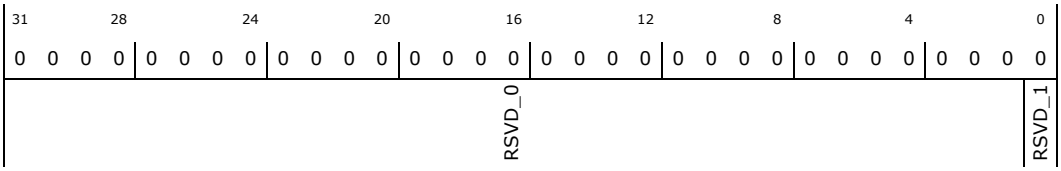
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**VC:** [B:0, D:2, F:0] + B4h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:1 | 0000000h<br>RO | **Reserved (RSVD_0):** Reserved |
| 0 | 0b<br>RO | **Reserved (RSVD_1):** Placeholder for sku related fusing. VLV has no need for this |

## 14.9.25 FD—Offset C4h

Functional Disable. used by SBIOS, not by driver.SOXi Context Save/Restore : Yes

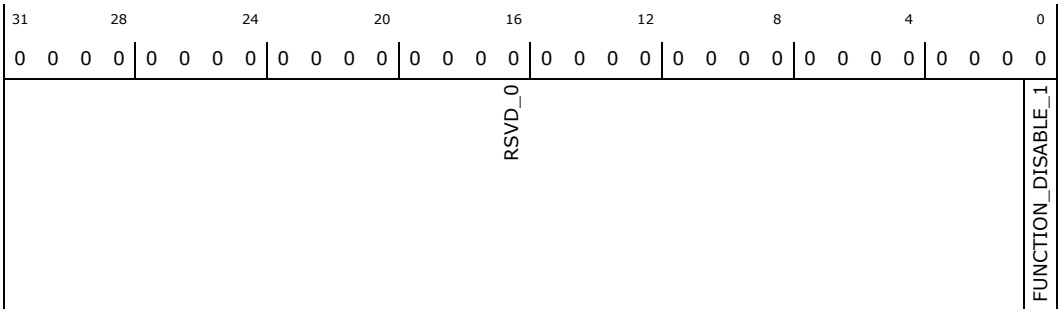
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**FD:** [B:0, D:2, F:0] + C4h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:1 | 00000000h RO | **RSVD (RSVD_0):** Reserved |
| 0 | 0b RW | **FUNCTION_DISABLE (FUNCTION_DISABLE_1):** FD: 0 : Default - normal operation. 1 : When set, the function is disabled (configuration space is disabled). All new requests on the IOSF Primary bus, including any new configuration cycle requests are not claimed on IOSF Primary. This bit as no effect register accessibility via IOSF SB. Once programmed to '1', the only way to re-enable device 2 is via an IOSF SB write of '0' to this register. |

## 14.9.26 PMCAPID—Offset D0h

Power Management Capabilities ID and PM capabilities.SOXi Context Save/Restore : Yes

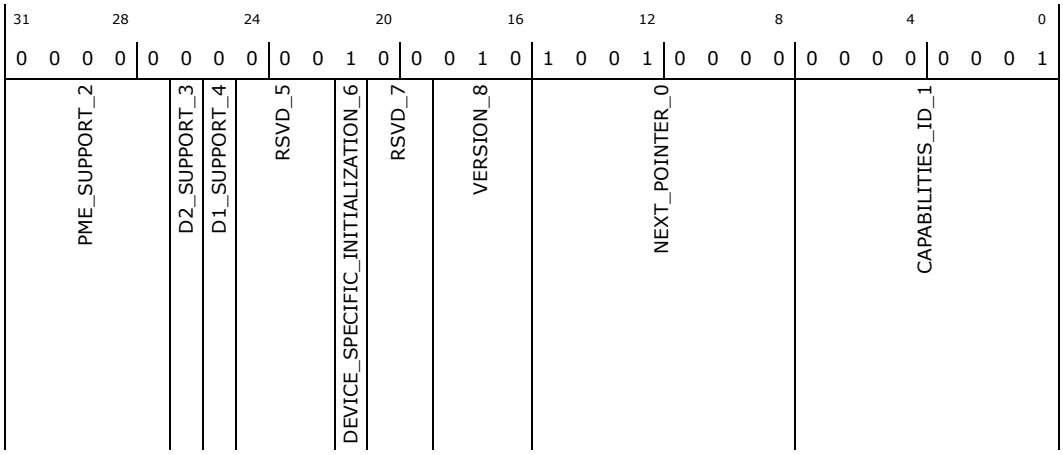
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**PMCAPID:** [B:0, D:2, F:0] + D0h

**Power Well:** Core

**Default:** 00229001h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:27 | 00h RO | **PME_SUPPORT (PME_SUPPORT_2):** PMES The graphics controller does not generate PME |
| 26 | 0b RO | **D2_SUPPORT (D2_SUPPORT_3):** D2S: D2 not supported |
| 25 | 0b RO | **D1_SUPPORT (D1_SUPPORT_4):** D1S: D1 not supported |
| 24:22 | 000b RO | **RSVD (RSVD_5):** Reserved |
| 21 | 1b RO | **DEVICE_SPECIFIC_INITIALIZATION (DEVICE_SPECIFIC_INITIALIZATION_6):** Hardwired to 1 |
| 20:19 | 00b RO | **RSVD (RSVD_7):** Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 18:16 | 010b<br>RO | **VERSION (VERSION_8):** Verion compliance with revision 1.1 of PCI PM spec |
| 15:8 | 90h<br>RW/O | **NEXT_POINTER (NEXT_POINTER_0):** Indicates the next item in the capabilities list.This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. Write once allowing changing of the capabilities list. |
| 7:0 | 01h<br>RO | **CAPABILITIES_ID (CAPABILITIES_ID_1):** CAPID: SIG defines this ID is 01h for PM |

## 14.9.27 PMCS—Offset D4h

Power Management Control/Status. Driver doesn't use this register. SBIOS doesn't use this register SOXi Context Save/Restore : Yes.

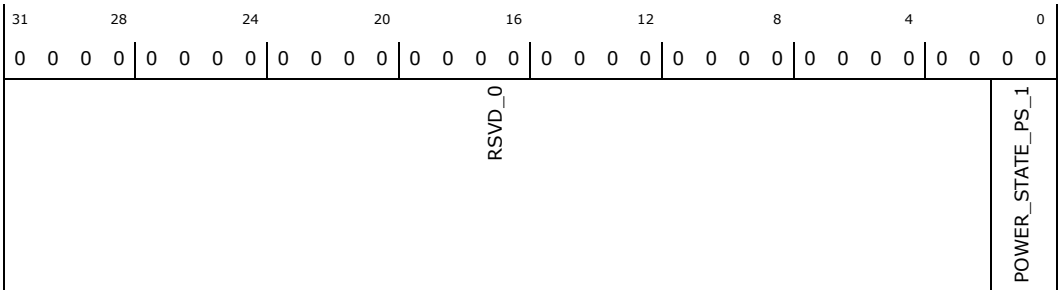
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**PMCS:** [B:0, D:2, F:0] + D4h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RO | **RSVD (RSVD_0):** Reserved |
| 1:0 | 00b<br>RW | **POWER_STATE_PS (POWER_STATE_PS_1):** This field indicates the current power state of the IGD and can be used to set the IGD into a new power state. If software attempts to write an unsupported state to this field, write operation must complete normally on the bus, but the data is discarded and no state change occurs. On a transition from D3 to D0 the graphics controller is optionally reset to initial values. Behavior of the graphics controller in supported states is detailed in the power management section of the Bspec. Bits[1:0] Power state 00: D0 Default 01: D1 Not Supported 10: D2 Not Supported 11: D3 Signal : gvd_dsp_power_state_d3_zncznfwoh output to 2D. |

## 14.9.28 SWSMISCI—Offset E0h

Software SMI or SCI.To generate a SW SMI event, software should program bit 15:0 and trigger SMI. Note : ILK/SNB/IVB had SCI and SMI separated (E0 and E8) As long as there is the potential that DVO port legacy drivers exist which expect this register at this address, this must be reserved for this register. The SCI mechanism for driver / BIOS communication. SMI is a system wide lock interrupt (halts the all the cores) as opposed to SCI. Vista and Win7 recommend to use the SCI. The SMI is slowly being

phased out. This register serves 2 purposes: 1) Support selection of SMI or SCI event source (SMISCISEL - bit15) 2) Event trigger (bit 0). To generate a SW SCI event, software (System BIOS/Graphics driver) should program bit 15 (SMISCISEL) to 1. This is typically programmed once (assuming SMIs are never triggered). On a ?0? to ?1? subsequent transition in bit 0 of this register (caused by a software write operation), GMCH sends a single SCI message. The SCI will set the DMISCI bit in its TCO1_STS register and TCOSCI_STS bit in its GPE0 register upon receiving this message from DMI. Once written as 1, software must write a ?0? to this bit to clear it, and all other write transitions (1-)0, 0-)0, 1-)1) or if bit 15 is ?0? will not cause GMCH to send SCI message to DMI link. To generate a SW SMI event, software should program bit 15 to 0 and trigger an SMI.

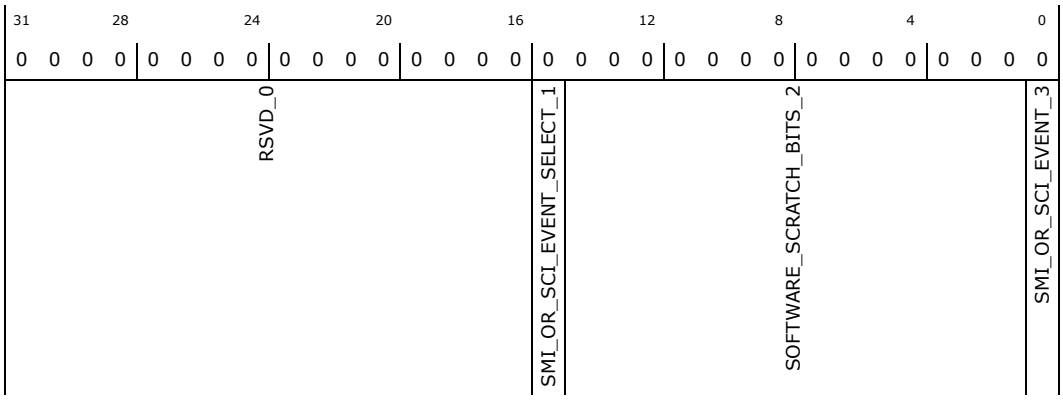
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**SWSMISCI:** [B:0, D:2, F:0] + E0h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **RSVD (RSVD_0):** Reserved |
| 15 | 0b<br>RW | **SMI_OR_SCI_EVENT_SELECT (SMI_OR_SCI_EVENT_SELECT_1):** MCS: SMI or SCI event select. 0 = SMI,1 = SCI |
| 14:1 | 0000h<br>RW | **SOFTWARE_SCRATCH_BITS (SOFTWARE_SCRATCH_BITS_2):** Used by driver to communicate information to SBIOS |
| 0 | 0b<br>RW | **SMI_OR_SCI_EVENT (SMI_OR_SCI_EVENT_3):** MCE:MCS=1, setting this bit causes an SCI. MCS=0, setting this bit causes an SMI. A 1 to 0, 0 to 0 or 1 to 1 transition of this bit does not trigger any events. The graphics driver writes to this register as a means to interrupt the SBIOS |

## 14.9.29 ASLE—Offset E4h

System Display Event Register. SBIOS writes this reg to generate interrupt to graphics/ display driver.

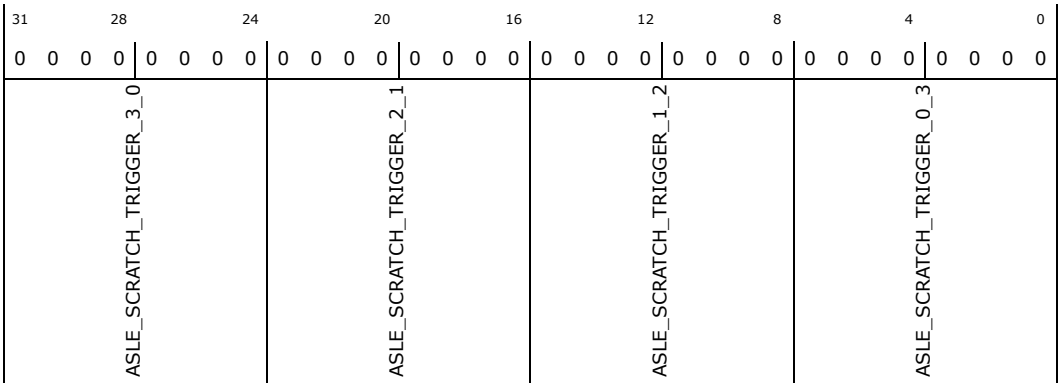
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**ASLE:** [B:0, D:2, F:0] + E4h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RW | **ASLE_SCRATCH_TRIGGER_3 (ASLE_SCRATCH_TRIGGER_3_0):** AST3: The writing of this by field (byte) ? even if just writing back the original contents ? will trigger a display controller interrupt (when the memory interface register bits IER[0] = 1 and IMR[0] = 0). If written as part of a 16-bit or 32-bit write, only one interrupt is generated in common |
| 23:16 | 00h RW | **ASLE_SCRATCH_TRIGGER_2 (ASLE_SCRATCH_TRIGGER_2_1):** AST2: The writing of this by field (byte) ? even if just writing back the original contents ? will trigger a display controller interrupt (when the memory interface register bits IER[0] = 1 and IMR[0] = 0). If written as part of a 16-bit or 32-bit write, only one interrupt is generated in common |
| 15:8 | 00h RW | **ASLE_SCRATCH_TRIGGER_1 (ASLE_SCRATCH_TRIGGER_1_2):** AST1: The writing of this by field (byte) ? even if just writing back the original contents ? will trigger a display controller interrupt (when the memory interface register bits IER[0] = 1 and IMR[0] = 0). If written as part of a 16-bit or 32-bit write, only one interrupt is generated in common |
| 7:0 | 00h RW | **ASLE_SCRATCH_TRIGGER_0 (ASLE_SCRATCH_TRIGGER_0_3):** AST0: The writing of this by field (byte) ? even if just writing back the original contents ? will trigger a display controller interrupt (when the memory interface register bits IER[0] = 1 and IMR[0] = 0). If written as part of a 16-bit or 32-bit write, only one interrupt is generated in common |

## 14.9.30 MANID—Offset F8h

Manufacturing ID. SOXi Context Save/Restore : Not required

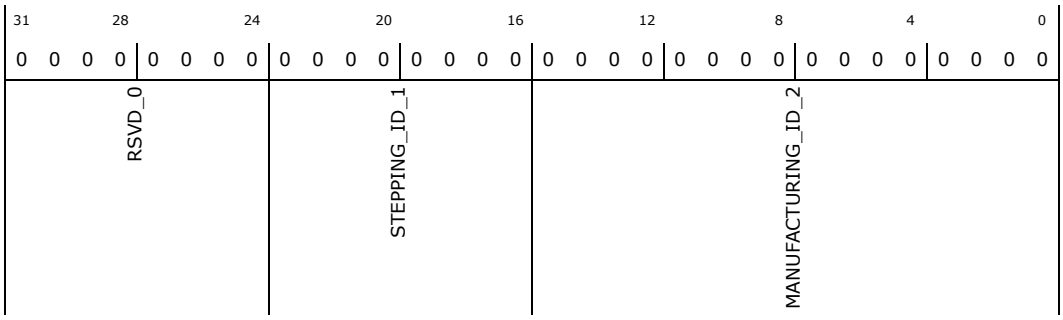
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MANID:** [B:0, D:2, F:0] + F8h

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RSVD (RSVD_0):** Reserved |
| 23:16 | 00000000b<br>RO | **Stepping_ID (STEPPING_ID_1):** Hardwired to strapRID[7:0] via top level metal.23:16 - Manufacturing Stepping ID (00 = A0) |
| 15:0 | 0000h<br>RO | **MANUFACTURING_ID (MANUFACTURING_ID_2):** Hardwired to strapMANID[15:0] via top level metal. 15:8 - Foundry (0Fh = Intel, Others = Reserved) 7:3 - Fab process 12h : Fab code for P1263 13h : P1264 14h : P1265 15h : P1266 ... 1Ah : P1271 (VV POR) Others : Reserved 2:0 - Identifies the dot process 000 = Code for 0 001 = Code for .1 (VV POR) 010 = Code for .2 110 = Code for .4 011 = Code for .7 |

## 14.9.31 ASLS—Offset FCh

ASL Storage. The Valleyview display driver does not need this register since memory Operational Region (OpRegion) is available. This register is kept for use as scratch space. SOXi Context Save/Restore : Yes This software scratch register only needs to be read/write accessible. The exact bit register usage must be worked out in common between System BIOS and driver software, but storage for switching/indicating up to 6 devices is possible with this amount. For each device, the ASL control method with require two bits for _DOD (BIOS detectable yes or no, VGA/NonVGA), one bit for _DGS (enable/disable requested), and two bits for _DCS (enabled now/disabled now, connected or not).

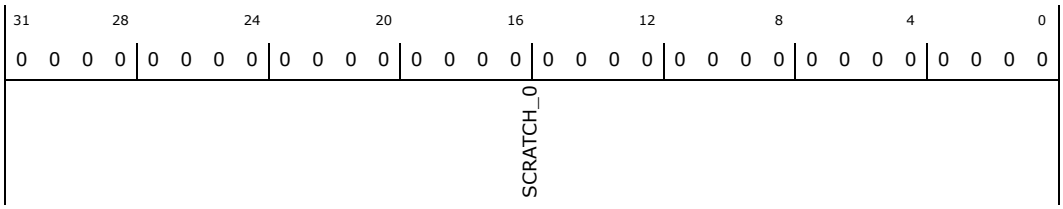
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

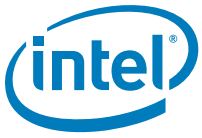
**ASLS:** [B:0, D:2, F:0] + FCh

**Power Well:** Core

**Default:** 00000000h



| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RW | **SCRATCH (SCRATCH_0):** This register provides a means for the BIOS to communicate with the driver. This definition of this scratch register is worked out in common between System BIOS and driver software. Storage for up to 6 devices is possible. For each device, the ASL control method requires two bits for _DOD (BIOS detectable yes or no, VGA/NonVGA), one bit for _DGS (enable/disable requested), and two bits for DCS (enabled now/disabled now, connected or not). |



## 14.10 Memory Mapped Registers (1 of 2)

### Table 172. Summary of Display Memory Mapped I/O Registers—GTTMMADR_LSB

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| 3B4–3B4h | 1 | "CRX (CRX_MDA)—Offset 3B4h" on page 456 | 00h |
| 3B5–3B5h | 1 | "CR (CR_MDA)—Offset 3B5h" on page 457 | 00h |
| 3C0–3C0h | 1 | "ARX—Offset 3C0h" on page 458 | 00h |
| 3C1–3C1h | 1 | "ARX—Offset 3C0h" on page 458 | 00h |
| 3C4–3C4h | 1 | "SRX—Offset 3C4h" on page 459 | 00h |
| 3C5–3C5h | 1 | "SRX—Offset 3C4h" on page 459 | 00h |
| 3C6–3C6h | 1 | "DACMASK—Offset 3C6h" on page 460 | 00h |

## 14.10.1 CRX (CRX_MDA)—Offset 3B4h

CRT Controller Index Register

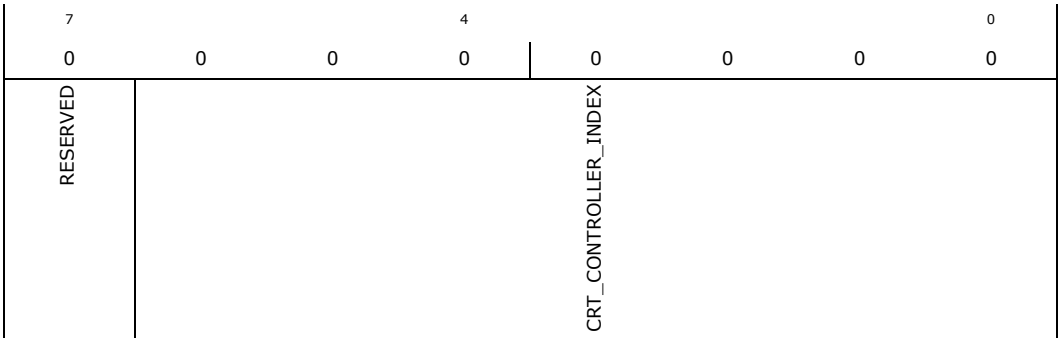
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3B4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **RESERVED:** Read as 0. |
| 6:0 | 0b<br>RW | **CRT_CONTROLLER_INDEX:** These 7 bits are used to select any one of the CRT controller registers to be accessed via the data port at I/O location 3B5h or 3D5h, depending upon whether the graphics system is configured for MDA or CGA emulation. The data port memory address offsets are 3B5h/3D5h. |

## 14.10.2 CR (CR_MDA)—Offset 3B5h

CR index registers

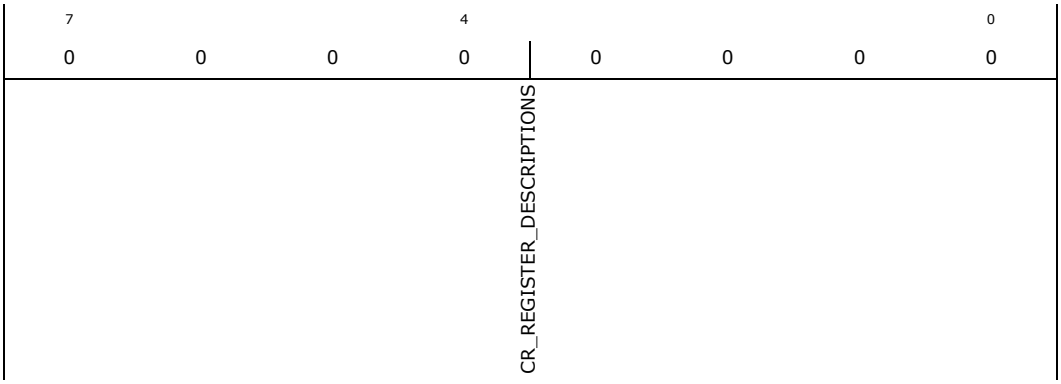
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3B5h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **CR_REGISTER_DESCRIPTIONS:** CR indexed register descriptions |

## 14.10.3 ARX—Offset 3C0h

Attribute Controller Index Register. Includes the 22 registers that share this offset (with different indexes). -enum ARX_e

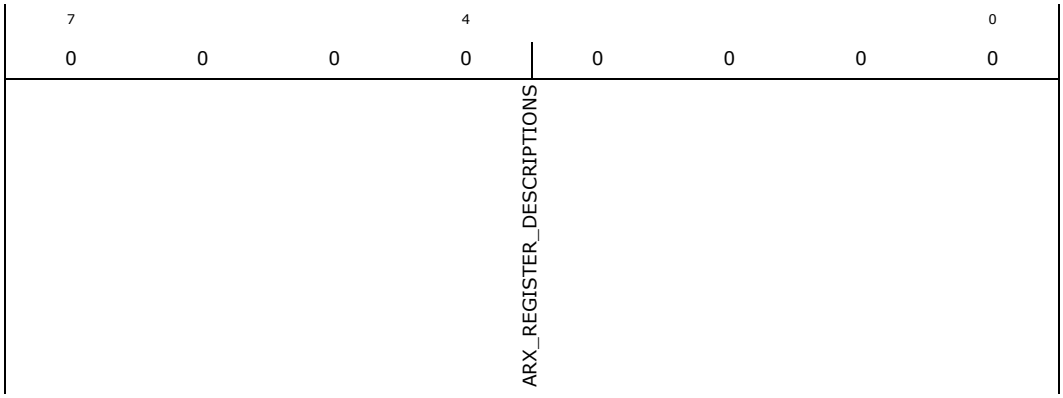
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **ARX_REGISTER_DESCRIPTIONS:** ARX indexed register descriptions |

## 14.10.4 AR—Offset 3C1h

AR index registers. Includes the 21 registers that share this offset (with differnet indexes.) -enum AR_e- in this document will lead to register definitions

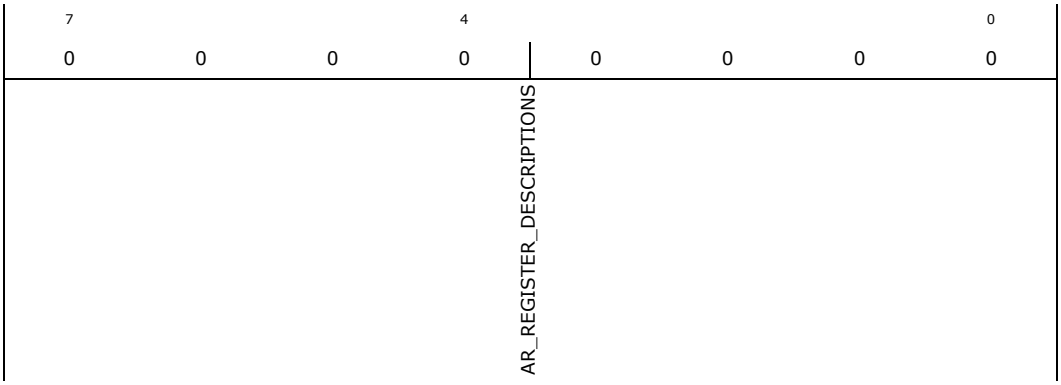
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C1h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **AR_REGISTER_DESCRIPTIONS:** AR indexed register descriptions |

## 14.10.5 SRX—Offset 3C4h

Sequencer Index

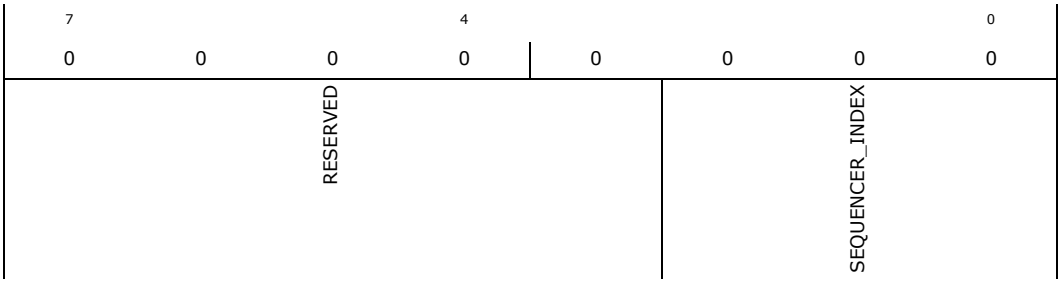
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0b<br>RW | **RESERVED:** Read as 0s. |
| 2:0 | 0b<br>RW | **SEQUENCER_INDEX:** This field contains a 3-bit Sequencer Index value used to access sequencer data re gisters at indices 0 through 7.<br>Notes:<br>SR02 is referred to in the VGA standard as the Map Mask Register. However, the word map is used with multiple meanings in the VGA standard and was, therefore, deemed too confusing; hence, the reason for calling it the Plane Mask Register.<br>SR07 is a standard VGA register that was not documented by IBM. It is not a graphics controller extension. |

## 14.10.6 SR—Offset 3C5h

SR index registers

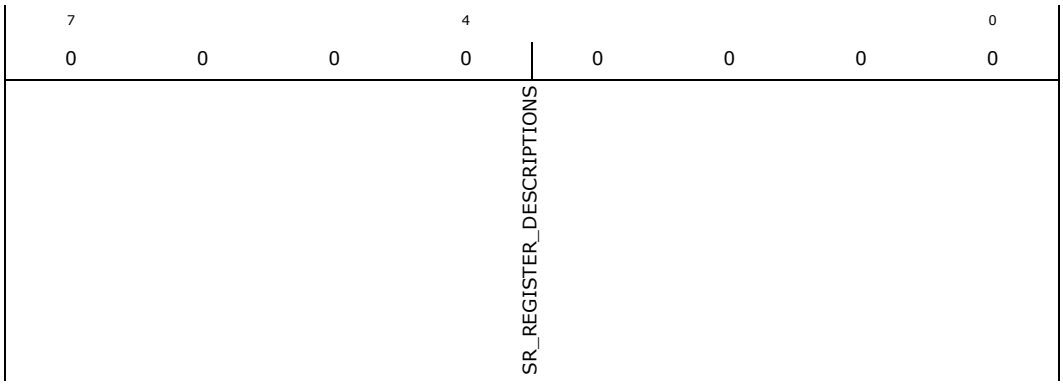
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C5h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **SR_REGISTER_DESCRIPTIONS:** SR indexed register descriptions |

## 14.10.7 DACMASK—Offset 3C6h

Pixel Data Mask Register

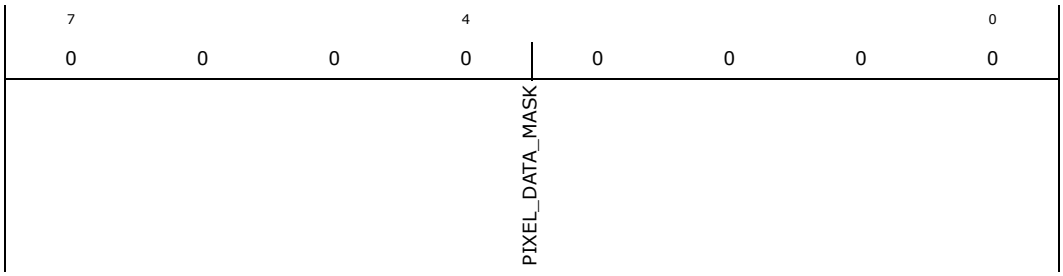
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C6h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **PIXEL_DATA_MASK:** In indexed-color mode, the 8 bits of this register are logically ANDed with the 8 bits of pixel data received from the frame buffer for each pixel. The result of this ANDing process becomes the actual index used to select color data positions within the palette. This has the effect of limiting the choice of color data positions that may be specified by the incoming 8-bit data.<br>0 = Corresponding bit in the resulting 8-bit index being forced to 0.<br>1 = Allows the corresponding bit in the resulting index to reflect the actual value of the corresponding bit in the incoming 8-bit pixel data. |

## 14.10.8 DACWX—Offset 3C8h

Palette Write Index Register

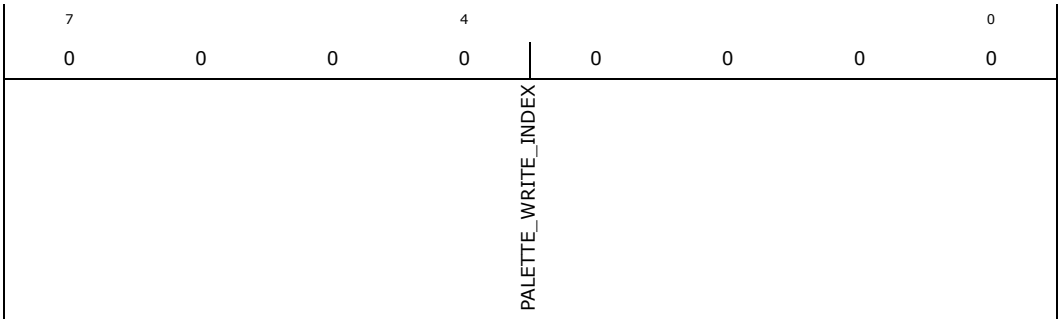
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C8h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>WO | **PALETTE_WRITE_INDEX:** The 8-bit index value programmed into this register chooses which of 256 standard color data positions within the palette are to be made accessible for being written via the Palette Data Register (DACDATA). The index value held in this register is automatically incremented when all three bytes of the color data position selected by the current index have been written. This register allows access to the palette even when running non-VGA display modes. |

## 14.10.9 DACDATA—Offset 3C9h

Palette Data Register

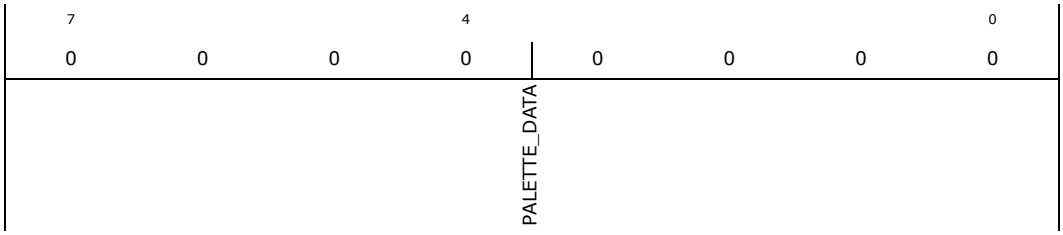
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C9h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **PALETTE_DATA:** This byte-wide data port provides read or write access to the three bytes of data of each color data position selected using the Palette Read Index Register (DACRX) or the Palette Write Index Register (DACWX).<br>The three bytes in each color data position are read or written in three successive read or write operations. The first byte read or written specifies the intensity of the red component of the color specified in the selected color data position. The second byte is for the green component, and the third byte is for the blue component. When writing data to a color data position, all three bytes must be written before the hardware will actually update the three bytes of the selected color data position.<br>When reading or writing to a color data position, ensure that neither the Palette Read Index Register (DACRX) or the Palette Write Index Register (DACWX) are written to before all three bytes are read or written. A write to either of these two registers causes the circuitry that automatically cycles through providing access to the bytes for red, green and blue components to be reset such that the byte for the red component is the one that will be accessed by the next read or write operation via this register. This register allows access to the palette even when running non-VGA display modes. Writes to the palette can cause sparkle if not done during inactive video periods. This sparkle is caused by an attempt to write and read the same address on the same cycle. Anti-sparkle circuits will substitute the previous pixel value for the read output. |

## 14.10.10 FCR (FCR_Read)—Offset 3CAh

Feature Control

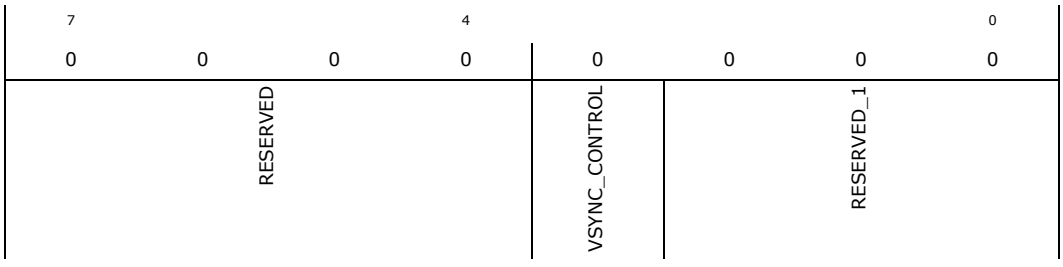
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3CAh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0b<br>RW | **RESERVED:** Read as 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0b<br>RW | **VSYNC_CONTROL:** This bit is provided for compatibility only and has no other function. Reads and writes to this bit have no effect other than to change the value of this bit. The previous definition of this bit selected the output on the VSYNC pin.<br>0 = Was used to set VSYNC out put on the VSYNC pin (default).<br>1 = Was used to set the log i cal 'OR' of VSYNC and Display Ena ble output on the VSYNC pin. This capability was not typically very useful.. |
| 2:0 | 0b<br>RW | **RESERVED_1:** Read as 0. |

## 14.10.11 MSR (MSR_READ)—Offset 3CCh

Miscellaneous Output

### Access Method

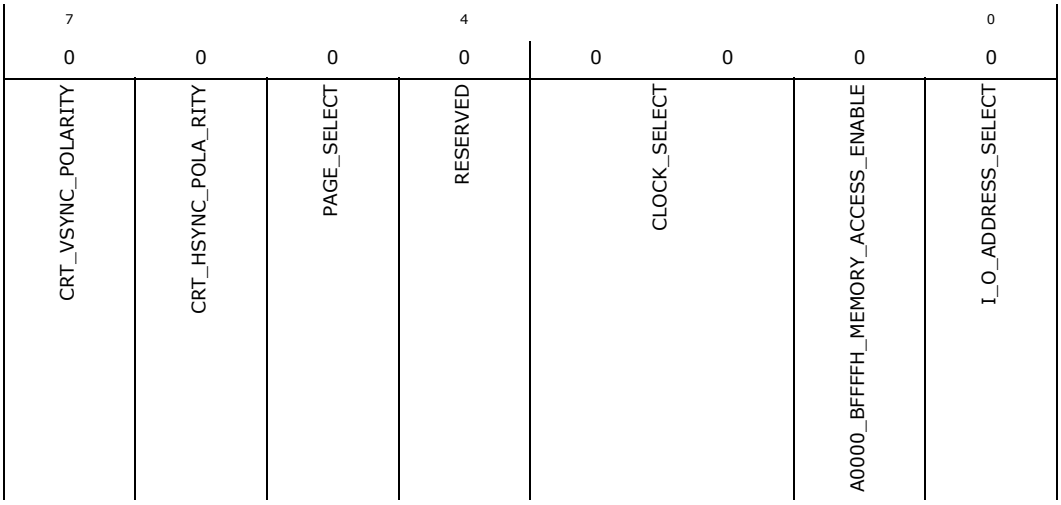
**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3CCh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **CRT_VSYNC_POLARITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode. Sync polarity was used in VGA to signal the monitor how many lines of active display are being generated.<br>0 = Positive Polarity (default).<br>1 = Negative Polarity. |
| 6 | 0b<br>RW | **CRT_HSYNC_POLA_RITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode.<br>0 = Positive Polarity (default).<br>1 = Negative Polarity |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0b<br>RW | **PAGE_SELECT:** In Odd/Even Memory Map Mode 1 (GR6), this bit selects the upper or lower 64 KB page in dis play mem ory for CPU access:<br>0 = Upper page (default)<br>1 = Lower page.<br>Selects between two 64KB pages of frame buffer memory during standard VGA odd/ even modes (modes 0h through 5h). Bit 1 of register GR06 can also program this bit in other modes. Note that this bit is would normally set to 1 by the software. |
| 4 | 0b<br>RW | **RESERVED:** Read as 0. |
| 3:2 | 0b<br>RW | **CLOCK_SELECT:** These bits can select the dot clock source for the CRT interface. The bits should be used to select the dot clock in standard native VGA modes only. When in the centering or upper left corner modes, these bits should be set to have no effect on the clock rate. The actual frequencies that these bits select, if they have any affect at all, is programmable through the DPLL registers that default to the standard values used for VGA.<br>00 = CLK0, 25.175 MHz (for standard VGA modes with 640 pixel (8-dot) horizontal resolution) (default)<br>01 = CLK1, 28.322 MHz. (for standard VGA modes with 720 pixel (9-dot) horizontal resolution)<br>10 = Was used to select an external clock (now unused)<br>11 = Reserved |
| 1 | 0b<br>RW | **A0000_BFFFFH_MEMORY_ACCESS_ENABLE:** VGA Compatibility bit enables access to local video memory (frame buffer) at A0000(BFFFFh. When disabled, accesses to VGA memory are blocked in this region. This bit is independent of and does not block CPU access to the video linear frame buffer at other addresses. Note that it is typical for AGP chipsets to shadow this register to allow proper steering of memory accesses to the proper bus.<br>0 = Prevent CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture (default).<br>1 = Allow CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture. This memory must be mapped as UC by the CPU; see VGA Host Access Memory Munging in Display and Overlay Functions. |
| 0 | 0b<br>RW | **I_O_ADDRESS_SELECT:** This bit selects 3Bxh or 3Dxh as the I/O address for the CRT Controller re gisters, the Feature Control Register (FCR), and Input Status Register 1 (ST01). Presently ignored (whole range is claimed), but will ignore 3Bx for color configuration or 3Dx for monochrome. Note that it is typical in AGP chipsets to shadow this bit and properly steer I/O cycles to the proper bus for operation where a MDA exists on another bus such as ISA.<br>0 = Select 3Bxh I/O address (MDA emulation) (default).<br>1 = Select 3Dxh I/O address (CGA emulation). |

## 14.10.12 GRX—Offset 3CEh

GRX Graphics Controller Index Register

### Access Method

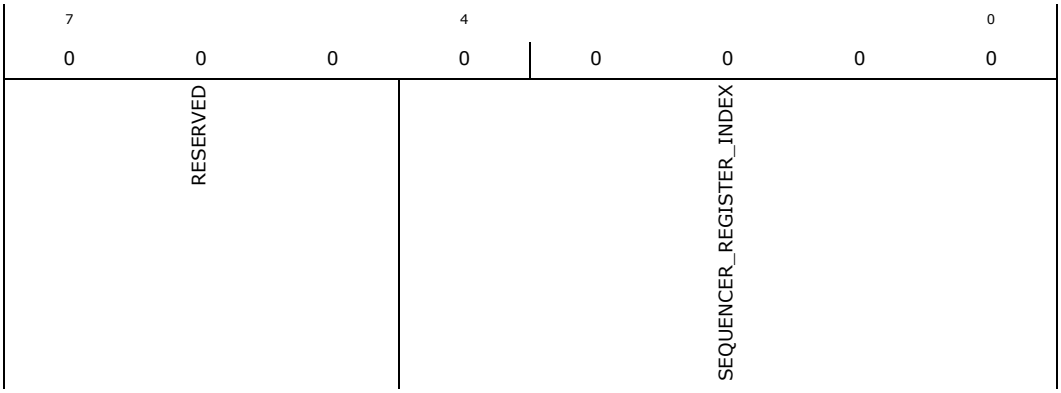
**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3CEh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0b<br>RW | **RESERVED:** Read as 0. |
| 4:0 | 0b<br>RW | **SEQUENCER_REGISTER_INDEX:** This field selects any one of the graphics controller registers (GR00-GR11]) to be accessed via the data port at I/O (or memory offset) location 3CFh. |

## 14.10.13 GR—Offset 3CFh

GR index registers

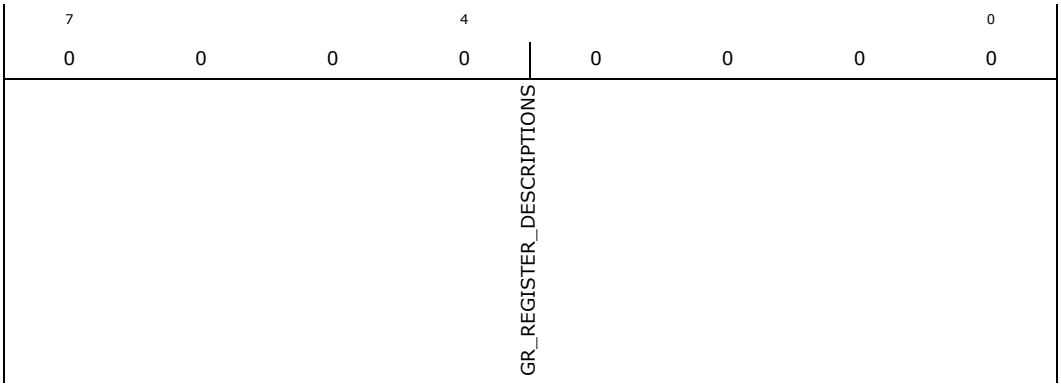
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3CFh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **GR_REGISTER_DESCRIPTIONS:** GR indexed register descriptions |

## 14.10.14 CRX (CRX_CGA)—Offset 3D4h

CRT Controller Index Register

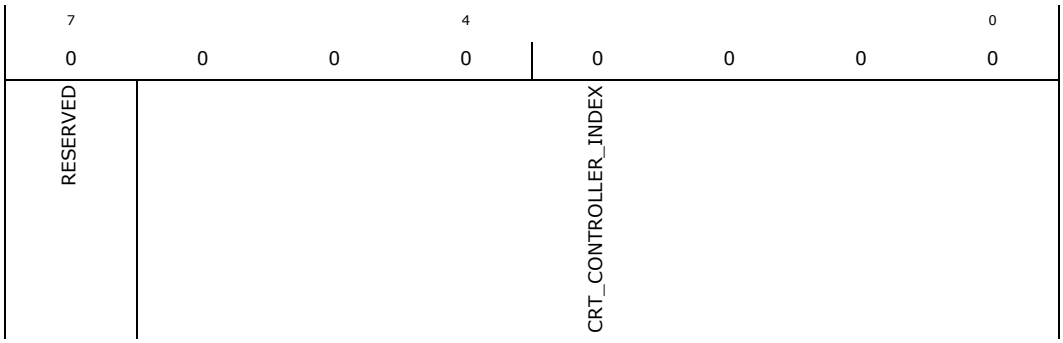
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3D4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **RESERVED:** Read as 0. |
| 6:0 | 0b<br>RW | **CRT_CONTROLLER_INDEX:** These 7 bits are used to select any one of the CRT controller registers to be accessed via the data port at I/O location 3B5h or 3D5h, depending upon whether the graphics system is configured for MDA or CGA emulation. The data port memory address offsets are 3B5h/3D5h. |

## 14.10.15 CR (CR_CGA)—Offset 3D5h

CR index registers

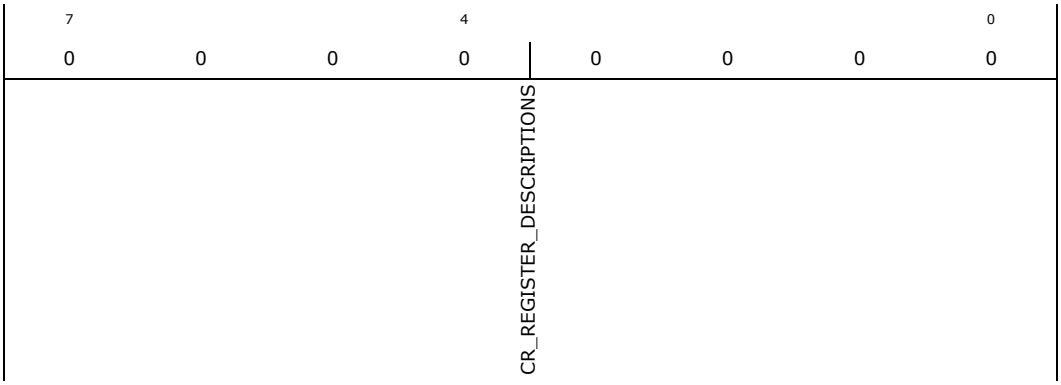
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3D5h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>RW | **CR_REGISTER_DESCRIPTIONS:** CR indexed register descriptions |

## 14.10.16 GPIOCTL_0—Offset 5010h

GPIO Control Registers GPIO I2C register (gmbus_register.v reg_gpio0, reg_gpio1, reg_gpio2. reg_gpio3, reg_gpio4)

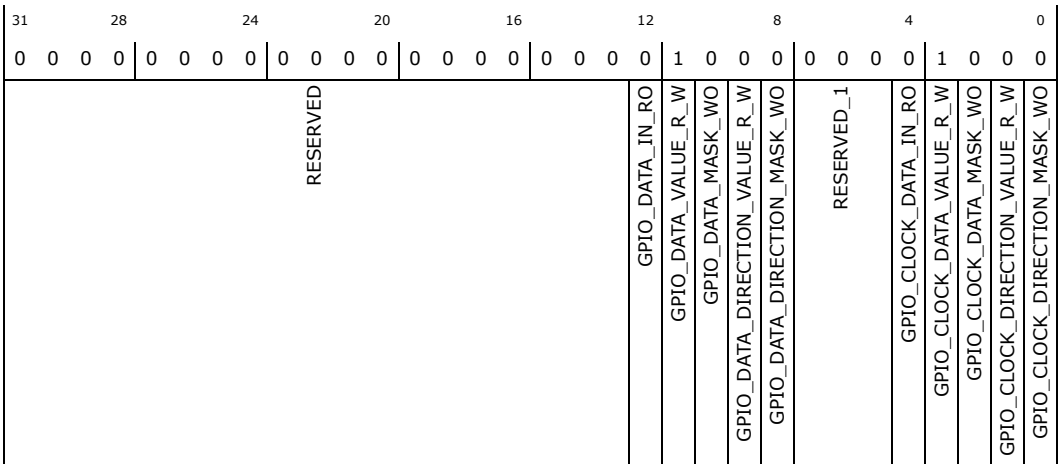
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 5010h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000808h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 0b<br>RO | **GPIO_DATA_IN_RO:** This is the value that is sampled on the GPIO_Data pin as an input.<br>This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset.<br>AccessType: Read Only |
| 11 | 1b<br>RW | **GPIO_DATA_VALUE_R_W:** This is the value that should be place on the GPIO Data pin as an output. This value is only written into the register if GPIO DATA MASK is also asserted. The value will appear on the pin if this data value is actually written to this register and the GPIO Data DIRECTION VALUE contains a value that will configure the pin as an output.<br>Default = 1. The GPIO default clock data value is programmed to 1 in hardware. The hardware drives a default of 1 since the I2C interface defaults to a 1 . (this mimics the I2C external pull-ups on the bus) |
| 10 | 0b<br>WO | **GPIO_DATA_MASK_WO:** This is a mask bit to determine whether the GPIO DATA VALUE bit should be written into the register. This value is not stored and when read returns 0.<br>0 = Do NOT write GPIO Data Value bit (default).<br>1 = Write GPIO Data Value bit.<br>AccessType: Write Only |
| 9 | 0b<br>RW | **GPIO_DATA_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Data pin. This value is only written into the register if GPIO Data DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO DATA VALUE bit.<br>0 = Pin is configured as an input (default)<br>1 = Pin is configured as an output. |
| 8 | 0b<br>WO | **GPIO_DATA_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO DIRECTION VALUE bit should be written into the register. This value is not stored and when read always returns 0.<br>0 = Do NOT write GPIO Data Direction Value bit (default).<br>1 = Write GPIO Data Direction Value bit.<br>AccessType: Write Only |
| 7:5 | 0b<br>RW | **RESERVED_1:** must be written with zeros. |
| 4 | 0b<br>RO | **GPIO_CLOCK_DATA_IN_RO:** This is the value that is sampled on the GPIO Clock pin as an input.<br>This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset.<br>AccessType: Read Only |
| 3 | 1b<br>RW | **GPIO_CLOCK_DATA_VALUE_R_W:** This is the value that should be place on the GPIO Clk pin as an output. This value is only written into the register if GPIO Clock DATA MASK is also asserted. The value will appear on the pin if this data value is actually written to this register and the GPIO Clock DIRECTION VALUE contains a value that will configure the pin as an output.<br>Default = 1. The GPIO default clock data value is programmed to 1 in hardware. The hardware drives a default of 1 since the I2C interface defaults to a 1 . (this mimics the I2C external pull-ups on the bus) |
| 2 | 0b<br>WO | **GPIO_CLOCK_DATA_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DATA VALUE bit should be written into the register. This value is not stored and when read always returns 0.<br>0 = Do NOT write GPIO Clock Data Value bit (default).<br>1 = Write GPIO Clock Data Value bit.<br>AccessType: Write Only |
| 1 | 0b<br>RW | **GPIO_CLOCK_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Clock pin. This value is only written into the register if GPIO Clock DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO Clock DATA VALUE bit.<br>0 = Pin is configured as an input and the output driver is set to tri-state (default)<br>1 = Pin is configured as an output. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0b<br>WO | **GPIO_CLOCK_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DIRECTION VALUE bit should be written into the register. This value is not stored and when read returns 0.<br>0 = Do NOT update the GPIO Clock Direction Value bit on a write (default).<br>1 = Update the GPIO Clock Direction Value bit. on a write operation to this register.<br>AccessType: Write Only |

## 14.10.17 GPIOCTL_1—Offset 5014h

GPIO Control Registers GPIO I2C register (gmbus_register.v reg_gpio0, reg_gpio1, reg_gpio2. reg_gpio3, reg_gpio4)

### Access Method

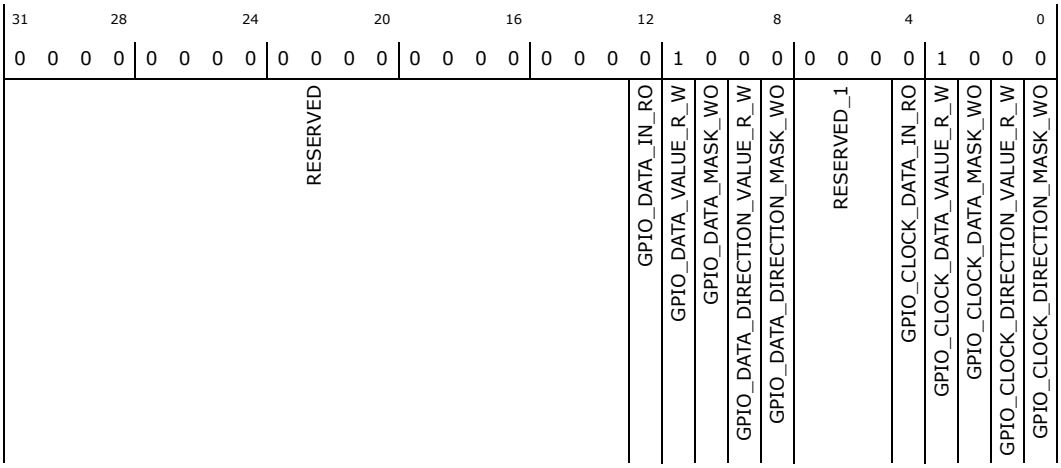
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 5014h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000808h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0b<br>RW | **RESERVED:** Reserved. |
| 12 | 0b<br>RO | **GPIO_DATA_IN_RO:** This is the value that is sampled on the GPIO_Data pin as an input.<br>This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset.<br>AccessType: Read Only |

| 1 | 0b<br>RW | **GPIO_CLOCK_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Clock pin. This value is only written into the register if GPIO Clock DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO Clock DATA VALUE bit.<br>0 = Pin is configured as an input and the output driver is set to tri-state (default)<br>1 = Pin is configured as an output. |
| 0 | 0b<br>WO | **GPIO_CLOCK_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DIRECTION VALUE bit should be written into the register. This value is not stored and when read returns 0.<br>0 = Do NOT update the GPIO Clock Direction Value bit on a write (default).<br>1 = Update the GPIO Clock Direction Value bit. on a write operation to this register.<br>AccessType: Write Only |

## 14.10.18 GPIOCTL_2—Offset 5018h

GPIO Control Registers GPIO I2C register (gmbus_register.v reg_gpio0, reg_gpio1, reg_gpio2. reg_gpio3, reg_gpio4)

### Access Method

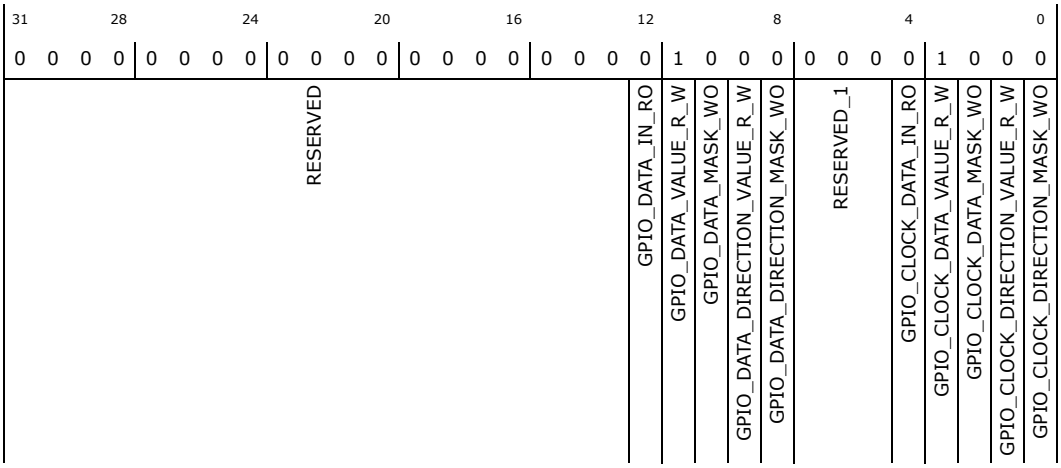
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 5018h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000808h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0b<br>RW | **RESERVED:** Reserved. |
| 12 | 0b<br>RO | **GPIO_DATA_IN_RO:** This is the value that is sampled on the GPIO_Data pin as an input.<br>This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset.<br>AccessType: Read Only |
| 11 | 1b<br>RW | **GPIO_DATA_VALUE_R_W:** This is the value that should be place on the GPIO Data pin as an output. This value is only written into the register if GPIO DATA MASK is also asserted. The value will appear on the pin if this data value is actually written to this register and the GPIO Data DIRECTION VALUE contains a value that will configure the pin as an output.<br>Default = 1. The GPIO default clock data value is programmed to 1 in hardware. The hardware drives a default of 1 since the I2C interface defaults to a 1 . (this mimics the I2C external pull-ups on the bus) |
| 10 | 0b<br>WO | **GPIO_DATA_MASK_WO:** This is a mask bit to determine whether the GPIO DATA VALUE bit should be written into the register. This value is not stored and when read returns 0.<br>0 = Do NOT write GPIO Data Value bit (default).<br>1 = Write GPIO Data Value bit.<br>AccessType: Write Only |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0b<br>RW | **GPIO_DATA_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Data pin. This value is only written into the register if GPIO Data DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO DATA VALUE bit.<br>0 = Pin is configured as an input (default)<br>1 = Pin is configured as an output. |
| 8 | 0b<br>WO | **GPIO_DATA_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO DIRECTION VALUE bit should be written into the register. This value is not stored and when read always returns 0.<br>0 = Do NOT write GPIO Data Direction Value bit (default).<br>1 = Write GPIO Data Direction Value bit.<br>AccessType: Write Only |
| 7:5 | 0b<br>RW | **RESERVED_1:** must be written with zeros. |
| 4 | 0b<br>RO | **GPIO_CLOCK_DATA_IN_RO:** This is the value that is sampled on the GPIO Clock pin as an input.<br>This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset.<br>AccessType: Read Only |
| 3 | 1b<br>RW | **GPIO_CLOCK_DATA_VALUE_R_W:** This is the value that should be place on the GPIO Clk pin as an output. This value is only written into the register if GPIO Clock DATA MASK is also asserted. The value will appear on the pin if this data value is actually written to this register and the GPIO Clock DIRECTION VALUE contains a value that will configure the pin as an output.<br>Default = 1. The GPIO default clock data value is programmed to 1 in hardware. The hardware drives a default of 1 since the I2C interface defaults to a 1 . (this mimics the I2C external pull-ups on the bus) |
| 2 | 0b<br>WO | **GPIO_CLOCK_DATA_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DATA VALUE bit should be written into the register. This value is not stored and when read always returns 0.<br>0 = Do NOT write GPIO Clock Data Value bit (default).<br>1 = Write GPIO Clock Data Value bit.<br>AccessType: Write Only |
| 1 | 0b<br>RW | **GPIO_CLOCK_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Clock pin. This value is only written into the register if GPIO Clock DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO Clock DATA VALUE bit.<br>0 = Pin is configured as an input and the output driver is set to tri-state (default)<br>1 = Pin is configured as an output. |
| 0 | 0b<br>WO | **GPIO_CLOCK_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DIRECTION VALUE bit should be written into the register. This value is not stored and when read returns 0.<br>0 = Do NOT update the GPIO Clock Direction Value bit on a write (default).<br>1 = Update the GPIO Clock Direction Value bit. on a write operation to this register.<br>AccessType: Write Only |

## 14.10.19 GPIOCTL_3—Offset 501Ch

GPIO Control Registers GPIO I2C register (gmbus_register.v reg_gpio0, reg_gpio1, reg_gpio2. reg_gpio3, reg_gpio4)

### Access Method

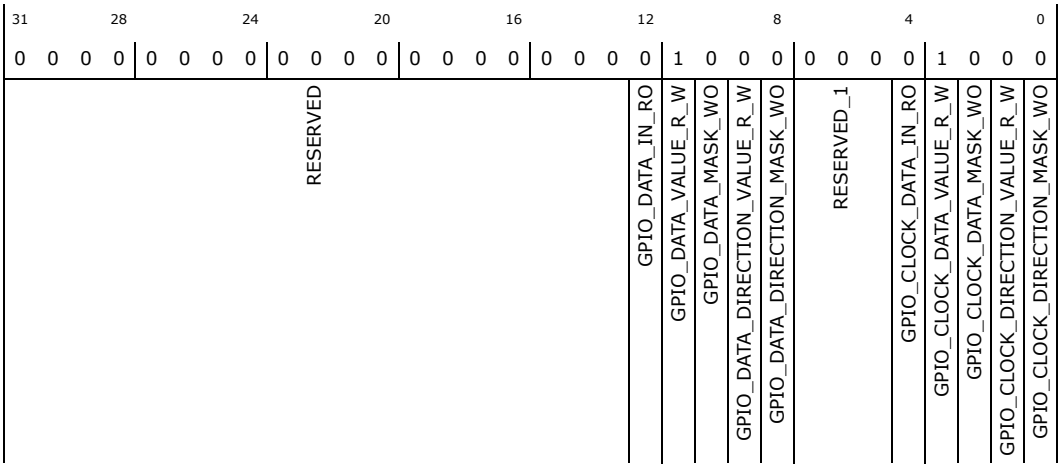
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 501Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000808h



| Bit Range | Default & Access | Field Name (ID): Description |

This value is not stored and when read returns 0.<br>0 = Do NOT update the GPIO Clock Direction Value bit on a write (default).<br>1 = Update the GPIO Clock Direction Value bit. on a write operation to this register.<br>AccessType: Write Only |

## 14.10.21 GMBUS0—Offset 5100h

GMBUS Clock/Port Select gmbus clock and port select (gmbus_register.v reg_gmbus0)

### Access Method

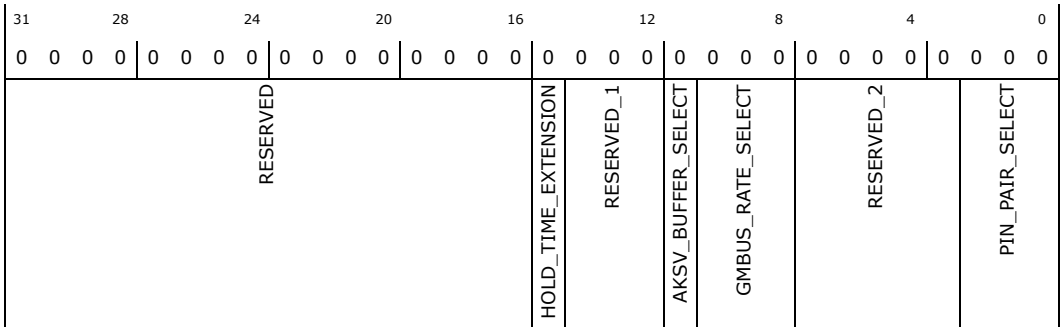
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 5100h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15 | 0b<br>RW | **HOLD_TIME_EXTENSION:** This bit selects the hold time on the data line driven from the GMCH.<br>0 = Hold time of 0ns<br>1 = Hold time of 300 ns |
| 14:12 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 11 | 0b<br>RW | **AKSV_BUFFER_SELECT:** [DevBLC, DevCTG, DevCDV] This bit selects whether the data to be written over GMBUS comes from the Aksv buffer for HDCP authentication, or from the GMBUS data buffer. Please note that when writing data from the Aksv buffer, all GMBUS protocol must be followed, including indicating the number of bytes to be transferred during the DATA phase of a GMBUS cycle.<br>0 (Default) Use the GMBUS data buffer (GMBUS3) for data transmission<br>1 Use the Aksv data buffer (GMBUS6 and GMBUS7) for data transmission.<br>[DevBW, DevCL] Reserved: |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0b<br>RW | **GMBUS_RATE_SELECT:** These two bits select the rate that the GMBUS will run at. It also defines the AC timing parameters used. It should only be changed when between transfers when the GMBUS is idle.<br>1xx = Reserved.<br>000 = 100 KHz<br>001 = 50 KHz<br>010 = 400 KHz<br>011 = 1 MHz for SDVO |
| 7:3 | 0b<br>RW | **RESERVED_2:** Reserved. |
| 2:0 | 0b<br>RW | **PIN_PAIR_SELECT:** This field selects an GMBUS pin pair for use in the GMBUS communication. Use the table above to determine which pin pairs are available for a particular device and the intended function of that pin pair. Note that it is not a straight forward mapping of port numbers to pair select numbers.<br>000 = None (disabled)<br>001 = MIPI I2C use<br>010 = Dedicated Analog Monitor DDC Pins (DDC1DATA, DDC1CLK)<br>011 = Reserved<br>100 = DP/HDMI port C Use [DevCTG]<br>101 = sDVO/HDMI Use<br>110 = Reserved<br>111 = D connector control signals |

## 14.10.22 GMBUS1—Offset 5104h

GMBUS Command and Status gmbus command and status (gmbus_register.v reg_gmbus1)

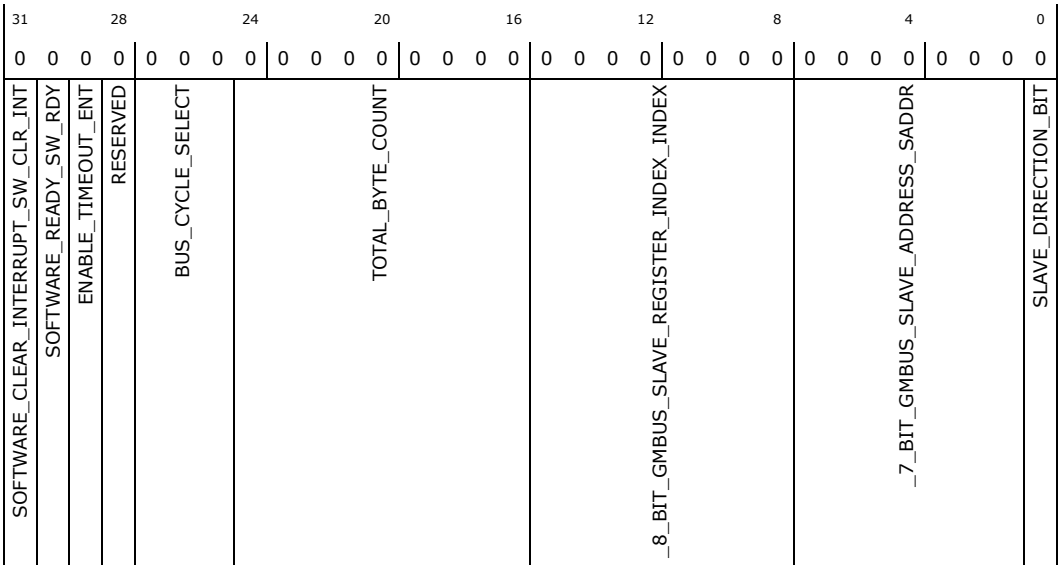
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 5104h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SOFTWARE_CLEAR_INTERRUPT_SW_CLR_INT:** This bit must be clear for normal operation. Setting the bit , then clearing it acts as local reset to the GMBUS controller. This bit is commonly used by software to clear a BUS_ERROR when a slave device delivers a NACK.<br>0 = If this bit is written as a zero when its current state is a one, will clear the HW_RDY bit and allows register writes to be accepted to the GMBUS registers (Write Protect Off). This bit is cleared to zero when an event causes the HW_RDY bit transition to occur.<br>1 = Asserted by software after servicing the GMBUS interrupt. Setting this bit causes the INT status bit to be cleared. Setting (1) this bit also asserts the HW_RDY bit (until this bit is written with a 0). When this bit is set, no writes to GMBUS registers will cause the contents to change with the exception of this bit which can be written. |
| 30 | 0b<br>RW | **SOFTWARE_READY_SW_RDY:** Data handshake bit used in conjunction with HW_RDY bit.<br>0 = De-asserted via the assertion event for HW_RDY bit<br>1 = When asserted by software, results in de-assertion of HW_RDY bit |
| 29 | 0b<br>RW | **ENABLE_TIMEOUT_ENT:** Enables timeout for slave response. When this bit is enabled and the slave device response has exceeded the timeout period, the GMBUS Slave Stall Timeout Error interrupt bit is set.<br>0 = disable timeout counter<br>1 = enable timeout counter |
| 28 | 0b<br>RW | **RESERVED:** Reserved. |
| 27:25 | 0b<br>RW | **BUS_CYCLE_SELECT:** 000 = No GMBUS cycle is generated.<br>001 = GMBUS cycle is generated without an INDEX, with no STOP, and ends with a WAIT<br>010 = Reserved<br>011 = GMBUS cycle is generated with an INDEX, with no STOP, and ends with a WAIT<br>100 = Generates a STOP if currently in a WAIT or after the completion of the current byte if active.<br>101 = GMBUS cycle is generated without an INDEX and with a STOP<br>110 = Reserved<br>111 = GMBUS cycle is generated with an INDEX and with a STOP<br>GMBUS cycle will always consist of a START followed by Slave Address, followed by an optional read or write data phase. A read cycle with an index will consist of a START followed by a Slave Address a WRITE indication and the INDEX and then a RESTART with a Slave Address and an optional read data phase. The GMBUS cycle will terminate either with a STOP or by entering a wait state. The WAIT state is exited by generating a STOP or by starting another GMBUS cycle.<br>This can only cause a STOP to be generated if a GMBUS cycle is generated, the GMBUS is currently in a data phase, or it is in a WAIT phase:<br>Note that the three bits can be decoded as follows:<br>27 = STOP generated<br>26 = INDEX used<br>25 = cycle ends in a WAIT |
| 24:16 | 0b<br>RW | **TOTAL_BYTE_COUNT:** (9-bits). This determines the total number of bytes to be transferred during the DATA phase of a GMBUS cycle. The DATA phase can be prematurely terminated by generating a STOP while in the DATA phase (see Bus Cycle Select). Do not change the value of this field during GMBUS cycles transactions. |
| 15:8 | 0b<br>RW | **_8_BIT_GMBUS_SLAVE_REGISTER_INDEX_INDEX:** This field specifies the 8-bits of index to be used for the generated bus write transaction or the index used for the WRITE portion of the WRITE/READ pair. It only has an effect if the enable Index bit is set. Do not change this field during a GMBUS transaction. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0b<br>RW | **_7_BIT_GMBUS_SLAVE_ADDRESS_SADDR:** When a GMBUS cycle is to be generated using the Bus Cycle Select field, this field specifies the value of the slave address that is to be sent out.<br>For use with 10-bit slave address devices, set this value to 11110XXb (where the last two bits (xx) are the two MSBs of the 10-bit address) and the slave direction bit to a write. This is followed by the first data byte being the 8 LSBs of the 10-bit slave address.<br>Special Slave Addresses<br>0000 000R = General Call Address<br>0000 000W = Start byte<br>0000 001x = CBUS Address<br>0000 010x = Reserved<br>0000 011x = Reserved<br>0000 1xxx = Reserved<br>1111 1xxx = Reserved<br>1111 0xxx = 10-Bit addressing |
| 0 | 0b<br>RW | **SLAVE_DIRECTION_BIT:** When a GMBUS cycle is to be generated based on the Bus Cycle Select, this bit determines if the operation will be a read or a write. A read operation with the index enabled will perform a write with just the index followed by a re-start and a read.<br>1 = Indicates that a Read from the slave device operation is to be performed.<br>0 = Indicates that a Write to slave device operation is to be performed. |

### 14.10.23 GMBUS2—Offset 5108h

GMBUS Status Register gmbus status (gmbus_register.v reg_gmbus2)

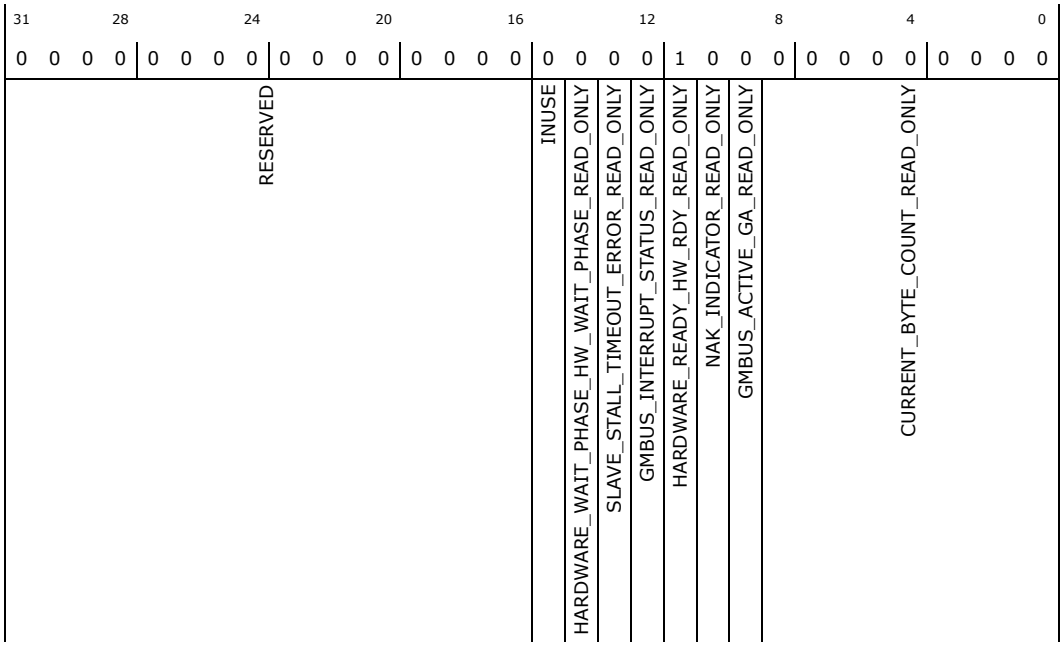
#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 5108h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000800h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15 | 0b<br>RW/1C | **INUSE:** 0 = read operation that contains a zero in this bit position indicates that the GMBUS engine is now acquired and the subsequent reads of this register will now have this bit set. Writing a 0 to this bit has no effect.<br>1 = read operation that contains a one for this bit indicates that the GMBUS is currently allocated to someone else and In use . Once set, a write of a 1 to this bit indicates that the software has relinquished the GMBUS resource and will reset the value of this bit to a 0.<br>Software wishing to arbitrate for the GMBUS resource can poll this bit until it reads a zero and will then own usage of the GMBUS controller. This bit has no effect on the hardware, and is only used as semaphore among various independent software threads that don t know how to synchronize their use of this resource that may need to use the GMBUS logic. Writing a one to this bit is software s indication that the software use of this resource is now terminated and it is available for other clients.<br>AccessType: One to clear |
| 14 | 0b<br>RO | **HARDWARE_WAIT_PHASE_HW_WAIT_PHASE_READ_ONLY:** 0 = The GMBUS engine is not in a wait phase.<br>1 = Set when GMBUS engine is in wait phase. Wait phase is entered at the end of the current transaction when that transaction is selected not to terminate with a STOP. Once in a WAIT_PHASE, the software can now choose to generate a STOP cycle or a repeated start (RESTART) cycle followed by another GMBUS transaction on the GMBUS.<br>AccessType: Read Only |
| 13 | 0b<br>RO | **SLAVE_STALL_TIMEOUT_ERROR_READ_ONLY:** This bit indicates that a slave stall timeout has occurred. It is tied to the Enable Timeout (ENT) bit.<br>0 = No slave timeout has occurred.<br>1 = A slave acknowledge timeout has occurred<br>AccessType: Read Only |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 0b<br>RO | **GMBUS_INTERRUPT_STATUS_READ_ONLY:** This bit indicates that an event that causes a GMBUS interrupt has occurred.<br>0 = The conditions that could cause a GMBUS interrupt have not occurred or this bit has been cleared by software assertion of the SW_CLR_INT bit.<br>1 = GMBUS interrupt event occurred. This interrupt must have been one of the types enabled in the GMBUS4 register.<br>[DevCDV, DevCTG]: Reserved<br>AccessType: Read Only |
| 11 | 1b<br>RO | **HARDWARE_READY_HW_RDY_READ_ONLY:** This provides a method of detecting when the current software client routine can proceed with the next step in a sequence of GMBUS operations. This data handshake bit is used in conjunction with the SW_RDY bit. When this bit is changed to asserted by the GMBUS controller, it results in the de-assertion of the SW_RDY bit.<br>0 = Condition required for assertion has not occurred or when this bit was a one and: SW_RDY bit has been asserted.<br>During a GMBUS read transaction, after the each read of the data register.<br>During a GMBUS write transaction, after each write of the data register.<br>SW_CLR_INT bit has been cleared.<br>1 = This bit is asserted under the following conditions:<br>After a reset or when the transaction is aborted by the setting of the SW_CLR_INT bit.<br>When an active GMBUS cycle has terminated with a STOP.<br>When during a GMBUS write transaction, the data register needs and can accept another four bytes of data.<br>During a GMBUS read transaction, this bit is asserted when the data register has four bytes of new data or the read transaction DATA phase is complete and the data register contains the last few bytes of the read data.<br>This bit resumes to normal operation when the SW_CLR_INT bit is written to a 0.<br>AccessType: Read Only |
| 10 | 0b<br>RO | **NAK_INDICATOR_READ_ONLY:** Was previously called Slave Acknowledge Timeout Error SATOER.<br>0 = No bus error has been detected or SW_CLR_INT has been written as a zero since the last bus error.<br>1 = Set by hardware if any expected device acknowledge is not received from the slave within the timeout.<br>AccessType: Read Only |
| 9 | 0b<br>RO | **GMBUS_ACTIVE_GA_READ_ONLY:** This is a status bit that indicates whether the GMBUS controller is in an IDLE state or not.<br>0 = The GMBUS controller is currently IDLE.<br>1 = This indicates that the bus is in START, ADDRESS, INDEX, DATA, WAIT, or STOP Phase. Set when GMBUS hardware is not IDLE.<br>AccessType: Read Only |
| 8:0 | 0b<br>RO | **CURRENT_BYTE_COUNT_READ_ONLY:** Can be used to determine the number of bytes currently transmitted/received by the GMBUS controller hardware. Set to zero at the start of a GMBUS transaction data transfer and incremented after the completion of each byte of the data phase. Note that because reads have internal storage, the byte count on a read operation may be ahead of the data that has been accepted from the data register.<br>AccessType: Read Only |

## 14.10.24 GMBUS3—Offset 510Ch

GMBUS Data Buffer gmbus data buffer (gmbus_register.v reg_gmbus3)

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 510Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

Rawclk Frequency

### Access Method

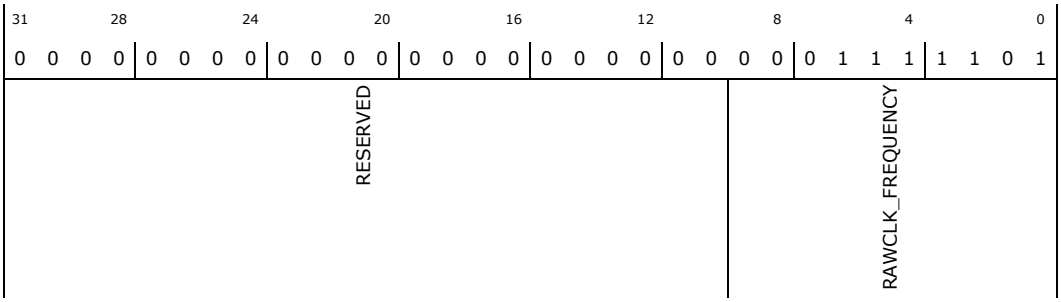
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6024h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 0000007Dh



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0b<br>RW | **RESERVED:** Project: All Format: |
| 9:0 | 0001111101b<br>RW | **RAWCLK_FREQUENCY:** Project: All Format:<br>Program this field with rawclk frequency. This is used to generate a divided down clock for miscellaneous timers in display. |

## 14.10.34 D_STATE—Offset 6104h

D State Function Control Register Power state behaviour (cpdmmreg.v reg11_lt)

### Access Method

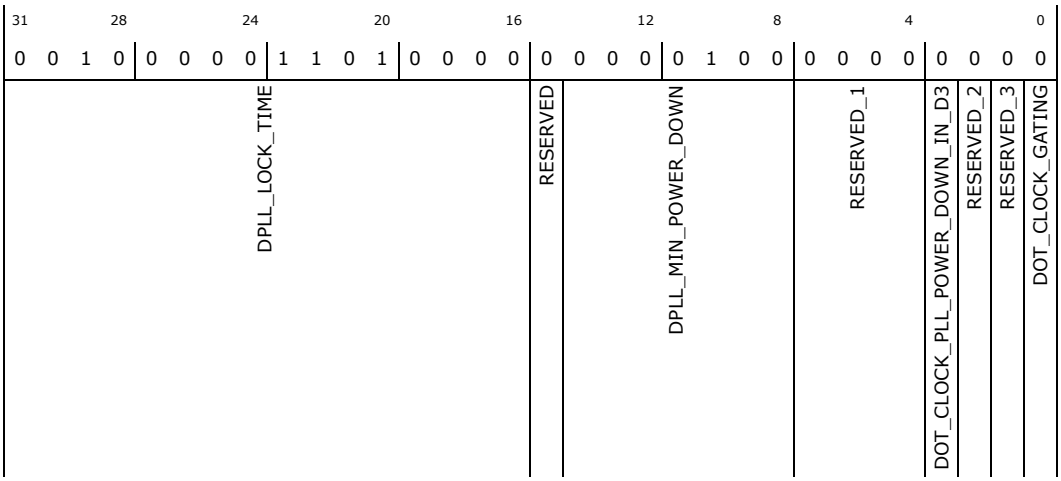
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6104h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 20D00400h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0010000011010000b<br>RW | **DPLL_LOCK_TIME:** (DevCDV):<br>This is the time required to the DPLL to relock. The counter using the HRAW clk (5nsec) and resolution of 5nsec. (SEG DPLL lock time is 42usec) |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0b<br>RW | **RESERVED:** : MBZ |
| 14:8 | 0000100b<br>RW | **DPLL_MIN_POWER_DOWN:** (DevCDV):<br>This is the minimum time required the DPLL to be power down until it is allowed to turn it on again. The HW counter using HRAW clk (5nsec) and has resolution of 160nsec (SEG DPLL required time is 0.5usec) |
| 7:4 | 0b<br>RW | **RESERVED_1:** : MBZ |
| 3 | 0b<br>RW | **DOT_CLOCK_PLL_POWER_DOWN_IN_D3:** This bit determines whether the PCI Power State Powers down the Dot Clock PLLs when in D3. A 0 on this bit does not power down the DPLLs, requiring software to gate them if necessary. When this bit is a 1, the dot PLLs are powered down when in D3. The PCI power state is determined by bits 1:0 of the PCI Power Management Control/Status register. |
| 2 | 0b<br>RW | **RESERVED_2:** Reserved. |
| 1 | 0b<br>RW | **RESERVED_3:** [DevCDV]<br>Graphics Core Clock Gating: This bit determines whether the PCI Power State gates the Graphics Core clocks when in the D3 state. A 0 on this bit does not gate the clocks, requiring software to gate them if necessary. When this bit is a 1, the graphics core clocks are gated at the outputs of the PLLs when in D3. The PCI power state is determined by bits 1:0 of the PCI Power Management Control/Status register.<br>This register field has no use in current products. |
| 0 | 0b<br>RW | **DOT_CLOCK_GATING:** This bit determines whether the PCI Power State gates the Dot clocks when in the D3 state. A 0 on this bit does not gate the clocks, requiring software to gate them if necessary. When this bit is a 1, the dot clocks are gated at the outputs of the PLLs when in D3. The PCI power state is determined by bits 1:0 of the PCI Power Management Control/Status register. |

### 14.10.35 DSPCLK_GATE_D—Offset 6200h

Clock Gating Disable for Display Register clock gating (cpdmmreg.v reg12_lt)

#### Access Method

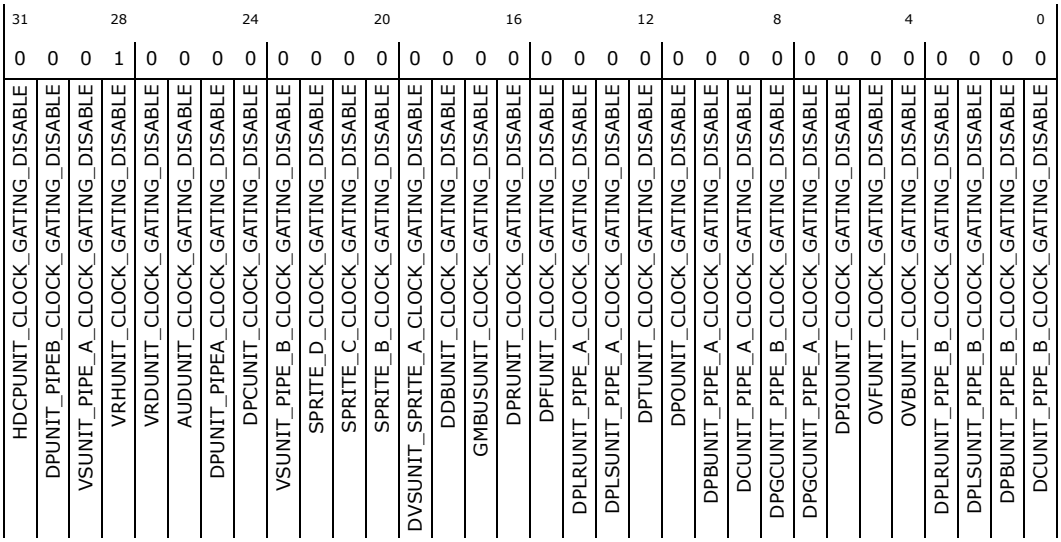
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6200h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 10000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

## 14.10.41 GCI_CONTROL—Offset 650Ch

GCI Control Register.

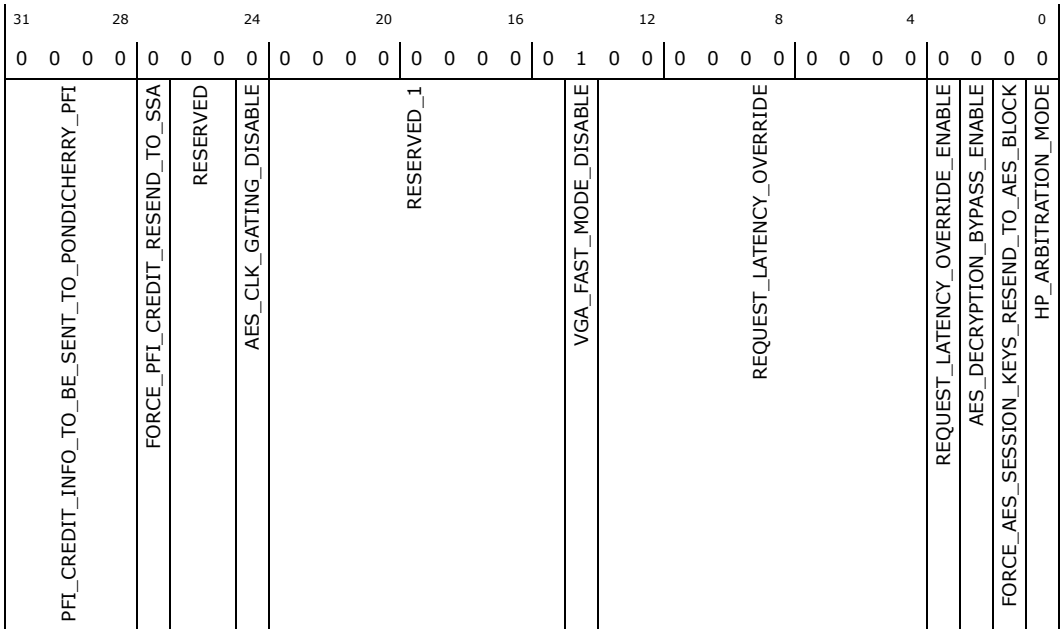
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 650Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00004000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **PFI_CREDIT_INFO_TO_BE_SENT_TO_PONDICHERRY_PFI:** Others = reserved<br>0111 = 15 credits<br>0110 = 14 credits<br>0101 = 13 credits<br>0100 = 12 credits<br>0011 = 11 credits<br>0010 = 10 credits<br>0001 = 9 credits<br>0000 = 8 credits available to PND (default)<br>Based on the czclk/cdclk ratio, display driver has to determine the appropriate PFI credits to be used |
| 27 | 0b<br>RW | **FORCE PFI CREDIT RESEND TO SSA (FORCE_PFI_CREDIT_RESEND_TO_SSA):** 0 = Disable PFI credit to resend to SSA. Hardware is responsible to clear this bit after the PFI credit initialization request is sent. 1 = Enable PFI credit to resend to SSA. When driver sets this bit, Display PFI request engine will resend the new PFI credit bit [31:28] to SSA. Hardware is responsible to clear this bit after the PFI credit initialization request is sent. |
| 26:25 | 0b<br>RW | **RESERVED:** Reserved. |
| 24 | 0b<br>RW | **AES_CLK_GATING_DISABLE:** 0 = Enable clock gating for AES clock (default)<br>1 = Disable clock gating for AES clock |
| 23:15 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 14 | 1b<br>RW | **VGA_FAST_MODE_DISABLE:** 0 = Fast Mode enabled. The Gfx mem arbiter can accept a vga display read request every clock. Note that the HP Address (G_HP_CONTROL[28:24]) and ID (G_HP_CONTROL[21:16]) FIFO depths must be set to a value greater than 1 when Fast Mode is enabled.<br>1 = Fast Mode disabled. (default) The Gfx mem arbiter can accept a vga display read request every other clock<br>Programming note: VGA FAST MODE is not supported in VLVP. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 13:4 | 0b<br>RW | **REQUEST_LATENCY_OVERRIDE:** If bit 3 of this register is set, the 10-btt Request Latency Override value programmed here is used as the latency offset from the global timer for requests that win arbitration. If bit 3 is not set, normal request latency from streamers is used.<br>Programming note: This value should not be larger than the actual required request latency. Otherwise, it will cause underrun. The guidline is to use latency corresponds to low watermark level or even smaller. When this field is used, the actual request latency is defeatured, either zero or a small value is used but still not causing underrun. |
| 3 | 0b<br>RW | **REQUEST_LATENCY_OVERRIDE_ENABLE:** 1 = Request Latency Override values in bit[13:4] is used as the latency offset from global timer<br>0 = Request Latency Override values is disabled. Normal request latency from streamer is used. (default) |
| 2 | 0b<br>RW | **AES_DECRYPTION_BYPASS_ENABLE:** 0 = AES decryption engine is enabled (Default)<br>1 = AES decryption engine is bypassed |
| 1 | 0b<br>RW | **FORCE_AES_SESSION_KEYS_RESEND_TO_AES_BLOCK:** 0 = Disable sending AES session keys to AES when going from Panel Self Refresh (PSR) inactive to PSR active mode (Default). Hardware is responsible to clear this bit after this bit is set to resend the session keys.<br>1 = Enable sending AES session keys to AES engine when going from PSR inactive to PSR active mode. When driver sets this bit, PAVP engine will resend the session keys to AES engine. Hardware is responsible to clear this bit after the session keys are sent. |
| 0 | 0b<br>RW | **HP_ARBITRATION_MODE:** 0 = Select hierarchical arbiter<br>1 = Select backup round robin arbiter |

## 14.10.42 GMBUSFREQ—Offset 6510h

GMBUS frequency binary encoding GMBUS Frequency Binary Encoding Register.

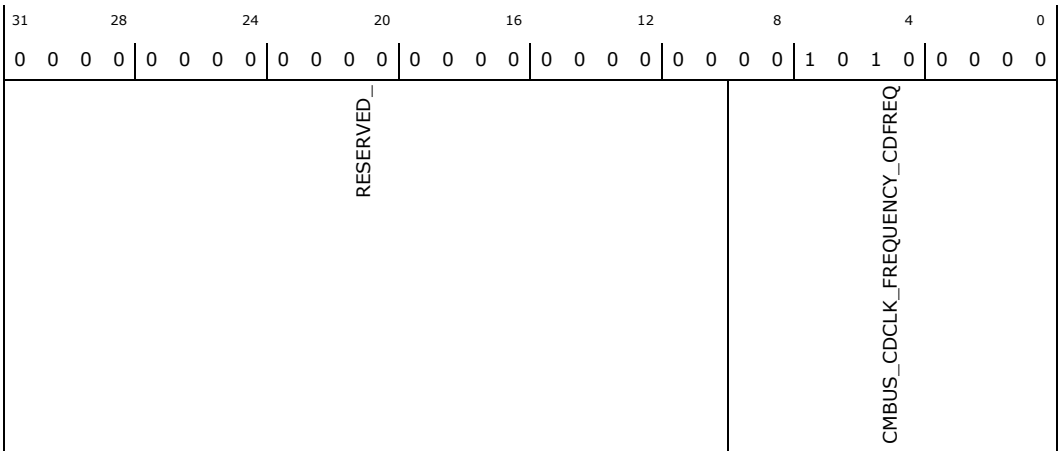
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6510h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 000000A0h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0b<br>RW | **RESERVED_:** Reserved. |
| 9:0 | 001010000<br>0b<br>RW | **CMBUS_CDCLK_FREQUENCY_CDFREQ:** Programmng note: bit[9:2] should be programmed to the number of cdclk that generates 4MHz reference clock freq which is used to generate GMBus clock. This will vary with the cdclk freq.<br>Programming note: For hot plug detect on exact 100ms as long pulse, driver shall program [9:0] = cdclk_1.01 |

## 14.10.43 DPALETTE_A—Offset A000h

Pipe A Display Palette

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + A000h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 2:1 | 0b<br>RW | **ULPS_STATE:** ULPS state for mipi pipe A |
| 0 | 0b<br>RW | **DEVICE_READY_:** Set by the processor to inform that device is ready |

## 14.10.46 MIPIA_INTR_STAT_REG—Offset B004h

interrupt stat reg for mipi pipe A

### Access Method

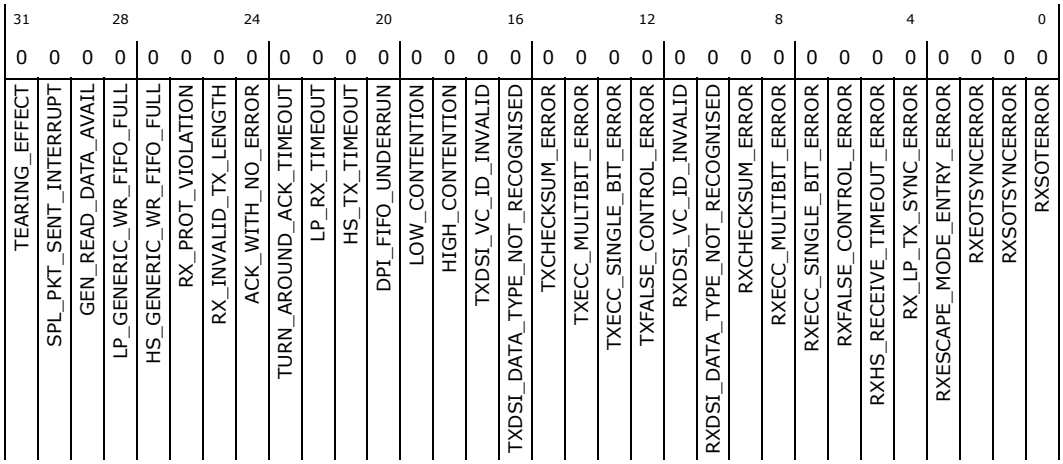
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B004h

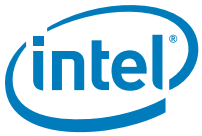
**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **TEARING_EFFECT:** Set to indicate that tearing effect trigger message is Received |
| 30 | 0b<br>RW | **SPL_PKT_SENT_INTERRUPT:** Set to confirm the transmission of the DPI event specific commands set in the dpi control and dpi data register |
| 29 | 0b<br>RW | **GEN_READ_DATA_AVAIL:** Set to indicate that the requested data for a Generic Read request is available in the buffer i.e., generic read response data is available in the read FIFO |
| 28 | 0b<br>RW | **LP_GENERIC_WR_FIFO_FULL:** Set to indicate that the LP generic write fifo is full |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27 | 0b<br>RW | **HS_GENERIC_WR_FIFO_FULL:** Set to indicate that the HS generic write fifo is full |
| 26 | 0b<br>RW | **RX_PROT_VIOLATION:** Set if DSI protocol violation error is reported in the acknowledge packet by the display device |
| 25 | 0b<br>RW | **RX_INVALID_TX_LENGTH:** Set if invalid transmission length error is reported in the acknowledge packet by the display device |
| 24 | 0b<br>RW | **ACK_WITH_NO_ERROR:** Set if acknowledge trigger message is received with out any error |
| 23 | 0b<br>RW | **TURN_AROUND_ACK_TIMEOUT:** Set if a turn around acknowledgement sequence is not received from the display device |
| 22 | 0b<br>RW | **LP_RX_TIMEOUT:** Set if a low power reception count expires this interrupt is generated |
| 21 | 0b<br>RW | **HS_TX_TIMEOUT:** Set if a high speed transmission prevails for more than the expected count value this interrupt is raised |
| 20 | 0b<br>RW | **DPI_FIFO_UNDERRUN:** Set to '1' if there is no data in the dpi fifo to make a in time delivery of the pixel data to the DSI receiver |
| 19 | 0b<br>RW | **LOW_CONTENTION:** Set to '1' if a LP low fault is registered by at the D-PHY contention detector |
| 18 | 0b<br>RW | **HIGH_CONTENTION:** Set to '1' if a LP high fault is registered by at the D-PHY contention detector |
| 17 | 0b<br>RW | **TXDSI_VC_ID_INVALID:** Set to '1' if the received virtual channel ID is invalid |
| 16 | 0b<br>RW | **TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to '1' if the received data type is not recognised |
| 15 | 0b<br>RW | **TXCHECKSUM_ERROR:** Set to '1' if the computed CRC differs from the received CRC value during the reception of packets by Arasan_DSI host. |
| 14 | 0b<br>RW | **TXECC_MULTIBIT_ERROR:** Set to '1' if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan_DSI_host |
| 13 | 0b<br>RW | **TXECC_SINGLE_BIT_ERROR:** Set to '1' if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan_DSI_host |
| 12 | 0b<br>RW | **TXFALSE_CONTROL_ERROR:** Set to '1' if a control error is observed on the lanes by the Arasan_DSI_host |
| 11 | 0b<br>RW | **RXDSI_VC_ID_INVALID:** Set to '1' if the virtual channel ID is invalid by the display device is reported in the Acknowledge packet by the display device |
| 10 | 0b<br>RW | **RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to '1' if the data type is not recognised by the display device is reported in the Acknowledge packet by the display device |
| 9 | 0b<br>RW | **RXCHECKSUM_ERROR:** Set to '1' if the computed CRC differs from the received CRC value and is reported in the Acknowledge packet by the display device |
| 8 | 0b<br>RW | **RXECC_MULTIBIT_ERROR:** Set to '1' if there is no ECC correction for the packet or there are more than 2 bit errors in the packet is reported in the Acknowledge packet by the display device |
| 7 | 0b<br>RW | **RXECC_SINGLE_BIT_ERROR:** Set to '1' if ECC syndrome was computed and corrected for one bit error is reported in the Acknowledge packet by the display device |
| 6 | 0b<br>RW | **RXFALSE_CONTROL_ERROR:** Set to '1' if a control error is reported in the Acknowledge packet by the display device |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0b<br>RW | **RXHS_RECEIVE_TIMEOUT_ERROR:** Set to '1' if the high speed receive timer value expires and data transfer lasts on the data lane is reported in the Acknowledge packet by the display device |
| 4 | 0b<br>RW | **RX_LP_TX_SYNC_ERROR:** Set to '1' if Low power transmission sync error occurs in the display device and is reported in the Acknowledge packet by the display device |
| 3 | 0b<br>RW | **RXESCAPE_MODE_ENTRY_ERROR:** Set to '1' if Escape Mode Entry command is not understandable by the display device and is reported in the Acknowledge packet by the display device |
| 2 | 0b<br>RW | **RXEOTSYNCERROR:** RX eot sync Error |
| 1 | 0b<br>RW | **RXSOTSYNCERROR:** Set to '1' if a start of transmission synchronisation error is reported in the Acknowledge packet by the display device |
| 0 | 0b<br>RW | **RXSOTERROR:** Set to '1' if a start of transmission error is reported in the Acknowledge packet by the display device |

## 14.10.47 MIPIA_INTR_EN_REG—Offset B008h

mipi pipe A interrupt enable register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B008h

| 16 | 0b<br>RW | **TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt if the received packets data type is not recognised |
| 15 | 0b<br>RW | **TXCHECKSUM_ERROR:** Set to enable the interrupt if the computed CRC differs from the received CRC value for the received packets |
| 14 | 0b<br>RW | **TXECC_MULTIBIT_ERROR:** Set to enable the interrupt if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan DSI host |
| 13 | 0b<br>RW | **TXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan DSIhost |
| 12 | 0b<br>RW | **TXFALSE_CONTROL_ERROR:** Set to enable the interrupt for the control error.,observed on the lanes by the Arasan_DSI_host |
| 11 | 0b<br>RW | **RXDSI_VC_ID_INVALID:** Set to enable the interrupt for invalid virtual channel ID in the acknowledgment packet reports |
| 10 | 0b<br>RW | **RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt for the un recognised data type in the acknowledgment packet reports |
| 9 | 0b<br>RW | **RXCHECKSUM_ERROR:** Set to enable the interrupt for the computed CRC differs from the received CRC value in the acknowledgment packet reports |
| 8 | 0b<br>RW | **RXECC_MULTIBIT_ERROR:** Set to enable the interrupt for no ECC correction for the packet or there are more than 2 bit errors reported in the acknowledgment packet |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **RXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt for ECC syndrome computation and one bit error correction for the acknowledgment packet |
| 6 | 0b<br>RW | **RXFALSE_CONTROL_ERROR:** Set to enable the interrupt for control error in the acknowledgment packet reports |
| 5 | 0b<br>RW | **RXHS_RECEIVE_TIMEOUT_ERROR:** Set to enable the interrupt for the high speed receive timeout Error in the acknowledgment packet reports |
| 4 | 0b<br>RW | **RX_LP_TX_SYNC_ERROR:** Set to enable the interrupt for Low power transmission sync error in the acknowledgment packet reports |
| 3 | 0b<br>RW | **RXESCAPE_MODE_ENTRY_ERROR:** Set to enable the interrupt for Escape Mode Entry command error in the acknowledgment packet reports |
| 2 | 0b<br>RW | **RXEOTSYNC_ERROR:** Set to enable the interrupt for End of transmission synchronisation Error in the acknowledgement packet reports |
| 1 | 0b<br>RW | **RXSOTSYNC_ERROR:** Set to enable the interrupt for start of transmission synchronisation error in the acknowledgement packet reports |
| 0 | 0b<br>RW | **RXSOT_ERROR:** Set to enable the interrupt for start of transmission error in the acknowledgment packet reports |

## 14.10.48 MIPIA_DSI_FUNC_PRG__REG—Offset B00Ch

mipi pipe A dsi function program register

### Access Method

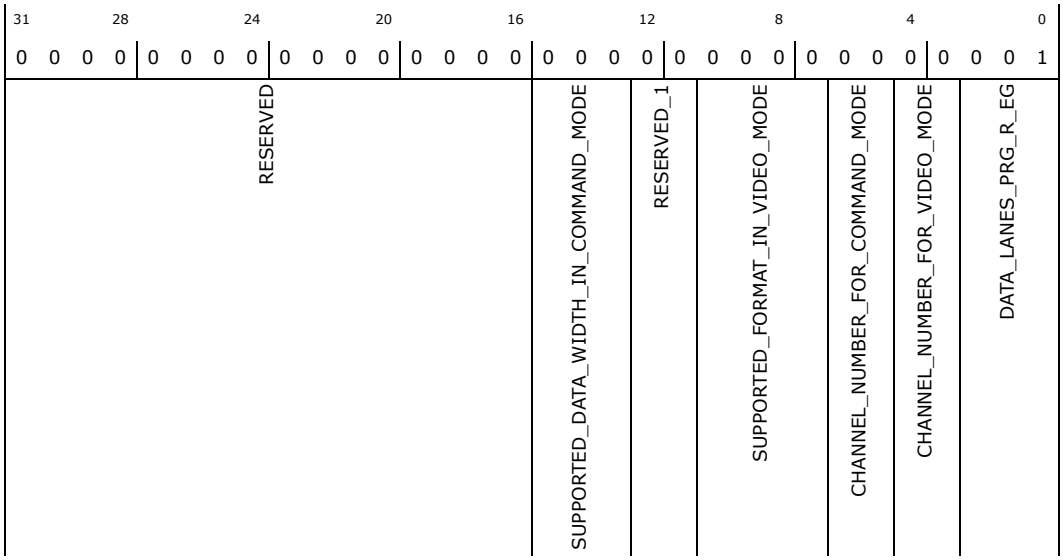
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B00Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000001h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:13 | 0b<br>RW | **SUPPORTED_DATA_WIDTH_IN_COMMAND_MODE:** 000 --) Reserved,<br>001 --) 16 bit data ,<br>010 --) 9 bit data ,<br>011 --) 8 bit data ,<br>100 --) option 1 :<br>101 --) option 2 :<br>110 to 111 --) Reserved |
| 12:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10:7 | 0b<br>RW | **SUPPORTED_FORMAT_IN_VIDEO_MODE:** Supported colour format,<br>0001 --) RGB565,<br>0010 --) RGB666,<br>0011 --) RGB 666 loosely packed format,<br>0100 --) RGB888 |
| 6:5 | 0b<br>RW | **CHANNEL_NUMBER_FOR_COMMAND_MODE:** Virtual channel number for command mode is programmed by the processor |
| 4:3 | 0b<br>RW | **CHANNEL_NUMBER_FOR_VIDEO_MODE:** Virtual channel number for command mode is programmed by the processor |
| 2:0 | 001b<br>RW | **DATA_LANES_PRG_R_EG:** Number of data lanes to be supported is programmed by the processor |

## 14.10.49 MIPIA_HS_TX_TIMEOUT_REG—Offset B010h

mipi piepe A HS TX timout register

### Access Method

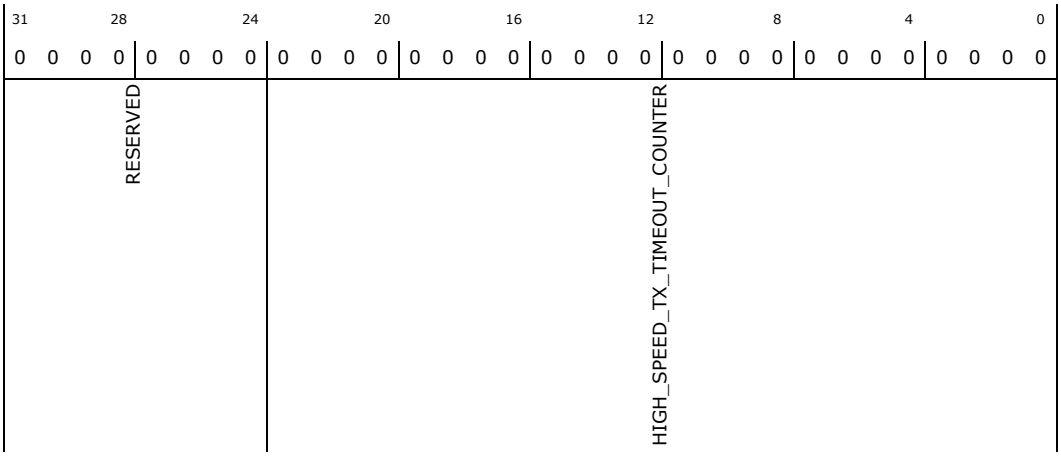
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B010h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:0 | 0b<br>RW | **HIGH_SPEED_TX_TIMEOUT_COUNTER:** The maximum duration allowed for the DSI host ,to remain in high speed mode for a transmission. If the counter expires, HS mode is terminated with EOT and the lanes enter stop state |

## 14.10.50 MIPIA_LP_RX_TIMEOUT_REG—Offset B014h

mipi pipe A LP RX timeout register

### Access Method

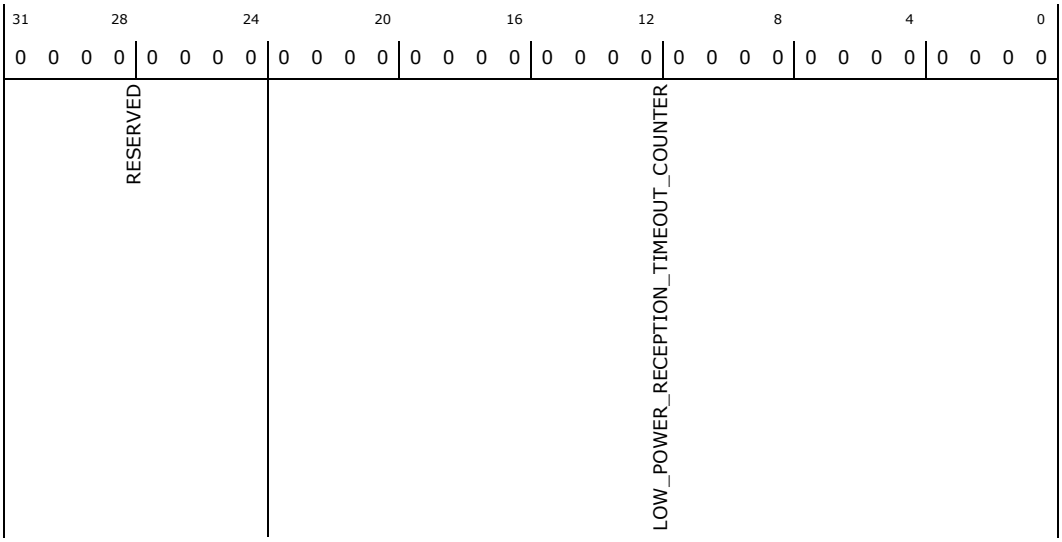
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B014h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:0 | 0b<br>RW | **LOW_POWER_RECEPTION_TIMEOUT_COUNTER:** Timeout value to be checked for received short packets .If the timer expires the DSI Host enters stop state |

## 14.10.51 MIPIA_TURN_AROUND_TIMEOUT_REG—Offset B018h

mipi pipe A turn around timeout register

### Access Method

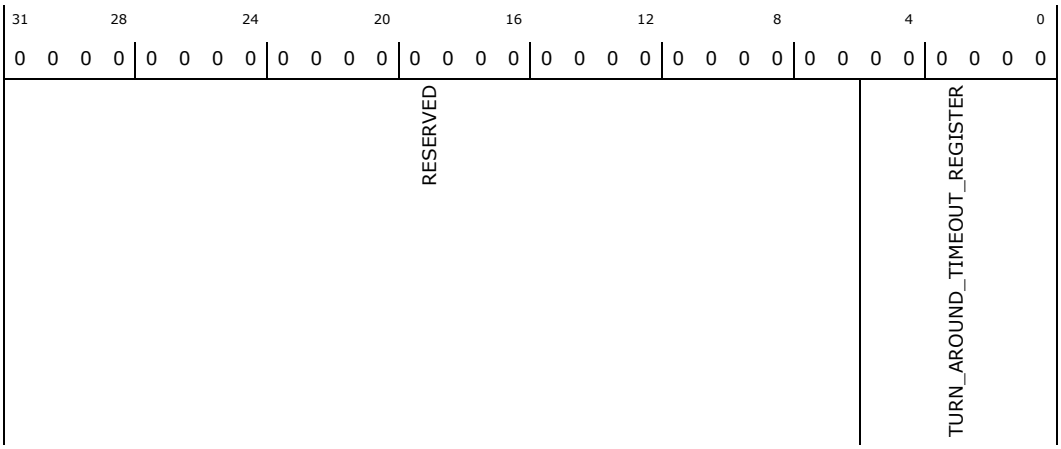
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B018h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **RESERVED:** Reserved. |
| 5:0 | 0b<br>RW | **TURN_AROUND_TIMEOUT_REGISTER:** Timeout value to be checked after the DSI host makes a turn around in the direction of transfers. If the timer expires the DSI Host enters stop state |

## 14.10.52 MIPIA_DEVICE_RESET_TIMER—Offset B01Ch

mipi pipe A device reset timer

### Access Method

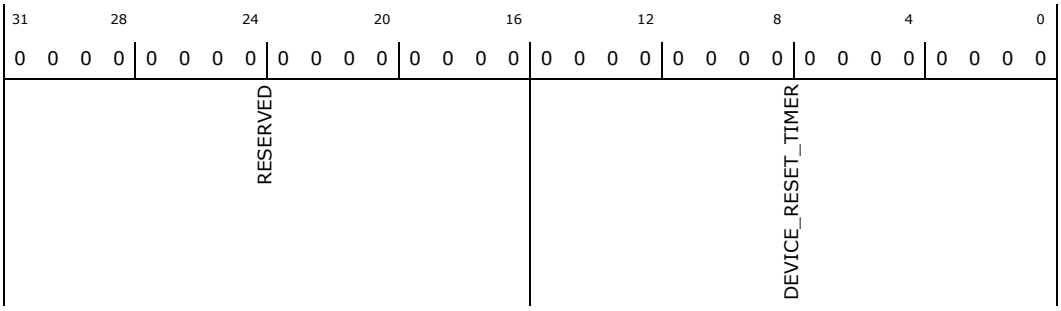
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B01Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **DEVICE_RESET_TIMER:** Timeout value to be checked for device to be reset after issuing reset entry command. If the timer expires the DSI Host enters normal operation |

## 14.10.53 MIPIA_DPI_RESOLUTION_REG—Offset B020h

mipi piepe A DPI Resolution reg

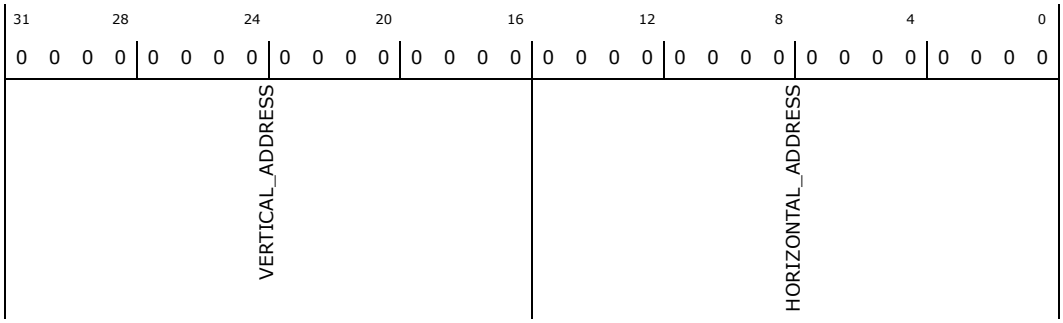
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B020h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **VERTICAL_ADDRESS:** Shows the vertical address count in lines |
| 15:0 | 0b<br>RW | **HORIZONTAL_ADDRESS:** Shows the horizontal address count in pixels |

## 14.10.54 MIPIA_DBI_RESOLUTION_REG—Offset B024h

mipi A DBI resolution reg

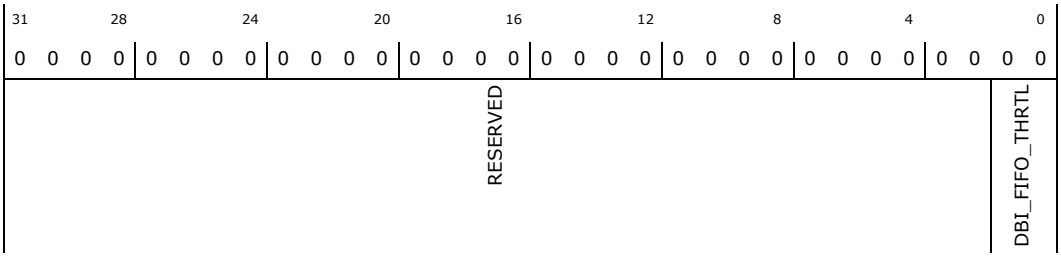
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B024h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1:0 | 0b<br>RW | **DBI_FIFO_THRTL:** DBI FIFO's watermark can be set using the following bits so as to enable dbi_stall de-assertion whenever the below FIFO condition is reached:<br>00 - (1/2) DBI fifo empty<br>01 - (1/4) DBI fifo empty<br>10 - 7 locations are empty<br>11 - Reserved |

## 14.10.55 MIPIA_HORIZ_SYNC_PADDING_COUNT—Offset B028h

mipi A horizontal sync padding out

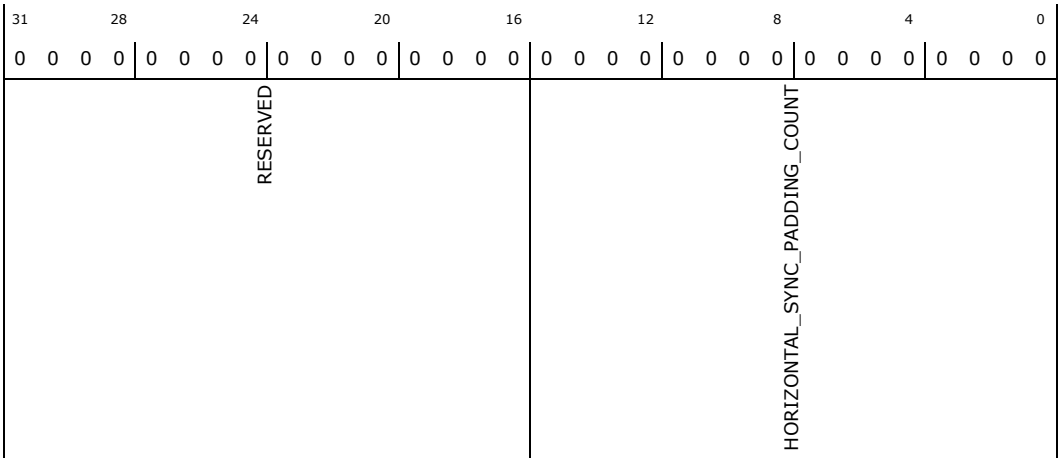
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B028h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0b<br>RW | **HORIZONTAL_SYNC_PADDING_COUNT:** Shows the horizontal sync padding value in terms of txbyteclkhs |

## 14.10.56 MIPIA_HORIZ_BACK_PORCH_COUNT—Offset B02Ch

mipi pipe A horizontal back porch counter

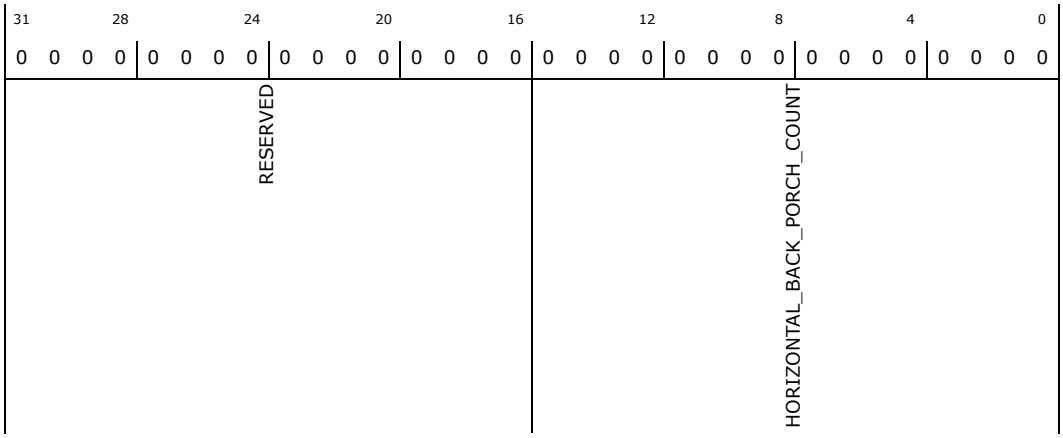
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B02Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_BACK_PORCH_COUNT:** Shows the horizontal back porch value in terms of txbyteclkhs |

## 14.10.57 MIPIA_HORIZ_FRONT_PORCH_COUNT—Offset B030h

mipi pipe A horizontal front porch counter

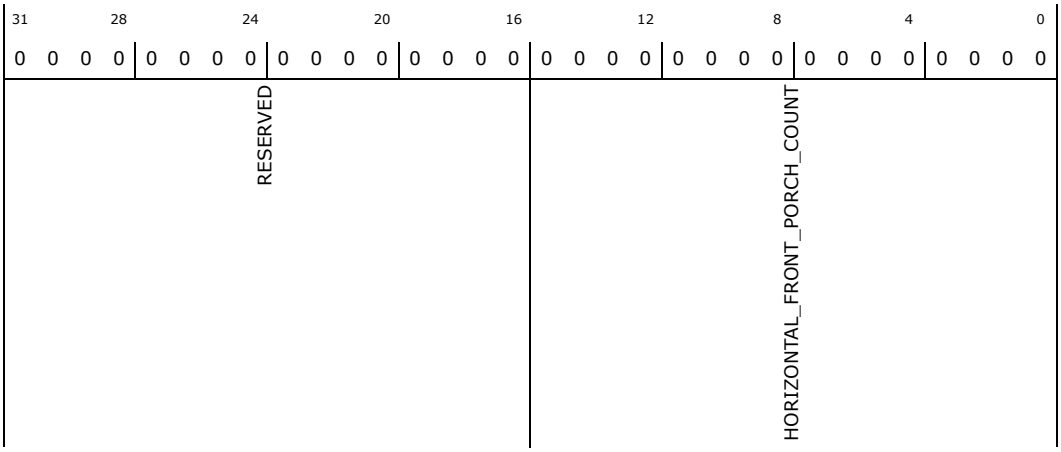
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B030h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_FRONT_PORCH_COUNT:** Shows the horizontal front porch value in terms of txbyteclkhs |

## 14.10.58 MIPIA_HORIZ_ACTIVE_AREA_COUNT—Offset B034h

mipi A horizontal active area counter

### Access Method

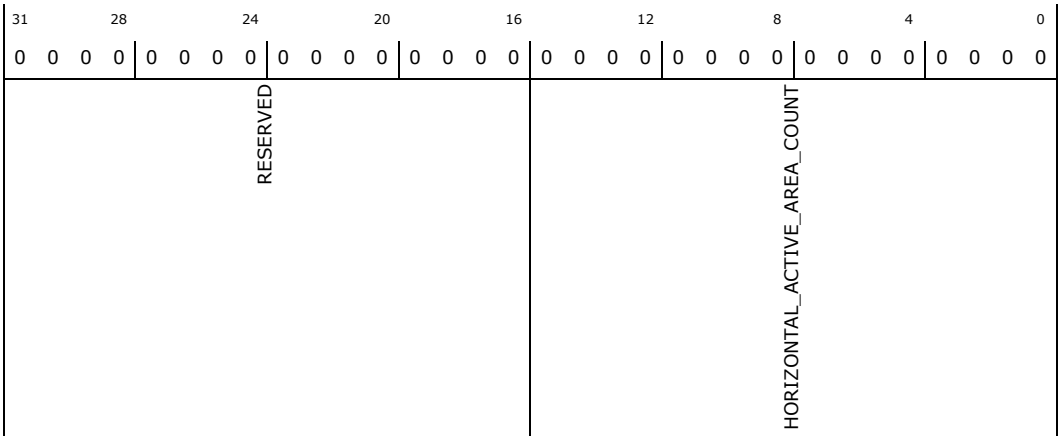
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B034h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_ACTIVE_AREA_COUNT:** Shows the horizontal active area value in terms of txbyteclkhs |

## 14.10.59 MIPIA_VERT_SYNC_PADDING_COUNT—Offset B038h

mipi pipe A vertical sync padding counter

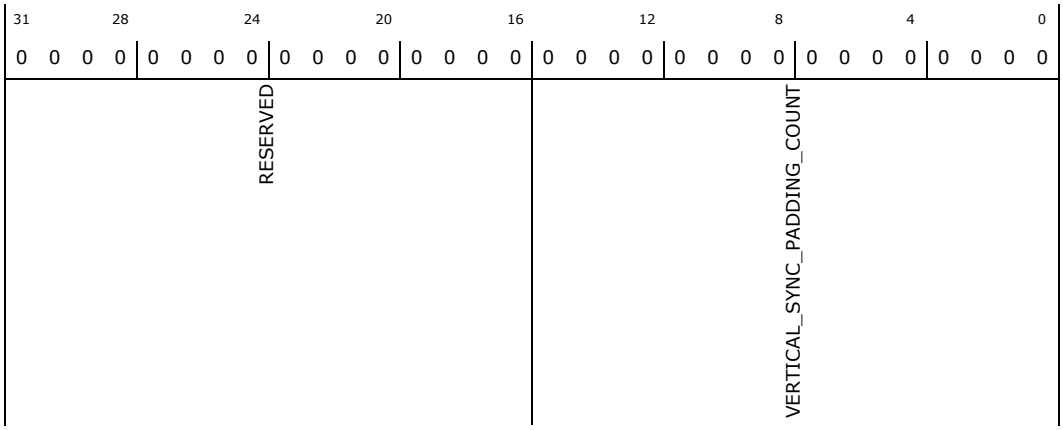
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B038h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **VERTICAL_SYNC_PADDING_COUNT:** Shows the vertical sync padding value in terms of lines |

## 14.10.60 MIPIA_VERT_BACK_PORCH_COUNT—Offset B03Ch

mipi pipe A vertical back portch counter

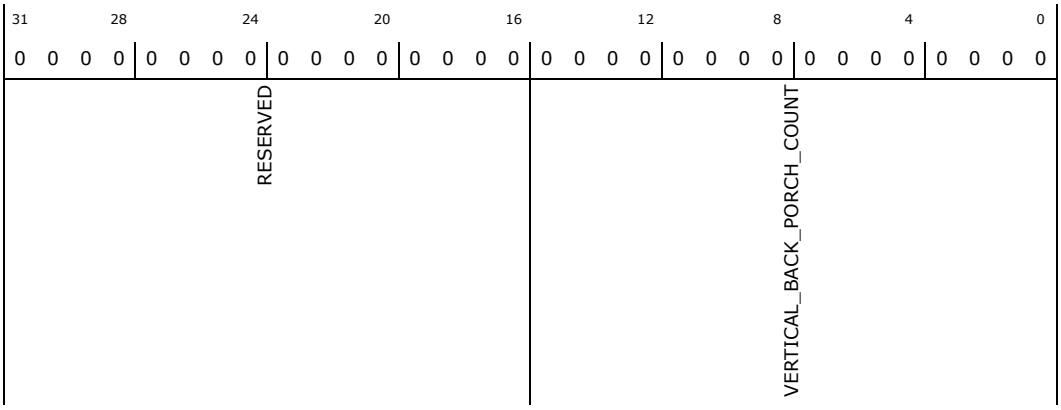
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B03Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **VERTICAL_BACK_PORCH_COUNT:** Shows the vertical back porch value in terms of lines |

## 14.10.61 MIPIA_VERT_FRONT_PORCH_COUNT—Offset B040h

mipi pipe A vertical front portch counter

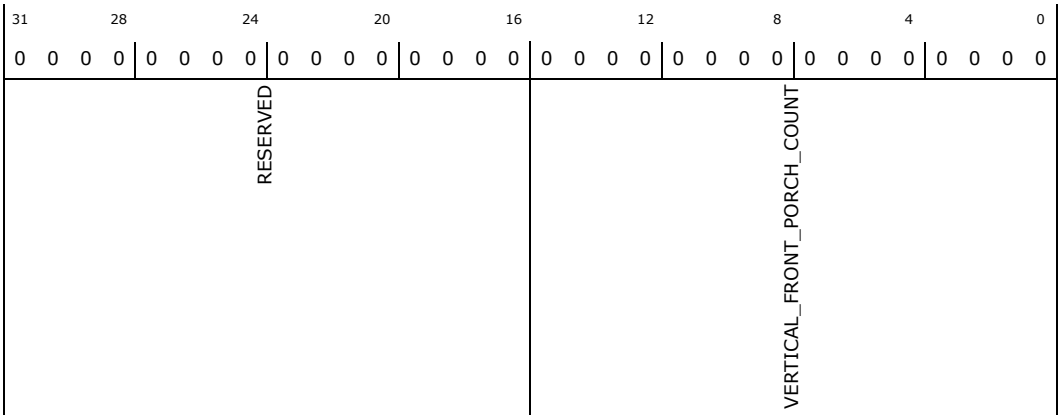
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B040h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0b<br>RW | **VERTICAL_FRONT_PORCH_COUNT:** Shows the vertical front porch value in terms of lines |

## 14.10.62 MIPIA_HIGH_LOW_SWITCH_COUNT—Offset B044h

mipi A high low switch count

### Access Method

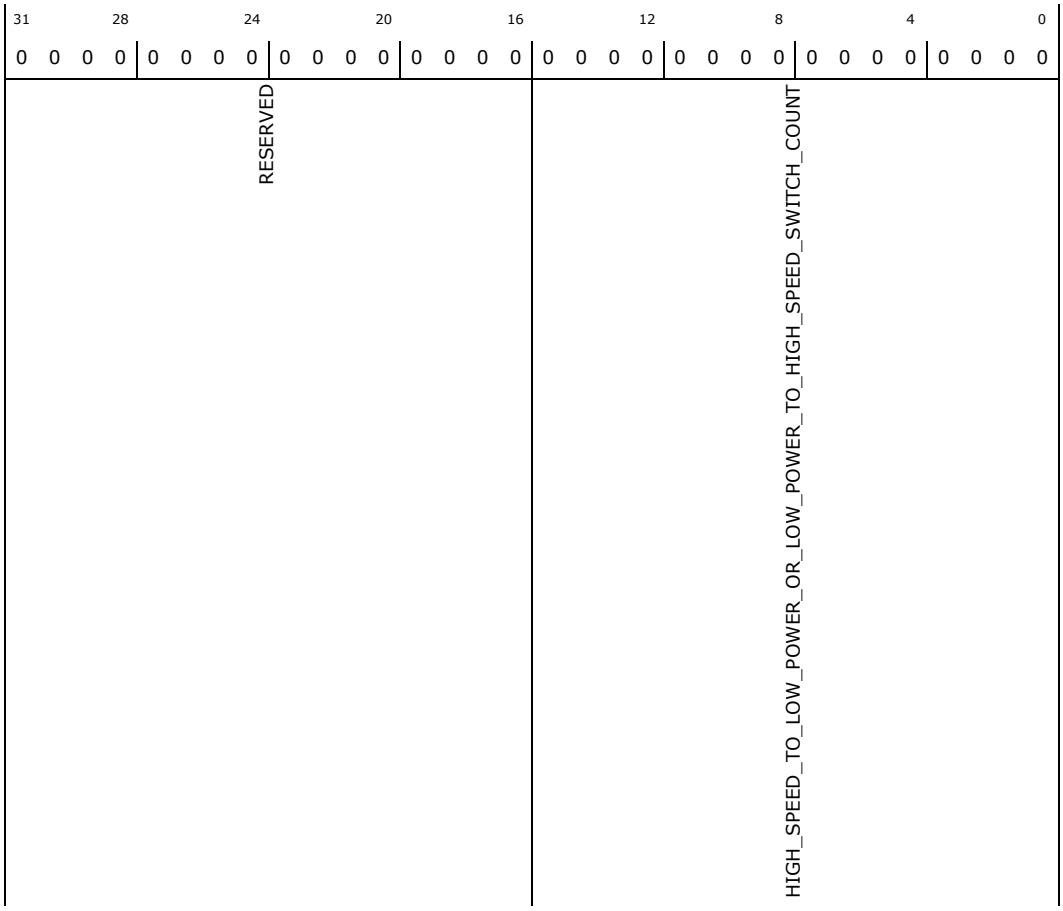
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B044h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** High speed to low power or Low power to high speed switching time in terms of txbyteclkhs |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0b<br>RW | **HIGH_SPEED_TO_LOW_POWER_OR_LOW_POWER_TO_HIGH_SPEED_SWITCH_COUNT:** High speed to low power or Low power to high speed switching time in terms of txbyteclkhs |

## 14.10.63 MIPIA_DPI_CTRL_REG—Offset B048h

mipi A dpi ctrl register

### Access Method

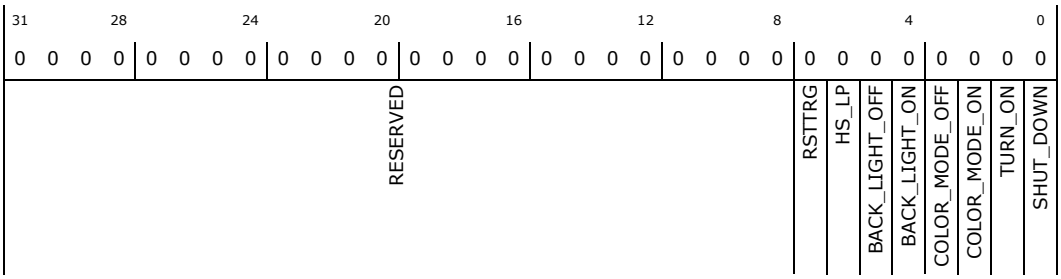
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B048h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** |
| 7 | 0b<br>RW | **RSTTRG:** mipi A dpi ctrl reg RSTTRG |
| 6 | 0b<br>RW | **HS_LP:** Set to '0' to indicate the special packets are sent through the DSI link using HS transmission and set to '1' to indicate that the special packets are sent through the DSI link using low power mode |
| 5 | 0b<br>RW | **BACK_LIGHT_OFF:** Set to '1' to indicate a backlight OFF short packet has to be packetised for the DPI's virtual channel |
| 4 | 0b<br>RW | **BACK_LIGHT_ON:** Set to '1' to indicate a backlight ON short packet has to be packetised for the DPI's virtual channel |
| 3 | 0b<br>RW | **COLOR_MODE_OFF:** Set to '1' to indicate a color mode OFF short packet has to be packetised for the DPI's virtual channel |
| 2 | 0b<br>RW | **COLOR_MODE_ON:** Set to '1' to indicate a color mode ON short packet has to be packetised for the DPI's virtual channel |
| 1 | 0b<br>RW | **TURN_ON:** Set to '1' to indicate a turn on short packet has to be packetised for the DPI's virtual channel |
| 0 | 0b<br>RW | **SHUT_DOWN:** Set to '1' to indicate a shut down short packet has to be packetised for the DPI's virtual channel |

## 14.10.64 MIPIA_DPI_DATA_REGISTER—Offset B04Ch

mipi A dpi data register

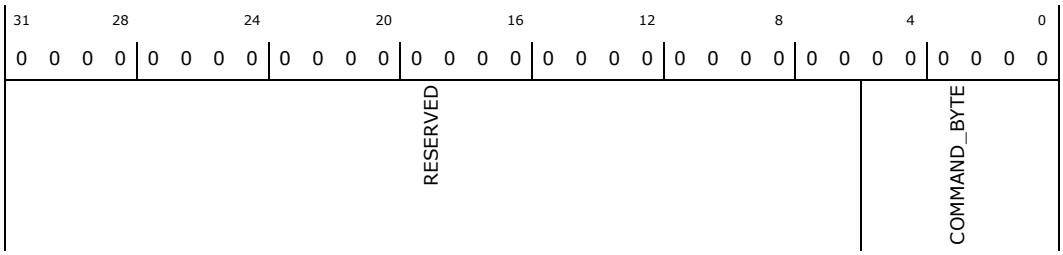
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B04Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **RESERVED:** Reserved. |
| 5:0 | 0b<br>RW | **COMMAND_BYTE:** Command Byte to represent the new or not defined command bytes usage for special features representation. [Like backlight ON and OFF]. This register should be programmed before the DPI control register is being programmed for backlight ON/OFF |

## 14.10.65 MIPIA_INIT_COUNT_REGISTER—Offset B050h

mipi A init count register

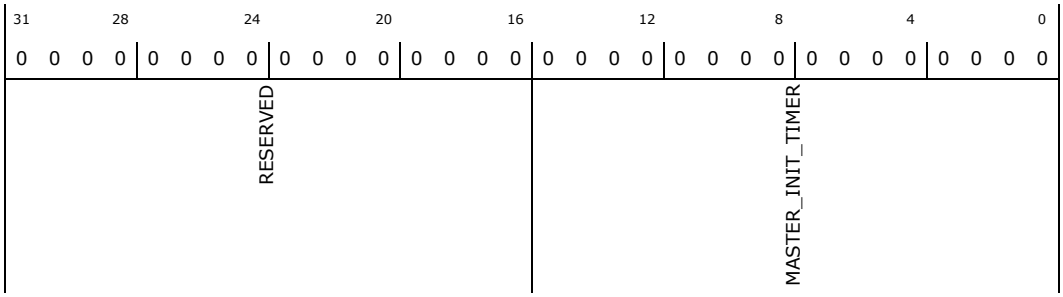
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B050h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **MASTER_INIT_TIMER:** Counter value in terms of low power clock to initialise the DSI Host IP [ TINT] that drives a stop state on the mipi's D-PHY bus |

## 14.10.66 MIPIA_MAX_RETURN_PKT_SIZE_REGISTER—Offset B054h

mipi A max resturn pkt size register

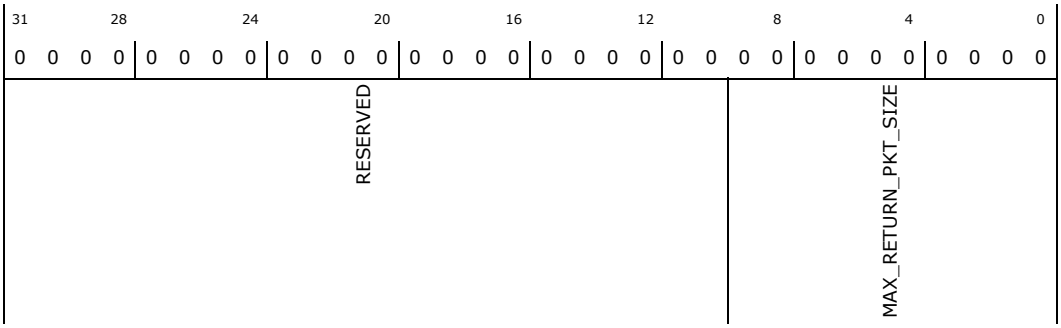
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B054h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0b<br>RW | **RESERVED:** Reserved. |
| 9:0 | 0b<br>RW | **MAX_RETURN_PKT_SIZE:** Set the count value in bytes to collect the return data packet for reverse direction data flow in data lane0 in response to a DBI read operation |

## 14.10.67 MIPIA_VIDEO_MODE_FORMAT_REGISTER—Offset B058h

mipi A video mode format register

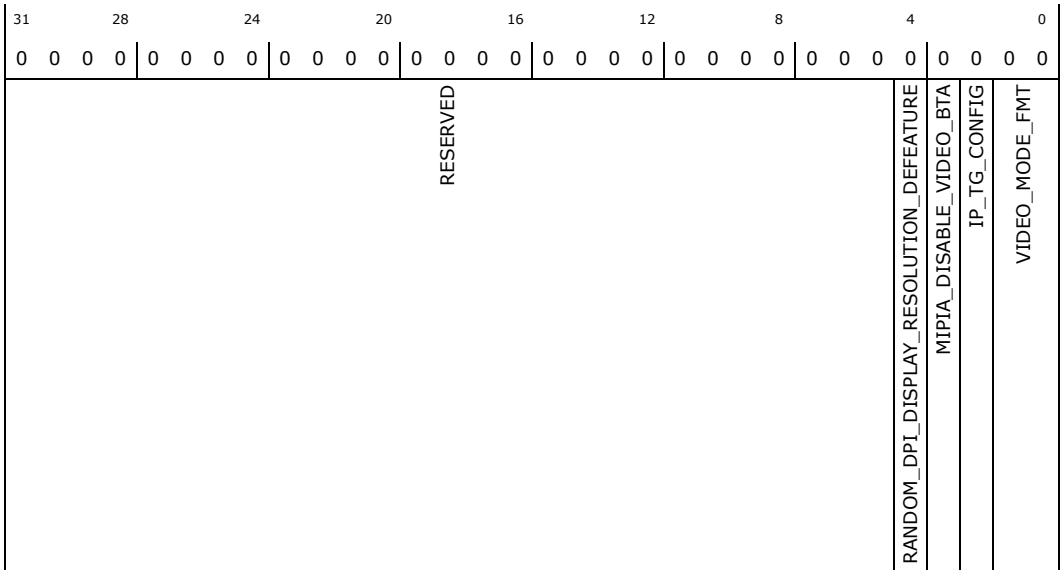
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B058h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **RESERVED:** Reserved. |
| 4 | 0b<br>RW | **RANDOM_DPI_DISPLAY_RESOLUTION_DEFEATURE:** Set by the processor to support random DPI display resolution<br>0 - random DPI display resolution support disabled.<br>1 - random DPI display resolution support enabled. |
| 3 | 0b<br>RW | **MIPIA_DISABLE_VIDEO_BTA:** Set by the processor to inform the DSI controller to disable the BTA sent at the last blanking line of VFP. By default, this bit is set to 0.0 BTA sending at the last blanking line of VFP is enabled. 1 BTA sentding at teh last blanking line of VFP is disabeld. |
| 2 | 0b<br>RW | **IP_TG_CONFIG:** Set by the processor to inform that the DSI controller should discontinue the DPI transfer after the last line of the VFP after ip_tg_enable deassertion. By default, this bit is set to 0.<br>0 - After ip_tg_enable deassertion, DSI Tx controller stops the DPI transfer immediately after the current packet is transmitted.<br>1 - After ip_tg_enable deassertion, DSI Tx controller discontinues the DPI transfer after the last line of the VFP |
| 1:0 | 0b<br>RW | **VIDEO_MODE_FMT:** Sets the Video mode format (packet sequence) to be supported in DSI. In Non Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed equal to RGB word count value In Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed greater than the RGB word count value, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link.<br>00 Reserved<br>01 - Non Burst Mode with Sync Pulse<br>10 - Non Burst Mode with Sync events<br>11 - Burst Mode |

## 14.10.68 MIPIA_EOT_DISABLE_REGISTER—Offset B05Ch

mipi A eot disable register

**Access Method**

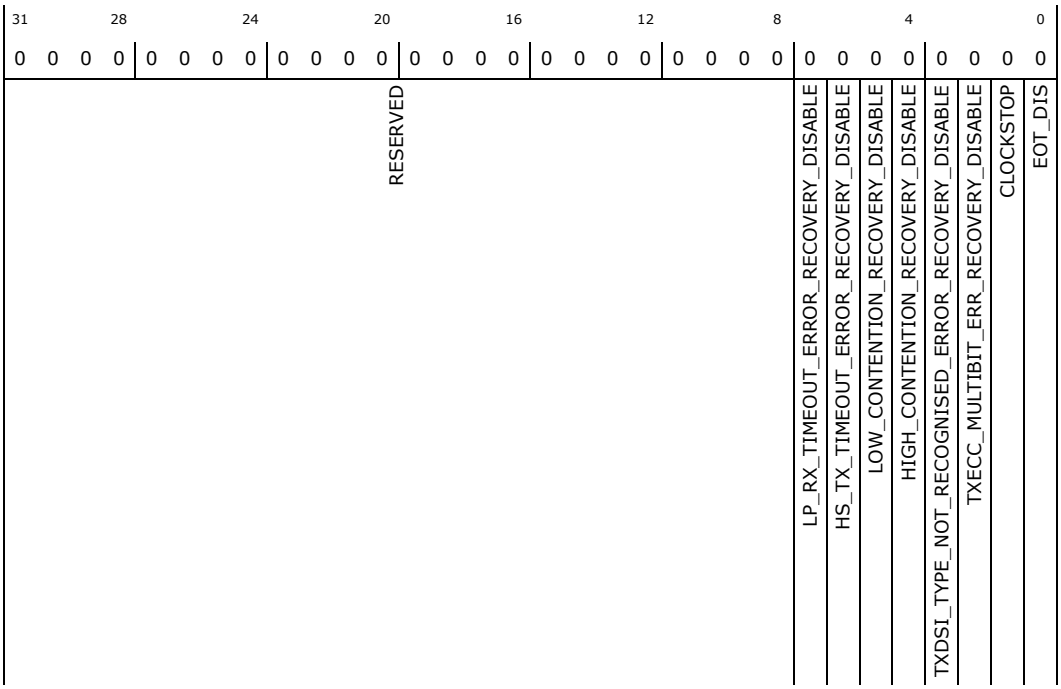
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B05Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7 | 0b<br>RW | **LP_RX_TIMEOUT_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the LP_Rx_timeout error recovery if the processor clears LP_Rx_timeout error interrupt.<br>0 - LP_Rx_timeout error recovery action will be taken by the DSI Tx controller if the processor clears the LP_Rx_timeout error interrupt.<br>1 - If the processor clears the LP_Rx_timeout error interrupt, LP_Rx_timeout error recovery action will not happen in DSI Tx contorller. LP Rx timeout error interrupt will act as an informative interrupt |
| 6 | 0b<br>RW | **HS_TX_TIMEOUT_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the HS_Tx_timeout error recovery if the processor clears HS_Tx_timeout interrupt.<br>0 - HS_Tx_timeout error recovery action will be taken by the DSI Tx controller if the processor clears the HS_Tx_timeout error interrupt.<br>1 - If the processor clears the HS_Tx_timeout error interrupt, HS_Tx_timeout error recovery action will not happen in DSI Tx contorller. HS Tx timeout error interrupt will act as an informative interrupt |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0b<br>RW | **LOW_CONTENTION_RECOVERY_DISABLE:** Set by the processor to enable or disable the contention recovery procedure if the processor clears Low contention interrupt.<br>0 - Contention recovery will happen if the processor clears Low contention interrupt.<br>1 - If the processor clears the low contention interrupt, contention recovery procedure will not be initiated by the DSI Tx contorller. Low contention interrupt will act as an informative interrupt |
| 4 | 0b<br>RW | **HIGH_CONTENTION_RECOVERY_DISABLE:** Set by the processor to enable or disable the contention recovery procedure if the processor clears High contention interrupt.<br>0 - Contention recovery will happen if the processor clears High contention interrupt.<br>1 - If the processor clears the high contention interrupt, contention recovery procedure will not be initiated by the DSI Tx contorller. Ignore the High Contention Interrupt in MIPI_INTR_STAT_REG |
| 3 | 0b<br>RW | **TXDSI_TYPE_NOT_RECOGNISED_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the error recovery action to be taken by the DSI Tx controller if TxDSI data type not recognised error interrupt is cleared by the processor.<br>0 - Error recovery action will be taken if TxDSI data type not recognised error interrupt is cleared by the processor.<br>1 - If TxDSI data type not recognised error interrupt is cleared by the processor, error recovery action will not be taken by the DSI TX controller. Tx DSI data type not recognized error interrupt will act as an informative interrupt |
| 2 | 0b<br>RW | **TXECC_MULTIBIT_ERR_RECOVERY_DISABLE:** Set by the processor to enable or disable the error recovery action to be taken by the DSI Tx controller if Tx ECC multibit error interrupt is cleared by the processor.<br>0 - Error recovery action will be taken if Tx ECC multibit error interrupt is cleared by the processor.<br>1 - If Tx ECC multibit error interrupt is cleared by the processor, error recovery action will not be taken by the DSI TX controller. Tx multibit error interrupt will act as an informative interrupt |
| 1 | 0b<br>RW | **CLOCKSTOP:** Set by the processor to enable or disable clock stopping feature during BLLP timing in a DPI transfer in dual channel mode or during DPI only mode and also when there is no traffic in the DBI interface in DBI only enabled mode. By default this register value is 0.<br>0 - clock stopping disabled<br>1 - clock stopping enabled |
| 0 | 0b<br>RW | **EOT_DIS:** Set by the processor to enable or disable EOT short packet transmission. By default this register value is 0. For backward comapatibility of earlier DSI systems, EOT short packet transmission can be disabled.<br>0 - EOT short packet transmission enabled<br>1 - EOT short packet transmission disabled |

## 14.10.69 MIPIA_LP_BYTECLK_REGISTER—Offset B060h

mipi A LP bytclk register

### Access Method

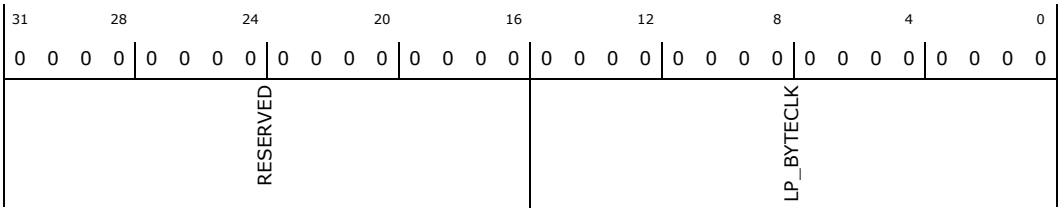
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B060h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **LP_BYTECLK:** Low power clock equivalence in terms of byte clock. The value programmed in this register is equal to the number of byte clocks occupied in one low power clock. This value is based on the byte clock (txbyteclkhs) and low power clock frequency (txclkesc) |

## 14.10.70 MIPIA_LP_GEN_DATA_REGISTER—Offset B064h

mipi A LP gen DATA register

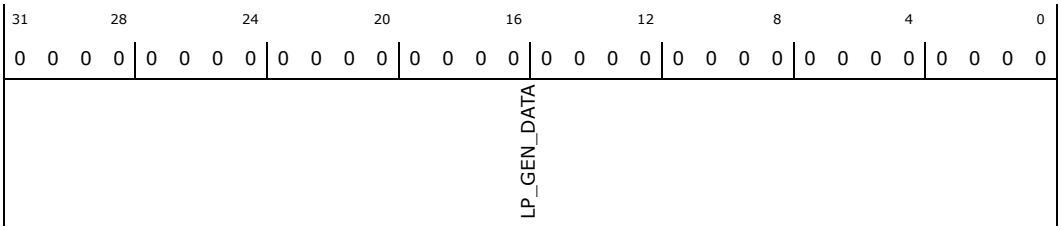
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B064h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **LP_GEN_DATA:** Data port register used for generic data transfers in low power mode |

## 14.10.71 MIPIA_HS_GEN_DATA_REGISTER—Offset B068h

mipi A HS GEN data register

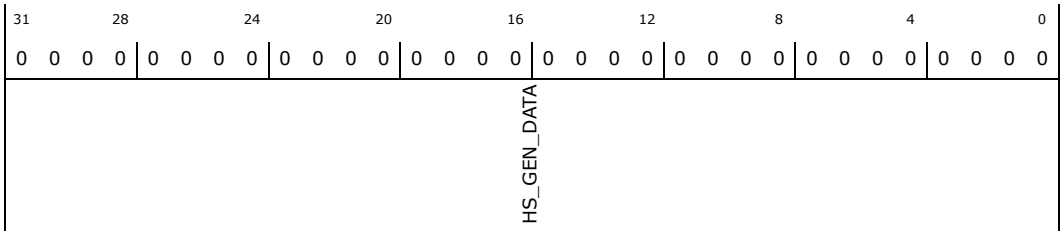
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B068h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **HS_GEN_DATA:** Data port register used for generic data transfers in low power mode |

## 14.10.72 MIPIA_LP_GEN_CTRL_REGISTER—Offset B06Ch

mipi A LP Gen CTRL register

### Access Method

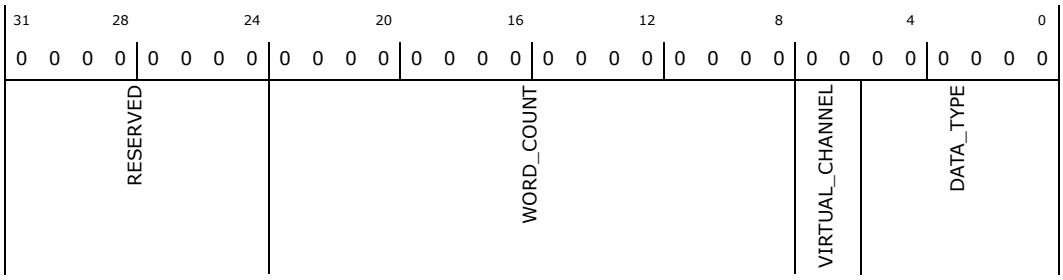
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B06Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>WO | **RESERVED:** Reserved. |
| 23:8 | 0b<br>WO | **WORD_COUNT:** Specifies the word count for generic long packet Specifies the accompanied parameters for generic short packets.<br>Note: Invalid parameters must be set to 00h |
| 7:6 | 0b<br>WO | **VIRTUAL_CHANNEL:** Used to specify the virtual channel for which the generic data transmission is intended |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5:0 | 0b<br>WO | **DATA_TYPE:** Used to specify the generic data types<br>03h - Generic short write, no parameters<br>13h - Generic short write, 1 parameter<br>23h - Generic short write, 2 parameters<br>04h - Generic read, no parameters<br>14h - Generic read, 1 parameter<br>24h - Generic read 2 parameter<br>29h - Generic long write<br>05h - Manufacturer DCS short write, no parameter<br>15h - Manufacturer DCS short write , one parameter<br>06h - Manufacturer DCS read, no parameter<br>39h - Manufacturer DCS long write |

## 14.10.73 MIPIA_HS_GEN_CTRL_REGISTER—Offset B070h

mipi A HS GEN CTRL register

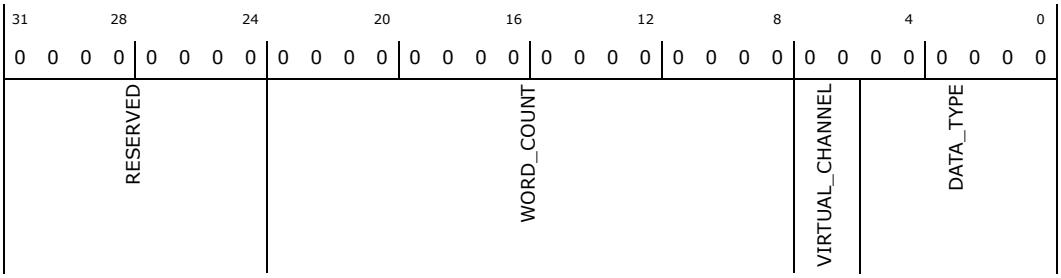
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B070h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>WO | **RESERVED:** Reserved. |
| 23:8 | 0b<br>WO | **WORD_COUNT:** Specifies the word count for generic long packet Specifies the accompanied parameters for generic short packets.<br>Note: Invalid parameters must be set to 00h |
| 7:6 | 0b<br>WO | **VIRTUAL_CHANNEL:** Used to specify the virtual channel for which the generic data transmission is intended |
| 5:0 | 0b<br>WO | **DATA_TYPE:** Used to specify the generic data types<br>03h - Generic short write, no parameters<br>13h - Generic short write, 1 parameter<br>23h - Generic short write, 2 parameters<br>04h - Generic read, no parameters<br>14h - Generic read, 1 parameter<br>24h - Generic read 2 parameter<br>29h - Generic long write<br>05h - Manufacturer DCS short write, no parameter<br>15h - Manufacturer DCS short write, one parameter<br>06h - Manufacturer DCS read, no parameter<br>39h - Manufacturer DCS long write |

## 14.10.74 MIPIA_GEN_FIFO_STAT_REGISTER—Offset B074h

mipi A gen fifo stat register

### Access Method

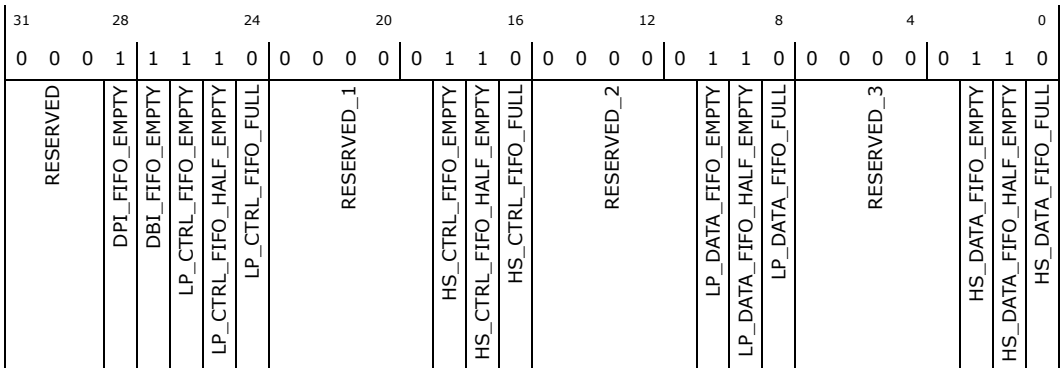
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B074h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 1E060606h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RO | **RESERVED:** Reserved. |
| 28 | 1b<br>RO | **DPI_FIFO_EMPTY:** Default 1 |
| 27 | 1b<br>RO | **DBI_FIFO_EMPTY:** Default 1 |
| 26 | 1b<br>RO | **LP_CTRL_FIFO_EMPTY:** Default 1 |
| 25 | 1b<br>RO | **LP_CTRL_FIFO_HALF_EMPTY:** Default 1 |
| 24 | 0b<br>RO | **LP_CTRL_FIFO_FULL:** Default 0 |
| 23:19 | 0b<br>RO | **RESERVED_1:** Reserved. |
| 18 | 1b<br>RO | **HS_CTRL_FIFO_EMPTY:** Default 1 |
| 17 | 1b<br>RO | **HS_CTRL_FIFO_HALF_EMPTY:** Default 1 |
| 16 | 0b<br>RO | **HS_CTRL_FIFO_FULL:** Default 0 |
| 15:11 | 0b<br>RO | **RESERVED_2:** Reserved. |
| 10 | 1b<br>RO | **LP_DATA_FIFO_EMPTY:** Default 1 |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 1b<br>RO | **LP_DATA_FIFO_HALF_EMPTY:** Default 1 |
| 8 | 0b<br>RO | **LP_DATA_FIFO_FULL:** Default 0 |
| 7:3 | 0b<br>RO | **RESERVED_3:** Reserved. |
| 2 | 1b<br>RO | **HS_DATA_FIFO_EMPTY:** Default 1 |
| 1 | 1b<br>RO | **HS_DATA_FIFO_HALF_EMPTY:** Default 1 |
| 0 | 0b<br>RO | **HS_DATA_FIFO_FULL:** Default 0 |

## 14.10.75 MIPIA_HS_LS_DBI_ENABLE_REG—Offset B078h

Note : dbi_hs_lp_switch_reg has to be written only if DBI FIFO is empty

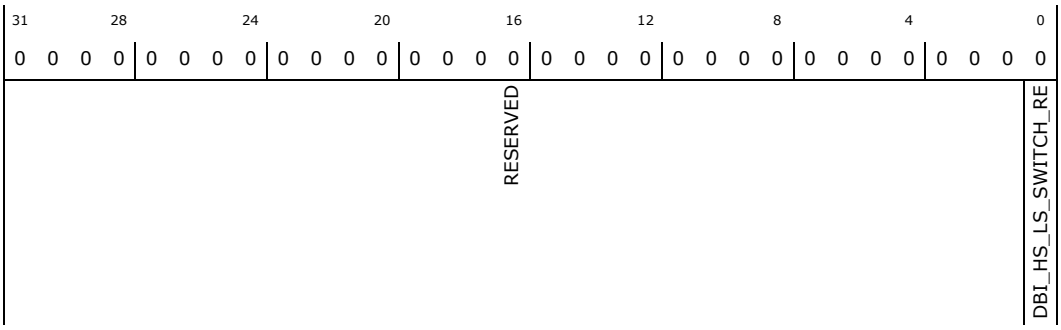
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B078h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0b<br>RW | **RESERVED:** Reserved. |
| 0 | 0b<br>RW | **DBI_HS_LS_SWITCH_RE:** Set to 1 if DBI packets have to be transmitted in Low power mode<br>Set to 0 if DBI packets have to be transmitted in High speed mode |

## 14.10.76 MIPIA_RESERVED—Offset B07Ch

Reserved.

### Access Method

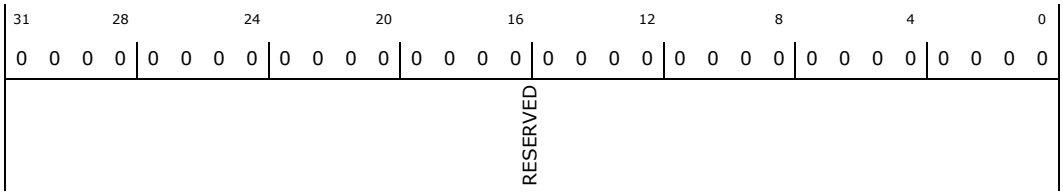
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B07Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RESERVED:** Reserved. |

## 14.10.77 MIPIA_DPHY_PARAM_REG—Offset B080h

mipi A dphy parameter register

### Access Method

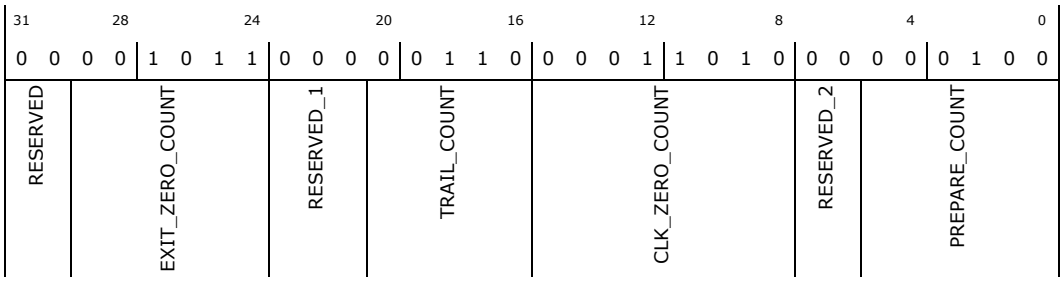
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B080h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 0B061A04h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RW | **RESERVED:** Reserved. |
| 29:24 | 001011b<br>RW | **EXIT_ZERO_COUNT:** THS_0_TIM_UI_CNT and THS_EXIT_TIM_UI_CNT for dphy are programmed as exit zero count by the processor |
| 23:21 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 20:16 | 00110b<br>RW | **TRAIL_COUNT:** TCLK_POST_TIM_UI_CNT and TCLK_TRAIL_TIM_UI_CNT for dphy are programmed as trail count by the processor |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 00011010b<br>RW | **CLK_ZERO_COUNT:** TCLK_0_TIM_UI_CNT for dphy is programmed as clk zero count by the processor |
| 7:6 | 0b<br>RW | **RESERVED_2:** Reserved. |
| 5:0 | 000100b<br>RW | **PREPARE_COUNT:** TCLK_PREP_TIM_UI_CNT and THS_PREP_TIM_UI_CNT for dphy are programmed as prepare count by the processor |

## 14.10.78 MIPIA_DBI_BW_CTRL_REG—Offset B084h

mipi A DBI BW ctrl register

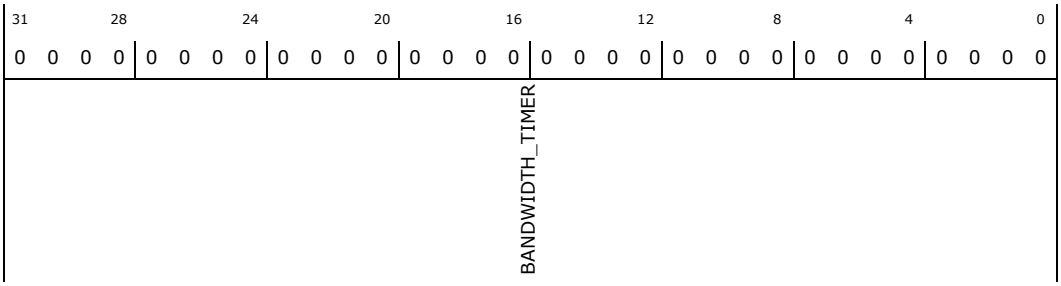
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B084h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **BANDWIDTH_TIMER:** DBI Bandwidth control Register. The bandwidth essential for transmitting 16 long packets containing 252 bytes meant for DCS write memory command is programmed in this register in terms of byte clocks. Based on the DSI transfer rate and the number of lanes configured the time taken to transmit 16 long packets in a DSI stream varies.<br>Note: The value programmed in this timer must be greater than the actual time taken to carryout 16 long packets transmission in DSI stream plus the time taken to transmit two blanking packets |

## 14.10.79 MIPIA_CLK_LANE_SWITCHING_TIME_CNT—Offset B088h

mipi A clk clane switching time counter

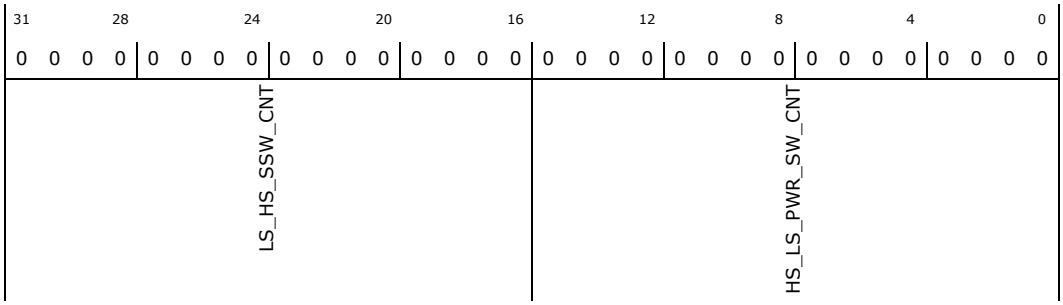
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B088h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **LS_HS_SSW_CNT:** Low power to high speed switching time in terms byte clock (txbyteclkhs). This value is based on the byte clock (txbyteclkhs) and low power clock frequency (txclkesc). Typical value - Number of byte clocks required to switch from low power mode to high speed mode after txrequesths_clk is asserted.<br>Current Value is ah = 10 txbyteclkhs |
| 15:0 | 0b<br>RW | **HS_LS_PWR_SW_CNT:** High speed to low power switching time in terms byte clock (txbyteclkhs). This value is based on the byte clock (txbyteclkhs) and low power clock frequency (txclkesc). Typical value - Number of byte clocks request to switch from high speed mode to low power mode after txrequesths_clk is de-asserted.<br>Current Value is 14h = 20 txbyteclkhs |

## 14.10.80 MIPIA_STOP_STATE_STALL—Offset B08Ch

mipi A stop state stall

### Access Method

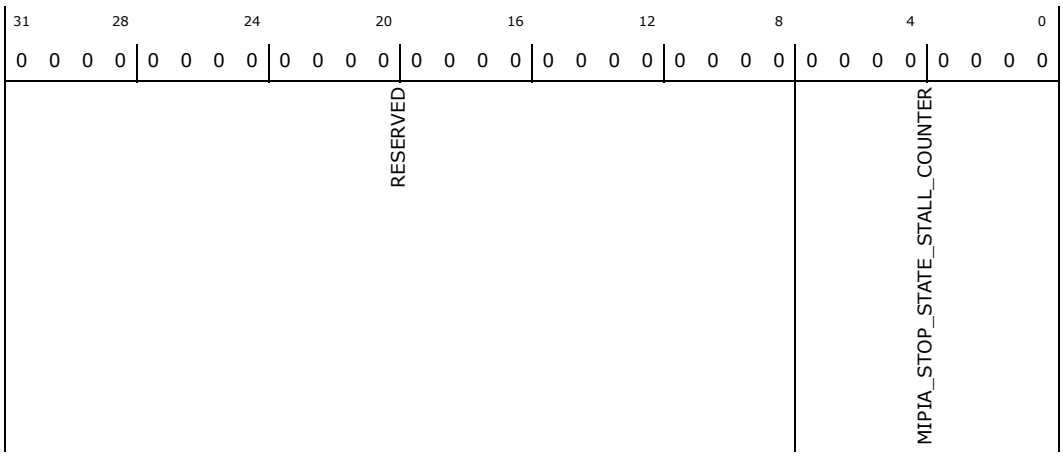
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B08Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** reserved |
| 7:0 | 0b<br>RW | **MIPIA_STOP_STATE_STALL_COUNTER:** Delay between (stall the stop state signal) the data transfer is increased based on this counter value. This counter is calculated from txclkesc. Note: If processor programs this register then it needs to reprogram the high_low_ switch counter in B044h and lp_equivalent_byteclk reg in B060h to compensate this delay. High_low_switch_count B044h: High to low switch counter = Actual High to low switch + stop_sta_stall_reg value * Low power clock equivalence value in terms of byte clock LP equivalent byteclk register B060h: LP equivalent byteclk value = txclkesc time/ txbyteclk time * (105 + stop_sta_stall_reg value) / 105 Minimum time of Low Power short packet transfer = 105 txclkesc |

## 14.10.81 MIPIA_INTR_STAT_REG_1—Offset B090h

mipi A interrupt state register 1

### Access Method

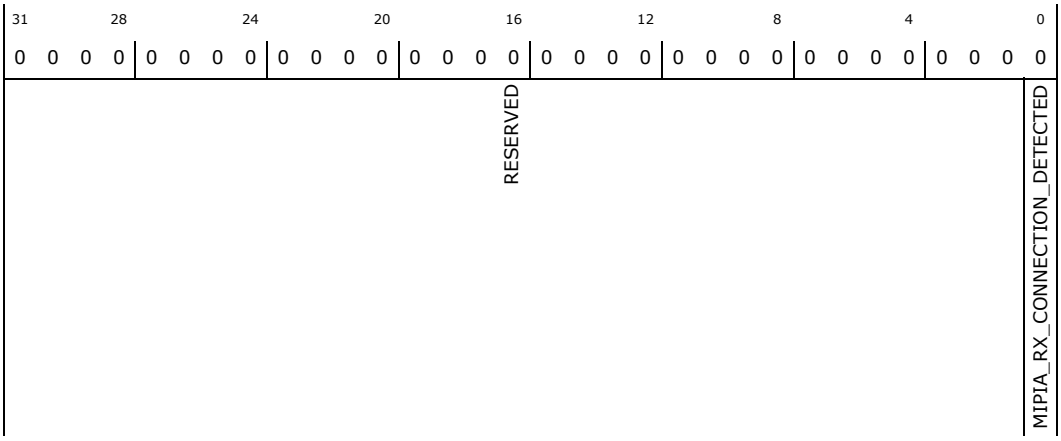
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B090h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0b<br>RW | **RESERVED:** reserved |
| 0 | 0b<br>RW | **MIPIA_RX_CONNECTION_DETECTED:** Set to 1'b1 if the contention detected in the display device and is reported in the Acknowledge packet by the display device |

## 14.10.82 MIPIA_INTR_EN_REG_1—Offset B094h

mipi A interrupt enable register 1

### Access Method

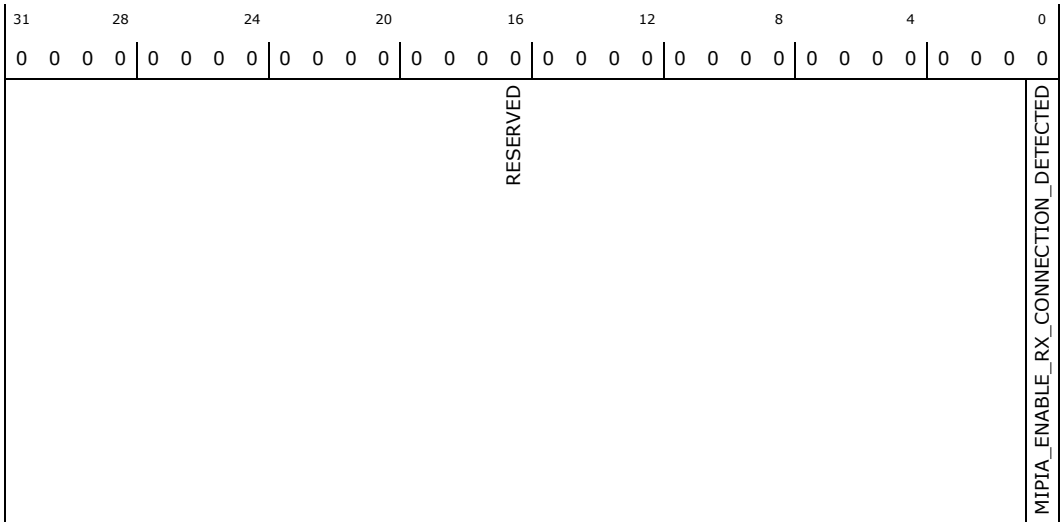
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B094h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0b<br>RW | **RESERVED:** reserved |
| 0 | 0b<br>RW | **MIPIA_ENABLE_RX_CONNECTION_DETECTED:** Set to enable the interrupt for contention detected error in the acknowledgement packet reports |

## 14.10.83 MIPIA_DBI_TYPEC_CTRL—Offset B100h

mipi A Dbit typeC ctrl

### Access Method

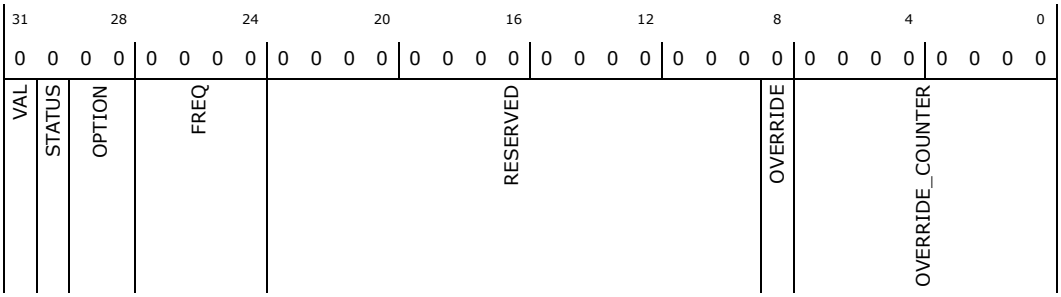
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B100h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **VAL:** 0= disable DBI TYPE-C interface (default)<br>1= enable DBI TYPE-C interface<br>Driver to make sure that the command and data buffers are cleared before this bit is changed |
| 30 | 0b<br>RW | **STATUS:** command and data buffer empty and link completed sending out all serialized data and IDLE<br>0 = IDLE<br>1 = work in progress |
| 29:28 | 0b<br>RW | **OPTION:** TYPE-C option selection<br>00 option 1<br>01 option 2<br>10 option 3<br>11 no defined functionality |
| 27:24 | 0b<br>RW | **FREQ:** Type-C clock frequency ; A counter based onczclk is used to generate the TYPE-C Clock. So based on the czclk, a frequency close to the specified below will be generated. Not the exact frequency.<br>0000 1Mhz (default)<br>0001 1Mhz<br>0010 2Mhz<br>1111 15Mhz |
| 23:9 | 0b<br>RW | **RESERVED:** Reserved. |
| 8 | 0b<br>RW | **OVERRIDE:** Use override counter value to derive the TYPE-C clock frequency |
| 7:0 | 0b<br>RW | **OVERRIDE_COUNTER:** Override counter value to generate the TYPE-C clock |

## 14.10.84 MIPIA_CTRL—Offset B104h

MIPI adapter has a control register with options to control width of the dbi bus and the divide value of the clock that needs to be supplied to the Clocks module so that a 2x divided clock can be provided to the MIPI D-PHY IP. Self refresh capability is in DCS commands. The other 3 controls bits (SD, CM and back light control) are now moved to MIPI IP registers.

### Access Method

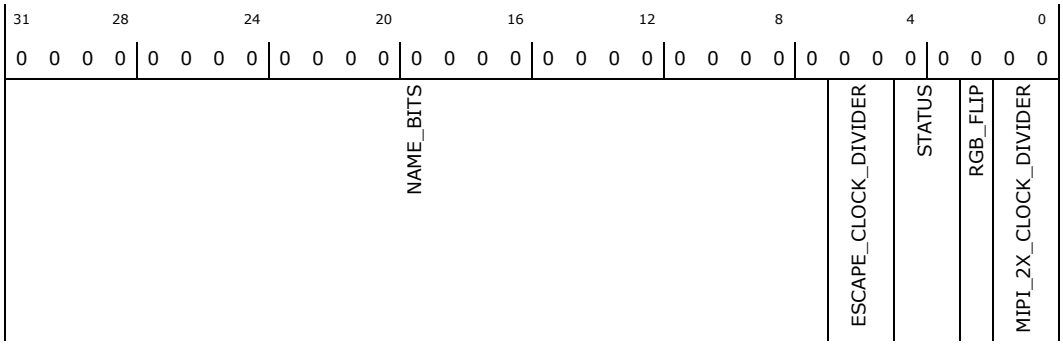
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B104h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0b<br>RW | **NAME_BITS:** Reserved |
| 6:5 | 0b<br>RW | **ESCAPE_CLOCK_DIVIDER:** Read Only<br>Escape clock divider select for Pipe A and Pipe C<br>Escape clock is shared by both Pipe A and Pipe C so it cant be set different.<br>00= 1 X (20 Mhz) (default)<br>01= X (10Mhz)<br>10= X (5Mhz)<br>Changing this register can only be done when the MIPI device_ready is turned OFF |
| 4:3 | 0b<br>RW | **STATUS:** 2'b00: low priority on read requests to G-unit<br>2'b11 : high priority |
| 2 | 0b<br>RW | **RGB_FLIP:** 1'b0 : RGB data from disp2d is reverted to BGR<br>1'b1 : RGB data from disp2d is passed as is to MIPI IP |
| 1:0 | 0b<br>RW | **MIPI_2X_CLOCK_DIVIDER:** Reserved |

## 14.10.85 MIPIA_DATA_ADD—Offset B108h

mipi A data ADD

### Access Method

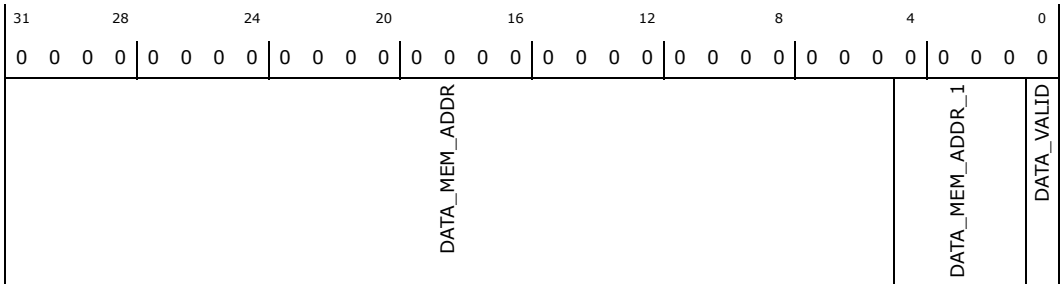
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B108h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **DATA_MEM_ADDR:** When there is updated data for the display panel, S/W programs this register with the memory address to read from |
| 4:1 | 0b<br>RW | **DATA_MEM_ADDR_1:** Reserved |
| 0 | 0b<br>RW | **DATA_VALID:** This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.10.86 MIPIA_DATA_LEN—Offset B10Ch

mipiA data length

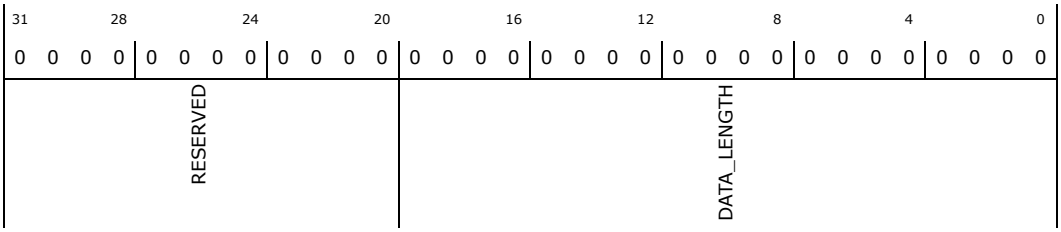
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B10Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **DATA_LENGTH:** This field shows the remaining length of data that needs to be read from memory, Initially set by S/W and is decremented by H/W as reads are issued |

## 14.10.87 MIPIA_CMD_ADD—Offset B110h

mipi A cmd ADD

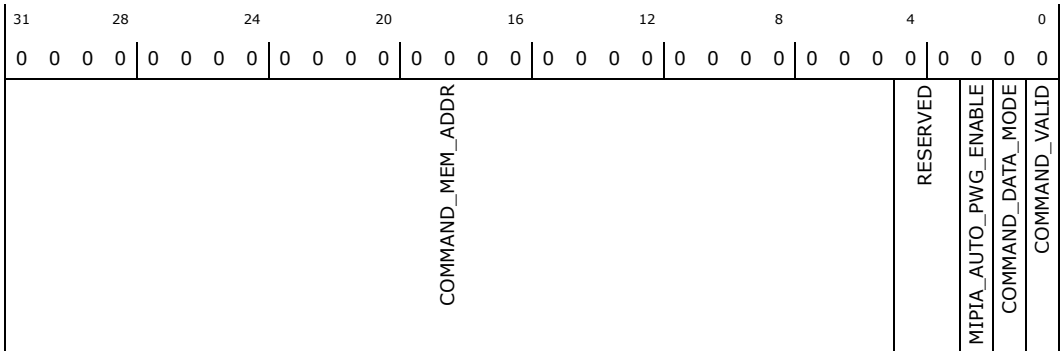
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B110h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **COMMAND_MEM_ADDR:** When there are new commands that need to be sent to the display panel, S/W programs this register with the memory address to read the commands from |
| 4:3 | 0b<br>RW | **RESERVED:** MBZ |
| 2 | 0b<br>RW | **MIPIA_AUTO_PWG_ENABLE:** Idle state: SW driver writes to this bit to enable auto power gating for MIPIA controller<br>0: default<br>1: auto power gate is enabled |
| 1 | 0b<br>RW | **COMMAND_DATA_MODE:** 0: data for memory write command from system buffer that is specified by MIPI data address register<br>1: data for memory write command from pipe A rendering |
| 0 | 0b<br>RW | **COMMAND_VALID:** This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.10.88 MIPIA_CMD_LEN—Offset B114h

mipi A clm length

### Access Method

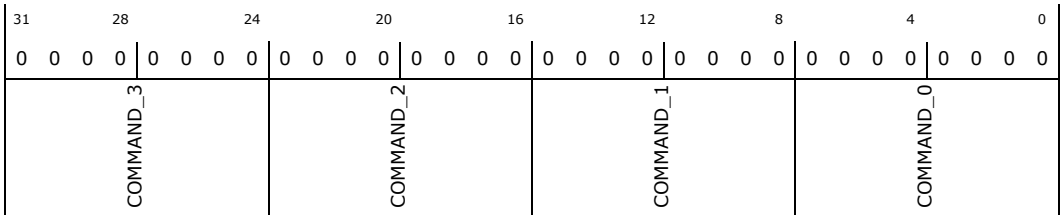
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B114h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **COMMAND_3:** This is command 3 length (command + parameters) in bytes |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23:16 | 0b<br>RW | **COMMAND_2:** This is command 2 length (command + parameters) in bytes |
| 15:8 | 0b<br>RW | **COMMAND_1:** This is command 1 length (command + parameters) in bytes |
| 7:0 | 0b<br>RW | **COMMAND_0:** This is command 0 length (command + parameters) in bytes |

## 14.10.89 MIPIA_RD_DATA_RETURN0—Offset B118h

In addition to the command and data registers, adapter provides 8 read only registers for S/W to read the return data from the panel. At this time the usage case for the read path from the panel is for configuration reads only. Hence, more than 4 bytes of read are not allowed. Maximum read return size in the MIPI IP should be no greater than 32 bytes.

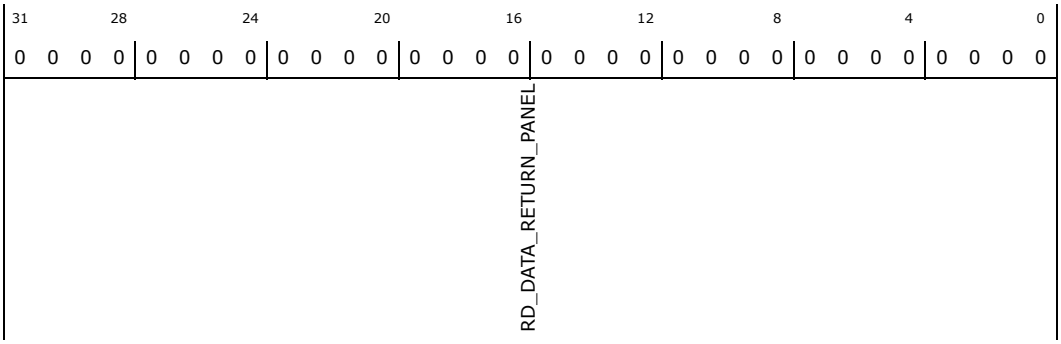
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B118h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.90 MIPIA_RD_DATA_RETURN1—Offset B11Ch

Refer to the description of MIPIA_RD_DATA_RETURN0.

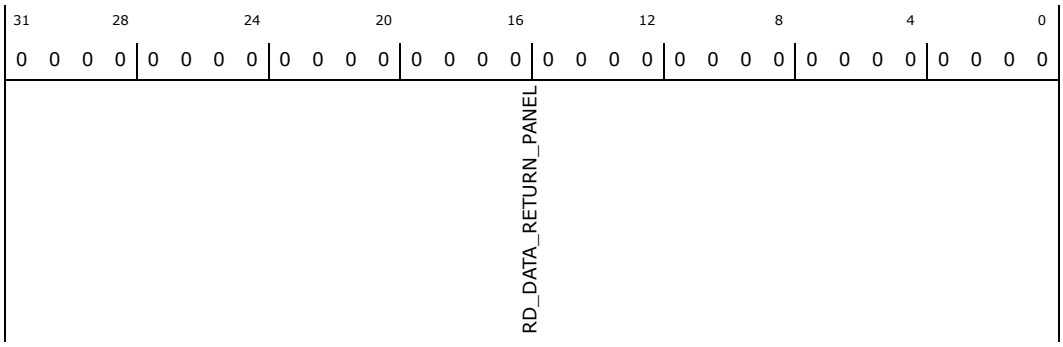
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B11Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.91 MIPIA_RD_DATA_RETURN2—Offset B120h

Refer to the description of MIPIA_RD_DATA_RETURN0.

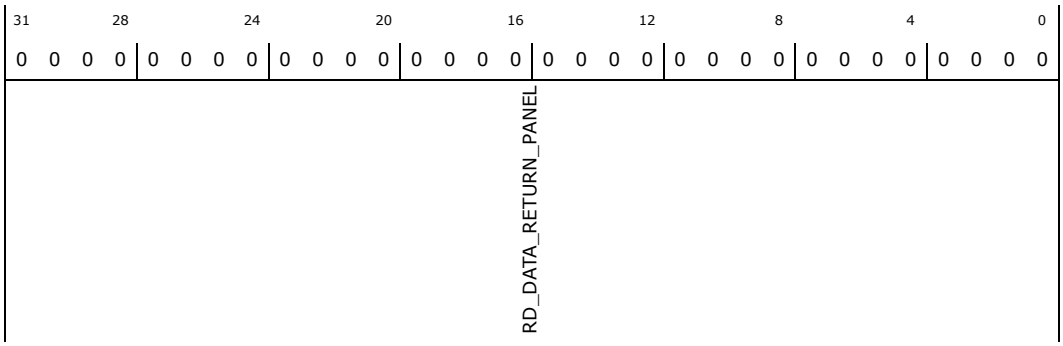
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B120h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.92 MIPIA_RD_DATA_RETURN3—Offset B124h

Refer to the description of MIPIA_RD_DATA_RETURN0.

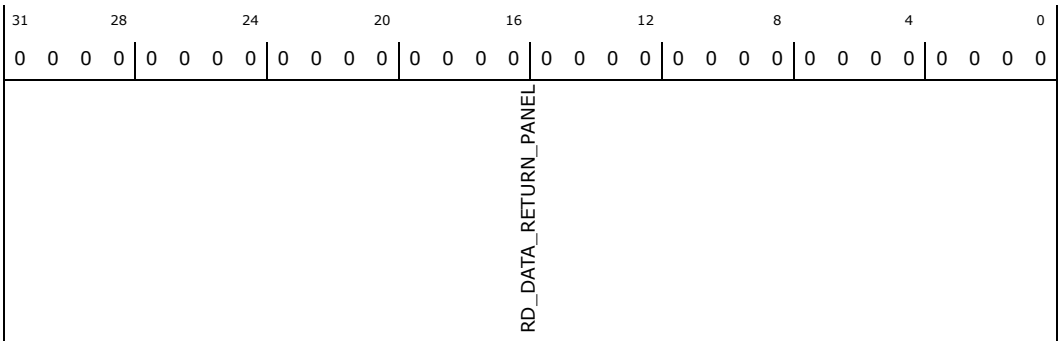
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B124h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.93 MIPIA_RD_DATA_RETURN4—Offset B128h

Refer to the description of MIPIA_RD_DATA_RETURN0.

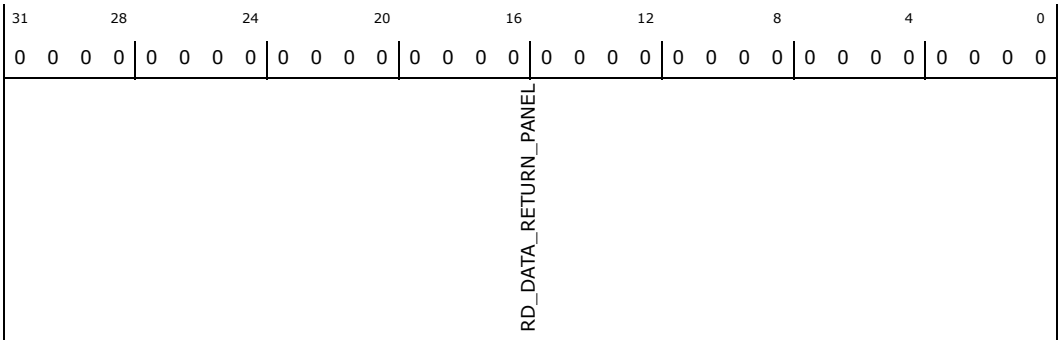
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B128h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.94 MIPIA_RD_DATA_RETURN5—Offset B12Ch

Refer to the description of MIPIA_RD_DATA_RETURN0.

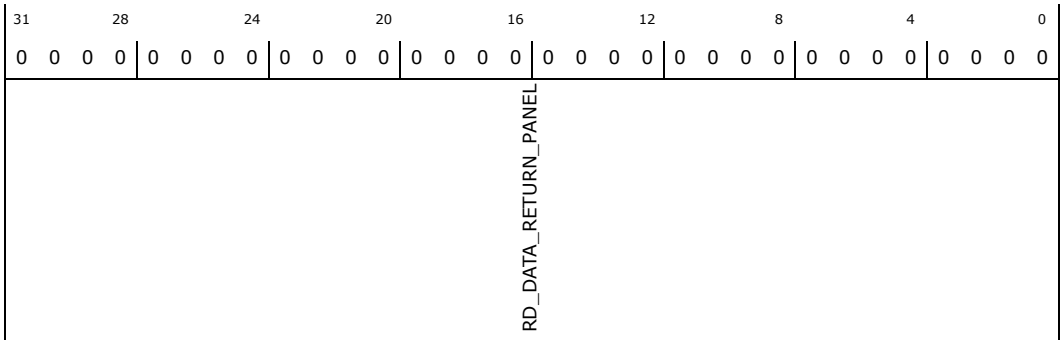
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B12Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.95 MIPIA_RD_DATA_RETURN6—Offset B130h

Refer to the description of MIPIA_RD_DATA_RETURN0.

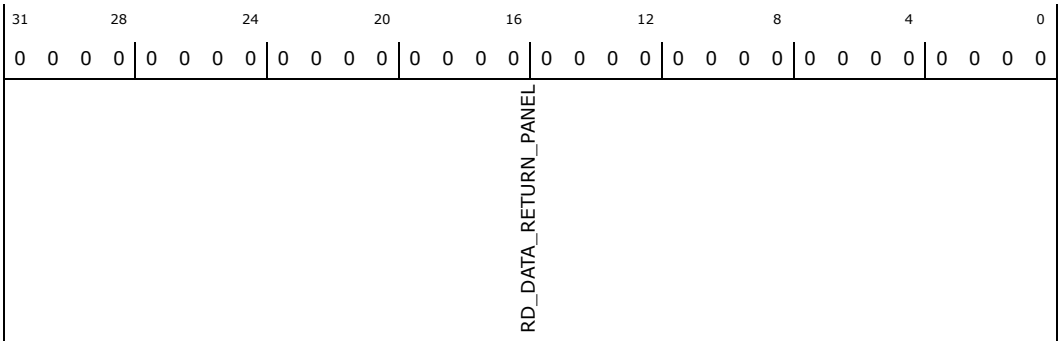
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B130h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.96 MIPIA_RD_DATA_RETURN7—Offset B134h

Refer to the description of MIPIA_RD_DATA_RETURN0.

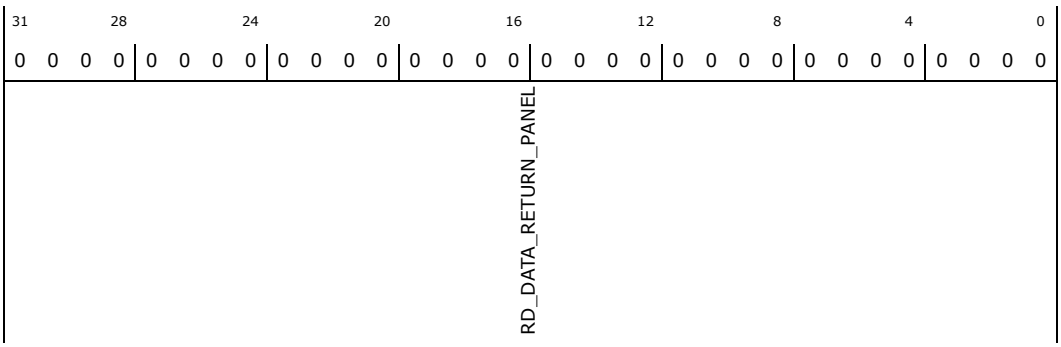
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B134h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.97 MIPIA_RD_DATA_VALID—Offset B138h

Refer to the description of MIPIA_RD_DATA_RETURN1.

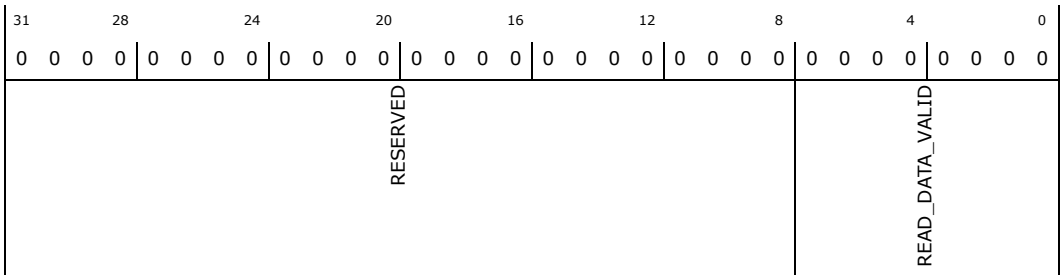
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B138h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7:0 | 0b<br>RW | **READ_DATA_VALID:** Each bit corresponds to presence of valid data in the registers above. When data is returned from the panel, H/W will write into these registers in sequence, and set the corresponding valid bit.<br>When S/W issues a write '1 to the registers, this bit is cleared |

## 14.10.98 MIPIC_DEVICE_READY_REG—Offset B800h

MIPI C Device Ready Register

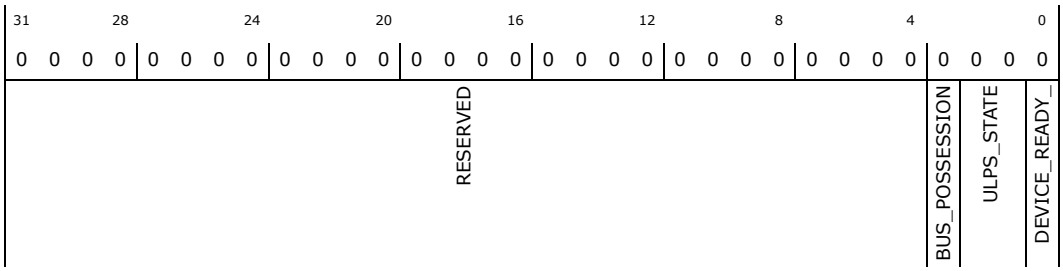
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B800h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0b<br>RW | **RESERVED:** Reserved. |
| 3 | 0b<br>RW | **BUS_POSSESSION:** mipi C Bus Possession |
| 2:1 | 0b<br>RW | **ULPS_STATE:** mipi C ULPS state |
| 0 | 0b<br>RW | **DEVICE_READY_:** Set by the processor to inform that device is ready |

## 14.10.99 MIPIC_INTR_STAT_REG—Offset B804h

mipi C intrrupt state registr

### Access Method

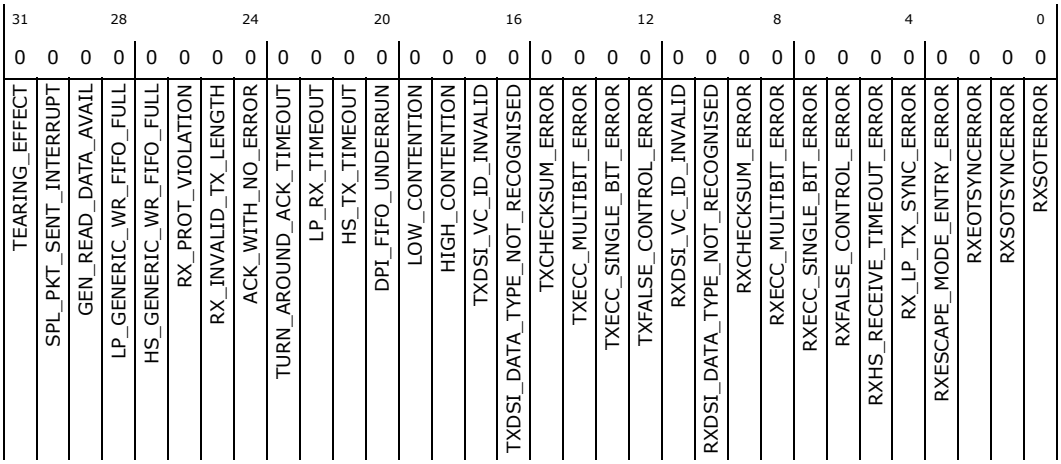
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B804h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **TEARING_EFFECT:** Set to indicate that tearing effect trigger message is received |
| 30 | 0b<br>RW | **SPL_PKT_SENT_INTERRUPT:** Set to confirm the transmission of the DPI event specific commands set in the dpi control and dpi data register |
| 29 | 0b<br>RW | **GEN_READ_DATA_AVAIL:** Set to indicate that the requested data for a Generic Read request is available in the buffer i.e., generic read response data is available in the read FIFO |
| 28 | 0b<br>RW | **LP_GENERIC_WR_FIFO_FULL:** Set to indicate that the LP generic write fifo is full |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27 | 0b<br>RW | **HS_GENERIC_WR_FIFO_FULL:** Set to indicate that the HS generic write fifo is full |
| 26 | 0b<br>RW | **RX_PROT_VIOLATION:** Set if DSI protocol violation error is reported in the acknowledge packet by the display device |
| 25 | 0b<br>RW | **RX_INVALID_TX_LENGTH:** Set if invalid transmission length error is reported in the acknowledge packet by the display device |
| 24 | 0b<br>RW | **ACK_WITH_NO_ERROR:** Set if acknowledge trigger message is received with out any error |
| 23 | 0b<br>RW | **TURN_AROUND_ACK_TIMEOUT:** Set if a turn around acknowledgement sequence is not received from the display device |
| 22 | 0b<br>RW | **LP_RX_TIMEOUT:** Set if a low power reception count expires this interrupt is generated |
| 21 | 0b<br>RW | **HS_TX_TIMEOUT:** Set if a high speed transmission prevails for more than the expected count value this interrupt is raised |
| 20 | 0b<br>RW | **DPI_FIFO_UNDERRUN:** Set to '1' if there is no data in the dpi fifo to make a in time delivery of the pixel data to the DSI receiver |
| 19 | 0b<br>RW | **LOW_CONTENTION:** Set to '1' if a LP low fault is registered by at the D-PHY contention detector |
| 18 | 0b<br>RW | **HIGH_CONTENTION:** Set to '1' if a LP high fault is registered by at the D-PHY contention detector |
| 17 | 0b<br>RW | **TXDSI_VC_ID_INVALID:** Set to '1' if the received virtual channel ID is invalid |
| 16 | 0b<br>RW | **TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to '1' if the received data type is not recognised |
| 15 | 0b<br>RW | **TXCHECKSUM_ERROR:** Set to '1' if the computed CRC differs from the received CRC value during the reception of packets by Arasan_DSI host. |
| 14 | 0b<br>RW | **TXECC_MULTIBIT_ERROR:** Set to '1' if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan_DSI_host |
| 13 | 0b<br>RW | **TXECC_SINGLE_BIT_ERROR:** Set to '1' if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan_DSI_host |
| 12 | 0b<br>RW | **TXFALSE_CONTROL_ERROR:** Set to '1' if a control error is observed on the lanes by the Arasan_DSI_host |
| 11 | 0b<br>RW | **RXDSI_VC_ID_INVALID:** Set to '1' if the virtual channel ID is invalid by the display device is reported in the Acknowledge packet by the display device |
| 10 | 0b<br>RW | **RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to '1' if the data type is not recognised by the display device is reported in the Acknowledge packet by the display device |
| 9 | 0b<br>RW | **RXCHECKSUM_ERROR:** Set to '1' if the computed CRC differs from the received CRC value and is reported in the Acknowledge packet by the display device |
| 8 | 0b<br>RW | **RXECC_MULTIBIT_ERROR:** Set to '1' if there is no ECC correction for the packet or there are more than 2 bit errors in the packet is reported in the Acknowledge packet by the display device |
| 7 | 0b<br>RW | **RXECC_SINGLE_BIT_ERROR:** Set to '1' if ECC syndrome was computed and corrected for one bit error is reported in the Acknowledge packet by the display device |
| 6 | 0b<br>RW | **RXFALSE_CONTROL_ERROR:** Set to '1' if a control error is reported in the Acknowledge packet by the display device |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0b<br>RW | **RXHS_RECEIVE_TIMEOUT_ERROR:** Set to '1' if the high speed receive timer value expires and data transfer lasts on the data lane is reported in the Acknowledge packet by the display device |
| 4 | 0b<br>RW | **RX_LP_TX_SYNC_ERROR:** Set to '1' if Low power transmission sync error occurs in the display device and is reported in the Acknowledge packet by the display device |
| 3 | 0b<br>RW | **RXESCAPE_MODE_ENTRY_ERROR:** Set to '1' if Escape Mode Entry command is not understandable by the display device and is reported in the Acknowledge packet by the display device |
| 2 | 0b<br>RW | **RXEOTSYNCERROR:** mipi C RX eot synce error |
| 1 | 0b<br>RW | **RXSOTSYNCERROR:** Set to '1' if a start of transmission synchronisation error is reported in the Acknowledge packet by the display device |
| 0 | 0b<br>RW | **RXSOTERROR:** Set to '1' if a start of transmission error is reported in the Acknowledge packet by the display device |

## 14.10.100 MIPIC_INTR_EN_REG—Offset B808h

mipi C intrrupt En reg

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B808h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **TEARING_EFFECT (RESERVED):** Set to eanble tearing effect |
| 30 | 0b<br>RW | **SPL_PKT_SENT_INTERRUPT:** Set to enable the confirmation of transmission of the DPI event specific commands set in the dpi control and dpi data register |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 29 | 0b<br>RW | **GEN_READ_DATA_AVAIL:** Set to enable Generic Read available interrupt |
| 28 | 0b<br>RW | **LP_GENERIC_WR_FIFO_FULL:** Set to indicate that the LP generic write fifo is full |
| 27 | 0b<br>RW | **HS_GENERIC_WR_FIFO_FULL:** Set to indicate that the HS generic write fifo is full |
| 26 | 0b<br>RW | **RX_PROT_VIOLATION:** Set to enable protocol violation error |
| 25 | 0b<br>RW | **RX_INVALID_TX_LENGTH:** Set to enable invalid transmission length error |
| 24 | 0b<br>RW | **ACK_WITH_NO_ERROR:** Set to enable acknowledge trigger message reception with out any error |
| 23 | 0b<br>RW | **TURN_AROUND_ACK_TIMEOUT:** Set to enable turn around acknowledgement ,sequence timeout |
| 22 | 0b<br>RW | **LP_RX_TIMEOUT:** Set to enable low power reception count timeouts |
| 21 | 0b<br>RW | **HS_TX_TIMEOUT:** Set to enable a high speed transmission timeout |
| 20 | 0b<br>RW | **DPI_FIFO_UNDERRUN:** Set to enable if there is no data in the dpi fifo to make a in time delivery of the pixel data to the DSI receiver |
| 19 | 0b<br>RW | **LOW_CONTENTION:** Set to enable a LP low fault interrupt |
| 18 | 0b<br>RW | **HIGH_CONTENTION:** Set to enable a LP high fault interrupt |
| 17 | 0b<br>RW | **TXDSI_VC_ID_INVALID:** Set to enable the interrupt if the received packets virtual channel ID is invalid |
| 16 | 0b<br>RW | **TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt if the received packets data type is not recognised |
| 15 | 0b<br>RW | **TXCHECKSUM_ERROR:** Set to enable the interrupt if the computed CRC differs from the received CRC value for the received packets |
| 14 | 0b<br>RW | **TXECC_MULTIBIT_ERROR:** Set to enable the interrupt if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan DSI host |
| 13 | 0b<br>RW | **TXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan DSIhost |
| 12 | 0b<br>RW | **TXFALSE_CONTROL_ERROR:** Set to enable the interrupt for the control error.,observed on the lanes by the Arasan_DSI_host |
| 11 | 0b<br>RW | **RXDSI_VC_ID_INVALID:** Set to enable the interrupt for invalid virtual channel ID in the acknowledgment packet reports |
| 10 | 0b<br>RW | **RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt for the un recognised data type in the acknowledgment packet reports |
| 9 | 0b<br>RW | **RXCHECKSUM_ERROR:** Set to enable the interrupt for the computed CRC differs from the received CRC value in the acknowledgment packet reports |
| 8 | 0b<br>RW | **RXECC_MULTIBIT_ERROR:** Set to enable the interrupt for no ECC correction for the packet or there are more than 2 bit errors reported in the acknowledgment packet |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **RXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt for ECC syndrome computation and one bit error correction for the acknowledgment packet |
| 6 | 0b<br>RW | **RXFALSE_CONTROL_ERROR:** Set to enable the interrupt for control error in the acknowledgment packet reports |
| 5 | 0b<br>RW | **RXHS_RECEIVE_TIMEOUT_ERROR:** Set to enable the interrupt for the high speed receive timeout Error in the acknowledgment packet reports |
| 4 | 0b<br>RW | **RX_LP_TX_SYNC_ERROR:** Set to enable the interrupt for Low power transmission sync error in the acknowledgment packet reports |
| 3 | 0b<br>RW | **RXESCAPE_MODE_ENTRY_ERROR:** Set to enable the interrupt for Escape Mode Entry command error in the acknowledgment packet reports |
| 2 | 0b<br>RW | **RXEOTSYNC_ERROR:** Set to enable the interrupt for End of transmission synchronisation Error in the acknowledgement packet reports |
| 1 | 0b<br>RW | **RXSOTSYNC_ERROR:** Set to enable the interrupt for start of transmission synchronisation error in the acknowledgement packet reports |
| 0 | 0b<br>RW | **RXSOT_ERROR:** Set to enable the interrupt for start of transmission error in the acknowledgment packet reports |

## 14.10.101 MIPIC_DSI_FUNC_PRG__REG—Offset B80Ch

mipi C DSI func prg reg

### Access Method

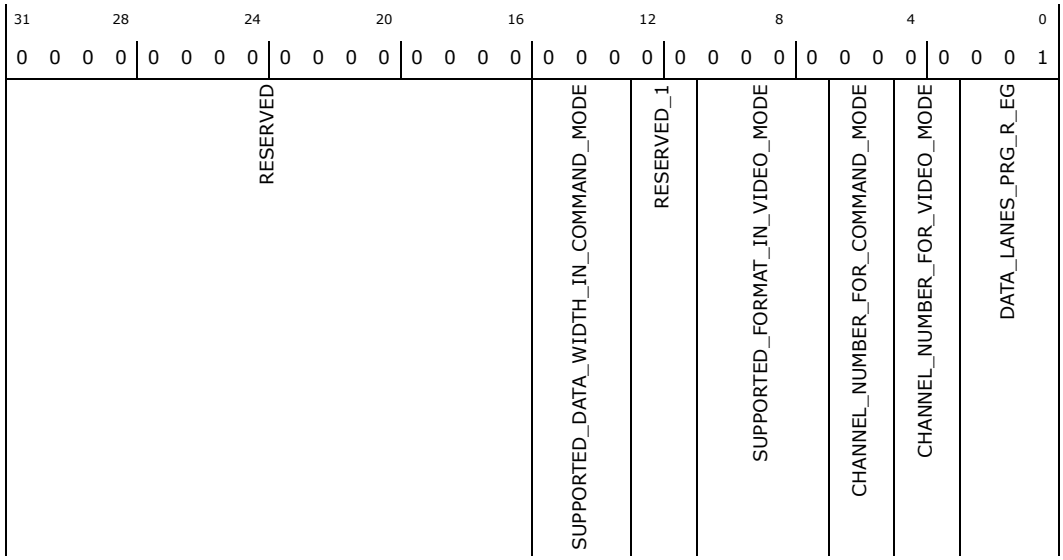
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B80Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000001h



| Bit Range | Default & Access | Field Name (ID): Description |

| 2:0 | 001b<br>RW | **DATA_LANES_PRG_R_EG:** Number of data lanes to be supported is programmed by the processor |

## 14.10.102 MIPIC_HS_TX_TIMEOUT_REG—Offset B810h

mipi C HS TX timeout reg

### Access Method

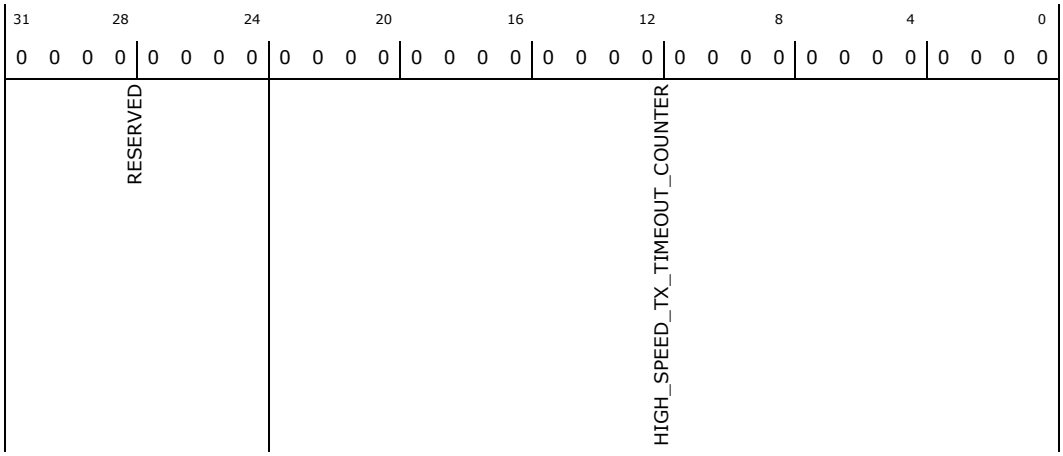
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B810h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:0 | 0b<br>RW | **HIGH_SPEED_TX_TIMEOUT_COUNTER:** The maximum duration allowed for the DSI host ,to remain in high speed mode for a transmission. If the counter expires, HS mode is terminated with EOT and the lanes enter stop state |

## 14.10.103 MIPIC_LP_RX_TIMEOUT_REG—Offset B814h

mipi C LP RX timeout reg

### Access Method

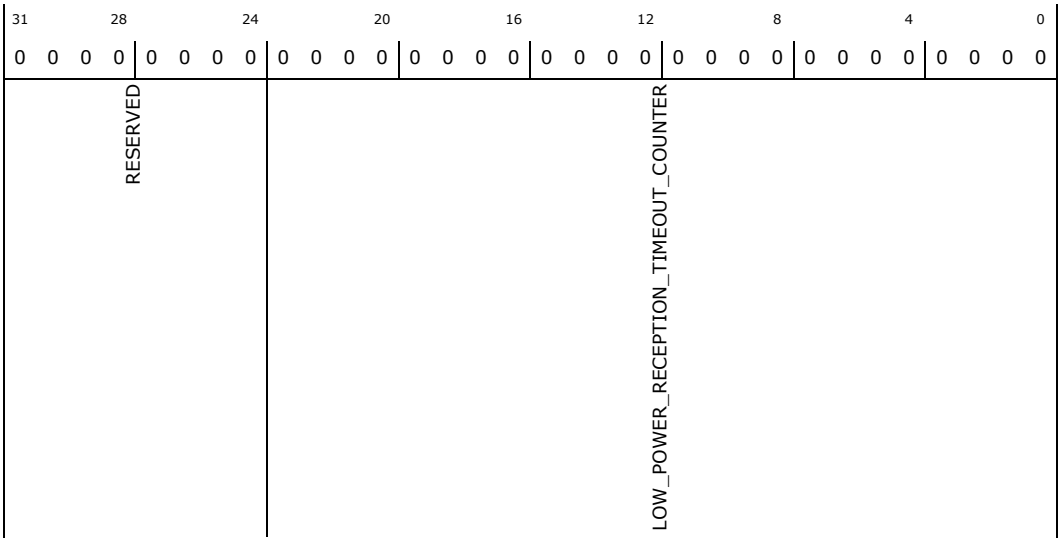
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B814h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:0 | 0b<br>RW | **LOW_POWER_RECEPTION_TIMEOUT_COUNTER:** Timeout value to be checked for received short packets .If the timer expires the DSI Host enters stop state |

## 14.10.104 MIPIC_TURN_AROUND_TIMEOUT_REG—Offset B818h

mipi C Turn Arounf timeout reg

### Access Method

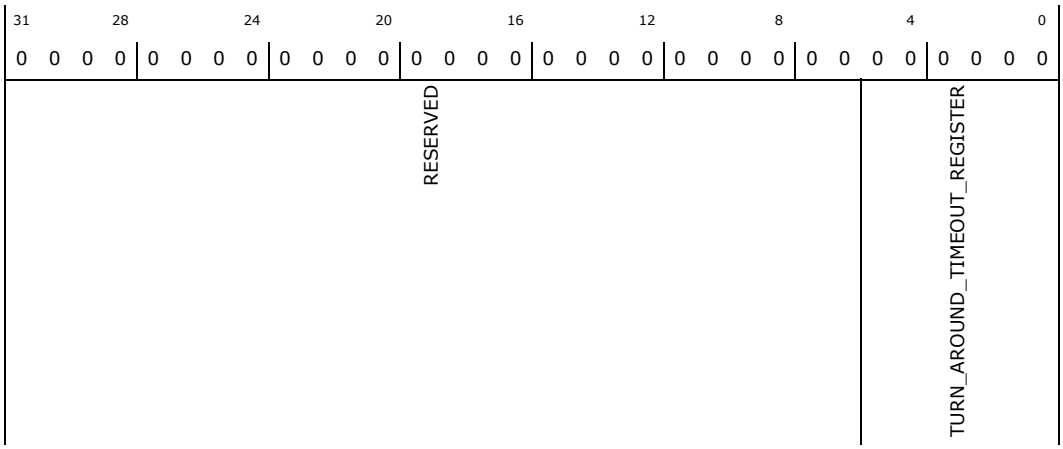
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B818h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **RESERVED:** Reserved. |
| 5:0 | 0b<br>RW | **TURN_AROUND_TIMEOUT_REGISTER:** Timeout value to be checked after the DSI host makes a turn around in the direction of transfers. If the timer expires the DSI Host enters stop state |

## 14.10.105 MIPIC_DEVICE_RESET_TIMER—Offset B81Ch

mipi C Device reset timer

### Access Method

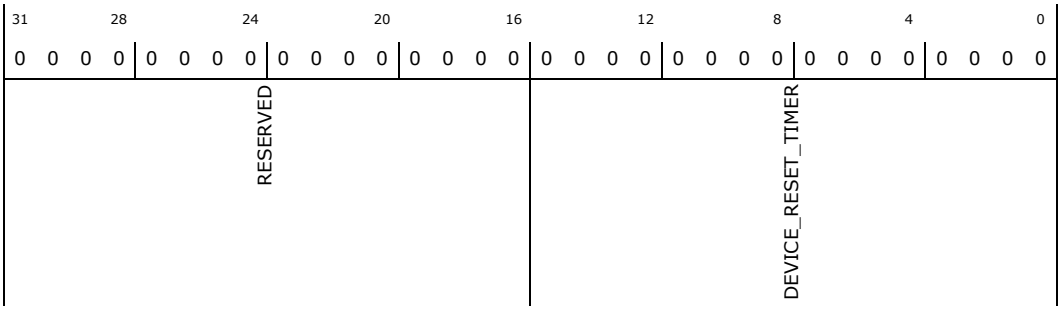
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B81Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **DEVICE_RESET_TIMER:** Timeout value to be checked for device to be reset after issuing reset entry command. If the timer expires the DSI Host enters normal operation |

## 14.10.106 MIPIC_DPI_RESOLUTION_REG—Offset B820h

mipi C dpi Resolution reg

### Access Method

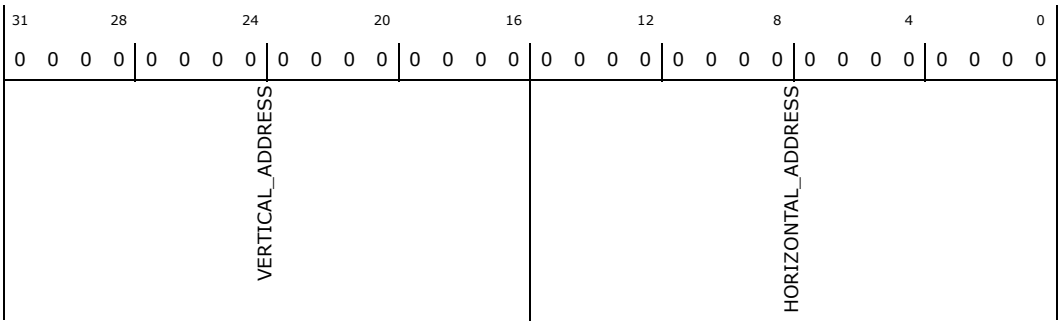
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B820h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **VERTICAL_ADDRESS:** Shows the vertical address count in lines |
| 15:0 | 0b<br>RW | **HORIZONTAL_ADDRESS:** Shows the horizontal address count in pixels |

## 14.10.107 MIPIC_DBI_RESOLUTION_REG—Offset B824h

mipi C DBI resolution reg

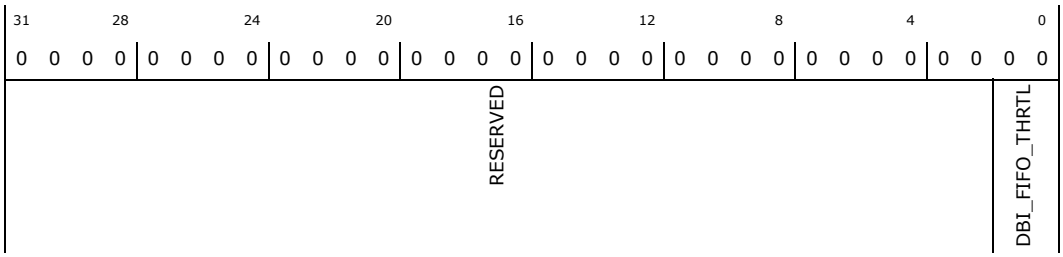
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B824h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1:0 | 0b<br>RW | **DBI_FIFO_THRTL:** DBI FIFO's watermark can be set using the following bits so as to enable dbi_stall de-assertion whenever the below FIFO condition is reached:<br>00 - (1/2) DBI fifo empty<br>01 - (1/4) DBI fifo empty<br>10 - 7 locations are empty<br>11 - Reserved |

## 14.10.108 MIPIC_HORIZ_SYNC_PADDING_COUNT—Offset B828h

mipi C horizxontal sync padding out

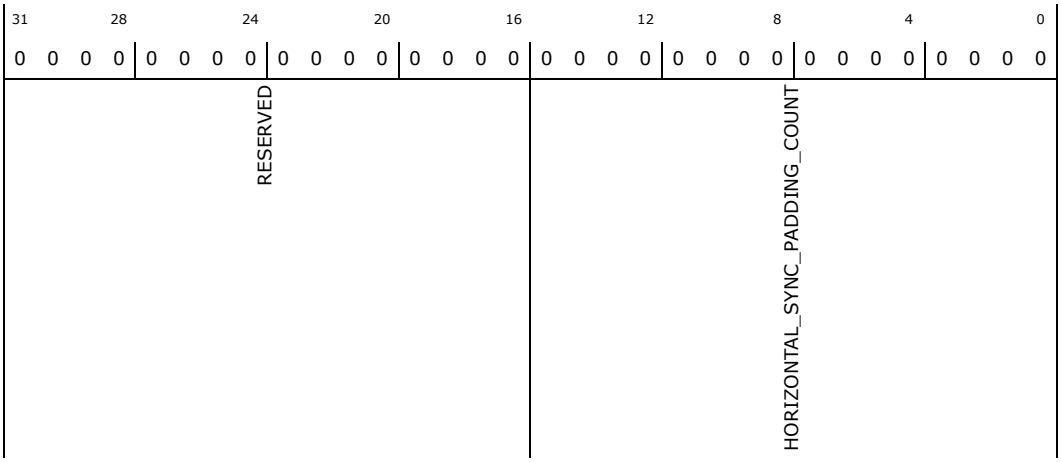
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B828h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_SYNC_PADDING_COUNT:** Shows the horizontal sync padding value in terms of txbyteclkhs |

## 14.10.109 MIPIC_HORIZ_BACK_PORCH_COUNT—Offset B82Ch

mipi C horizontal back portch counter

### Access Method

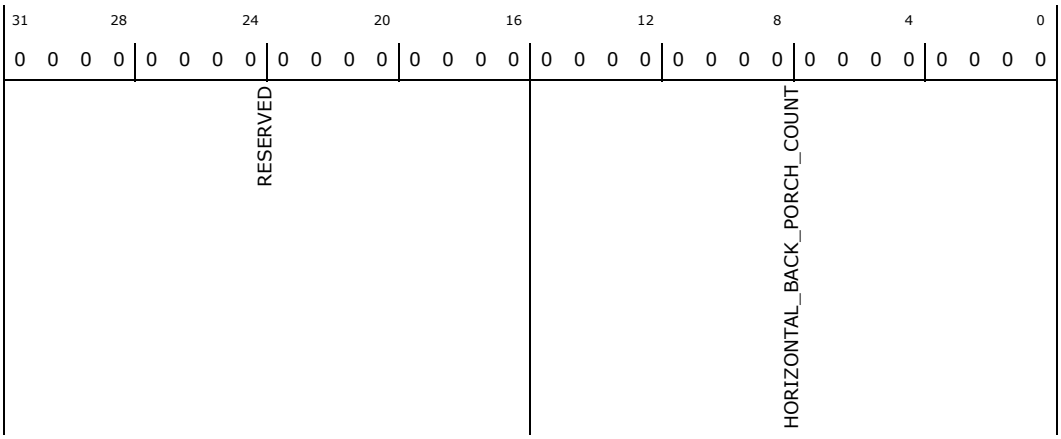
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B82Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_BACK_PORCH_COUNT:** Shows the horizontal back porch value in terms of txbyteclkhs |

## 14.10.110 MIPIC_HORIZ_FRONT_PORCH_COUNT—Offset B830h

mipi C horizontal front Porch counter

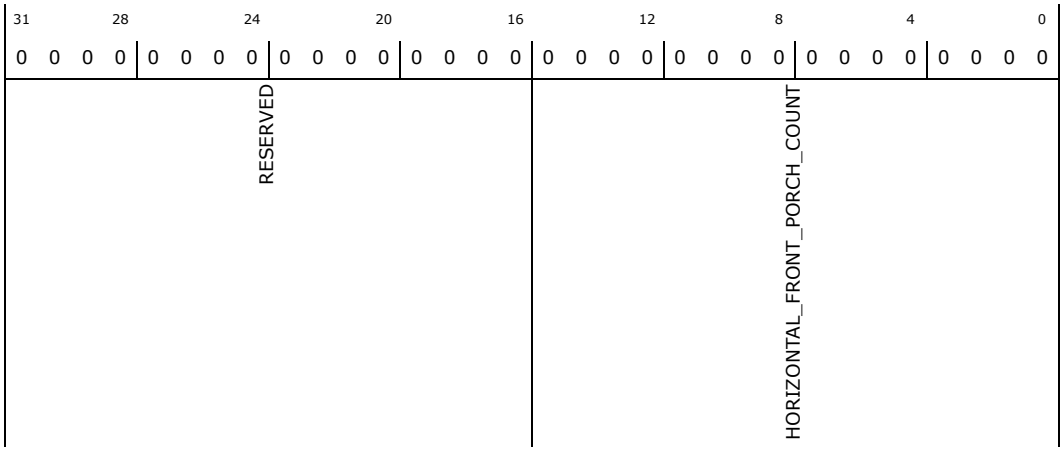
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B830h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_FRONT_PORCH_COUNT:** Shows the horizontal front porch value in terms of txbyteclkhs |

## 14.10.111 MIPIC_HORIZ_ACTIVE_AREA_COUNT—Offset B834h

mipi C horizontal active area count

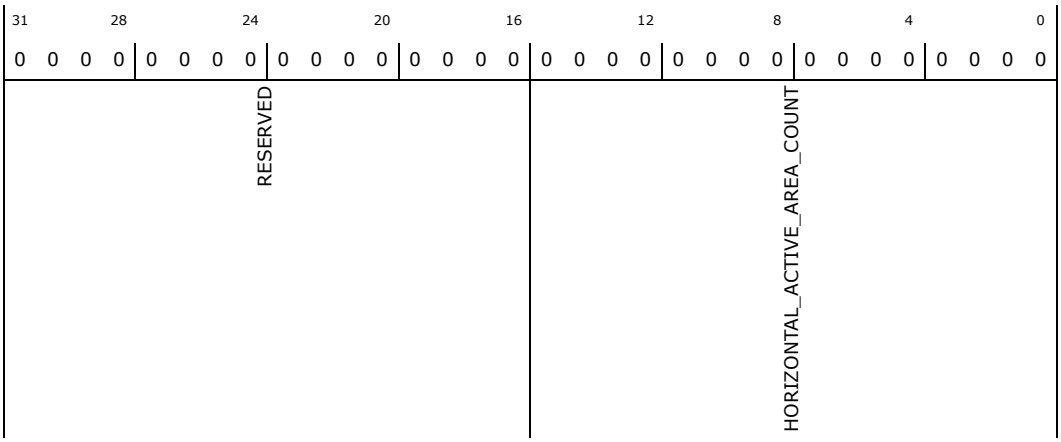
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B834h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **HORIZONTAL_ACTIVE_AREA_COUNT:** Shows the horizontal active area value in terms of txbyteclkhs |

## 14.10.112 MIPIC_VERT_SYNC_PADDING_COUNT—Offset B838h

mipi C vertical sync padding count

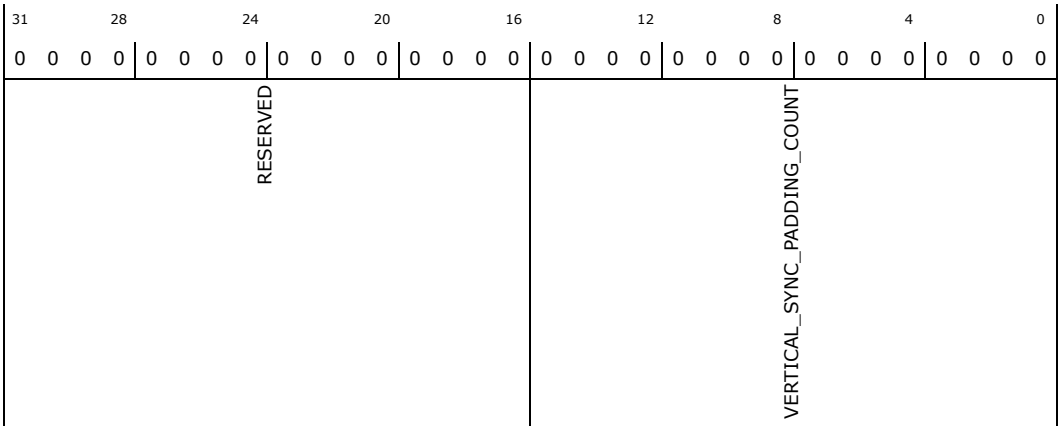
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B838h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **VERTICAL_SYNC_PADDING_COUNT:** Shows the vertical sync padding value in terms of lines |

## 14.10.113 MIPIC_VERT_BACK_PORCH_COUNT—Offset B83Ch

mipic Vertical back porch count

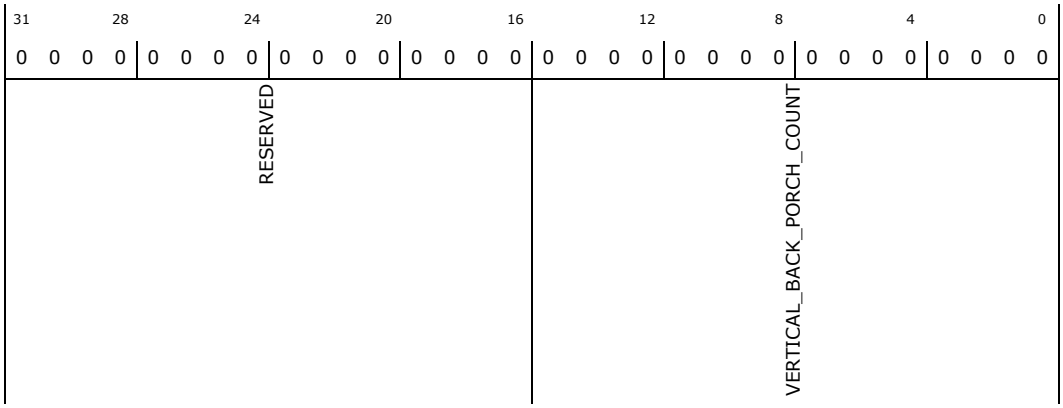
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B83Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **VERTICAL_BACK_PORCH_COUNT:** Shows the vertical back porch value in terms of lines |

## 14.10.114 MIPIC_VERT_FRONT_PORCH_COUNT—Offset B840h

mipi C vertical front porch count

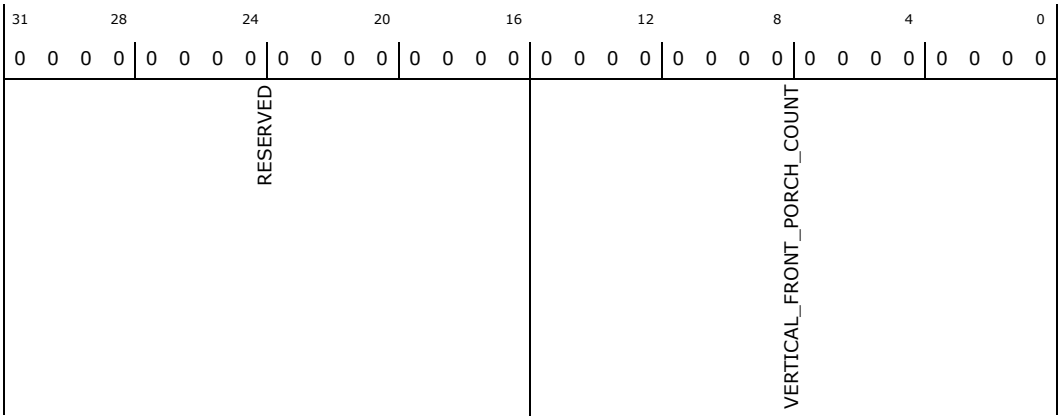
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B840h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **VERTICAL_FRONT_PORCH_COUNT:** Shows the vertical front porch value in terms of lines |

## 14.10.115 MIPIC_HIGH_LOW_SWITCH_COUNT—Offset B844h

mipi C high low switch count

### Access Method

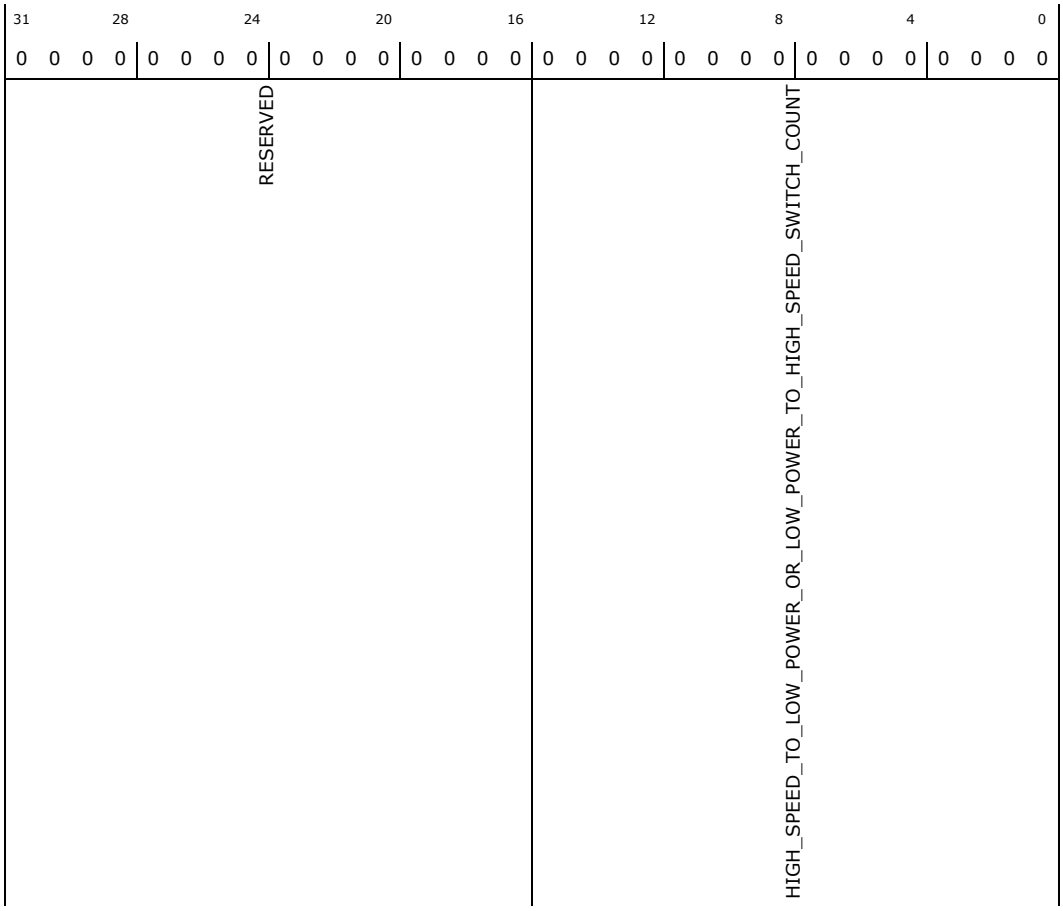
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B844h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** High speed to low power or Low power to high speed switching time in terms of txbyteclkhs |
| 15:0 | 0b<br>RW | **HIGH_SPEED_TO_LOW_POWER_OR_LOW_POWER_TO_HIGH_SPEED_SWITCH_COUNT:** High speed to low power or Low power to high speed switching time in terms of txbyteclkhs |

## 14.10.116 MIPIC_DPI_CTRL_REG—Offset B848h

mipi C dpi ctrl reg

### Access Method

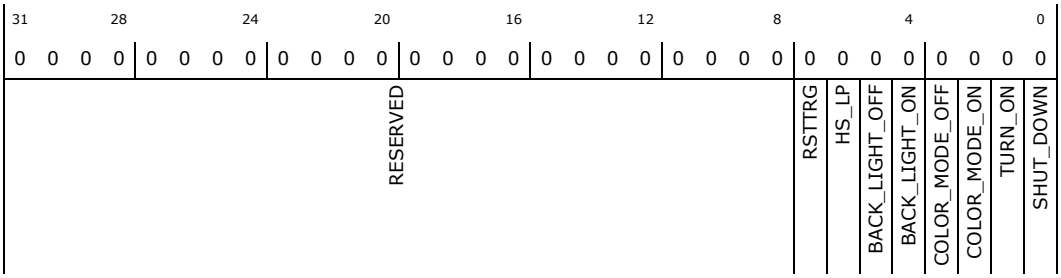
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B848h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7 | 0b<br>RW | **RSTTRG:** mipi C dpi ctrl Reg RSTTRG |
| 6 | 0b<br>RW | **HS_LP:** Set to '0' to indicate the special packets are sent through the DSI link using HS transmission and set to '1' to indicate that the special packets are sent through the DSI link using low power mode |
| 5 | 0b<br>RW | **BACK_LIGHT_OFF:** Set to '1' to indicate a backlight OFF short packet has to be packetised for the DPI's virtual channel |
| 4 | 0b<br>RW | **BACK_LIGHT_ON:** Set to '1' to indicate a backlight ON short packet has to be packetised for the DPI's virtual channel |
| 3 | 0b<br>RW | **COLOR_MODE_OFF:** Set to '1' to indicate a color mode OFF short packet has to be packetised for the DPI's virtual channel |
| 2 | 0b<br>RW | **COLOR_MODE_ON:** Set to '1' to indicate a color mode ON short packet has to be packetised for the DPI's virtual channel |
| 1 | 0b<br>RW | **TURN_ON:** Set to '1' to indicate a turn on short packet has to be packetised for the DPI's virtual channel |
| 0 | 0b<br>RW | **SHUT_DOWN:** Set to '1' to indicate a shut down short packet has to be packetised for the DPI's virtual channel |

## 14.10.117 MIPIC_DPI_DATA_REGISTER—Offset B84Ch

mipiC dpi data register

### Access Method

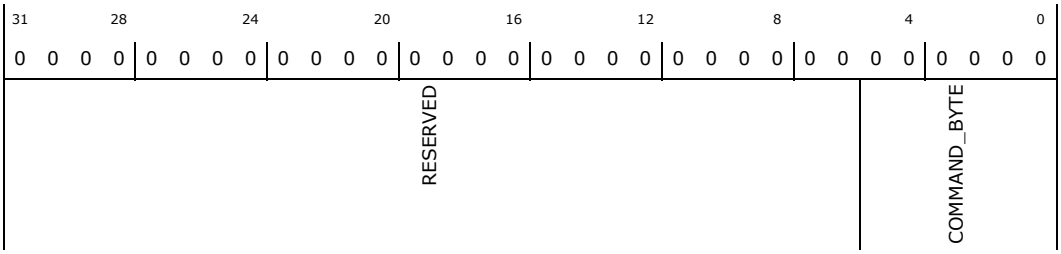
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B84Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **RESERVED:** Reserved. |
| 5:0 | 0b<br>RW | **COMMAND_BYTE:** Command Byte to represent the new or not defined command bytes usage for special features representation. [Like backlight ON and OFF]. This register should be programmed before the DPI control register is being programmed for backlight ON/OFF |

## 14.10.118 MIPIC_INIT_COUNT_REGISTER—Offset B850h

mipi C init counter register

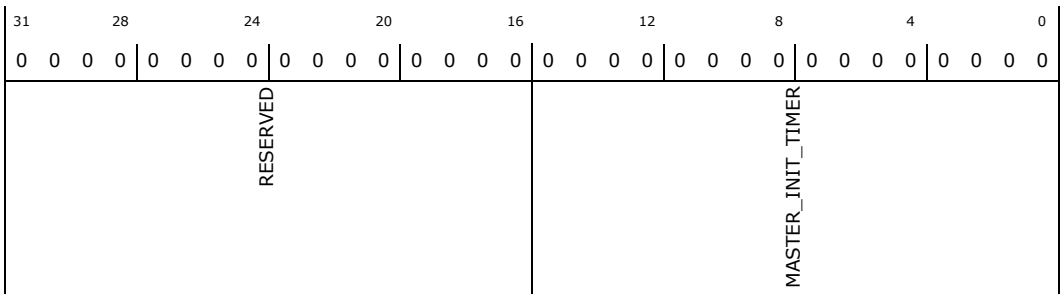
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B850h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **MASTER_INIT_TIMER:** Counter value in terms of low power clock to initialise the DSI Host IP [ TINT] that drives a stop state on the mipi's D-PHY bus |

## 14.10.119 MIPIC_MAX_RETURN_PKT_SIZE_REGISTER—Offset B854h

mipi C max return PKT size register

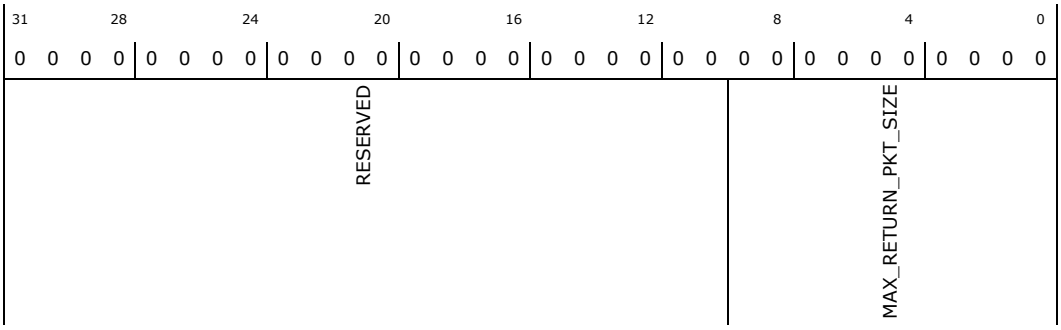
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B854h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0b<br>RW | **RESERVED:** Reserved. |
| 9:0 | 0b<br>RW | **MAX_RETURN_PKT_SIZE:** Set the count value in bytes to collect the return data packet for reverse direction data flow in data lane0 in response to a DBI read operation |

## 14.10.120 MIPIC_VIDEO_MODE_FORMAT_REGISTER—Offset B858h

mipi C video mode format register

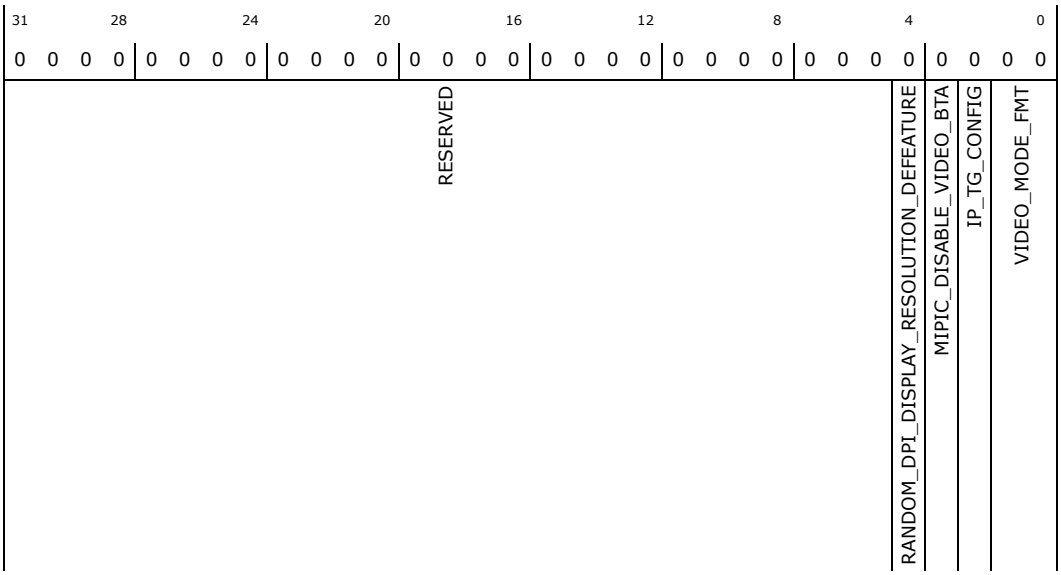
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B858h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **RESERVED:** Reserved. |
| 4 | 0b<br>RW | **RANDOM_DPI_DISPLAY_RESOLUTION_DEFEATURE:** Set by the processor to support random DPI display resolution<br>0 - random DPI display resolution support disabled.<br>1 - random DPI display resolution support enabled. |
| 3 | 0b<br>RW | **MIPIC_DISABLE_VIDEO_BTA:** Set by the processor to inform the DSI controller to disable the BTA sent at the last blanking line of VFP.<br>By default, this bit is set to 0.<br>0- BTA sending at the last blanking line of VFP is enabled.<br>1 - BTA sentding at teh last blanking line of VFP is disabeld. |
| 2 | 0b<br>RW | **IP_TG_CONFIG:** Set by the processor to inform that the DSI controller should discontinue the DPI transfer after the last line of the VFP after ip_tg_enable deassertion.<br>By default, this bit is set to 0.<br>0 - After ip_tg_enable deassertion, DSI Tx controller stops the DPI transfer immediately after the current packet is transmitted.<br>1 - After ip_tg_enable deassertion, DSI Tx controller discontinues the DPI transfer after the last line of the VFP |
| 1:0 | 0b<br>RW | **VIDEO_MODE_FMT:** Sets the Video mode format (packet sequence) to be supported in DSI. In Non Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed equal to RGB word count value In Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed greater than the RGB word count value, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link.<br>00 Reserved<br>01 - Non Burst Mode with Sync Pulse<br>10 - Non Burst Mode with Sync events<br>11 - Burst Mode |

## 14.10.121 MIPIC_EOT_DISABLE_REGISTER—Offset B85Ch

mipi C EOT disable register

### Access Method

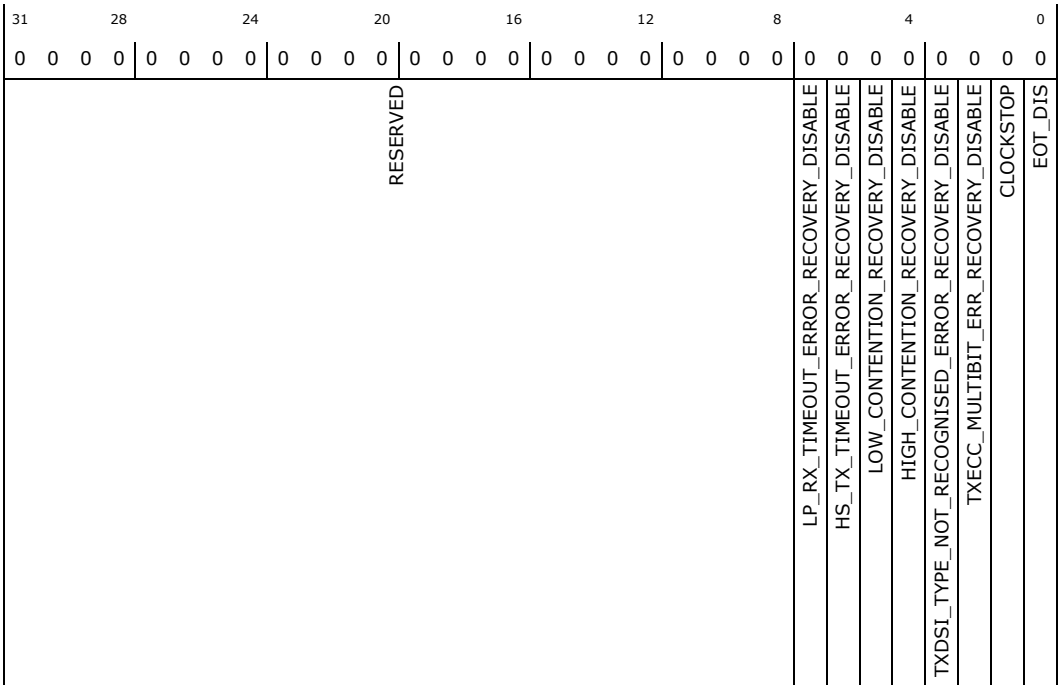
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B85Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7 | 0b<br>RW | **LP_RX_TIMEOUT_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the LP_Rx_timeout error recovery if the processor clears LP_Rx_timeout error interrupt.<br>0 - LP_Rx_timeout error recovery action will be taken by the DSI Tx controller if the processor clears the LP_Rx_timeout error interrupt.<br>1 - If the processor clears the LP_Rx_timeout error interrupt, LP_Rx_timeout error recovery action will not happen in DSI Tx contorller. LP Rx timeout error interrupt will act as an informative interrupt |
| 6 | 0b<br>RW | **HS_TX_TIMEOUT_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the HS_Tx_timeout error recovery if the processor clears HS_Tx_timeout interrupt.<br>0 - HS_Tx_timeout error recovery action will be taken by the DSI Tx controller if the processor clears the HS_Tx_timeout error interrupt.<br>1 - If the processor clears the HS_Tx_timeout error interrupt, HS_Tx_timeout error recovery action will not happen in DSI Tx contorller. HS Tx timeout error interrupt will act as an informative interrupt |
| 5 | 0b<br>RW | **LOW_CONTENTION_RECOVERY_DISABLE:** Set by the processor to enable or disable the contention recovery procedure if the processor clears Low contention interrupt.<br>0 - Contention recovery will happen if the processor clears Low contention interrupt.<br>1 - If the processor clears the low contention interrupt, contention recovery procedure will not be initiated by the DSI Tx contorller. Low contention interrupt will act as an informative interrupt |
| 4 | 0b<br>RW | **HIGH_CONTENTION_RECOVERY_DISABLE:** Set by the processor to enable or disable the contention recovery procedure if the processor clears High contention interrupt.<br>0 - Contention recovery will happen if the processor clears High contention interrupt.<br>1 - If the processor clears the high contention interrupt, contention recovery procedure will not be initiated by the DSI Tx contorller. Ignore the High Contention Interrupt in MIPI_INTR_STAT_REG |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0b<br>RW | **TXDSI_TYPE_NOT_RECOGNISED_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the error recovery action to be taken by the DSI Tx controller if TxDSI data type not recognised error interrupt is cleared by the processor.<br>0 - Error recovery action will be taken if TxDSI data type not recognised error interrupt is cleared by the processor.<br>1 - If TxDSI data type not recognised error interrupt is cleared by the processor, error recovery action will not be taken by the DSI TX controller. Tx DSI data type not recognized error interrupt will act as an informative interrupt |
| 2 | 0b<br>RW | **TXECC_MULTIBIT_ERR_RECOVERY_DISABLE:** Set by the processor to enable or disable the error recovery action to be taken by the DSI Tx controller if Tx ECC multibit error interrupt is cleared by the processor.<br>0 - Error recovery action will be taken if Tx ECC multibit error interrupt is cleared by the processor.<br>1 - If Tx ECC multibit error interrupt is cleared by the processor, error recovery action will not be taken by the DSI TX controller. Tx multibit error interrupt will act as an informative interrupt |
| 1 | 0b<br>RW | **CLOCKSTOP:** Set by the processor to enable or disable clock stopping feature during BLLP timing in a DPI transfer in dual channel mode or during DPI only mode and also when there is no traffic in the DBI interface in DBI only enabled mode. By default this register value is 0.<br>0 - clock stopping disabled<br>1 - clock stopping enabled |
| 0 | 0b<br>RW | **EOT_DIS:** Set by the processor to enable or disable EOT short packet transmission. By default this register value is 0. For backward comapatibility of earlier DSI systems, EOT short packet transmission can be disabled.<br>0 - EOT short packet transmission enabled<br>1 - EOT short packet transmission disabled |

## 14.10.122 MIPIC_LP_BYTECLK_REGISTER—Offset B860h

mipi C LP byteclk register

### Access Method

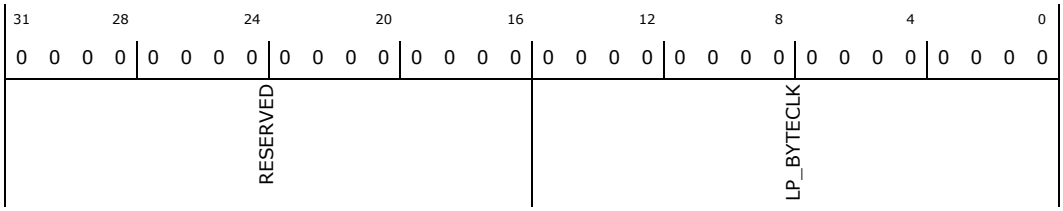
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B860h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:0 | 0b<br>RW | **LP_BYTECLK:** Low power clock equivalence in terms of byte clock. The value programmed in this register is equal to the number of byte clocks occupied in one low power clock. This value is based on the byte clock (txbyteclkhs) and low power clock frequency (txclkesc) |

## 14.10.123 MIPIC_LP_GEN_DATA_REGISTER—Offset B864h

mipi C LP gen DATA register

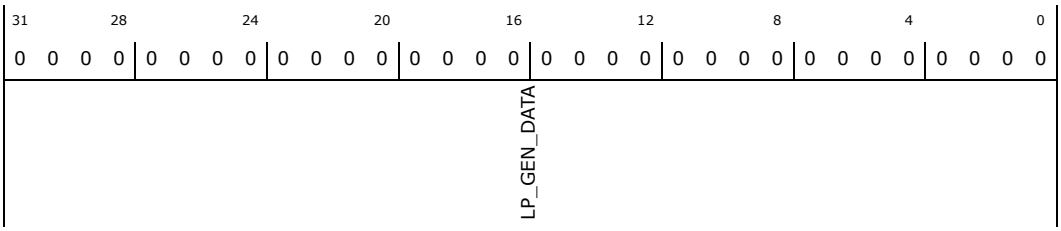
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B864h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **LP_GEN_DATA:** Data port register used for generic data transfers in low power mode |

## 14.10.124 MIPIC_HS_GEN_DATA_REGISTER—Offset B868h

mipi C HS Gen data register

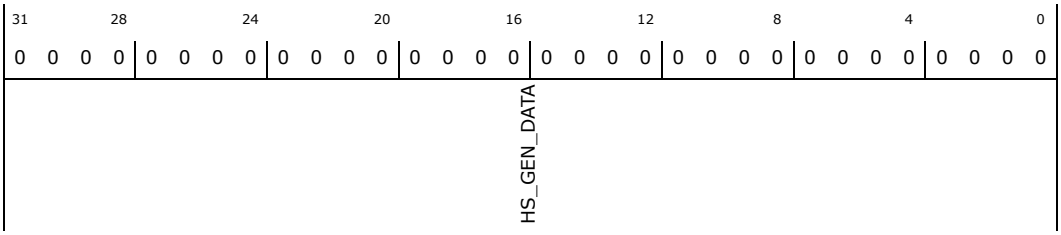
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B868h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **HS_GEN_DATA:** Data port register used for generic data transfers in low power mode |

## 14.10.125 MIPIC_LP_GEN_CTRL_REGISTER—Offset B86Ch

mipi C LP Gen ctrl register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B86Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

## 14.10.131 MIPIC_DBI_BW_CTRL_REG—Offset B884h

mipi C DBI BW ctrl reg

### Access Method

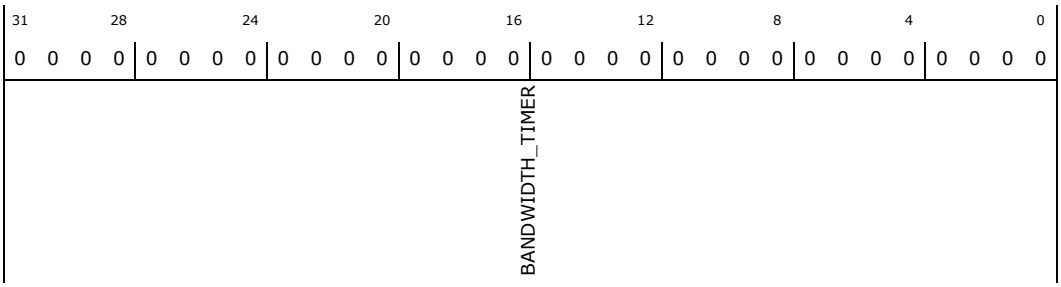
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B884h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **BANDWIDTH_TIMER:** DBI Bandwidth control Register. The bandwidth essential for transmitting 16 long packets containing 252 bytes meant for DCS write memory command is programmed in this register in terms of byte clocks. Based on the DSI transfer rate and the number of lanes configured the time taken to transmit 16 long packets in a DSI stream varies.<br>Note: The value programmed in this timer must be greater than the actual time taken to carryout 16 long packets transmission in DSI stream plus the time taken to transmit two blanking packets |

## 14.10.132 MIPIC_CLK_LANE_SWITCHING_TIME_CNT—Offset B888h

mipi C clk lane switching time count

### Access Method

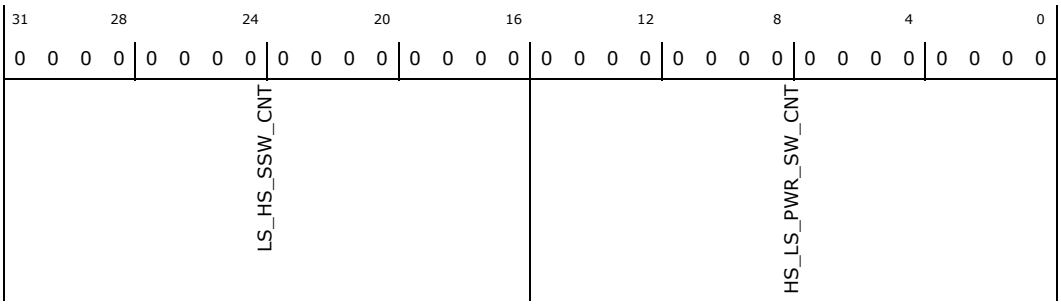
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B888h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **LS_HS_SSW_CNT:** Low power to high speed switching time in terms byte clock (txbyteclkhs). This value is based on the byte clock (txbyteclkhs) and low power clock frequency (txclkesc). Typical value - Number of byte clocks required to switch from low power mode to high speed mode after txrequesths_clk is asserted.<br>Current Value is ah = 10 txbyteclkhs |
| 15:0 | 0b<br>RW | **HS_LS_PWR_SW_CNT:** High speed to low power switching time in terms byte clock (txbyteclkhs). This value is based on the byte clock (txbyteclkhs) and low power clock frequency (txclkesc). Typical value - Number of byte clocks request to switch from high speed mode to low power mode after txrequesths_clk is de-asserted.<br>Current Value is 14h = 20 txbyteclkhs |

## 14.10.133 MIPIC_STOP_STATE_STALL—Offset B88Ch

mipi C stop state stall

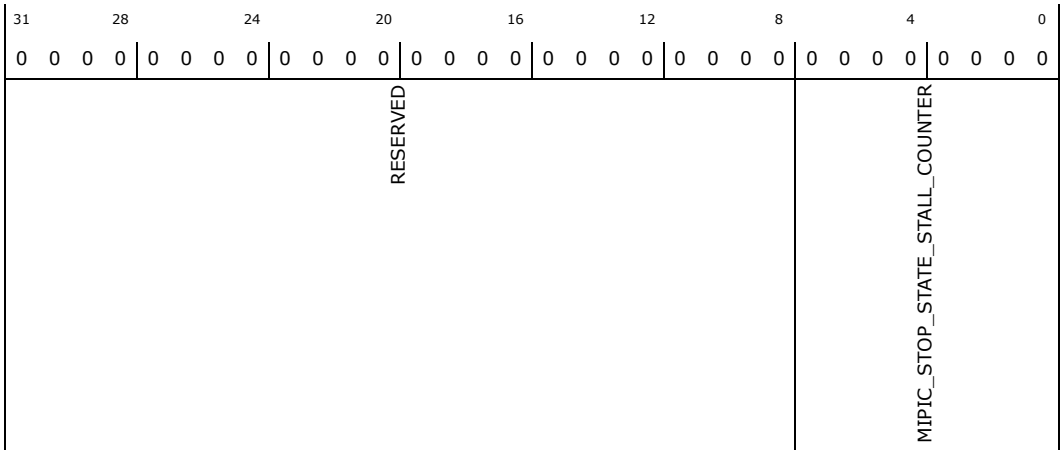
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B88Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** reserved |
| 7:0 | 0b<br>RW | **MIPIC_STOP_STATE_STALL_COUNTER:** Delay between (stall the stop state signal) the data transfer is increased based on this counter value. This counter is calculated from txclkesc. Note: If processor programs this register then it needs to reprogram the high_low_ switch counter in B844h and lp_equivalent_byteclk reg in B860h to compensate this delay. High_low_switch_count B844h: High to low switch counter = Actual High to low switch + stop_sta_stall_reg value * Low power clock equivalence value in terms of byte clock LP equivalent byteclk register B860h: LP equivalent byteclk value = txclkesc time/ txbyteclk time * (105 + stop_sta_stall_reg value) / 105 Minimum time of Low Power short packet transfer = 105 txclkesc |

## 14.10.134 MIPIC_INTR_STAT_REG_1—Offset B890h

mipi C intrrupt stat register 1

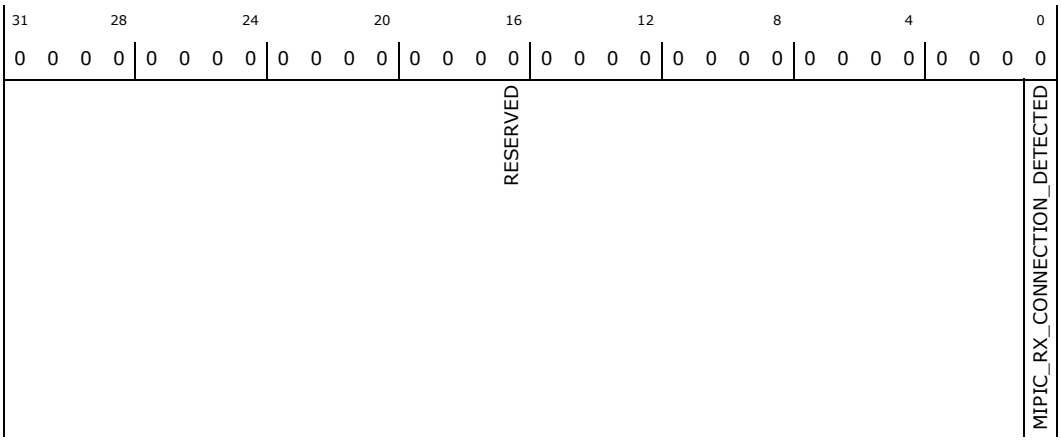
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B890h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0b<br>RW | **RESERVED:** reserved |
| 0 | 0b<br>RW | **MIPIC_RX_CONNECTION_DETECTED:** Set to 1'b1 if the contention detected in the display device and is reported in the Acknowledge packet by the display device |

## 14.10.135 MIPIC_INTR_EN_REG_1—Offset B894h

mipic interrupt enable register

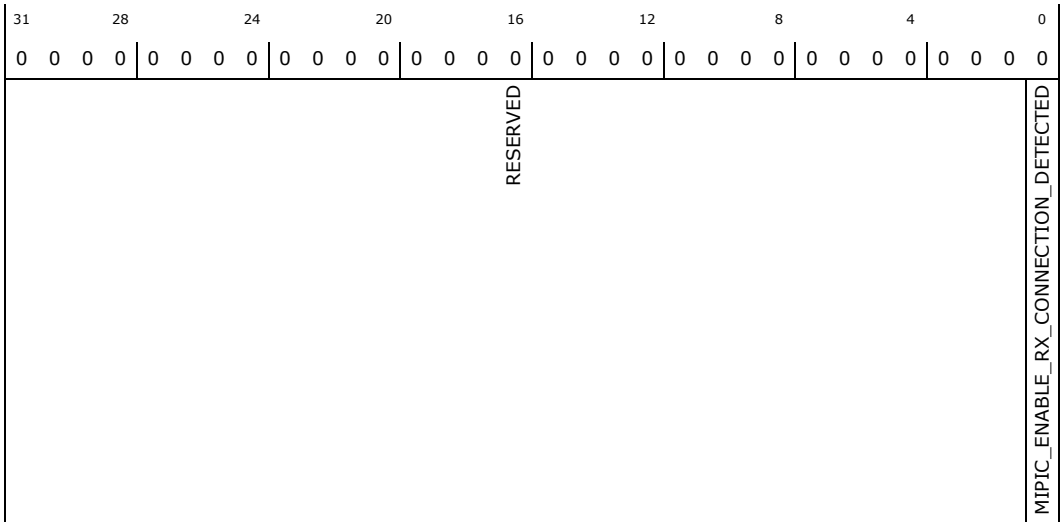
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B894h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0b<br>RW | **RESERVED:** reserved |
| 0 | 0b<br>RW | **MIPIC_ENABLE_RX_CONNECTION_DETECTED:** Set to enable the interrupt for contention detected error in the acknowledgement packet reports |

## 14.10.136 MIPIC_CTRL—Offset B904h

mipi ctrl reg

### Access Method

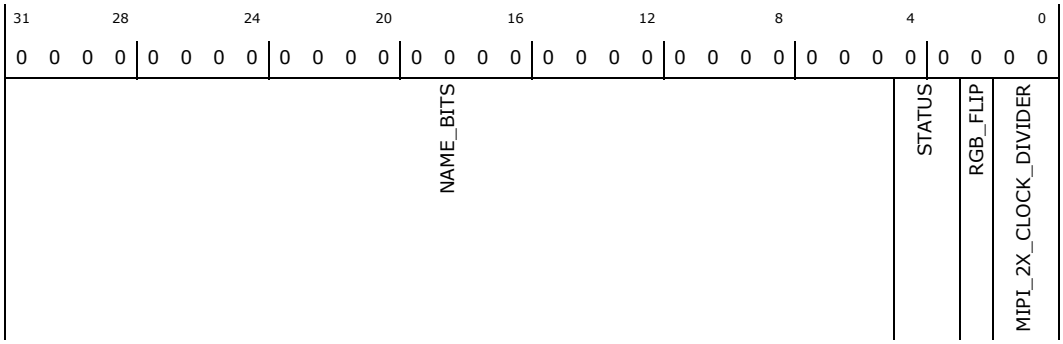
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B904h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **NAME_BITS:** Reserved |
| 4:3 | 0b<br>RW | **STATUS:** 2'b00: low priority on read requests to G-unit<br>2'b11 : high priority |
| 2 | 0b<br>RW | **RGB_FLIP:** 1'b0 : RGB data from disp2d is reverted to BGR<br>1'b1 : RGB data from disp2d is passed as is to MIPI IP |
| 1:0 | 0b<br>RW | **MIPI_2X_CLOCK_DIVIDER:** Reserved |

## 14.10.137 MIPIC_DATA_ADD—Offset B908h

mipi C data ADD

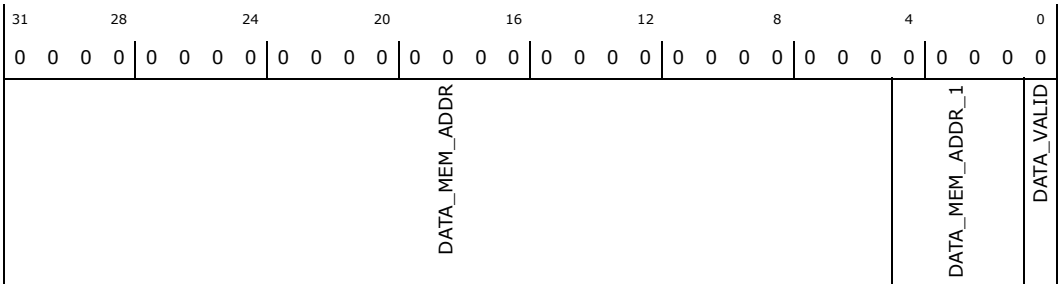
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B908h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **DATA_MEM_ADDR:** When there is updated data for the display panel, S/W programs this register with the memory address to read from |
| 4:1 | 0b<br>RW | **DATA_MEM_ADDR_1:** Reserved |
| 0 | 0b<br>RW | **DATA_VALID:** This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.10.138 MIPIC_DATA_LEN—Offset B90Ch

mipiC data length

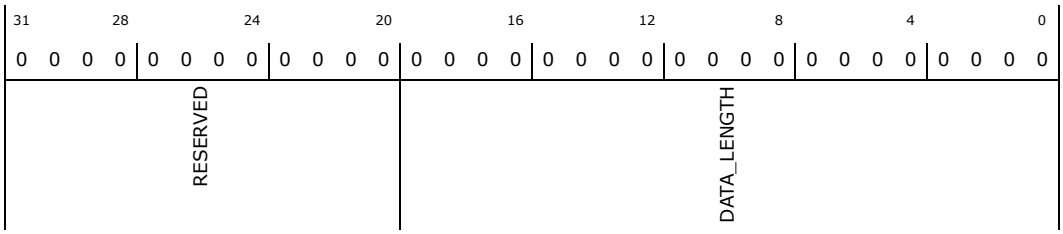
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B90Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **DATA_LENGTH:** This field shows the remaining length of data that needs to be read from memory, Initially set by S/W and is decremented by H/W as reads are issued |

## 14.10.139 MIPIC_CMD_ADD—Offset B910h

mipiC command add

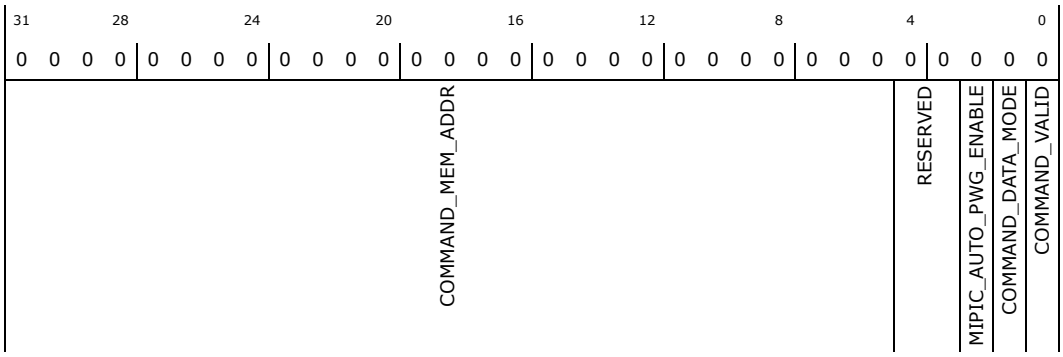
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B910h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0b<br>RW | **COMMAND_MEM_ADDR:** When there are new commands that need to be sent to the display panel, S/W programs this register with the memory address to read the commands from |
| 4:3 | 0b<br>RW | **RESERVED:** MBZ |
| 2 | 0b<br>RW | **MIPIC_AUTO_PWG_ENABLE:** Idle state: SW driver writes to this bit to enable auto power gating for MIPIC controller<br>0: default<br>1: auto power gate is enabled |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RW | **COMMAND_DATA_MODE:** 0: data for memory write command from system buffer that is specified by MIPI data address register<br>1: data for memory write command from pipe A rendering |
| 0 | 0b<br>RW | **COMMAND_VALID:** This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.10.140 MIPIC_CMD_LEN—Offset B914h

mipiC commanf Length

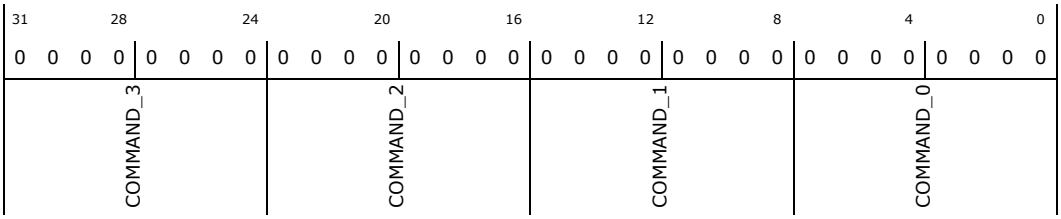
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B914h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **COMMAND_3:** This is command 3 length (command + parameters) in bytes |
| 23:16 | 0b<br>RW | **COMMAND_2:** This is command 2 length (command + parameters) in bytes |
| 15:8 | 0b<br>RW | **COMMAND_1:** This is command 1 length (command + parameters) in bytes |
| 7:0 | 0b<br>RW | **COMMAND_0:** This is command 0 length (command + parameters) in bytes |

## 14.10.141 MIPIC_RD_DATA_RETURN0—Offset B918h

mipi C Read data return 0

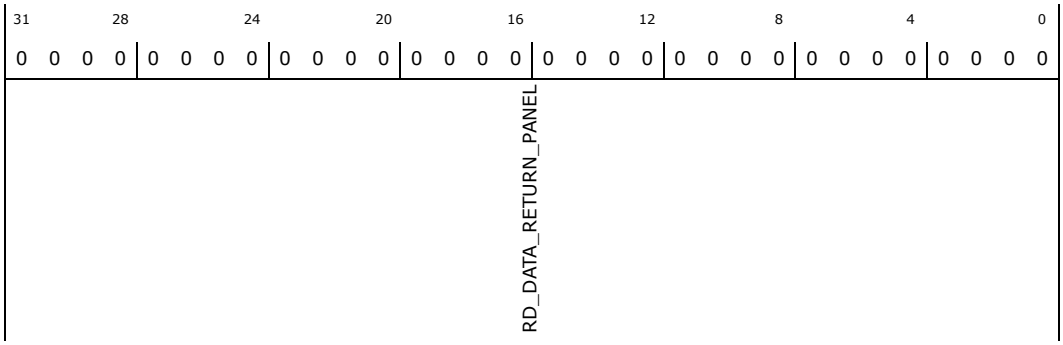
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B918h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.142 MIPIC_RD_DATA_RETURN1—Offset B91Ch

mipi C read data return 1

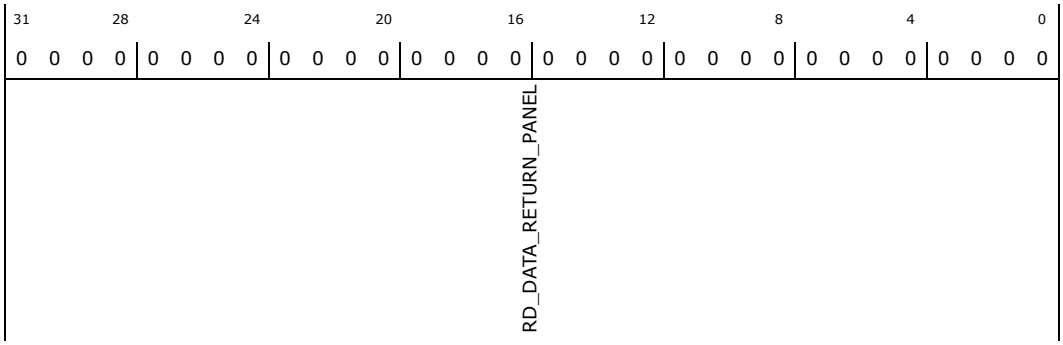
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B91Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.143 MIPIC_RD_DATA_RETURN2—Offset B920h

mipi C read data return 2

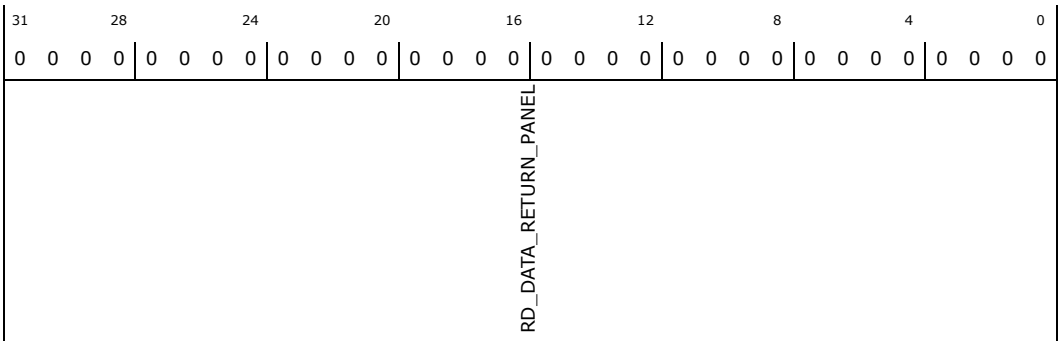
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B920h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.144 MIPIC_RD_DATA_RETURN3—Offset B924h

mipi C read data return 3

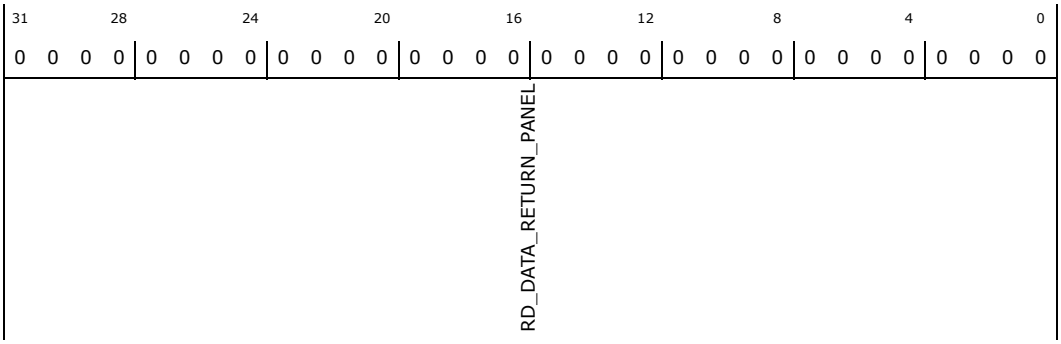
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B924h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.145 MIPIC_RD_DATA_RETURN4—Offset B928h

mipi C read data return 4

### Access Method

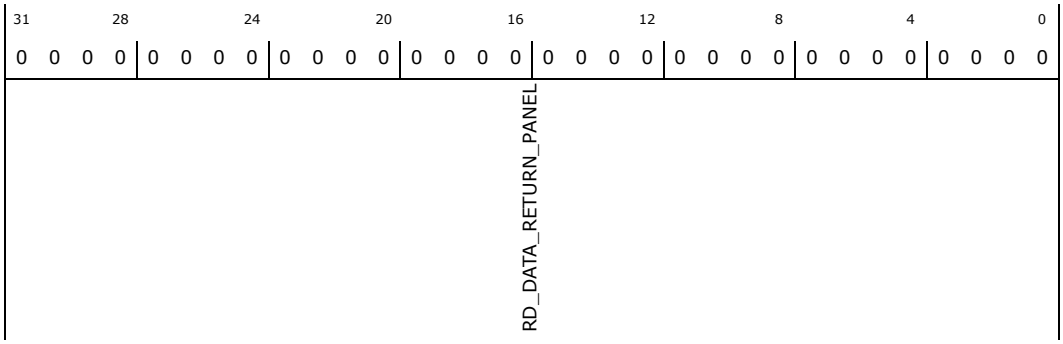
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B928h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.146 MIPIC_RD_DATA_RETURN5—Offset B92Ch

mipi C read data return 5

### Access Method

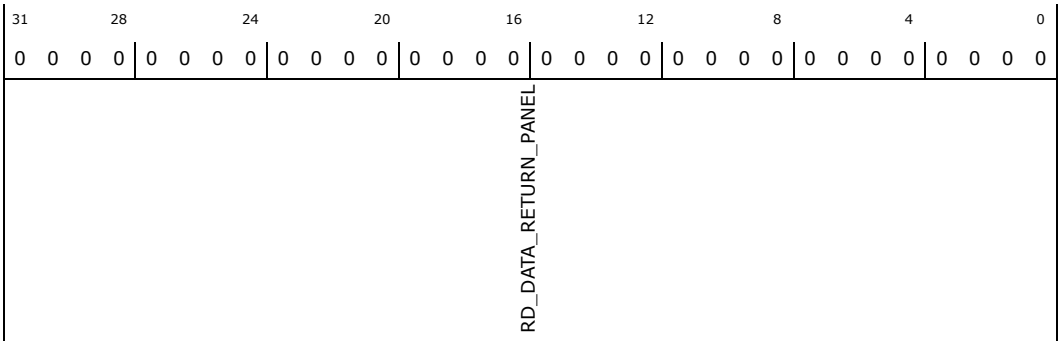
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B92Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.147 MIPIC_RD_DATA_RETURN6—Offset B930h

mipi C read data return 6

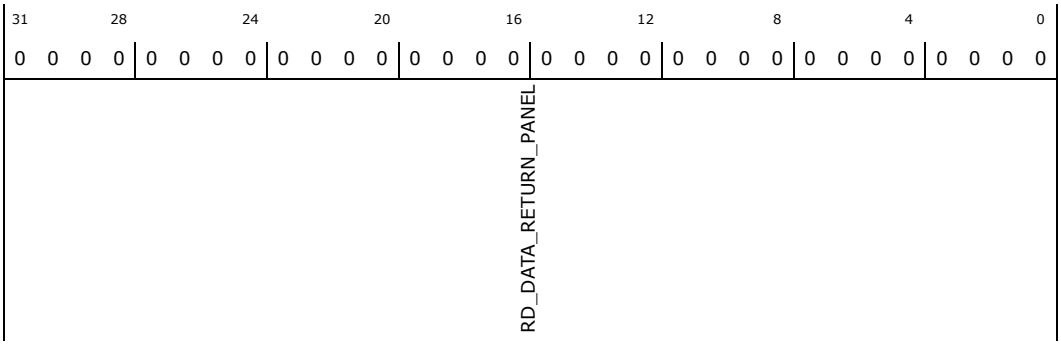
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B930h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.148 MIPIC_RD_DATA_RETURN7—Offset B934h

mipi C read data return 7

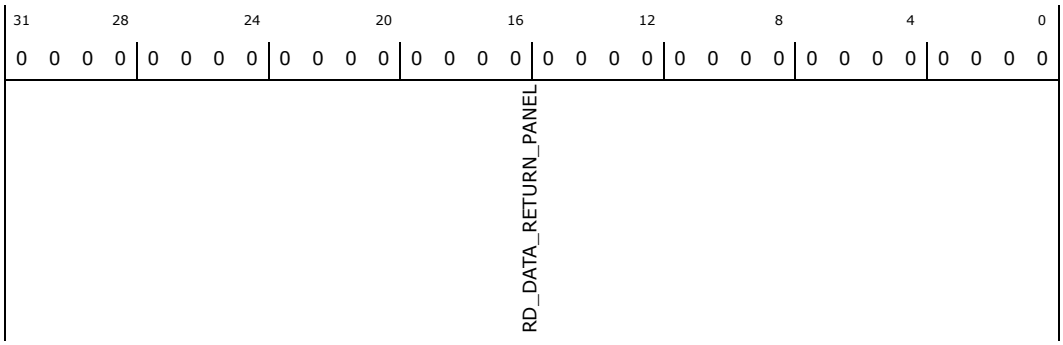
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B934h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **RD_DATA_RETURN_PANEL:** This is the configuration data returned from the panel |

## 14.10.149 MIPIC_RD_DATA_VALID—Offset B938h

mipi C read data valid

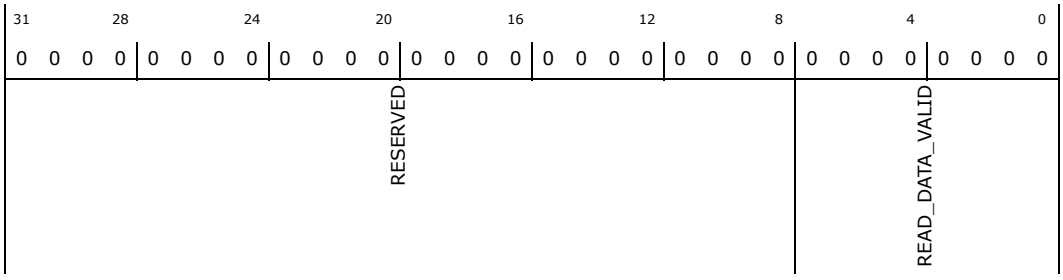
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + B938h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7:0 | 0b<br>RW | **READ_DATA_VALID:** Each bit corresponds to presence of valid data in the registers above. When data is returned from the panel, H/W will write into these registers in sequence, and set the corresponding valid bit.<br>When S/W issues a write '1 to the registers, this bit is cleared |

## 14.10.150 HTOTAL_A—Offset 60000h

Pipe A Horizontal Total Register

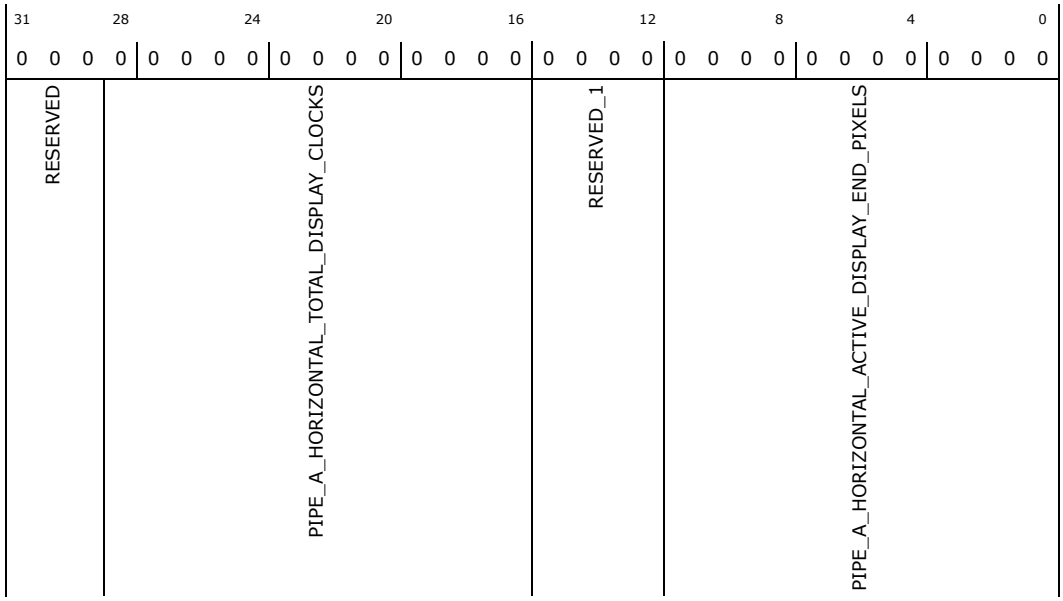
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60000h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Write as zero. |
| 28:16 | 0b<br>RW | **PIPE_A_HORIZONTAL_TOTAL_DISPLAY_CLOCKS:** This 13-bit field provides Horizontal Total up to 8192 pixels encompassing the Horizontal Active Display period, front/back border and retrace period. Any pending event (HSYNC, ACTIVE, HBLANK) is reset at HTOTAL and the programmed sequence begins again. This field is programmed to the number of clocks desired minus one.<br>This number of clocks needs to be a multiple of two when driving data out the digital port out the LVDS port in two channel mode. This value should always be equal or greater to the sum of the horizontal active and the horizontal blank, and border region sizes. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero. |
| 11:0 | 0b<br>RW | **PIPE_A_HORIZONTAL_ACTIVE_DISPLAY_END_PIXELS:** This 12-bit field provides Horizontal Active Display resolutions up to 4096 pixels. Note that the first horizontal active display pixel is considered pixel number 0. The value programmed should be the (active pixels/line 1).<br>The number of active pixels will be limited to multiples of two pixels when driving the integrated LVDS port in two channel mode. For proper results during VGA centering mode this value needs to be large enough to fit the largest VGA mode supported, this should be at least 720/1440 pixels for standard VGA type modes or 640/1280 pixels if the nine-dot disable bit in the VGA control register is set. When using the internal panel fitting logic, the minimum horizontal size allowed will be three pixels. |

## 14.10.151 HBLANK_A—Offset 60004h

Pipe A Horizontal Blank Register

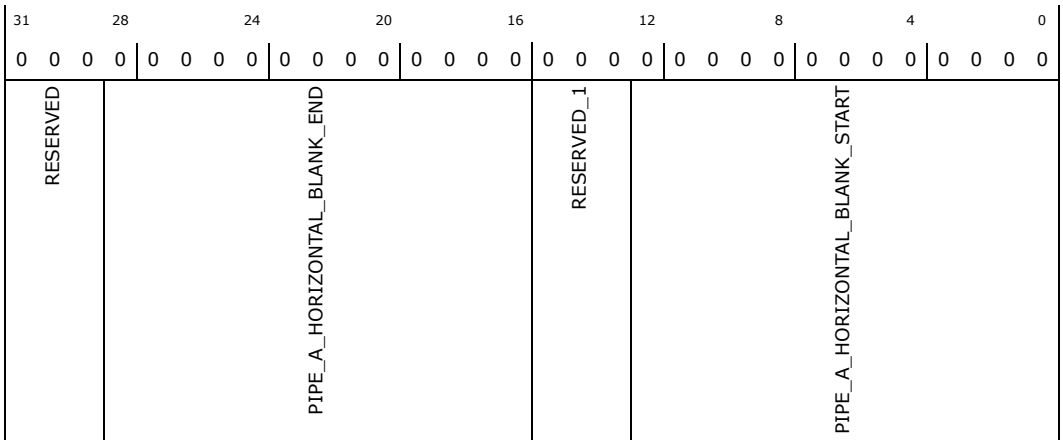
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60004h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Read Only. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28:16 | 0b<br>RW | **PIPE_A_HORIZONTAL_BLANK_END:** This 13-bit field specifies the position of Horizontal Blank End expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HBLANK End pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc. Horizontal blank ending at the same point as the horizontal total indicates that there is no left hand border area. HBLANK size has a minimum value of 32 clocks.<br>The number of clocks within blank needs to be a multiple of two when driving data out LVDS in two channel mode.<br>The value loaded in the register would be equal to RightBorder+Active+HBlank-1.<br>If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the HTOTAL register. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Read Only. |
| 12:0 | 0b<br>RW | **PIPE_A_HORIZONTAL_BLANK_START:** This 13-bit field specifies the Horizontal Blank Start position expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HBLANK Start pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc.<br>The number of clocks for both left and right borders need to be a multiple of two when driving data out the LVDS port in two channel mode. Horizontal blank should only start after the end of the horizontal active region.<br>The value loaded in the register would be equal to RightBorder+Active-1.<br>If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the HACTIVE register. |

## 14.10.152 HSYNC_A—Offset 60008h

Pipe A Horizontal Sync Register

### Access Method

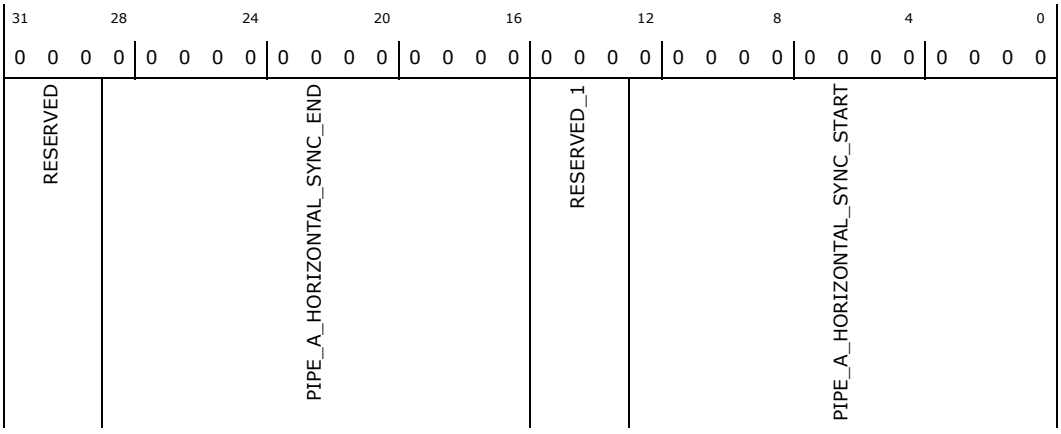
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60008h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Write as zero. |
| 28:16 | 0b<br>RW | **PIPE_A_HORIZONTAL_SYNC_END:** This 13-bit field specifies the horizontal Sync End position expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HSYNC End pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc.<br>The number of clocks in the sync period needs to be a multiple of two when driving data out the LVDS port in two channel mode. This value should be greater than the horizontal sync start position and would be loaded with the Active+RightBorder+FrontPorch+Sync-1. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Read Only. |
| 12:0 | 0b<br>RW | **PIPE_A_HORIZONTAL_SYNC_START:** This 13-bit field specifies the horizontal Sync Start position expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HSYNC Start pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc. Note that when HSYNC Start is programmed equal to HBLANK Start, both HSYNC and HBLANK will be asserted on the same pixel clock. It should never be programmed to less than HBLANK start.<br>The number of cycles from the beginning of the line needs to be a multiple of two when driving data out the LVDS port in two channel mode. This register should not be less than the horizontal active end. This register should be loaded with the Active+RightBorder+FrontPorch-1. |

## 14.10.153 VTOTAL_A—Offset 6000Ch

Pipe A Vertical Total Register

### Access Method

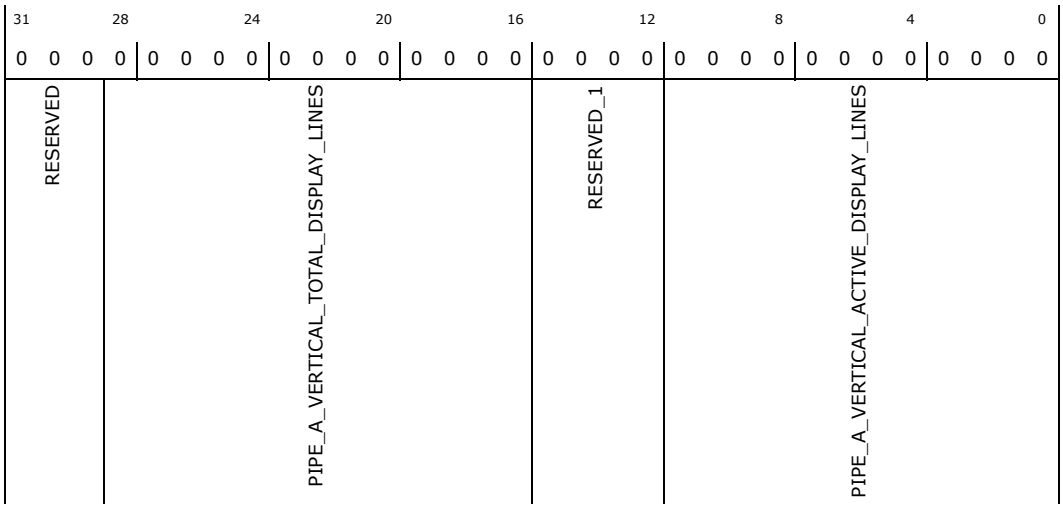
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6000Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Read Only. |
| 28:16 | 0b<br>RW | **PIPE_A_VERTICAL_TOTAL_DISPLAY_LINES:** This 13 bit field provides Vertical Total up to 8192 lines encompassing the Vertical Active Display Lines, top/bottom border and retrace period. The value programmed should be the number of lines required minus one. Vertical total needs to be large enough to be greater than the sum of the vertical active, vertical border, and the vertical blank regions. The vertical counter is incremented on the leading edge of the horizontal sync. For interlaced display modes, this indicates the total number of lines in both fields. In interlaced modes, hardware automatically divides this number by 2 to get the number of lines in each field. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Read Only. |
| 11:0 | 0b<br>RW | **PIPE_A_VERTICAL_ACTIVE_DISPLAY_LINES:** This 12-bit field provides vertical active display resolutions up to 4096 lines. It should be programmed with the desired number of lines minus one. When using the internal panel fitting logic, the minimum vertical active area must be three lines. For interlaced display modes, this indicates the total number of lines in both fields. In interlaced modes, hardware automatically divides this number by 2 to get the number of lines in each field. |

## 14.10.154 VBLANK_A—Offset 60010h

Pipe A Vertical Blank Register

### Access Method

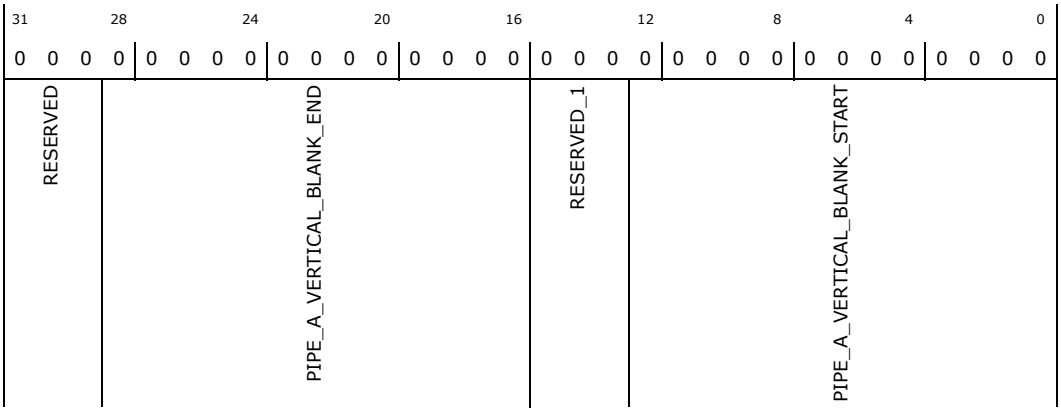
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60010h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Read Only. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28:16 | 0b<br>RW | **PIPE_A_VERTICAL_BLANK_END:** This 13-bit field specifies the Vertical Blank End position expressed in terms of the absolute Line number relative to the vertical active display start. The value programmed should be the VBLANK End line position, where the first active line is considered line 0, the second active line is considered line 1, etc. The end of vertical blank should be after the start of vertical blank and before or equal to the vertical total. This register should be loaded with the Vactive+BottomBorder+VBlank-1. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical blank end in each field. It does not count the two half lines that get added when operating in modes with half lines.<br>If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the VTOTAL register. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Read Only. |
| 12:0 | 0b<br>RW | **PIPE_A_VERTICAL_BLANK_START:** This 13-bit field specifies the Vertical Blank Start expressed in terms of the absolute line number relative to the vertical active display start. The value programmed should be the VBLANK Start line position, where the first active line is considered line 0, the second active line is considered line 1, etc. Minimum vertical blank size is required to be at least three lines. Blank should start after the end of active. This register is loaded with the Vactive+BottomBorder-1. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical blank start in each field. It does not count the two half lines that get added when operating in modes with half lines.<br>If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the VACTIVE register. |

## 14.10.155 VSYNC_A—Offset 60014h

Pipe A Vertical Sync Register

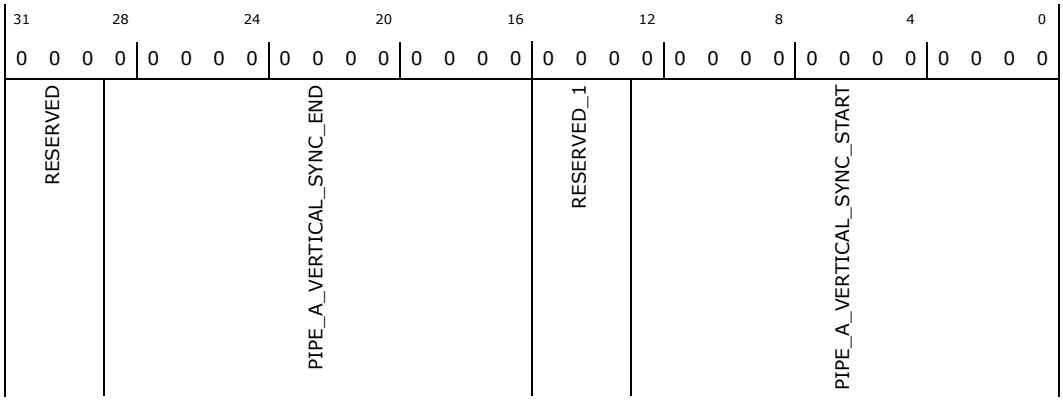
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60014h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Read Only. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28:16 | 0b<br>RW | **PIPE_A_VERTICAL_SYNC_END:** This 13-bit field specifies the Vertical Sync End position expressed in terms of the absolute Line number relative to the vertical active display start. The value programmed should be the VSYNC End line position, where the first active line is considered line 0, the second active line is considered line 1, etc. This register should be loaded with Vactive+BottomBorder+FrontPorch+Sync-1. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical sync end in each field. It does not count the two half lines that get added when operating in modes with half lines. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Read Only. |
| 12:0 | 0b<br>RW | **PIPE_A_VERTICAL_SYNC_START:** This 13-bit field specifies the Vertical Sync Start position expressed in terms of the absolute line number relative to the vertical active display start. The value programmed should be the VSYNC Start line position, where the first active line is considered line 0, the second active line is considered line 1, etc. This register would be loaded with Vactive+BottomBorder+FrontPorch-1. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical sync start in each field. It does not count the two half lines that get added when operating in modes with half lines. |

## 14.10.156 PIPESRCA—Offset 6001Ch

Pipe A Source Image Size

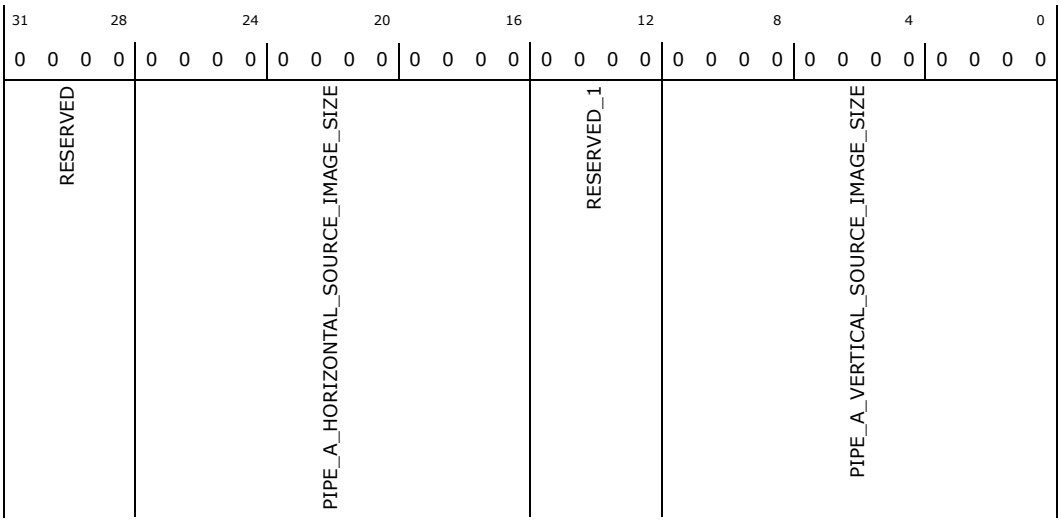
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6001Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27:16 | 0b<br>RW | **PIPE_A_HORIZONTAL_SOURCE_IMAGE_SIZE:** This 12-bit field specifies Horizontal source image size up to 4096. This determines the size of the image created by the display planes sent to the blender. The value programmed should be the source image size minus one. The actual source size must be two times the programmed value in the pixel multiply mode.<br>It must represent a size that is a multiple of two (even numbers) when driving the LVDS port in two channel mode. This implies that for this mode, the value programmed will always be an odd number.<br>Except in the case of panel fitting internal or in an external device, this register field would be programmed to a value identical to the horizontal active. This is the only register of the timing registers that is allowed to be programmed while the pipe is enabled. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **PIPE_A_VERTICAL_SOURCE_IMAGE_SIZE:** This 12-bit field specifies the vertical source image size up to 4096 lines. This determines the size of the image created by the display planes sent to the blender. The value programmed should be the source image size minus one.<br>Note that the actual number of lines needs to be at least twice the planes programmed value when in the pixel multiply mode.<br>Except in the case of panel fitting internal or in an external device, this register field would be programmed to a value identical to the vertical active.<br>For interlaced display modes, hardware automatically divides this number by 2 to get the vertical source image size in each field. |

## 14.10.157 BCLRPAT_A—Offset 60020h

Pipe A Border Color Pattern Register

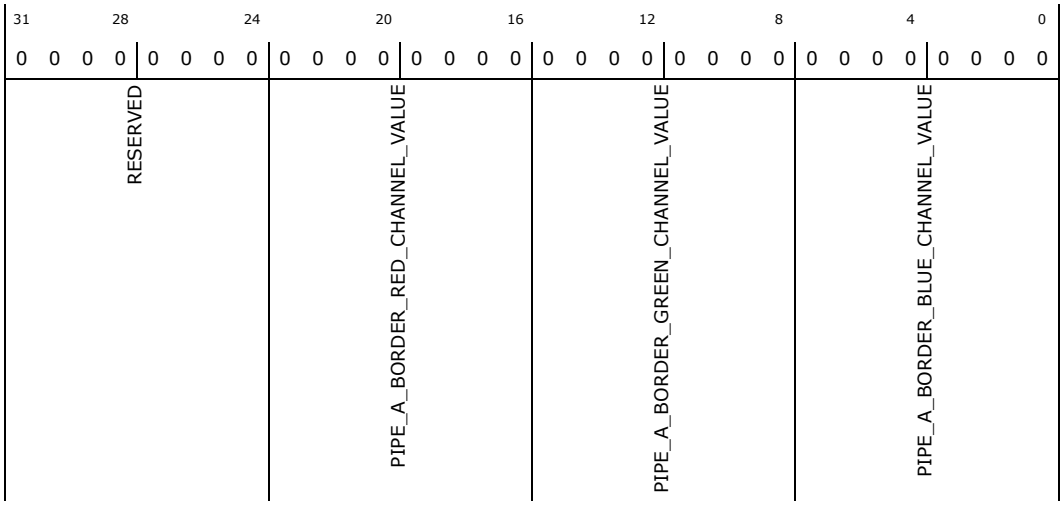
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60020h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RW | **PIPE_A_BORDER_RED_CHANNEL_VALUE:** pipeA border red channel values |
| 15:8 | 0b<br>RW | **PIPE_A_BORDER_GREEN_CHANNEL_VALUE:** pipeA border green channel values |
| 7:0 | 0b<br>RW | **PIPE_A_BORDER_BLUE_CHANNEL_VALUE:** pipeA border blue channel values |

## 14.10.158 VSYNCSHIFT_A—Offset 60028h

Vertical Sync Shift Register

### Access Method

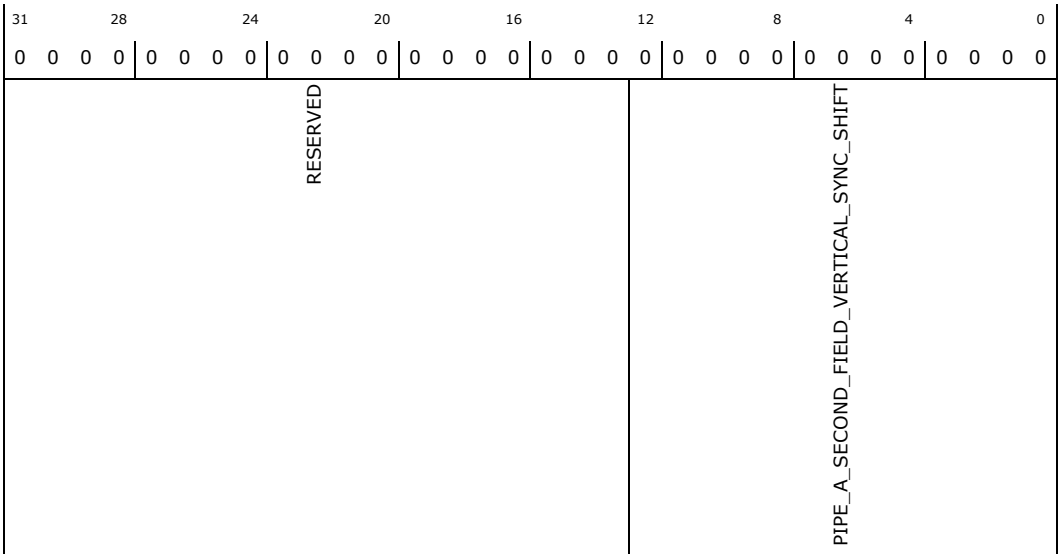
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60028h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0b<br>RW | **RESERVED:** Write as zero. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12:0 | 0b<br>RW | **PIPE_A_SECOND_FIELD_VERTICAL_SYNC_SHIFT:** This value specifies the vertical sync alignment for the start of the interlaced second field expressed in terms of the absolute pixel number relative to the horizontal active display start.<br>This value will only be used if the PIPEACONF is programmed to an interlaced mode using vsync shift. Otherwise a legacy value of floor[htotal / 2] will be used.<br>Typically, the interlaced second field vertical sync should start one pixel after the point halfway between successive horizontal syncs, so the value of this register should be programmed to:<br>(horizontal sync start - floor[horizontal total / 2]) (use the actual horizontal sync start and horizontal total values and not the minus one values programmed into registers).<br>This vertical sync shift only occurs during the interlaced second field. In all other cases the vertical sync start position is aligned with horizontal sync start. |

## 14.10.159 TRANSADATAM1—Offset 60030h

Pipe A Data M value 1

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60030h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

## 14.10.176 CRCRESRESIDUE2A—Offset 60080h

Pipe A CRC Color Channel Result Register

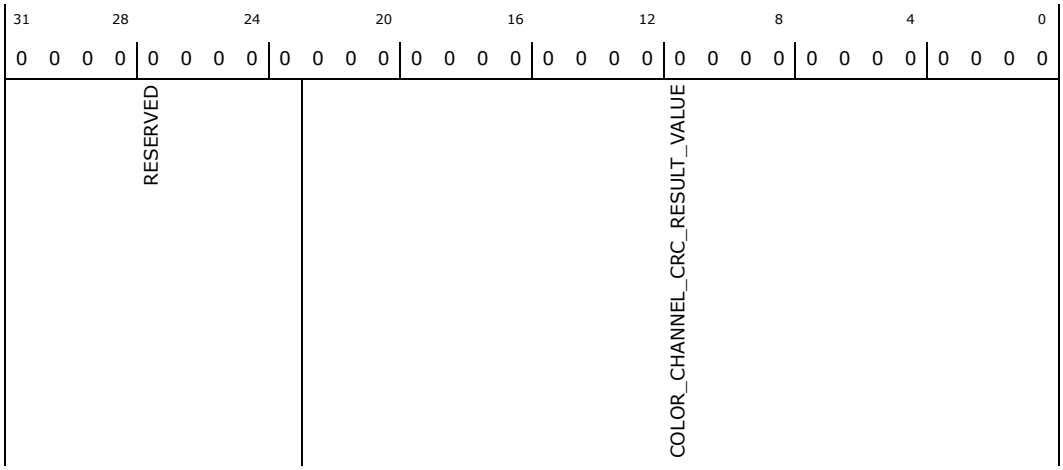
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60080h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 0b<br>RO | **RESERVED:** Read only |
| 22:0 | 0b<br>RO | **COLOR_CHANNEL_CRC_RESULT_VALUE:** This field contains the resultant CRC value for the particular Color Channel at the end of a frame. A status bit can be used as an indication that the data is the valid result of a CRC calculation. |

## 14.10.177 PSRCTLA—Offset 60090h

Pipe A Panel Self Refresh Control

### Access Method

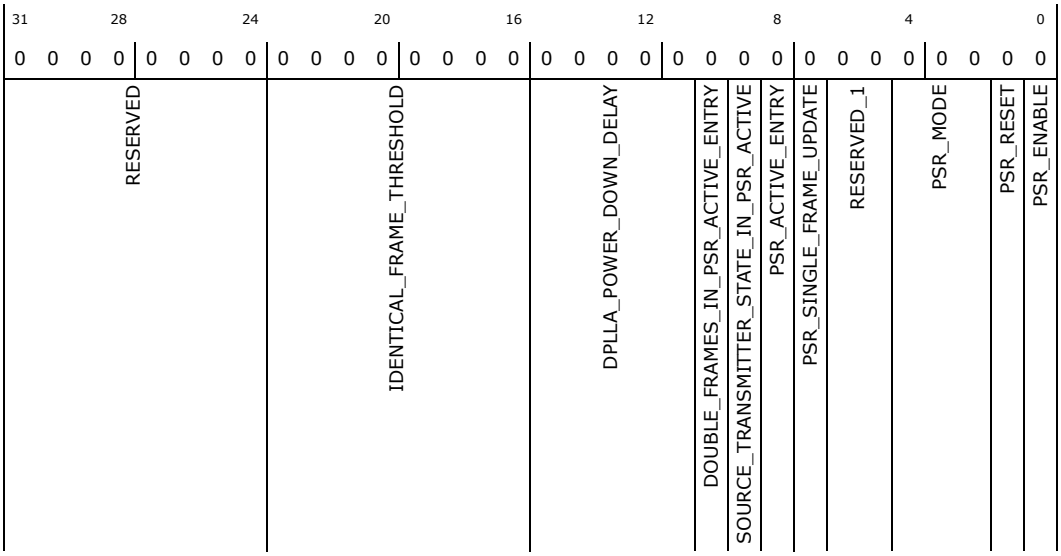
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60090h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RW | **IDENTICAL_FRAME_THRESHOLD:** : Number of identical frames that display controller needs to exceed in order to transition to PSR active state in HW timer mode |
| 15:11 | 0b<br>RW | **DPLLA_POWER_DOWN_DELAY:** programmable delay from main link powerdown to DPLLA powerdown. The delay is in number of cdclk clocks. |
| 10 | 0b<br>RW | **DOUBLE_FRAMES_IN_PSR_ACTIVE_ENTRY:** . If asserted, HW will send two frames with same SDP active setting when entry PSR active state. This bit is set if the vertical blanking time is less than 330us. |
| 9 | 0b<br>RW | **SOURCE_TRANSMITTER_STATE_IN_PSR_ACTIVE:** . If asserted, HW will keep transmitter active during PSR active state and sends only idle symbols. If deasserted, HW will turn off transmitter during PSR active state. Display driver will keep this bit consistent with Source transmitter state in PSR active bit in DPCD register of the sink. |
| 8 | 0b<br>RW | **PSR_ACTIVE_ENTRY:** This bit is only valid in PSR_mode is SW timer mode. If it is asserted, HW will transition into PSR_active state. If it is deasserted, HW will transition to PSR_inactive state. SW should not set or clear this bit more than once within one vblank period. |
| 7 | 0b<br>RW | **PSR_SINGLE_FRAME_UPDATE:** In PSR persistent mode, SW set this bit before writing registers for a flip. After HW finishes signle frame update, it goes back to PSR active ? no RFB state. SW driver may send new single frame update request.<br>Programming note: Reading this bit is updated at the next vblank. Writing this bit to 1 will cause PSR FSM to perform single frame update automatically, no vblank is required. When single frame update is done, it will automatically go back to PSR active ? no RFB update. 60094[2:0] = 3b011. |
| 6:5 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 4:2 | 0b<br>RW | **PSR_MODE:** b011-111: reserved.<br>b010: PSR with HW timer. HW timer decides PSR active entry point. PSR active state exits upon MMIO write registers that may change the frame buffer.<br>b001: PSR with SW timer. In this mode, SW will keep track of idle frames and buffer modification in the driver and explicitly specify the entry and exit PSR active state point.<br>b000: PSR manual (debug) mode. All of PSR state transitions and SDP content is managed by SW driver. SW is responsible to change SDP content for every frame with appropriate values to keep PSR panel in synchronized states. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RW | **PSR_RESET:** If assert all PSR functions are reset back to PSR inactive state. When it needs to resynchronize source and sync, SW writes 0x2 to DPCD register 600h and to this bit to get system back to PSR active states. This bit is self clear. |
| 0 | 0b<br>RW | **PSR_ENABLE:** Panel Self-refresh is enabled. When it is asserted PSR is enabled and operate in one of the mode that specified by PSR mode. |

## 14.10.178 PSRSTATA—Offset 60094h

Pipe A PSR status register

### Access Method

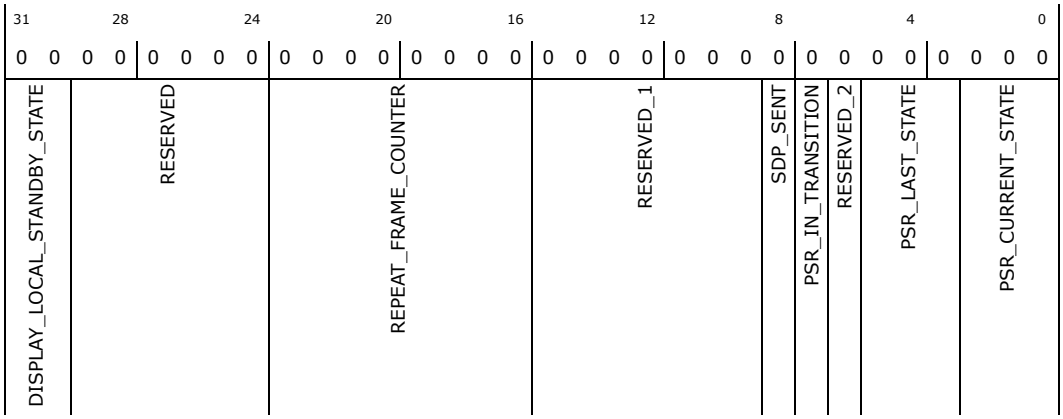
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60094h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RO | **DISPLAY_LOCAL_STANDBY_STATE:** :00: D0 idle state, fetch frame buffer from system memory<br>01: D0i1 not defined in VLVP<br>02: D0i2 PSR is active, display controller is trunk gated<br>03: D0i3 PSR is active, display controller is power gated |
| 29:24 | 0b<br>RO | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RO | **REPEAT_FRAME_COUNTER:** : Number of identical frames has been sent by display controller. Value is not roll over at 255. |
| 15:9 | 0b<br>RO | **RESERVED_1:** Reserved. |
| 8 | 0b<br>RO | **SDP_SENT:** it indicates if SDP packet has been sent in current frame. |
| 7 | 0b<br>RO | **PSR_IN_TRANSITION:** There is a period that source already committed to PSR active but sink did not. SW should not change the source state at this time but wait until this status bit is clear. The wait time should in the range of 120-250us in the worst case. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 6 | 0b<br>RO | **RESERVED_2:** Reserved. |
| 5:3 | 0b<br>RO | **PSR_LAST_STATE:** indicate last source state that VLVP PSR state machine were in (debug)<br>000: PSR_disabled<br>001: PSR_inactive<br>010: PSR_transition_to_active<br>011: PSR_active no RFB update<br>100: PSR_active single frame update<br>101: PSR_exit |

## 14.10.179 PSRCRC1A—Offset 60098h

Pipe A PSR CRC1 register

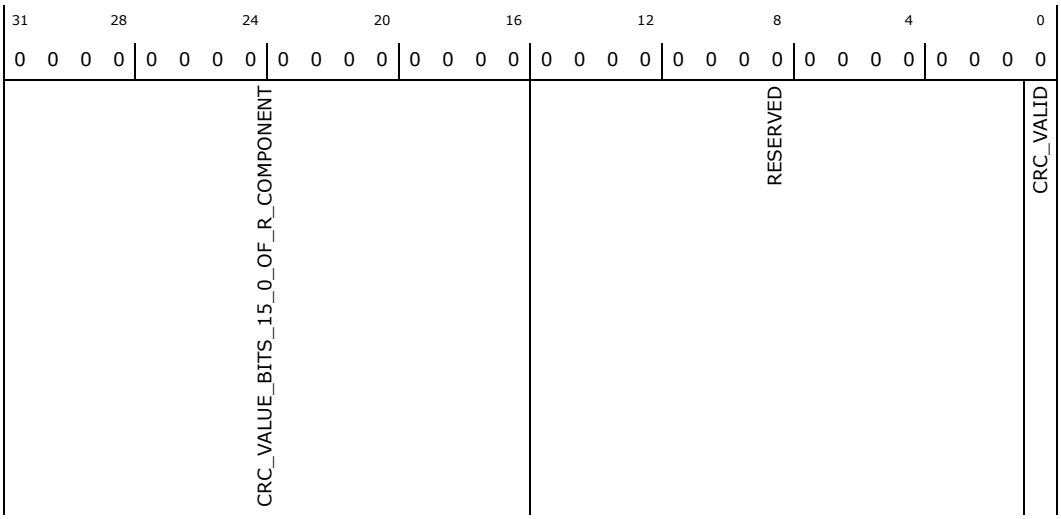
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 60098h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RO | **CRC_VALUE_BITS_15_0_OF_R_COMPONENT:** crc values bits 15 to 0 of Red component |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:1 | 0b<br>RO | **RESERVED:** Reserved. |
| 0 | 0b<br>RO | **CRC_VALID:** CRC calculation complete and valid for previous frame. |

## 14.10.180 PSRCRC2A—Offset 6009Ch

Pipe A PSR CRC2 register

### Access Method

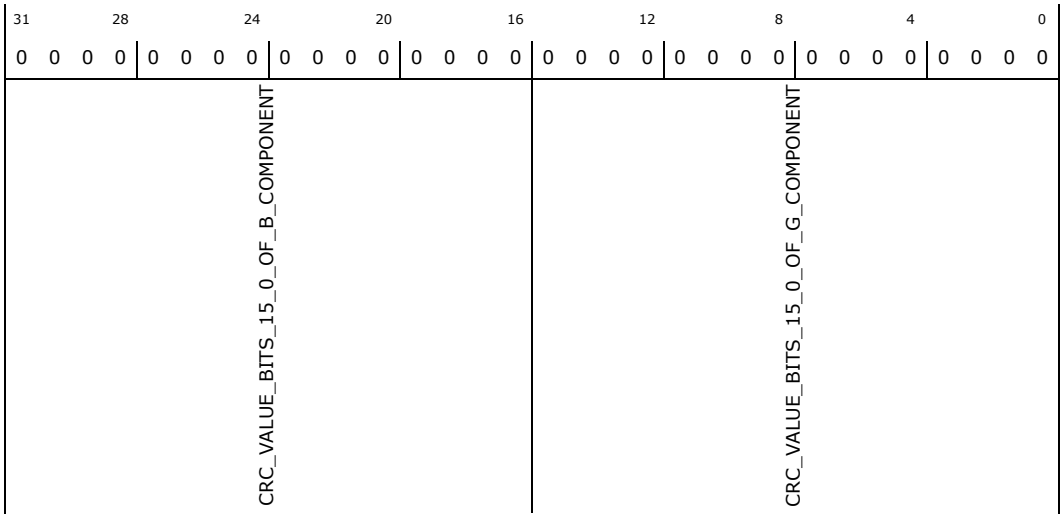
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6009Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RO | **CRC_VALUE_BITS_15_0_OF_B_COMPONENT:** crc values bits 15 to 0 of Blue component |
| 15:0 | 0b<br>RO | **CRC_VALUE_BITS_15_0_OF_G_COMPONENT:** crc values bits 15 to 0 of green component |

## 14.10.181 VSCSDPA—Offset 600A0h

Pipe A VSC SDP register

### Access Method

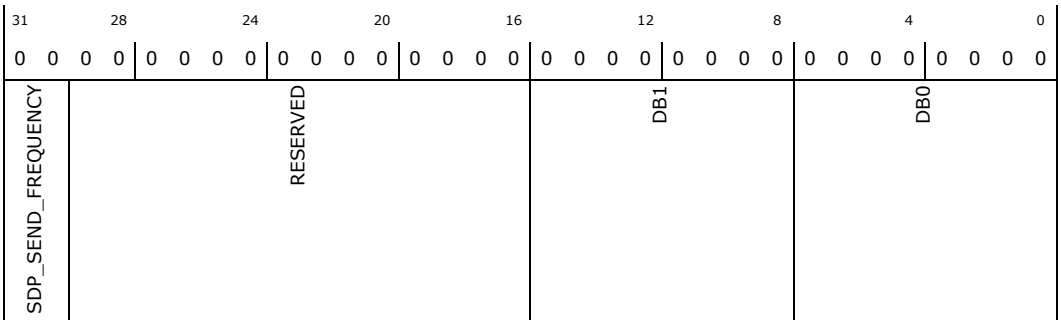
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 600A0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RW | **SDP_SEND_FREQUENCY:** 00: off, not sending<br>01: send one every frame<br>10: send once<br>11: reserved<br>Programming note: This field shall be programmed either send once or send one every frame when SW driver sets PSR active entry bit. When PSR is enabling this field is ignored. One SDP is sent in every frame until source is in PSR active state |
| 29:16 | 0b<br>RW | **RESERVED:** Reserved. |
| 15:8 | 0b<br>RW | **DB1:** : Programmed by display driver in manual mode, auto-generate by display controller in all other modes |

## 14.10.182 PIPEAWIDEGAMUTCOLORCORRECTIONC01_C00COEFFICIENTS—Offset 600B0h

When color correction matrix enable bit is set in PIPEACONF register, each of pixels in the pipe is multiplied with this matrix. Color matrix is used to convert pixels from one RGB color space to another RGB color space. There are many applications for the use of this matrix like gamut mapping between 72 percent color gamut to 92 percent color gamut. Each coefficient is a 12-bit signed fixed-point number. The application of coefficients are as follows:

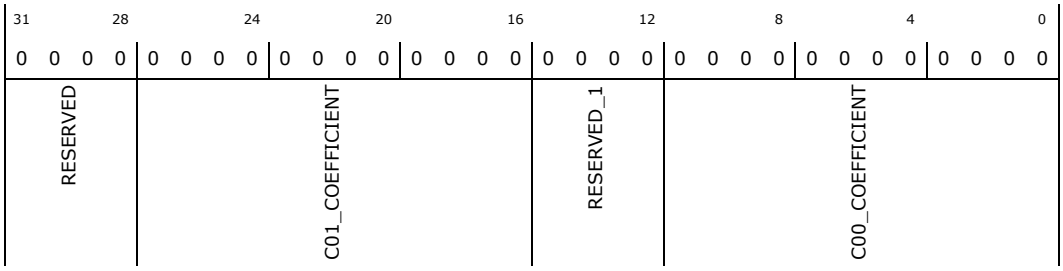
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 600B0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |

## 14.10.199 VSYNCSHIFT_B—Offset 61028h

Vertical Sync Shift Register

### Access Method

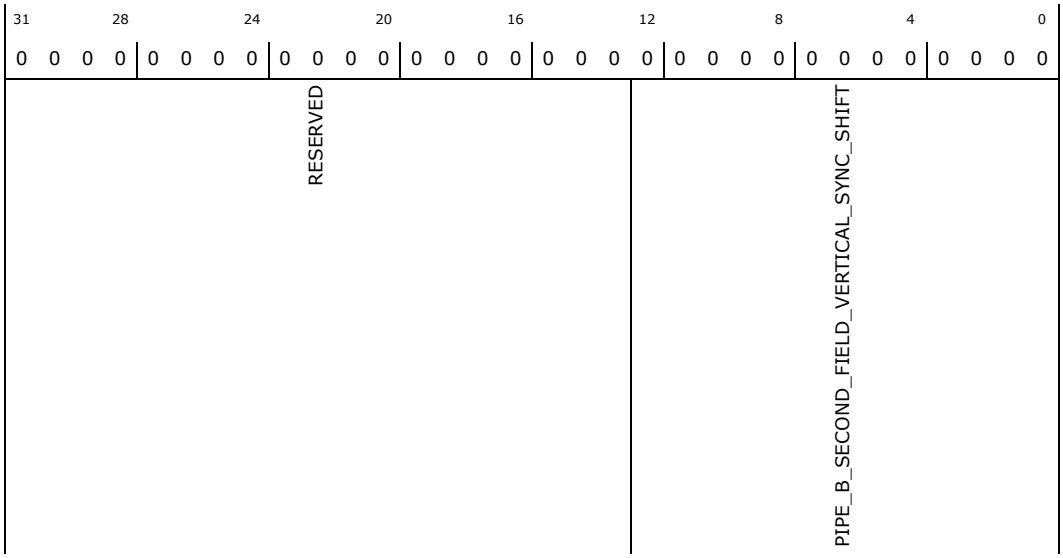
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61028h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0b<br>RW | **RESERVED:** Write as zero. |
| 12:0 | 0b<br>RW | **PIPE_B_SECOND_FIELD_VERTICAL_SYNC_SHIFT:** This value specifies the vertical sync alignment for the start of the interlaced second field expressed in terms of the absolute pixel number relative to the horizontal active display start.<br>This value will only be used if the PIPEBCONF is programmed to an interlaced mode using vsync shift. Otherwise a legacy value of floor[htotal / 2] will be used.<br>Typically, the interlaced second field vertical sync should start one pixel after the point halfway between successive horizontal syncs, so the value of this register should be programmed to:<br>(horizontal sync start - floor[horizontal total / 2]) (use the actual horizontal sync start and horizontal total values and not the minus one values programmed into registers).<br>This vertical sync shift only occurs during the interlaced second field. In all other cases the vertical sync start position is aligned with horizontal sync start. |

## 14.10.200 TRANSBDATAM1—Offset 61030h

Pipe B Data M value 1

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61030h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 7E000000h

## 14.11.1 CRCCTRLREDB—Offset 61050h

Pipe B CRC Color Control Register (Red)

### Access Method

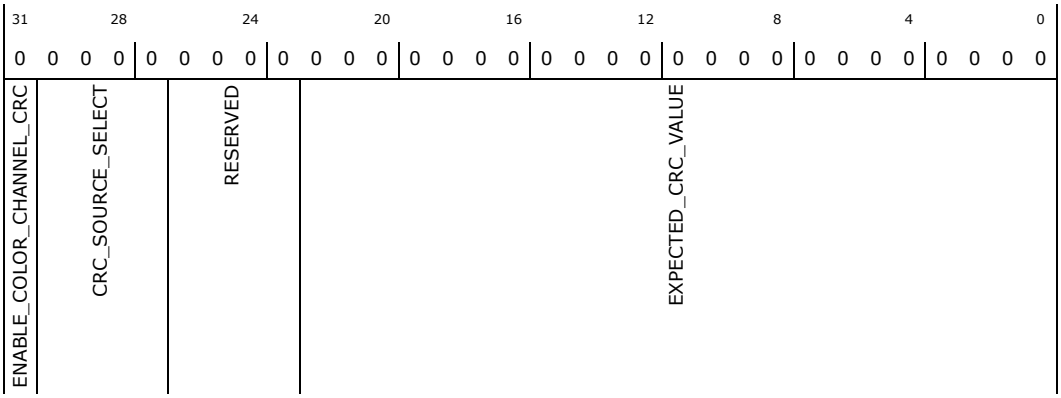
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61050h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **ENABLE_COLOR_CHANNEL_CRC:** After being enabled for the first time, you need to wait for two VBLANK events for a valid CRC result. After that, a CRC will be generated each frame.<br>0 = CRC Calculations are disabled<br>1 = CRC Calculations are enabled |
| 30:27 | 0b<br>RW | **CRC_SOURCE_SELECT:** These bits select the source of the data to put into the CRC logic.<br>0000: Pipe B (Not available when DisplayPort or TV is enabled on this pipe) [DevVLVP]<br>0001: sDVOB/HDMIB (30 bit format. Only select when HDMIB is set to pipe B) [DevVLVP]<br>0010: sDVOC/HDMIC (30 bit format. Only select when HDMIC is set to pipe B) [DevVLVP]<br>0011: DisplayPort D (40 bit format) [DevCTG]<br>0100: TV Encoder outputs (30 bit format)<br>0101: TV filter outputs (30 bit format)<br>0110: DisplayPort B (40 bit format) [DevCTG, DevCDV, DevVLVP]<br>0111: DisplayPort C (40 bit format) [DevCTG, DevCDV, DevVLVP]<br>1000: Audio DP (Audio for DisplayPort (pcdclk). A status bit can be used as an indication that the data is the valid result of a CRC calculation. The result of a CRC on an empty frame will be 7FFFFFh. |

## 14.11.11 PSRCTLB—Offset 61090h

Pipe B Panel Self Refresh Control

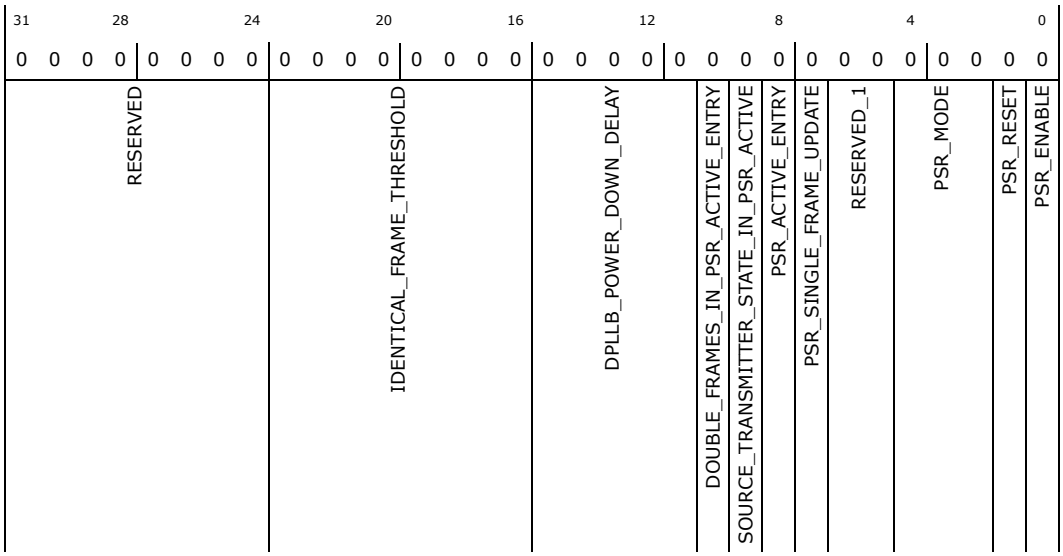
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61090h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RW | **IDENTICAL_FRAME_THRESHOLD:** : Number of identical frames that display controller needs to exceed in order to transition to PSR active state in HW timer mode |
| 15:11 | 0b<br>RW | **DPLLB_POWER_DOWN_DELAY:** programmable delay from main link powerdown to DPLLB powerdown. The delay is in number of cdclk clocks. |
| 10 | 0b<br>RW | **DOUBLE_FRAMES_IN_PSR_ACTIVE_ENTRY:** . If asserted, HW will send two frames with same SDP active setting when entry PSR active state. This bit is set if the vertical blanking time is less than 330us. |
| 9 | 0b<br>RW | **SOURCE_TRANSMITTER_STATE_IN_PSR_ACTIVE:** . If asserted, HW will keep transmitter active during PSR active state and sends only idle symbols. If deasserted, HW will turn off transmitter during PSR active state. Display driver will keep this bit consistent with Source transmitter state in PSR active bit in DPCD register of the sink. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8 | 0b<br>RW | **PSR_ACTIVE_ENTRY:** This bit is only valid in PSR_mode is SW timer mode. If it is asserted, HW will transition into PSR_active state. If it is deasserted, HW will transition to PSR_inactive state. SW should not set or clear this bit more than once within one vblank period. |
| 7 | 0b<br>RW | **PSR_SINGLE_FRAME_UPDATE:** In PSR SW or HW mode, SW set this bit before writing registers for a flip. After HW finishes signle frame update, it goes back to PSR active ? no RFB state. SW driver may send new single frame update request.<br>Programming note: Reading this bit is updated at the next vblank. Writing this bit to 1 will cause PSR FSM to perform single frame update automatically, no vblank is required. When single frame update is done, it will automatically go back to PSR active ? no RFB update. 61094[2:0] = 3b011. |
| 6:5 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 4:2 | 0b<br>RW | **PSR_MODE:** b011-111: reserved.<br>b010: PSR with HW timer. HW timer decides PSR active entry point. PSR active state exits upon MMIO write registers that may change the frame buffer.<br>b001: PSR with SW timer. In this mode, SW will keep track of idle frames and buffer modification in the driver and explicitly specify the entry and exit PSR active state point.<br>b000: PSR manual (debug) mode. All of PSR state transitions and SDP content is managed by SW driver. SW is responsible to change SDP content for every frame with appropriate values to keep PSR panel in synchronized states. |
| 1 | 0b<br>RW | **PSR_RESET:** If assert all PSR functions are reset back to PSR inactive state. When it needs to resynchronize source and sync, SW writes 0x2 to DPCD register 600h and to this bit to get system back to PSR active states. This bit is self clear. |
| 0 | 0b<br>RW | **PSR_ENABLE:** Panel Self-refresh is enabled. When it is asserted PSR is enabled and operate in one of the mode that specified by PSR mode. |

## 14.11.12 PSRSTATB—Offset 61094h

Pipe B PSR status register

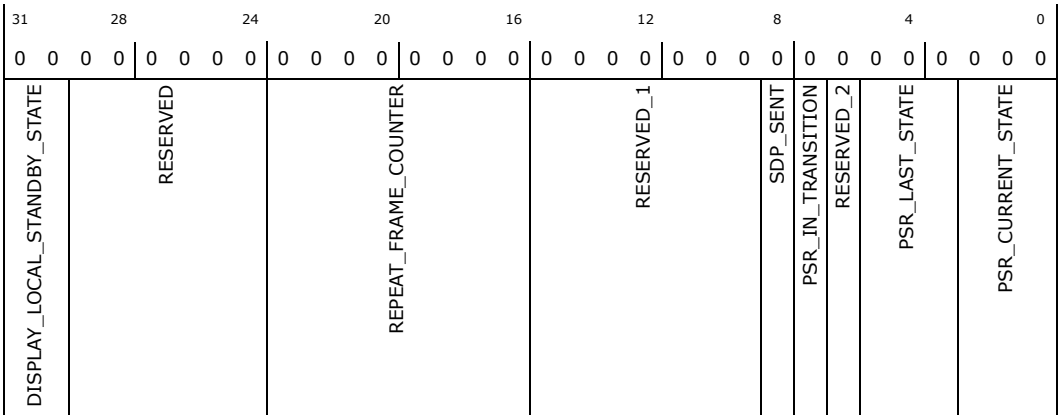
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61094h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RO | **DISPLAY_LOCAL_STANDBY_STATE:** :00: D0 idle state, fetch frame buffer from system memory<br>01: D0i1 not defined in VLVP<br>02: D0i2 PSR is active, display controller is trunk gated<br>03: D0i3 PSR is active, display controller is power gated |

## 14.11.16 PIPEBWIDEGAMUTCOLORCORRECTIONC01_C00COEFFICIENTS—Offset 610B0h

When color correction matrix enable bit is set in PIPEBCONF register, each of pixels in the pipe is multiplied with this matrix. Color matrix is used to convert pixels from one RGB color space to another RGB color space. There are many applications for the use of this matrix like gamut mapping between 72 percent color gamut to 92 percent color gamut. Each coefficient is a 12-bit signed fixed-point number. The application of coefficients are as follows:

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 610B0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

Software must enable this bit after training the link, and disable it when disabling the panel power state target.<br>0 = Backlight disabled<br>1 = Backlight enabled<br>[DevCL] Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RW | **POWER_DOWN_ON_RESET:** Enabling this bit causes the panel to power down when a reset warning comes to the GMCH from the ICH. When system reset is initiated, the embedded panel port automatically begins the panel power down sequence. If the panel is not on during a reset event, this bit is ignored.<br>0 = Do not run panel power down sequence when reset is detected<br>1 = Run panel power down sequence when system is reset |
| 0 | 0b<br>RW | **POWER_STATE_TARGET:** Writing this bit can occur any time, it will only be used at the completion of any current power cycle.<br>0 = The panel power state target is off, if the panel is either on or in a power on sequence, a power off sequence is started as soon as the panel reaches the power on state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done.<br>1= The panel power state target is on, if the panel is in either the off state or a power off sequence, if all pre-conditions are met, a power on sequence is started as soon as the panel reaches the power off state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done. While the panel is on or in a power on sequence, the register write lock will be enabled. |

## 14.11.41 PIPEA_PP_ON_DELAYS—Offset 61208h

PipeA Panel Power on Sequencing Delays ([DevCL, DevCTG, DevCDV]) PP On Delay values (dplrreg.v DPLRppon_sd)

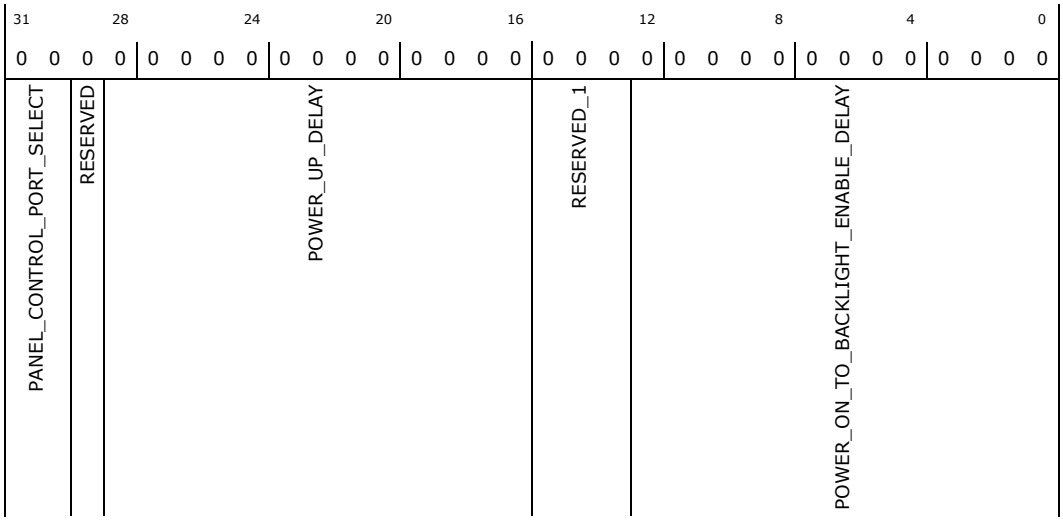
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61208h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RW | **PANEL_CONTROL_PORT_SELECT:** These bits define to which port the embedded panel is connected. This is used for automatic control of the panel power. If the selected port is disabled or if the port is not on pipe-B, then, the power sequence will not allow a panel power up.<br>00 = Reserved<br>01 = Panel is connected to the embedded DisplayPort B<br>10 = Panel is connected to the embedded DisplayPort C<br>11 = Reserved<br>The selection of non-existent ports are not allowed. This programming will disable panel power sequencing logic. |
| 29 | 0b<br>RW | **RESERVED:** Reserved. |
| 28:16 | 0b<br>RW | **POWER_UP_DELAY:** Programmable value of panel power sequencing delay during panel power up. This provides the time delay for the T1+T2 time sequence. The time unit used is the 100us timer. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 12:0 | 0b<br>RW | **POWER_ON_TO_BACKLIGHT_ENABLE_DELAY:** Programmable value of panel power sequencing delay during panel power up. This provides the time delay for the T5 (T3 for DisplayPort) time sequence. The time unit used is the 100us timer. |

## 14.11.42 PIPEA_PP_OFF_DELAYS—Offset 6120Ch

PipeA Panel Power off Sequencing Delays ([DevCL, DevCTG, DevCDV]) PP Delay Off values (dplrreg.v DPLRppoff_sd)

### Access Method

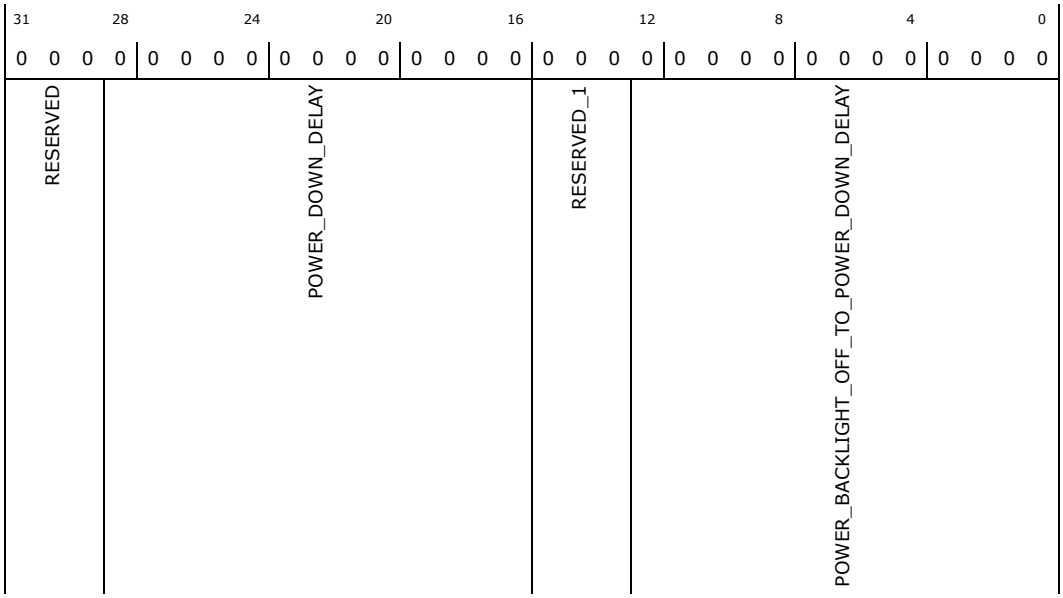
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6120Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Reserved. |
| 28:16 | 0b<br>RW | **POWER_DOWN_DELAY:** Programmable value of panel power sequencing delay during power up. This provides the time delay for the T3 (T5 for DisplayPort) time sequence. The time unit used is the 100us timer. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 12:0 | 0b<br>RW | **POWER_BACKLIGHT_OFF_TO_POWER_DOWN_DELAY:** Programmable value of panel power sequencing delay during power down. This provides the time delay for the Tx (T4 for DisplayPort) time sequence. The time unit used is the 100us timer. |

## 14.11.43 PIPEA_PP_DIVISOR—Offset 61210h

PipeA Panel Power Cycle Delay and Reference Divisor ([DevCL, DevCTG, DevCDV]) PP Divisor (dplrreg.v DPLRrefdiv_pp_cd)

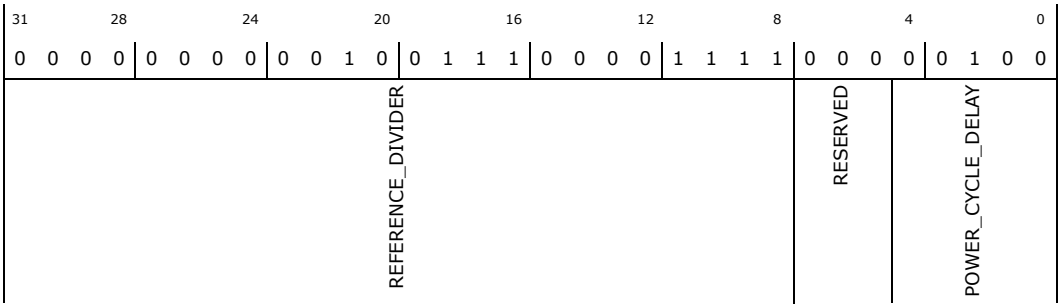
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61210h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00270F04h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 000000000 010011100 001111b RW | **REFERENCE_DIVIDER:** This field provides the value of the divider used for the creation of the panel timer reference clock. The output of the divider is used as the fastest of the three time bases (100us) for all other timers. The other time bases are divided from this frequency. The value of zero should not be used. When it is desired to divide by N, the actual value to be programmed is (N/2)-1. The value should be (100*RefinMHz/2)-1. The default value assumes the default value for the display core clock that is for [DevCL and DevCTG] a 200MHz reference value. The following are examples for other memory speeds.<br>Display Core Frequency Value of Field<br>233MHz 2D81h<br>200MHz 270Fh<br>133MHz 19F9h |
| 7:5 | 0b RW | **RESERVED:** Reserved. |
| 4:0 | 00100b RW | **POWER_CYCLE_DELAY:** Programmable value of time panel must remain in a powered down state after powering down. For devices coming out of reset, the default values will define how much time must pass before a power on sequence can be started. This field uses the .1 S time base unit from the divider. If the panel power on sequence is attempted during this delay, the power on sequence will commence once the power cycle delay is complete. Writing a value of 0 selects no delay or is used to abort the delay if it is active.<br>During the initial power up reset, a D3 cold power cycle, or a user instigated system reset, the timer will be set to the default value and the count down will begin after the de-assertion of reset. Writing this field to a zero while the count is active will abort this portion of the sequence. This corresponds to the T4 of the SPWG specification. Note: Even if the panel is not enabled, the T4 count happens after reset.<br>This register needs to be programmed to a +1 value. For instance for meeting the SPWG specification of 400mS, program 5 to achieve at least 400mS delay prior to powerup. |

## 14.11.44 PFIT_CONTROL—Offset 61230h

Panel Fitting Controls

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

## 14.11.48 PIPEA_BLC_PWM_CLT2—Offset 61250h

PipeA Backlight PWM Control Register 2

### Access Method

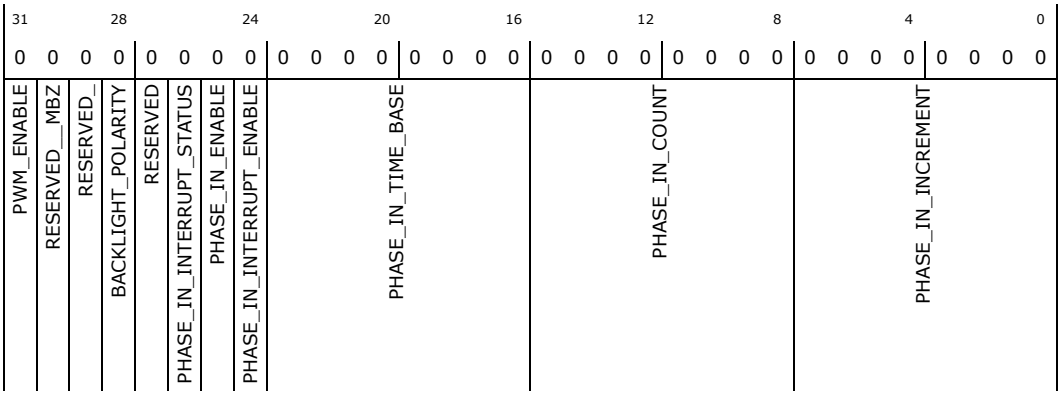
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61250h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **PWM_ENABLE:** This bit enables the PWM counter logic<br>0 = PWM disabled (drives 0 always)<br>1 = PWM enabled |
| 30 | 0b<br>RW | **RESERVED__MBZ:** Reserved. |
| 29 | 0b<br>RW | **RESERVED_:** Reserved. |
| 28 | 0b<br>RW | **BACKLIGHT_POLARITY:** This field controls the polarity of the PWM signal.<br>0 = Active High<br>1 = Active Low |
| 27 | 0b<br>RW | **RESERVED:** MBZ |
| 26 | 0b<br>RW/1C | **PHASE_IN_INTERRUPT_STATUS:** This bit will be set by hardware when a Phase-In interrupt has occurred. Software will clear this bit by writing a 1 , which will reset the interrupt generation.<br>[DevCL-A,B] Reserved<br>AccessType: One to Clear |
| 25 | 0b<br>RW | **PHASE_IN_ENABLE:** Setting this bit enables a PWM phase in based on the programming of the Phase In registers below. This bit clears itself when the phase in is completed. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 24 | 0b<br>RW | **PHASE_IN_INTERRUPT_ENABLE:** Setting this bit enables an interrupt to be generated when the PWM phase in is completed. |
| 23:16 | 0b<br>RW | **PHASE_IN_TIME_BASE:** This field determines the number of VBLANK events that pass before one increment occurs.<br>0 = invalid<br>1 = 1 vblank<br>2 = 2 vblanks<br>etc. |
| 15:8 | 0b<br>RW | **PHASE_IN_COUNT:** This field determines the number of increment events in this phase in. Writes to this register should only occur when hardware-phase-ins are disabled. Reads to this register can occur any time, where the value in this field indicates the number of increment events remaining to fully apply a phase-in request as hardware automatically decrements this value. A value of 0 is invalid.<br>In order to write the same value to this field for the second time, one must write a dummy value to this field, for example, 0 , before writing the real value for the second time. |
| 7:0 | 0b<br>RW | **PHASE_IN_INCREMENT:** This field indicates the amount to adjust the PWM duty cycle register on each increment event.<br>This is a two s complement number. |

## 14.11.49 PIPEA_BLC_PWM_CTL—Offset 61254h

PipeA Backlight PWM Control Register

### Access Method

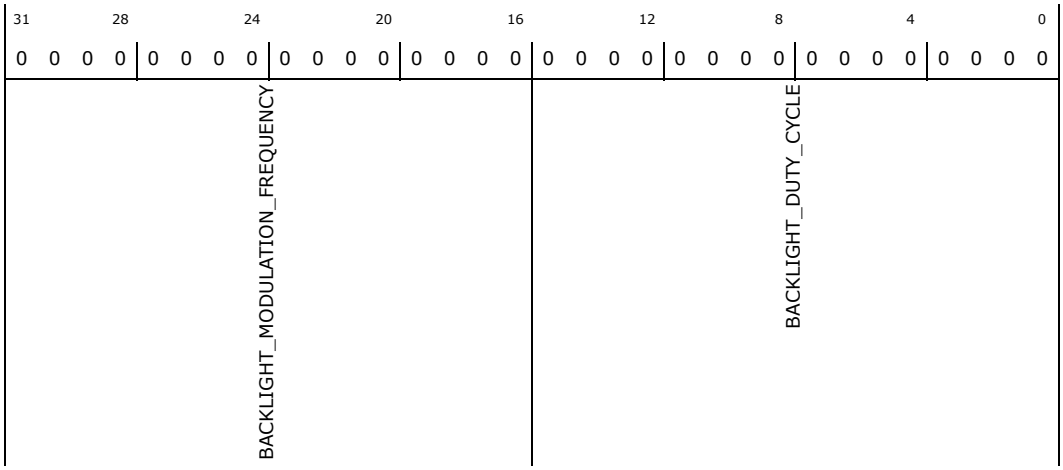
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61254h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **BACKLIGHT_MODULATION_FREQUENCY:** This field determines the number of time base events in total for a complete cycle of modulated backlight control. This field is normally set once during initialization based on the frequency of the clock that is being used and the desired PWM frequency. This value represents the period of the PWM stream in display core clocks ([DevCTG] 100MHz HRAW clocks) multiplied by 128 or 25MHz S0IX clocks multipled by 16. |
| 15:0 | 0b<br>RW | **BACKLIGHT_DUTY_CYCLE:** This field determines the number of time base events for the active portion of the PWM backlight control. This should never be larger than the frequency field. A value of zero will turn the backlight off. A value equal to the backlight modulation frequency field will be full on. This field gets updated when it is desired to change the intensity of the backlight, it will take affect at the end of the current PWM cycle. This value represents the active time of the PWM stream in display core clock ([DevCTG] HRAW clock) periods multiplied by 128 or 25MHz S0IX clocks multipled by 16. |

## 14.11.50 PIPEA_BLM_HIST_CTL—Offset 61260h

PipeA Image Enhancement Histogram Control Register

### Access Method

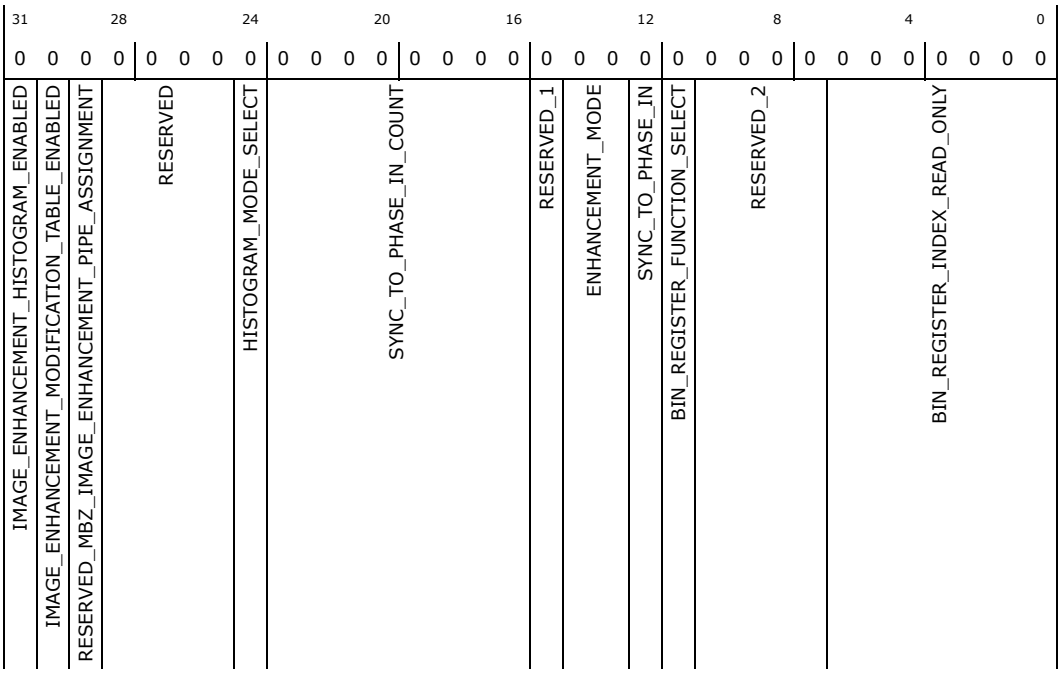
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61260h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **IMAGE_ENHANCEMENT_HISTOGRAM_ENABLED:** This bit enables the Image Enhancement histogram logic to collect data.<br>0 = Image histogram is disabled<br>1 = The Image histogram is enabled. When this bit is changed from a zero to a one, histogram calculations will begin after the next VBLANK of the assigned pipe. |
| 30 | 0b<br>RW | **IMAGE_ENHANCEMENT_MODIFICATION_TABLE_ENABLED:** This bit enables the Image Enhancement modification table.<br>0 = disabled<br>1 = enabled. When this bit is changed from a zero to a one, modifications begin after the next VBLANK of the assigned pipe. |

| 3 | 0b<br>RW | **EDP_PANEL_VDD_ENABLE:** [DevCDV]: Enabling this bit enables the panel vdd if the embedded panel is DisplayPort, as indicated in bits 31:30 of the panel power on sequencing. Software must enable this bit for eDP link training. After eDP link training is done, software must disable it and let the normal panel power sequencing to take control.<br>0 = eDP panel Vdd disabled<br>1 = eDP panel Vdd enabled<br>[DevCLN] Reserved |
| 2 | 0b<br>RW | **BACKLIGHT_ENABLE:** [DevCTG, DevCDV]: Enabling this bit enables the panel backlight if the embedded panel is DisplayPort, as indicated in bits 31:30 of the panel power on sequencing. Software must enable this bit after training the link, and disable it when disabling the panel power state target.<br>0 = Backlight disabled<br>1 = Backlight enabled<br>[DevCL] Reserved |
| 1 | 0b<br>RW | **POWER_DOWN_ON_RESET:** Enabling this bit causes the panel to power down when a reset warning comes to the GMCH from the ICH. When system reset is initiated, the embedded panel port automatically begins the panel power down sequence. If the panel is not on during a reset event, this bit is ignored.<br>0 = Do not run panel power down sequence when reset is detected<br>1 = Run panel power down sequence when system is reset |
| 0 | 0b<br>RW | **POWER_STATE_TARGET:** Writing this bit can occur any time, it will only be used at the completion of any current power cycle.<br>0 = The panel power state target is off, if the panel is either on or in a power on sequence, a power off sequence is started as soon as the panel reaches the power on state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done.<br>1= The panel power state target is on, if the panel is in either the off state or a power off sequence, if all pre-conditions are met, a power on sequence is started as soon as the panel reaches the power off state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done. While the panel is on or in a power on sequence, the register write lock will be enabled. |

## 14.11.55 PIPEB_PP_ON_DELAYS—Offset 61308h

PipeB Panel Power on Sequencing Delays ([DevVLVP]) PP On Delay values (dplrreg.v DPLRppon_sd)

### Access Method

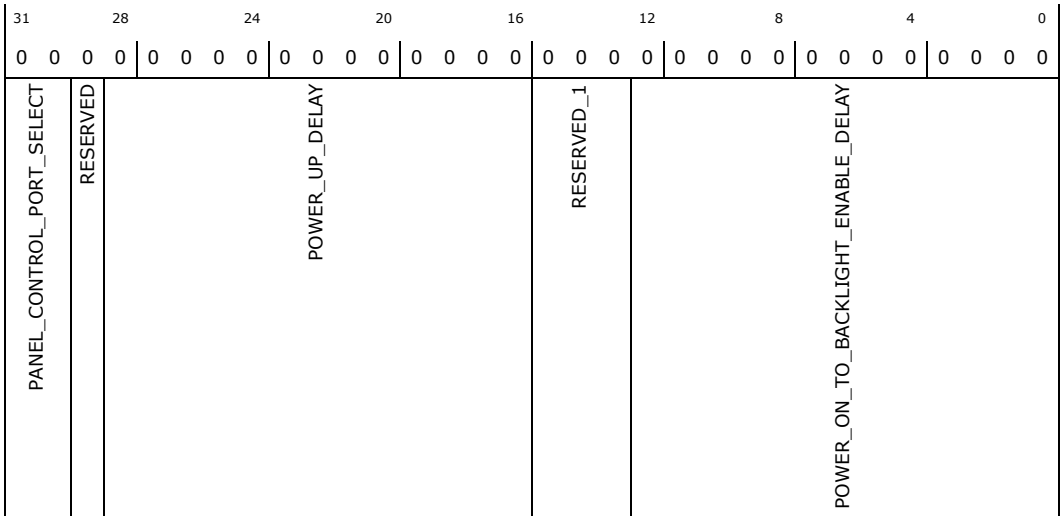
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61308h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RW | **PANEL_CONTROL_PORT_SELECT:** These bits define to which port the embedded panel is connected. This is used for automatic control of the panel power. If the selected port is disabled or if the port is not on pipe-B, then, the power sequence will not allow a panel power up.<br>00 = Reserved<br>01 = Panel is connected to the embedded DisplayPort B<br>10 = Panel is connected to the embedded DisplayPort C<br>11 = Reserved<br>The selection of non-existent ports are not allowed. This programming will disable panel power sequencing logic. |
| 29 | 0b<br>RW | **RESERVED:** Reserved. |
| 28:16 | 0b<br>RW | **POWER_UP_DELAY:** Programmable value of panel power sequencing delay during panel power up. This provides the time delay for the T1+T2 time sequence. The time unit used is the 100us timer. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 12:0 | 0b<br>RW | **POWER_ON_TO_BACKLIGHT_ENABLE_DELAY:** Programmable value of panel power sequencing delay during panel power up. This provides the time delay for the T5 (T3 for DisplayPort) time sequence. The time unit used is the 100us timer. |

## 14.11.56 PIPEB_PP_OFF_DELAYS—Offset 6130Ch

PipeB Panel Power off Sequencing Delays ([DevVLVP]) PP Delay Off values (dplrreg.v DPLRppoff_sd)

### Access Method

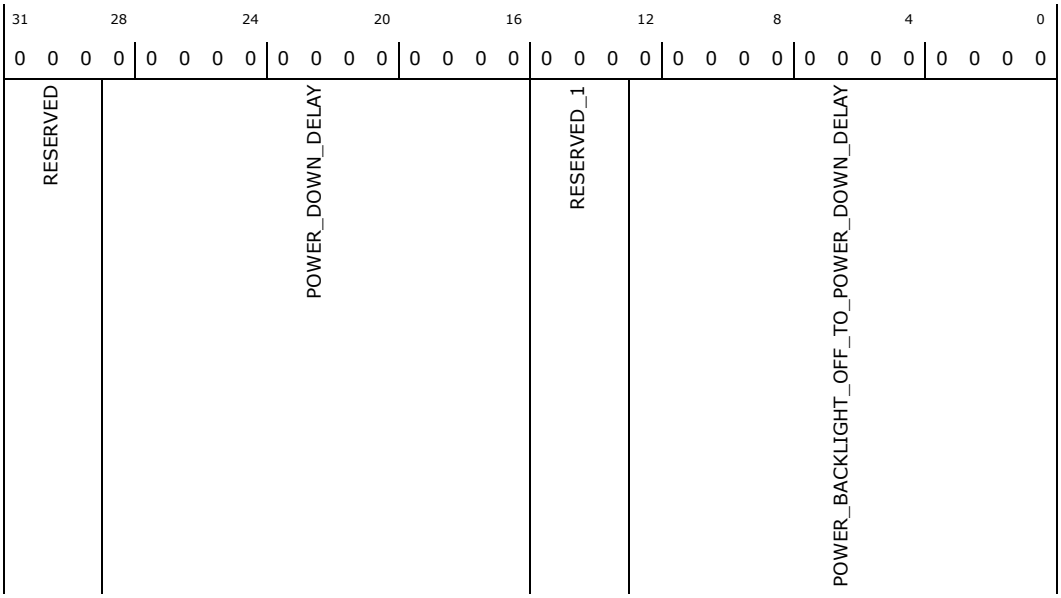
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6130Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0b<br>RW | **RESERVED:** Reserved. |
| 28:16 | 0b<br>RW | **POWER_DOWN_DELAY:** Programmable value of panel power sequencing delay during power up. This provides the time delay for the T3 (T5 for DisplayPort) time sequence. The time unit used is the 100us timer. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 12:0 | 0b<br>RW | **POWER_BACKLIGHT_OFF_TO_POWER_DOWN_DELAY:** Programmable value of panel power sequencing delay during power down. This provides the time delay for the Tx (T4 for DisplayPort) time sequence. The time unit used is the 100us timer. |

## 14.11.57 PIPEB_PP_DIVISOR—Offset 61310h

PipeB Panel Power Cycle Delay and Reference Divisor ([DevVLVP]) PP Divisor (dplrreg.v DPLRrefdiv_pp_cd)

### Access Method

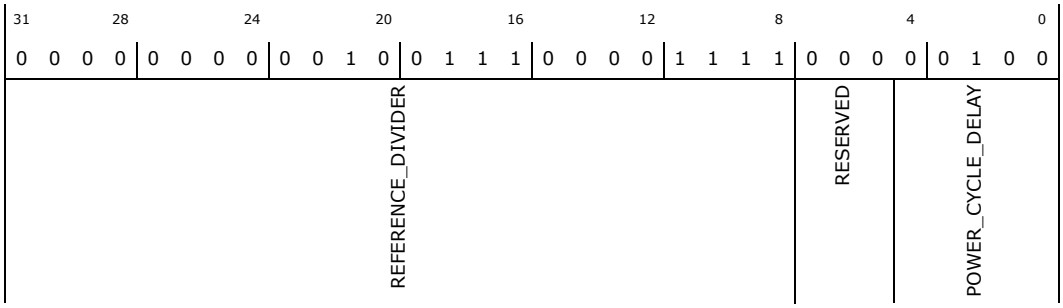
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61310h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00270F04h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 000000000 010011100 001111b RW | **REFERENCE_DIVIDER:** This field provides the value of the divider used for the creation of the panel timer reference clock. The output of the divider is used as the fastest of the three time bases (100us) for all other timers. The other time bases are divided from this frequency. The value of zero should not be used. When it is desired to divide by N, the actual value to be programmed is (N/2)-1. The value should be (100*RefinMHz/2)-1. The default value assumes the default value for the display core clock that is for [DevCL and DevCTG] a 200MHz reference value. The following are examples for other memory speeds.<br>Display Core Frequency Value of Field<br>233MHz 2D81h<br>200MHz 270Fh<br>133MHz 19F9h |
| 7:5 | 0b RW | **RESERVED:** Reserved. |
| 4:0 | 00100b RW | **POWER_CYCLE_DELAY:** Programmable value of time panel must remain in a powered down state after powering down. For devices coming out of reset, the default values will define how much time must pass before a power on sequence can be started. This field uses the .1 S time base unit from the divider. If the panel power on sequence is attempted during this delay, the power on sequence will commence once the power cycle delay is complete. Writing a value of 0 selects no delay or is used to abort the delay if it is active.<br>During the initial power up reset, a D3 cold power cycle, or a user instigated system reset, the timer will be set to the default value and the count down will begin after the de-assertion of reset. Writing this field to a zero while the count is active will abort this portion of the sequence. This corresponds to the T4 of the SPWG specification. Note: Even if the panel is not enabled, the T4 count happens after reset.<br>This register needs to be programmed to a +1 value. For instance for meeting the SPWG specification of 400mS, program 5 to achieve at least 400mS delay prior to powerup. |

## 14.11.58 PIPEB_BLC_PWM_CLT2—Offset 61350h

PipeB Backlight PWM Control Register 2

### Access Method

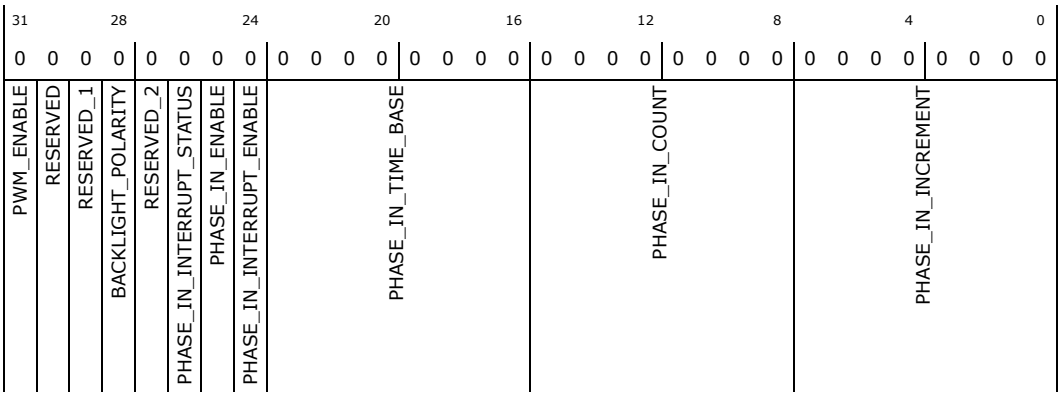
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61350h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **PWM_ENABLE:** This bit enables the PWM counter logic<br>0 = PWM disabled (drives 0 always)<br>1 = PWM enabled |
| 30 | 0b<br>RW | **RESERVED:** MBZ |
| 29 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 28 | 0b<br>RW | **BACKLIGHT_POLARITY:** This field controls the polarity of the PWM signal.<br>0 = Active High<br>1 = Active Low |
| 27 | 0b<br>RW | **RESERVED_2:** MBZ |
| 26 | 0b<br>RW/1C | **PHASE_IN_INTERRUPT_STATUS:** This bit will be set by hardware when a Phase-In interrupt has occurred. Software will clear this bit by writing a 1 , which will reset the interrupt generation.<br>[DevCL-A,B] Reserved<br>AccessType: One to Clear |
| 25 | 0b<br>RW | **PHASE_IN_ENABLE:** Setting this bit enables a PWM phase in based on the programming of the Phase In registers below. This bit clears itself when the phase in is completed. |
| 24 | 0b<br>RW | **PHASE_IN_INTERRUPT_ENABLE:** Setting this bit enables an interrupt to be generated when the PWM phase in is completed. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23:16 | 0b<br>RW | **PHASE_IN_TIME_BASE:** This field determines the number of VBLANK events that pass before one increment occurs.<br>0 = invalid<br>1 = 1 vblank<br>2 = 2 vblanks<br>etc. |
| 15:8 | 0b<br>RW | **PHASE_IN_COUNT:** This field determines the number of increment events in this phase in. Writes to this register should only occur when hardware-phase-ins are disabled. Reads to this register can occur any time, where the value in this field indicates the number of increment events remaining to fully apply a phase-in request as hardware automatically decrements this value. A value of 0 is invalid.<br>In order to write the same value to this field for the second time, one must write a dummy value to this field, for example, 0 , before writing the real value for the second time. |
| 7:0 | 0b<br>RW | **PHASE_IN_INCREMENT:** This field indicates the amount to adjust the PWM duty cycle register on each increment event.<br>This is a two s complement number. |

## 14.11.59 PIPEB_BLC_PWM_CTL—Offset 61354h

PipeB Backlight PWM Control Register

### Access Method

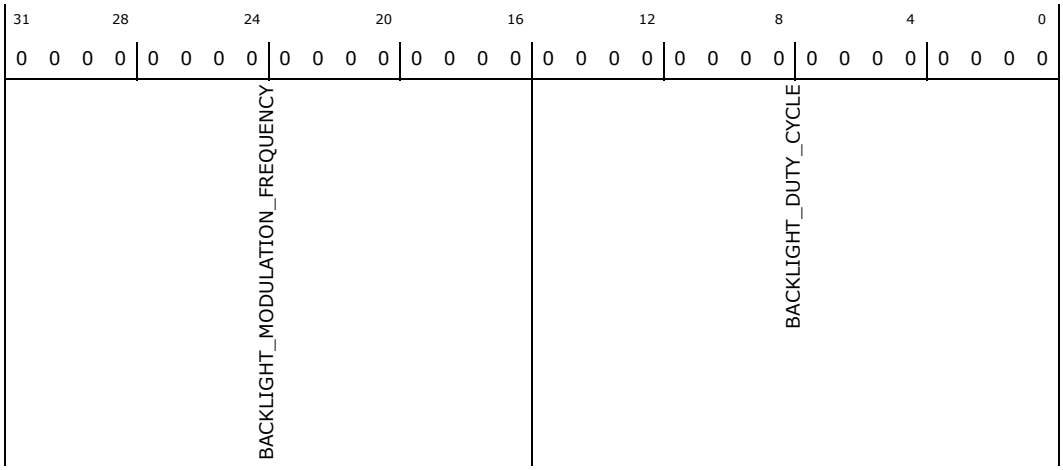
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61354h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0b<br>RW | **BACKLIGHT_MODULATION_FREQUENCY:** This field determines the number of time base events in total for a complete cycle of modulated backlight control. This field is normally set once during initialization based on the frequency of the clock that is being used and the desired PWM frequency. This value represents the period of the PWM stream in display core clocks ([DevCTG] HRAW clocks) multiplied by 128 or 25MHz S0IX clocks multipled by 16. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0b<br>RW | **BACKLIGHT_DUTY_CYCLE:** This field determines the number of time base events for the active portion of the PWM backlight control. This should never be larger than the frequency field. A value of zero will turn the backlight off. A value equal to the backlight modulation frequency field will be full on. This field gets updated when it is desired to change the intensity of the backlight, it will take affect at the end of the current PWM cycle. This value represents the active time of the PWM stream in display core clock ([DevCTG] HRAW clock) periods multiplied by 128 or 25MHz S0IX clocks multipled by 16. |

## 14.11.60 PIPEB_BLM_HIST_CTL—Offset 61360h

PipeB Image Enhancement Histogram Control Register

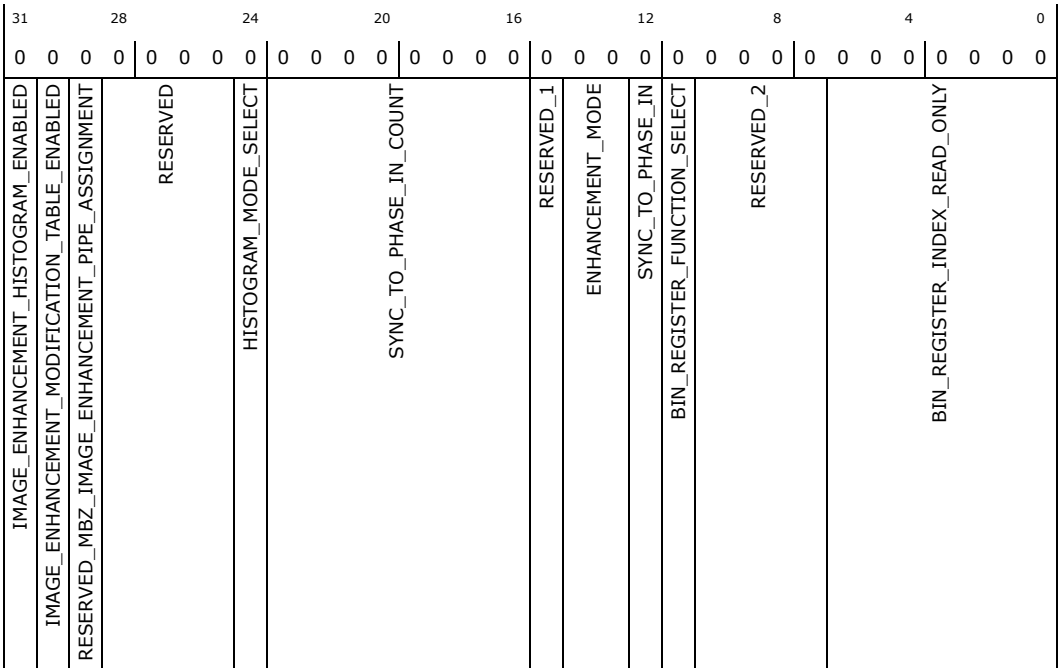
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61360h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **IMAGE_ENHANCEMENT_HISTOGRAM_ENABLED:** This bit enables the Image Enhancement histogram logic to collect data.<br>0 = Image histogram is disabled<br>1 = The Image histogram is enabled. When this bit is changed from a zero to a one, histogram calculations will begin after the next VBLANK of the assigned pipe. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 30 | 0b<br>RW | **IMAGE_ENHANCEMENT_MODIFICATION_TABLE_ENABLED:** This bit enables the Image Enhancement modification table.<br>0 = disabled<br>1 = enabled. When this bit is changed from a zero to a one, modifications begin after the next VBLANK of the assigned pipe. |
| 29 | 0b<br>RW | **RESERVED_MBZ_IMAGE_ENHANCEMENT_PIPE_ASSIGNMENT:** Each pipe has its own dedicated IE function. |
| 28:25 | 0b<br>RW | **RESERVED:** Always write as 0 s. |
| 24 | 0b<br>RW | **HISTOGRAM_MODE_SELECT:** 0: YUV Luma Mode<br>1: HSV Intensity Mode - Reserved on [DevCL] |
| 23:16 | 0b<br>RW | **SYNC_TO_PHASE_IN_COUNT:** This field indicates the phase in count number on which the Image Enhancement table will be loaded if the Sync to Phase in is enabled. |
| 15 | 0b<br>RW | **RESERVED_1:** Always write as 0. |
| 14:13 | 0b<br>RW | **ENHANCEMENT_MODE:** 00: Direct look up mode<br>01: Additive mode<br>10: Multiplicative mode - Reserved on [DevCL]<br>11: Reserved |
| 12 | 0b<br>RW | **SYNC_TO_PHASE_IN:** Setting this bit enables the double buffered registers to be loaded on the phase in count value specified instead of the next vblank. |
| 11 | 0b<br>RW | **BIN_REGISTER_FUNCTION_SELECT:** This field indicates what data is being written to or read from the bin data register.<br>0 = Bin Threshold Count. A read from the bin data register returns that bin s threshold value from the most recent vblank load event (guardband threshold trip). Valid range for the Bin Index is 0 to 31.<br>1 = Bin Image Enhancement Value. Valid range for the Bin Index is 0 to 32 |
| 10:7 | 0b<br>RW | **RESERVED_2:** Always write as 0's. |
| 6:0 | 0b<br>RO | **BIN_REGISTER_INDEX_READ_ONLY:** This field indicates the bin number whose data can be accessed through the bin data register. This value is automatically incremented by a read or a write to the bin data register if the busy bit is not set.<br>AccessType: Read Only |

## 14.11.61 PIPEB_IMAGE_ENHANCEMENT_BIN_DATA_REGISTER—Offset 61364h

PIPEB_IMAGE_ENHANCEMENT_BIN_DATA_REGISTER index registers

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 61364h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

It signifies the level of the GMBUS port 4 (port B) data line at boot.<br>0 = digital display not detected during initialization (Default)<br>1 = digital display detected during initialization<br>AccessType: Read Only |
| 1 | 0b<br>RW | **RESERVED_5:** MBZ |
| 0 | 0b<br>RW | **DISABLE_FRAMESTART_STALL:** This bit, when set, will disable the framestart window to stall DP AV mixer from sending audio samples before framestart. This applies to BOTH pipes.<br>0 = Enable framestart window to stall audio samples. (default)<br>1 = Disable framestart window to stall audio samples. |

## 14.11.116 DPB_AUX_CH_CTL—Offset 64110h

Display Port B AUX Channel Control [DevCDV] AuxB control (dprrega_b0.v auxb_ctl_rdback)

### Access Method

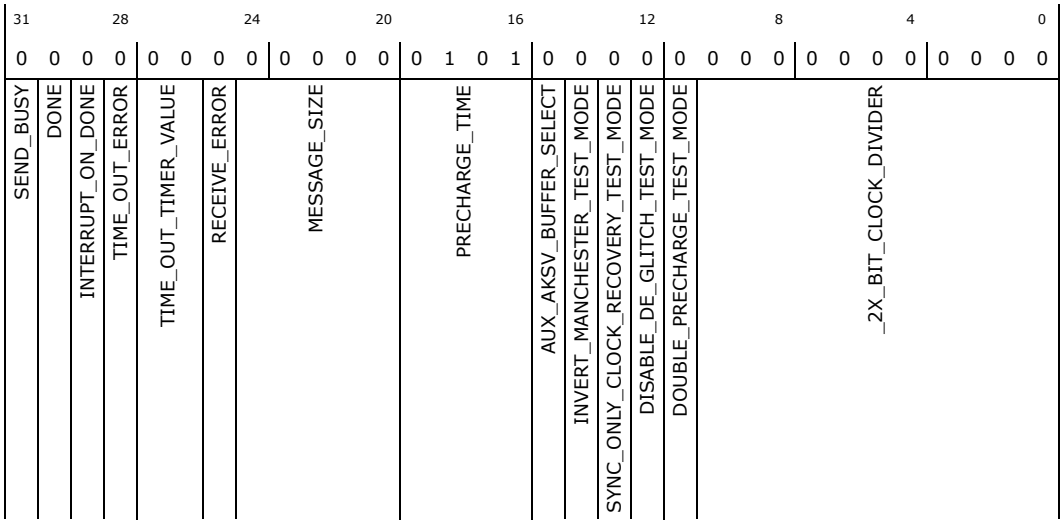
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 64110h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00050000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SEND_BUSY:** Setting this bit to a one initiates the transaction, when read this bit will be a 1 until the transmission completes. The transaction is completed when the response is received or when a timeout occurs. Do not write a 1 again until transaction completes. Writes of 0 will be ignored. |
| 30 | 0b<br>RW/1C | **DONE:** A sticky bit that indicates the transaction has completed. SW must write a 1 to this bit to clear the event.<br>AccessType: One to Clear |
| 29 | 0b<br>RW | **INTERRUPT_ON_DONE:** Enable an interrupt in the hotplug status register when the transaction completes or times out. |
| 28 | 0b<br>RW/1C | **TIME_OUT_ERROR:** A sticky bit that indicates the transaction has timed out. SW must write a 1 to this bit to clear the event.<br>AccessType: One to Clear |
| 27:26 | 0b<br>RW | **TIME_OUT_TIMER_VALUE:** 00: 400us (default)<br>01: 600us<br>10: 800us<br>11: 1600us<br>The time count depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz. |
| 25 | 0b<br>RW/1C | **RECEIVE_ERROR:** A sticky bit that indicates that the data received was corrupted, not in multiples of a full byte, or more than 20 bytes. SW must write a 1 to this bit to clear the event.<br>AccessType: One to Clear |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 24:20 | 0b<br>RW | **MESSAGE_SIZE:** This field is used to indicate the total number bytes to transmit (including the header). It also indicates the number of bytes received in a transaction (including the header). This field is valid only only when the done bit is set and timeout or receive error has not occurred. Sync/Stop are not part of the message or the message size.<br>Reads of this field will give the response message size.<br>The read value will not be valid while Busy bit 31 is asserted.<br>Message sizes of 0 or )20 are not allowed. |
| 19:16 | 0101b<br>RW | **PRECHARGE_TIME:** Used to determine the precharge time for the Aux Channel drivers. The value is the number of microseconds times 2. This depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz. Default is 5 decimal which gives 10us of precharge.<br>Example: For 12us precharge, program 6 (12us/2us). |
| 15 | 0b<br>RW | **AUX_AKSV_BUFFER_SELECT:** This bit selects whether some of the data to be written over Display Port AUX comes from the Aksv buffer for HDCP authentication, or all from the AUX Data registers.<br>Set this bit before initiating a transaction to write Aksv to the Display Port sink. All AUX protocol must be followed and Message Size set to 9 bytes. The first DWord transmitted will be from the AUX Data Register 1 for the header, then the DP_AUX_CH_AKSV_HI, then the last byte from DP_AUX_CH_AKSV_LO. The sink response is read back as usual from the AUX Data registers.<br>More than one AUX channel can select to use the Aksv buffer simultaneously.<br>0 (Default) Use AUX Data registers for regular data transmission<br>1 Use Aksv Buffer for part of the data transmission. |
| 14 | 0b<br>RW | **INVERT_MANCHESTER_TEST_MODE:** 1 = Manchester code rising edge mid-clk signifies one (test mode)<br>0 = Manchester code rising edge mid-clk signifies zero (default) |
| 13 | 0b<br>RW | **SYNC_ONLY_CLOCK_RECOVERY_TEST_MODE:** 1 = Only recover clock during sync pattern (test mode)<br>0 = Recover clock during sync pattern and data phase (default) |
| 12 | 0b<br>RW | **DISABLE_DE_GLITCH_TEST_MODE:** 1 = Disable serial input de-glitch logic (test mode)<br>0 = Enable serial input de-glitch logic (default) |
| 11 | 0b<br>RW | **DOUBLE_PRECHARGE_TEST_MODE:** 1 = Precharge time is doubled<br>0 = Precharge time is as programmed |
| 10:0 | 0b<br>RW | **_2X_BIT_CLOCK_DIVIDER:** Used to determine the 2X bit clock the Aux Channel logic runs on.<br>This value divides the input clock frequency down to 2X bit clock rate. The 2X bit clock rate is ideally 2MHz (0.5us).<br>[DevCTG-A] the input clock is cdclk.<br>[DevCTG-B, DevCDV] the input clock is hrawclk (200MHz)<br>Example:<br>For 300MHz input clock and desired 2MHz 2X bit clock, program 150 (300MHz/2MHz). |

## 14.11.117 DPB_AUX_CH_DATA1—Offset 64114h

Display Port B AUX Data Register 1 [DevCTG, DevCDV]

### Access Method

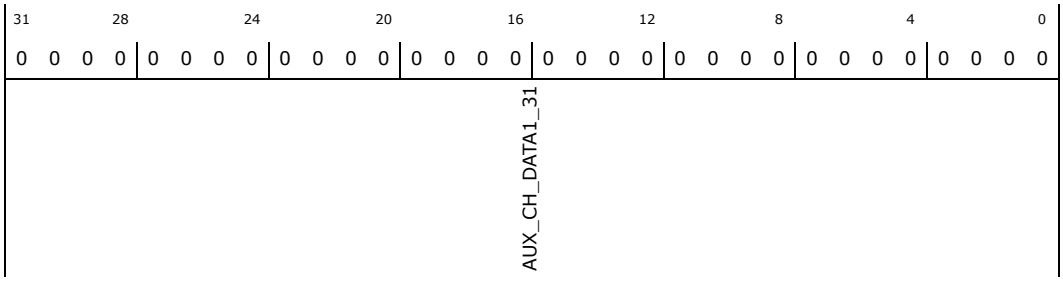
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 64114h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **AUX_CH_DATA1_31:** 0]:<br>The first Dword of the message. The Msbyte is transmitted first. Reads will give the response data after transaction complete. |

## 14.11.118 DPB_AUX_CH_DATA2—Offset 64118h

Display Port B AUX Data Register 2 [DevCTG, DevCDV] AuxB Data2 (dprrega_b0.v auxb_dpr_data2, ql_auxb_d2)

### Access Method

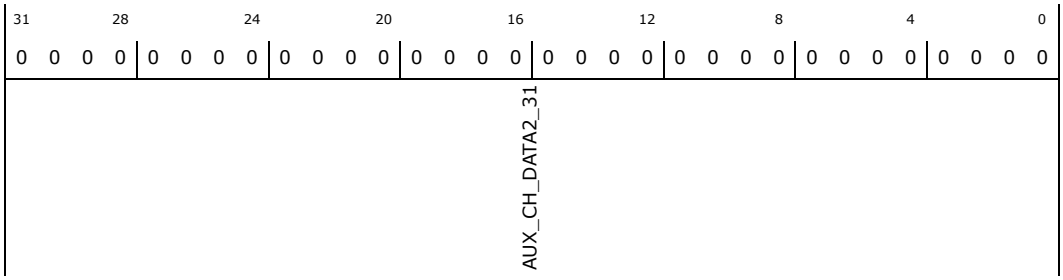
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 64118h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **AUX_CH_DATA2_31:** 0]:<br>The second Dword of the message. The Msbyte is transmitted first. Only used if the message size is greater than 4. Reads will give the response data after transaction complete. |

## 14.11.119 DPB_AUX_CH_DATA3—Offset 6411Ch

Display Port B AUX Data Register 3 [DevCTG, DevCDV] AuxB Data3 (dprrega_b0.v auxb_dpr_data3, ql_auxb_d3)

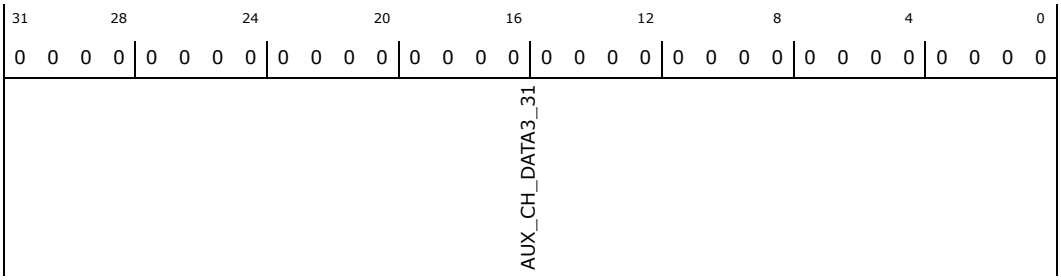
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6411Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |

It signifies the level of the GMBUS port (sDVO B/C) data line at boot.<br>0 = digital display not detected during initialization (Default)<br>1 = digital display detected during initialization<br>AccessType: Read only |
| 1:0 | 0b<br>RW | **RESERVED_5:** MBZ |

## 14.11.126 DPC_AUX_CH_CTL—Offset 64210h

Display Port C AUX Channel Control [DevCTG] AuxC Data1 (dprrega_b0.v auxc_dpr_data1, ql_auxc_d1)

### Access Method

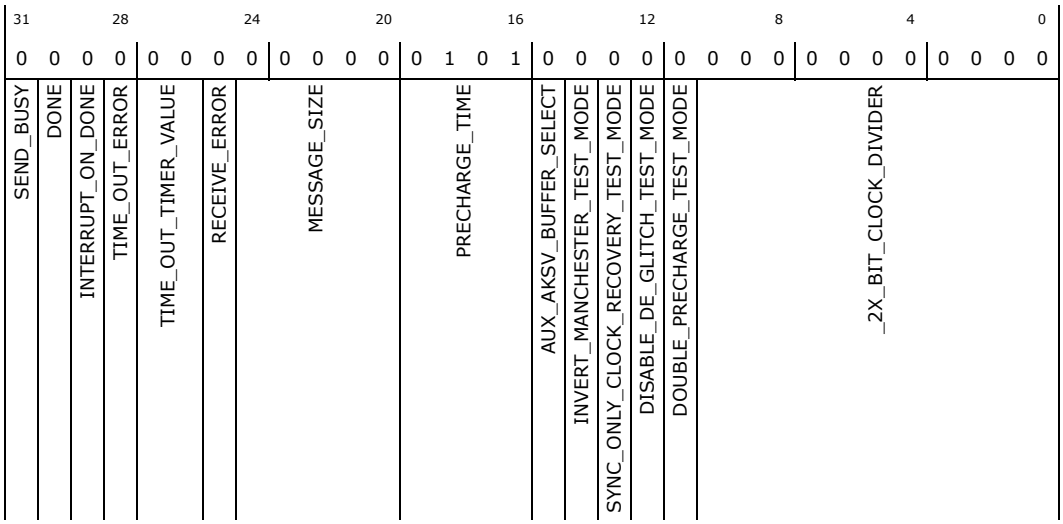
**Type:** Memory Mapped I/O Register (Size: 32 bits)

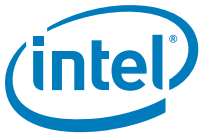
**Offset:** [GTTMMADR_LSB + 180000h] + 64210h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00050000h





| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SEND_BUSY:** Setting this bit to a one initiates the transaction, when read this bit will be a 1 until the transmission completes. The transaction is completed when the response is received or when a timeout occurs. Do not write a 1 again until transaction completes. Writes of 0 will be ignored. |
| 30 | 0b<br>RW/1C | **DONE:** A sticky bit that indicates the transaction has completed. SW must write a 1 to this bit to clear the event.<br>AccessType: One to Clear |
| 29 | 0b<br>RW | **INTERRUPT_ON_DONE:** Enable an interrupt in the hotplug status register when the transaction completes or times out. |
| 28 | 0b<br>RW/1C | **TIME_OUT_ERROR:** A sticky bit that indicates the transaction has timed out. SW must write a 1 to this bit to clear the event.<br>AccessType: One to Clear |
| 27:26 | 0b<br>RW | **TIME_OUT_TIMER_VALUE:** 00: 400us (default)<br>01: 600us<br>10: 800us<br>11: 1600us<br>The time count depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz. |
| 25 | 0b<br>RW/1C | **RECEIVE_ERROR:** A sticky bit that indicates that the data received was corrupted, not in multiples of a full byte, or more than 20 bytes. SW must write a 1 to this bit to clear the event.<br>AccessType: One to Clear |
| 24:20 | 0b<br>RW | **MESSAGE_SIZE:** This field is used to indicate the total number bytes to transmit (including the header). It also indicates the number of bytes received in a transaction (including the header). This field is valid only only when the done bit is set and timeout or receive error has not occurred. Sync/Stop are not part of the message or the message size.<br>Reads of this field will give the response message size.<br>The read value will not be valid while Busy bit 31 is asserted.<br>Message sizes of 0 or )20 are not allowed. |
| 19:16 | 0101b<br>RW | **PRECHARGE_TIME:** Used to determine the precharge time for the Aux Channel drivers.<br>The value is the number of microseconds times 2.<br>This depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz.<br>Default is 5 decimal which gives 10us of precharge.<br>Example:<br>For 12us precharge, program 6 (12us/2us). |
| 15 | 0b<br>RW | **AUX_AKSV_BUFFER_SELECT:** This bit selects whether some of the data to be written over Display Port AUX comes from the Aksv buffer for HDCP authentication, or all from the AUX Data registers.<br>Set this bit before initiating a transaction to write Aksv to the Display Port sink. All AUX protocol must be followed and Message Size set to 9 bytes. The first DWord transmitted will be from the AUX Data Register 1 for the header, then the DP_AUX_CH_AKSV_HI, then the last byte from DP_AUX_CH_AKSV_LO. The sink response is read back as usual from the AUX Data registers.<br>More than one AUX channel can select to use the Aksv buffer simultaneously.<br>0 (Default) Use AUX Data registers for regular data transmission<br>1 Use Aksv Buffer for part of the data transmission. |
| 14 | 0b<br>RW | **INVERT_MANCHESTER_TEST_MODE:** 1 = Manchester code rising edge mid-clk signifies one (test mode)<br>0 = Manchester code rising edge mid-clk signifies zero (default) |
| 13 | 0b<br>RW | **SYNC_ONLY_CLOCK_RECOVERY_TEST_MODE:** 1 = Only recover clock during sync pattern (test mode)<br>0 = Recover clock during sync pattern and data phase (default) |
| 12 | 0b<br>RW | **DISABLE_DE_GLITCH_TEST_MODE:** 1 = Disable serial input de-glitch logic (test mode)<br>0 = Enable serial input de-glitch logic (default) |
| 11 | 0b<br>RW | **DOUBLE_PRECHARGE_TEST_MODE:** 1 = Precharge time is doubled<br>0 = Precharge time is as programmed |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:0 | 0b<br>RW | **_2X_BIT_CLOCK_DIVIDER:** Used to determine the 2X bit clock the Aux Channel logic runs on.<br>This value divides the input clock frequency down to 2X bit clock rate. The 2X bit clock rate is ideally 2MHz (0.5us).<br>[DevCTG-A] the input clock is cdclk.<br>[DevCTG-B] the input clock is hrawclk.<br>Example:<br>For 300MHz input clock and desired 2MHz 2X bit clock, program 150 (300MHz/2MHz). |

## 14.11.127 DPC_AUX_CH_DATA1—Offset 64214h

Display Port C AUX Data Register 1 [DevCTG, DevCDV] AuxC Data1 (dprrega_b0.v auxc_dpr_data1, ql_auxc_d1)

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 64214h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

## 14.11.133 STREAM_A_LPE_AUD_CONFIG—Offset 65000h

LPE Audio Configuration

### Access Method

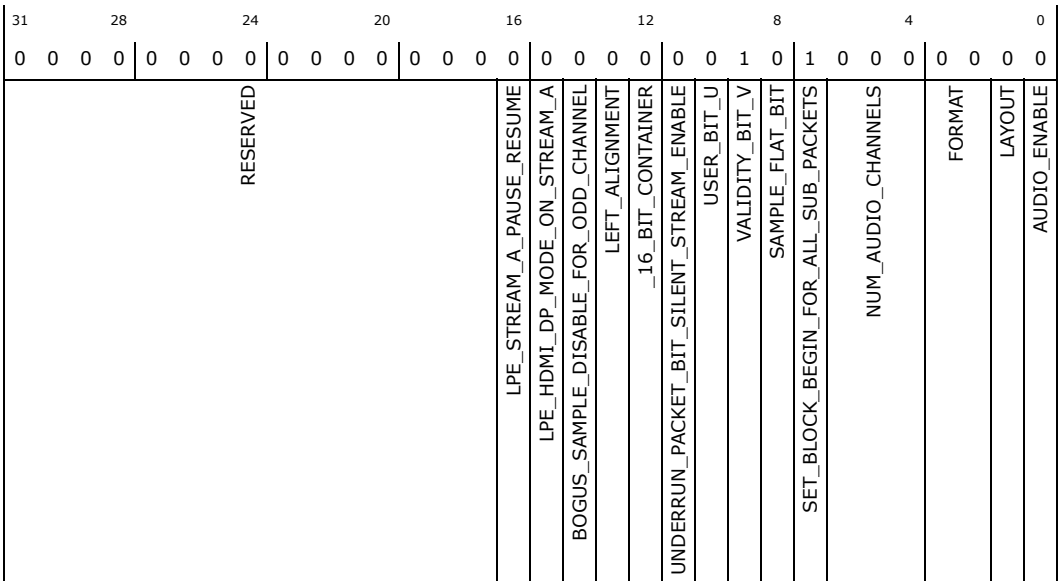
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65000h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000280h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0b<br>RW | **RESERVED:** Reserved. |
| 16 | 0b<br>RW | **LPE_STREAM_A_PAUSE_RESUME:** DMA pause fetching at the boundary of buffers when this bit is set, and resume fetching when this bit is cleared.<br>1- DMA stop requesting more audio sample from buffer A,B,C,D after reading and depleting all data from current buffer<br>0- DMA resume requesting data from the next available buffer (A,B,C,D).<br>Programming note: this bit should not be used by SW driver. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically |
| 15 | 0b<br>RW | **LPE_HDMI_DP_MODE_ON_STREAM_A:** 1 = DP mode<br>0 = HDMI mode (default) |
| 14 | 0b<br>RW | **BOGUS_SAMPLE_DISABLE_FOR_ODD_CHANNEL:** When number of channels in a sample is odd (3, 5, or 7) source application may pad a bogus sample to the next even number of channels. If this bit is set there is no padding in input buffer1= No bogus sample present in buffer for odd number of channels<br>0= Bogus sample present in buffer for odd number of channels (default) |
| 13 | 0b<br>RW | **LEFT_ALIGNMENT:** When input buffer is in 32-bit container mode. If this bit is set the MSB of audio sample is aligned bit 31 of the container if this bit is clear MSB of audio sample is aligned with bit 23 of the container.1= MSB is bit 31 of 32-bit container<br>0= MSB is bit 23 of 32-bit container (default) |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 0b<br>RW | **_16_BIT_CONTAINER:** When this bit is set 16-bit sample is stored in 16-bit container format. When it is clear container is 32-bit for each sample regardless of valid bits (default)1= 16-bit container<br>0= 32-bit container |
| 11 | 0b<br>RW | **UNDERRUN_PACKET_BIT_SILENT_STREAM_ENABLE:** Set this bit will enble HW to send valid zero-filled packet with Sample flat bit set when no sample buffer is available, NCTS packets (or Timesstamp packet) are sent to keep sink in sync even no audio sound will heard.1= send underrun packets (silent stream)<br>0= send null packets (default)<br>Programming note: SW driver shall always set silent stream bit. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically. |
| 10 | 0b<br>RW | **USER_BIT_U:** HW will clear this bit ineach sub-frames it sends, But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance<br>1= sey U bit in sub-frame<br>0= clear U bit in sub-frame (default) |
| 9 | 1b<br>RW | **VALIDITY_BIT_V:** HW will set this bit in both each sub-frames it sends. But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance<br>1= Set V bit in sub-frame (default)<br>0= clear V bit in sub-frame. For debug or testing |
| 8 | 0b<br>RW | **SAMPLE_FLAT_BIT:** When set the sample flat bit will be set in all HDMI sub-packets.<br>1= flat bit is set for valid sample<br>0= flat bit is not set for valid sample (default) |
| 7 | 1b<br>RW | **SET_BLOCK_BEGIN_FOR_ALL_SUB_PACKETS:** Controls the B bit in the header of only the first Audio Packet /frame of a 192 frame 60958 block in Layout 1 mode. This bit only applies to LPE HDMI mode.<br>0: The B bit will be set only for sub-packet 0<br>1: The B bit in the Audio sample packet header will be set for all valid sub-packets. (default) |
| 6:4 | 0b<br>RW | **NUM_AUDIO_CHANNELS:** 000: 2 channels (stereo)<br>001: 3 channels<br>010: 4 channels<br>011: 5 channels<br>100: 6 channels<br>101: 7 channels<br>110: 8 channels<br>Note: When disable_bogus sample bit is clear HW will always treat odd number of channels similar to the next higher even number. Thus 3 is similar to 4, 5 to 6 and 7 to 8. This is because SW ensures that an even number of samples are packed in the audio buffers.<br>Programming note: Bit 6 of of this field is a write only bit. When reads back, it always returns zero. Ensure to write bit 6 to 1?b1 when programming for 6/7/8 audio channels. |
| 3:2 | 0b<br>RW | **FORMAT:** 00: L-PCM or IEC 61937<br>01: High Bit Rate IEC 61937 stream packet (not supported)<br>10: One Bit Audio Sample packet (not supported)<br>11: DST Audio Sample packet (not supported) |
| 1 | 0b<br>RW | **LAYOUT:** 0: Layout 0 (2-ch)<br>1: Layout 1 (3-8 ch)<br>Note: Layout bit doesn t matter for HBR |
| 0 | 0b<br>RW | **AUDIO_ENABLE:** Controls generation of N/CTS and transmission of audio sample packets.<br>0: Audio sample packets are not transmitted, CTS calculation/transmission is disabled<br>1: Audio sample packets are transmitted and CTS calculation is enabled<br>When enable audio unit will wait until the next vertical blank period before sending out the audio packets. When disable, audio unit may continue to send audio packet until the end of current active video frame before stopping. |

## 14.11.134 STREAM_A_LPE_AUD_CH_STATUS_0—Offset 65008h

Audio Channel Status Attributes 0

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65008h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7:0 | 0b<br>RW | **CHANNEL_STATUS_REGISTER_1:** . These bits are transmitted as attributes of audio packets. There is only 8 bits valid in this register. |

## 14.11.136 STREAM_A_LPE_AUD_HDMI_CTS_DP_MAUD—Offset 65010h

Audio HDMI CTS Register (DP Maud)

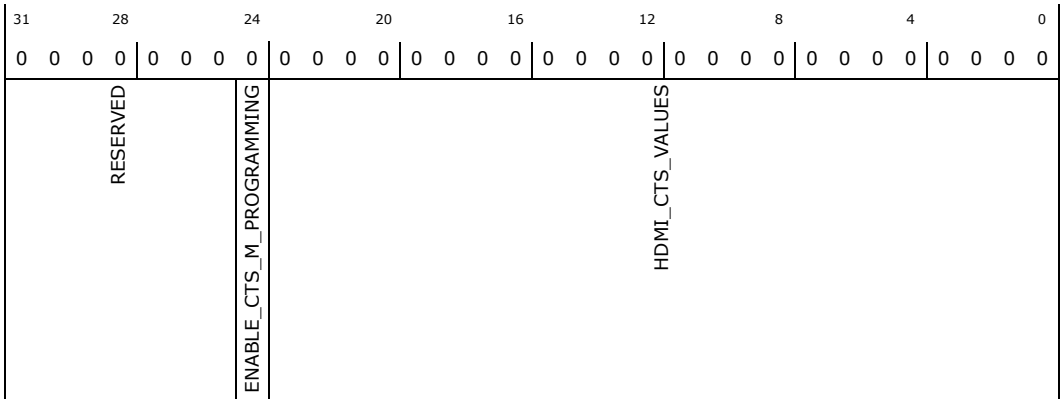
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65010h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 24 | 0b<br>RW | **ENABLE_CTS_M_PROGRAMMING:** 1 = Enable CTS/M programming<br>0 = Disable CTS/M programming |
| 23:0 | 0b<br>RW | **HDMI_CTS_VALUES:** These are bits [23:0] of programmable HDMI CTS values (or DP Maud) that is pre-calculated to achieve desired audio sample rates with a particular pixel clocks configuration.<br>Audio function must be disabled when changing this field. Bit 24 also need to write to 1 to enable this field. |

## 14.11.137 STREAM_A_LPE_AUD_HDMI_N_DP_NAUD—Offset 65014h

Audio HDMI N Register (DP Naud)

### Access Method

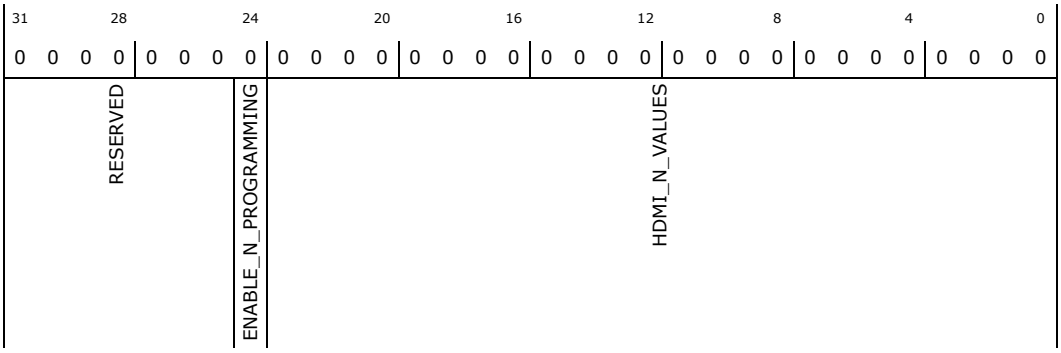
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65014h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0b<br>RW | **RESERVED:** Reserved. |
| 24 | 0b<br>RW | **ENABLE_N_PROGRAMMING:** 1 = Enable N programming<br>0 = Disable N programming |
| 23:0 | 0b<br>RW | **HDMI_N_VALUES:** These are bits [23:0] of programmable HDMI N (or DP Naud) values that is pre-calculated to achieve desired audio sample rates with a particular pixel clocks configuration.<br>Audio function must be disabled when changing this field. Bit 24 also need to write to 1 to enable this field. |

## 14.11.138 STREAM_A_LPE_AUD_BUFFER_CONFIG—Offset 65020h

LPE Audio buffer config

### Access Method

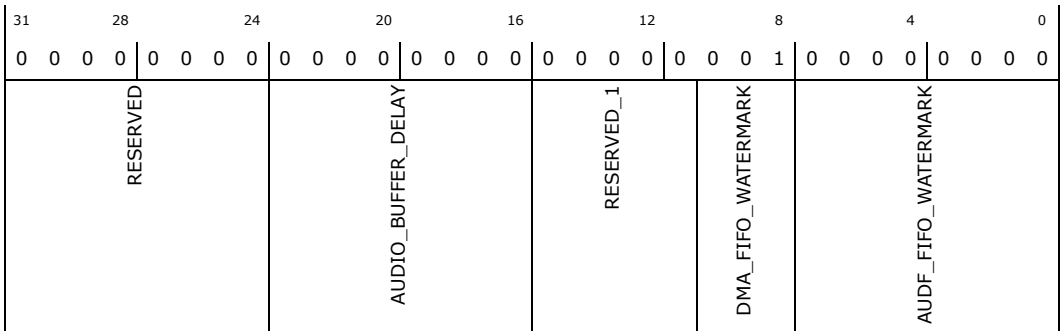
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65020h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000100h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RW | **AUDIO_BUFFER_DELAY:** This field specifies a delay in number of video frames that the audio controller will count off when audio enable bit is set before start transmitting audio sample. |
| 15:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10:8 | 001b<br>RW | **DMA_FIFO_WATERMARK:** Audio unit has a 8x64 bytes fifo for pre-fetching and staging audio samples. This register provides a watermark value in SWORDs (64B). When enable and sample buffer is available audio unit will fetch samples until this FIFO is full then it waits until HDMI/DP packet assembler drains the samples to a level less or equal the watermark setting then it will start fetching the samples again. Default value is 1 cacheline (SW). |
| 7:0 | 0b<br>RW | **AUDF_FIFO_WATERMARK:** Audio unit has a 96x8 bytes fifo for pre-fetching and staging audio samples. This register provides a watermark value in DWORDs. When enable and sample buffer is available audio unit will fetch samples until this FIFO occupancy is above the watermark then it waits until HDMI packet assembler drains the samples to a level less or equal the watermark setting then it will start fetching the samples again |

## 14.11.139 STREAM_A_LPE_AUD_BUF_CH_SWP—Offset 65024h

Audio Sample Swapping

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65024h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00FAC688h

## 14.11.140 STREAM_A_LPE_AUD_BUF_A_ADDR—Offset 65040h

Address for Audio Buffer A

### Access Method

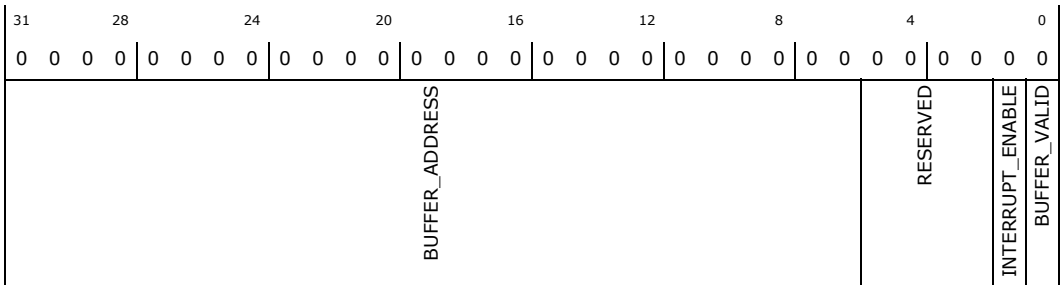
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65040h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |
| 5:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1 | 0b<br>RW | **INTERRUPT_ENABLE:** If enable hardware will generate an interrupt when it is done fetching this buffer |
| 0 | 0b<br>RW | **BUFFER_VALID:** . This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.11.141 STREAM_A_LPE_AUD_BUF_A_LENGTH—Offset 65044h

Length for Audio Buffer A

### Access Method

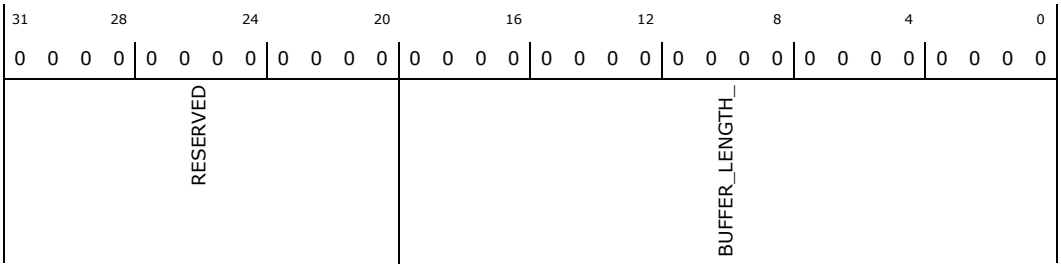
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65044h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.142 STREAM_A_LPE_AUD_BUF_B_ADDR—Offset 65048h

Address for Audio Buffer B

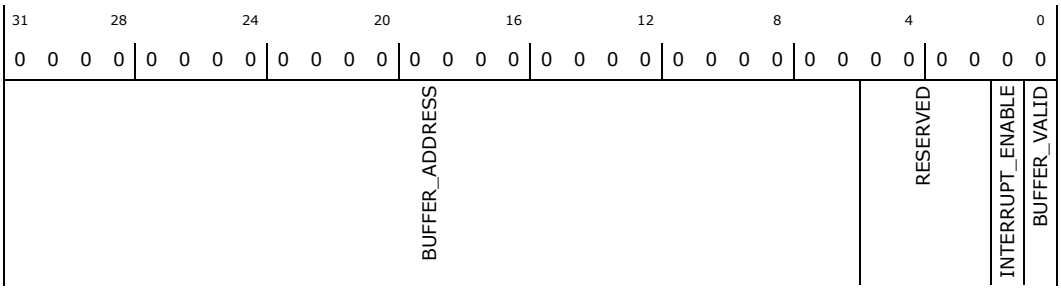
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65048h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |

## 14.11.145 STREAM_A_LPE_AUD_BUF_C_LENGTH—Offset 65054h

Length for Audio Buffer C

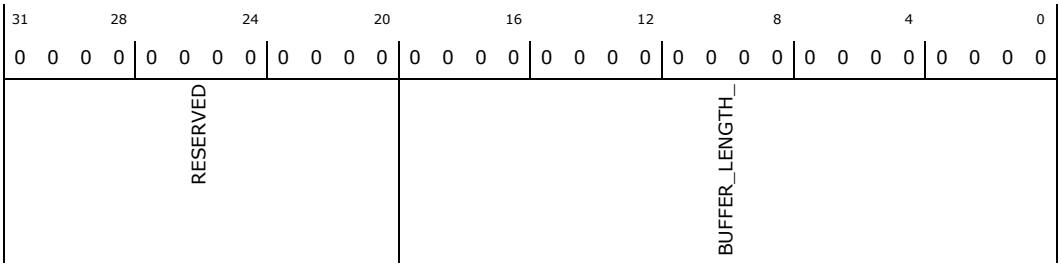
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65054h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.146 STREAM_A_LPE_AUD_BUF_D_ADDR—Offset 65058h

Address for Audio Buffer D

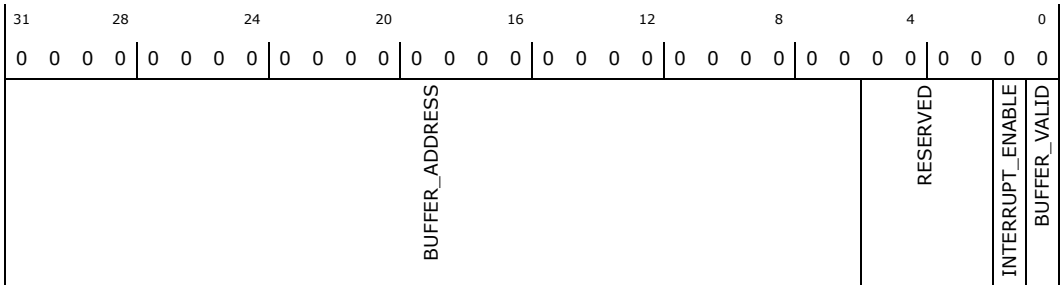
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65058h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |
| 5:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1 | 0b<br>RW | **INTERRUPT_ENABLE:** If enable hardware will generate an interrupt when it is done fetching this buffer |
| 0 | 0b<br>RW | **BUFFER_VALID:** . This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.11.147 STREAM_A_LPE_AUD_BUF_D_LENGTH—Offset 6505Ch

Length for Audio Buffer D

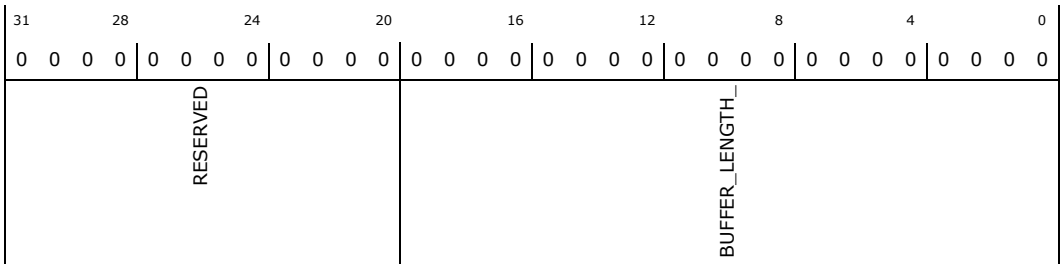
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6505Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.148 STREAM_A_LPE_AUD_CNTL_ST—Offset 65060h

LPE Audio Control State Register

### Access Method

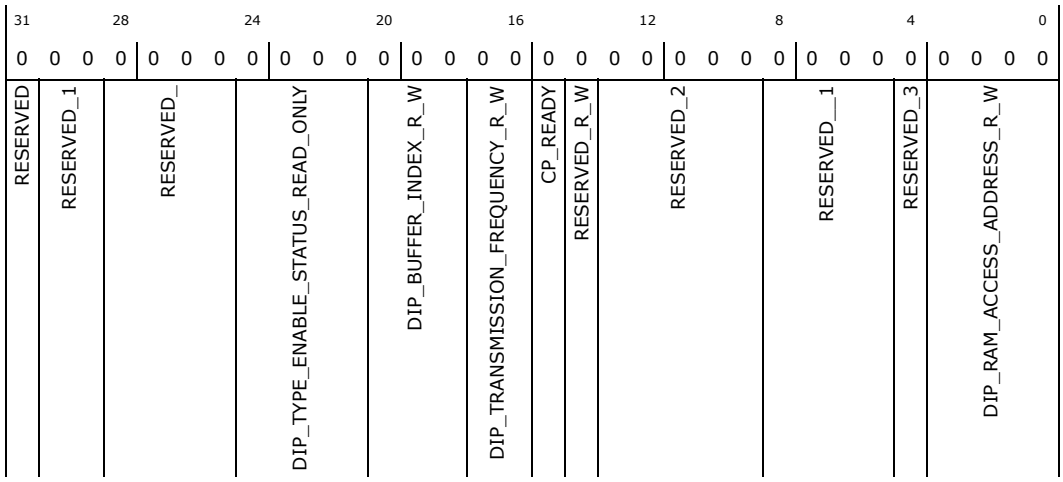
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65060h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **RESERVED:** Reserved. |
| 30:29 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 28:25 | 0b<br>RW | **RESERVED_:** for later DIP type if needed: Must be 0. |
| 24:21 | 0b<br>RW | **DIP_TYPE_ENABLE_STATUS_READ_ONLY:** These bits reflects the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling an DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP.<br>XXX1 = Audio DIP enable status (Default = disabled)<br>XX1X = Generic 1 (ACP) DIP enable status (Default = disabled)<br>X1XX = Generic 2 DIP enable status, can be used by ISRC1 or ISRC2 (Default = disabled)<br>1XXX = Reserved |
| 20:18 | 0b<br>RW | **DIP_BUFFER_INDEX_R_W:** This field is used during read or write of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0 s.<br>000 = (Default) Audio DIP (31 bytes of address space, 13 bytes of data)<br>001 = Generic 1 (ACP) Data Island Packet (31 bytes of address space, 11 bytes of data)<br>010 = Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data)<br>011 = Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data)<br>1XX = reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17:16 | 0b<br>RW | **DIP_TRANSMISSION_FREQUENCY_R_W:** These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written.When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18.<br>00 = Disabled (Default)<br>01 = once per frame<br>10 = Send once<br>11 = Best effort (Send at least every other vsync) |
| 15 | 0b<br>RW | **CP_READY:** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced.<br>0 = CP request pending or not ready to receive requests (default)<br>1 = CP request ready<br>CP_ready bit is programmable through Bit 14 for [DevCL, DevBLC].<br>CP_ready bit is programmable through Bit 15 for [DevCTG].<br>Bit 15 Reserved for [DevCL, DevBLC]. |
| 14 | 0b<br>RW | **RESERVED_R_W:** ELD valid: This bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit.0 = ELD data invalid (default, when writing ELD data, set 0 by software)<br>1 = ELD data valid (Set by video software only)<br>ELD bit is programmable through Bit 13 for [DevCL, DevBLC].<br>ELD bit is programmable through Bit 14 for [DevCTG]. |
| 13:9 | 0b<br>RW | **RESERVED_2:** ELD buffer size (read only)10000 = This field reflects the size of the ELD buffer in DWORDs<br>13:9 reflects ELD buffer size for [DevCTG].<br>12:9 reflects ELD buffer size for [DevCL, DevBLC]. |
| 8:5 | 0b<br>RW | **RESERVED__1:** ELD access address (R/W): Selects the DWORD address for access to the ELD buffer (48 bytes). The value wraps back to zero when incremented past the max addressing value 0xF. This field change takes effect immediately after being written. The read value indicates the current access address. |
| 4 | 0b<br>RW | **RESERVED_3:** ELD ACK: Acknowledgement from the audio driver that ELD read has been completed |
| 3:0 | 0b<br>RW | **DIP_RAM_ACCESS_ADDRESS_R_W:** Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address. |

## 14.11.149 STREAM_A_LPE_AUD_HDMI_STATUS—Offset 65064h

LPE Audio Status

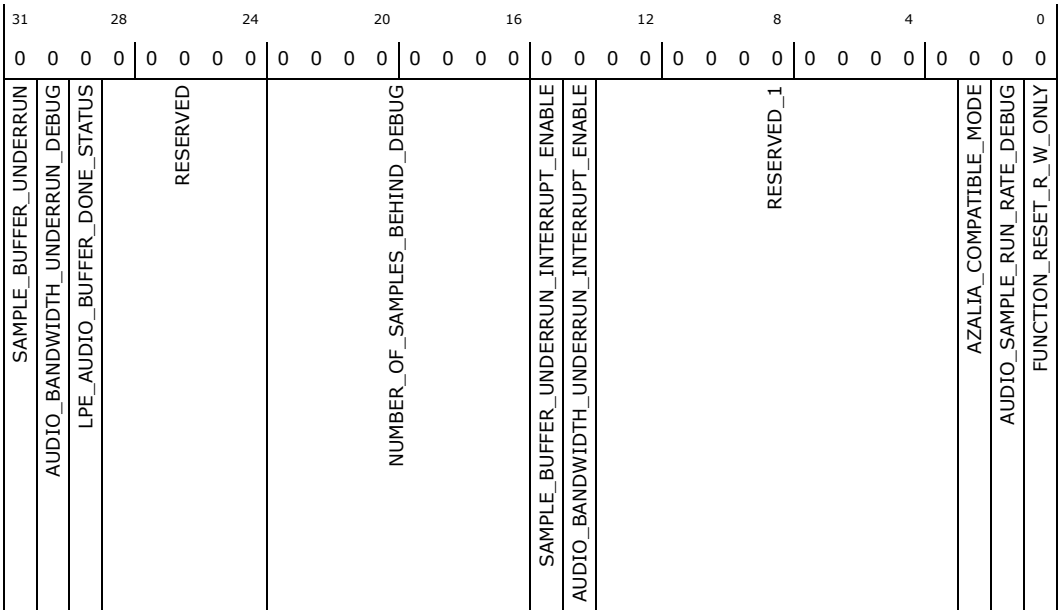
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65064h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW/1C | **SAMPLE_BUFFER_UNDERRUN:** This bit indicates an underrun in the sample buffer to HDMI controller when it needs to send. This bit is set at the last line of active video when there are no more sample in any valid buffers and HDMI audio unit has not satisfied number of audio samples intended in that video frame.<br>Clearing this status bit is accomplished by writing a 1 to this bit through MMIO.<br>AccessType: One to Clear |
| 30 | 0b<br>RW/1C | **AUDIO_BANDWIDTH_UNDERRUN_DEBUG:** This bit indicates an underrun of audio samples at HDMI audio packet assembly even there is still available sample buffers. Audio bandwidth underrun should not happen in normal functionality but it may happen when audio setting is unappropriate and/or memory bus was blocked by other clients, etc... This bit is set at the last line of active video when there is valid samples in a valid buffer and HDMI audio unit has not satisfied number of audio samples intended in that video frame<br>Clearing this status bit is accomplished by writing a 1 to this bit through MMIO.<br>AccessType: One to Clear |
| 29 | 0b<br>RW/1C | **LPE_AUDIO_BUFFER_DONE_STATUS:** This bit is set when a LPE audio buffer is completed transferred all of its data to LPE audio unit. This bit is clear when write 1 to it<br>AccessType: One to Clear |
| 28:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RO | **NUMBER_OF_SAMPLES_BEHIND_DEBUG:** This field is read only to get the number of audio samples that controller needs to load and send at the time of reading.<br>AccessType: Read Only |
| 15 | 0b<br>RW | **SAMPLE_BUFFER_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line buffer underrun interrupt when sample buffer underrun status is detected<br>0 = LPE sample Buffer Underrun Interrupt Disabled<br>1 = LPE sample Buffer Underrun Interrupt Enabled |
| 14 | 0b<br>RW | **AUDIO_BANDWIDTH_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line bandwidth underrun interrupt when bandwidth underrun status is detected<br>0 = LPE Bandwidth Underrun Interrupt Disabled<br>1 = LPE Bandwidth Underrun Interrupt Enabled |
| 13:3 | 0b<br>RW | **RESERVED_1:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0b<br>RW | **AZALIA_COMPATIBLE_MODE:** This bit is to enable the vucp, PR, ECC to be generated in the Azalia way<br>0 = Disable Azalia compatible mode on vucp, PR, ECC<br>1 = Enable Azalia compatible mode on vucp, PR, ECC |
| 1 | 0b<br>RW | **AUDIO_SAMPLE_RUN_RATE_DEBUG:** When set it allows to fetch sample 128 times than the real sample rate to allow a faster drain of sample bufferes. |
| 0 | 0b<br>RW | **FUNCTION_RESET_R_W_ONLY:** Write 1 to this bit will reset hardware within audio unit without needs of reset the full display controller. The FIFO and pointers will be reset and audio registers will be reset to default values. Write 0 will put the unit back to idle and ready to be programmed again. |

## 14.11.150 STREAM_A_LPE_AUD_HDMIW_INFOFR—Offset 65068h

Audio HDMI Data Island Packet Data

### Access Method

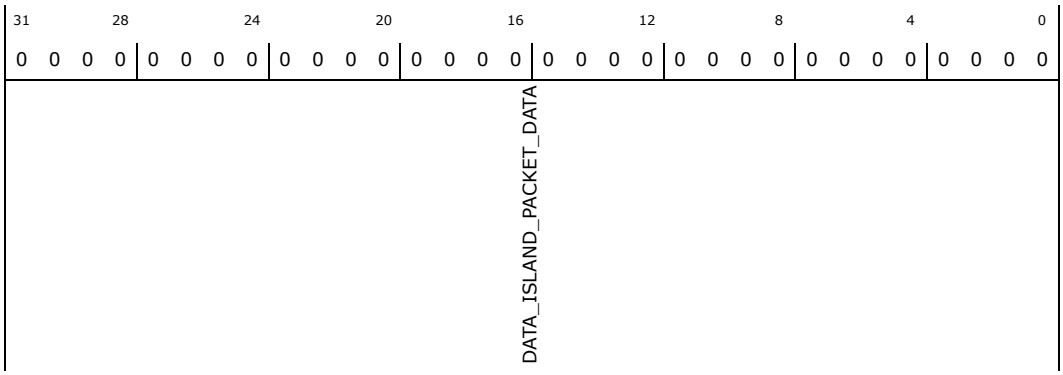
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65068h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **DATA_ISLAND_PACKET_DATA:** When read, this returns the current value at the location specified in the Video DIP buffer index select and Video DIP RAM access address fields. The index used to address the RAM is incremented after each read or write of this register. DIP data can be read at any time. Data should be loaded into the RAM before enabling the transmission through the DIP type enable bit. Accesses to this register are on a per-DWORD basis |

## 14.11.151 STREAM_B_LPE_AUD_CONFIG—Offset 65800h

LPE Audio Configuration

### Access Method

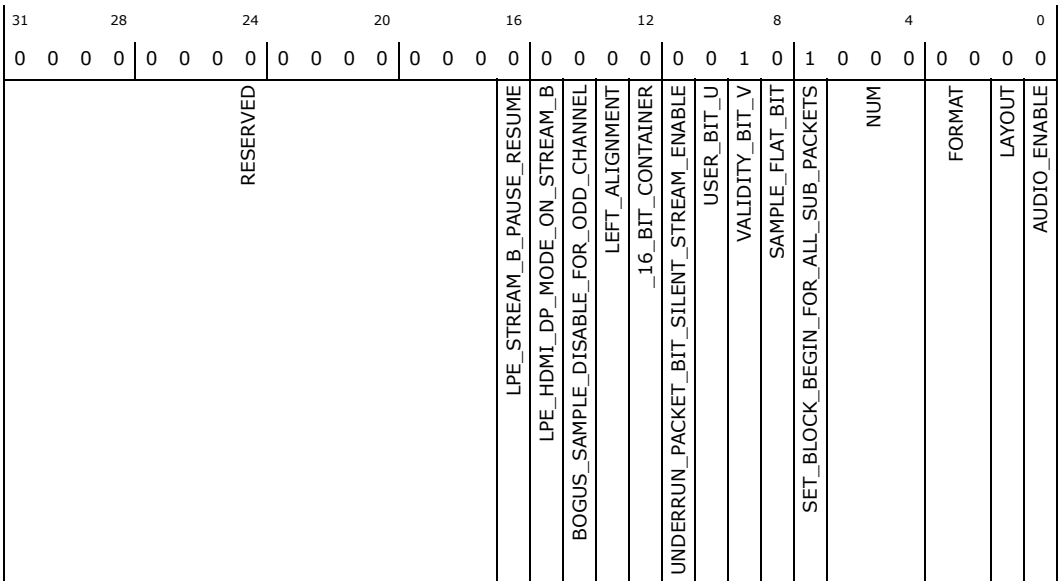
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65800h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000280h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0b<br>RW | **RESERVED:** Reserved. |
| 16 | 0b<br>RW | **LPE_STREAM_B_PAUSE_RESUME:** DMA pause fetching at the boundary of buffers when this bit is set, and resume fetching when this bit is cleared.<br>1- DMA stop requesting more audio sample from buffer A,B,C,D after reading and depleting all data from current buffer<br>0- DMA resume requesting data from the next available buffer (A,B,C,D).<br>Programming note: this bit should not be used by SW driver. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically. |
| 15 | 0b<br>RW | **LPE_HDMI_DP_MODE_ON_STREAM_B:** 1= DP mode<br>0 = HDMI mode (default) |
| 14 | 0b<br>RW | **BOGUS_SAMPLE_DISABLE_FOR_ODD_CHANNEL:** When number of channels in a sample is odd (3, 5, or 7) source application may pad a bogus sample to the next even number of channels. If this bit is set there is no padding in input buffer1= No bogus sample present in buffer for odd number of channels<br>0= Bogus sample present in buffer for odd number of channels (default) |
| 13 | 0b<br>RW | **LEFT_ALIGNMENT:** When input buffer is in 32-bit container mode. If this bit is set the MSB of audio sample is aligned bit 31 of the container if this bit is clear MSB of audio sample is aligned with bit 23 of the container.1= MSB is bit 31 of 32-bit container<br>0= MSB is bit 23 of 32-bit container (default) |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 0b<br>RW | **_16_BIT_CONTAINER:** When this bit is set 16-bit sample is stored in 16-bit container format. When it is clear container is 32-bit for each sample regardless of valid bits (default)1= 16-bit container<br>0= 32-bit container |
| 11 | 0b<br>RW | **UNDERRUN_PACKET_BIT_SILENT_STREAM_ENABLE:** Set this bit will enble HW to send valid zero-filled packet with Sample flat bit set when no sample buffer is available, NCTS packets (or Timesstamp packet) are sent to keep sink in sync even no audio sound will heard.1= send underrun packets (silent stream)<br>0= send null packets (default)<br>Programming note: SW driver shall always set silent stream bit. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically. |
| 10 | 0b<br>RW | **USER_BIT_U:** HW will clear this bit ineach sub-frames it sends, But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance<br>1= sey U bit in sub-frame<br>0= clear U bit in sub-frame (default) |
| 9 | 1b<br>RW | **VALIDITY_BIT_V:** HW will set this bit in both each sub-frames it sends. But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance<br>1= Set V bit in sub-frame (default)<br>0= clear V bit in sub-frame. For debug or testing |
| 8 | 0b<br>RW | **SAMPLE_FLAT_BIT:** When set the sample flat bit will be set in all HDMI sub-packets.<br>1= flat bit is set for valid sample<br>0= flat bit is not set for valid sample (default) |
| 7 | 1b<br>RW | **SET_BLOCK_BEGIN_FOR_ALL_SUB_PACKETS:** Controls the B bit in the header of only the first Audio Packet /frame of a 192 frame 60958 block in Layout 1 mode. This bit only applies to LPE HDMI mode.<br>0: The B bit will be set only for sub-packet 0<br>1: The B bit in the Audio sample packet header will be set for all valid sub-packets. (default) |
| 6:4 | 0b<br>RW | **NUM:** audio Channels<br>000: 2 channels (stereo)<br>001: 3 channels<br>010: 4 channels<br>011: 5 channels<br>100: 6 channels<br>101: 7 channels<br>110: 8 channels<br>Note: When disable_bogus sample bit is clear HW will always treat odd number of channels similar to the next higher even number. Thus 3 is similar to 4, 5 to 6 and 7 to 8. This is because SW ensures that an even number of samples are packed in the audio buffers.<br>Programming note: Bit 6 of of this field is a write only bit. When reads back, it always returns zero. Ensure to write bit 6 to 1?b1 when programming for 6/7/8 audio channels. |
| 3:2 | 0b<br>RW | **FORMAT:** 00: L-PCM or IEC 61937<br>01: High Bit Rate IEC 61937 stream packet (not supported)<br>10: One Bit Audio Sample packet (not supported)<br>11: DST Audio Sample packet (not supported) |
| 1 | 0b<br>RW | **LAYOUT:** 0: Layout 0 (2-ch)<br>1: Layout 1 (3-8 ch)<br>Note: Layout bit doesn t matter for HBR |
| 0 | 0b<br>RW | **AUDIO_ENABLE:** Controls generation of N/CTS and transmission of audio sample packets.<br>0: Audio sample packets are not transmitted, CTS calculation/transmission is disabled<br>1: Audio sample packets are transmitted and CTS calculation is enabled<br>When enable audio unit will wait until the next vertical blank period before sending out the audio packets. When disable, audio unit may continue to send audio packet until the end of current active video frame before stopping. |

## 14.11.152 STREAM_B_LPE_AUD_CH_STATUS_0—Offset 65808h

Audio Channel Status Attributes 0

### Access Method

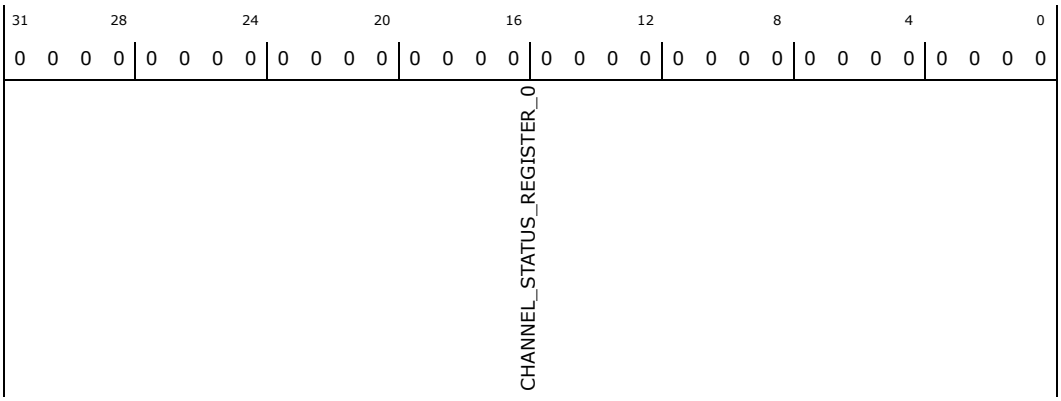
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65808h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **CHANNEL_STATUS_REGISTER_0:** . These bits are transmitted as attributes of audio packets |

| 31:8 | 0b<br>RW | **RESERVED:** Reserved. |
| 7:0 | 0b<br>RW | **CHANNEL_STATUS_REGISTER_1:** . These bits are transmitted as attributes of audio packets. There is only 8 bits valid in this register. |

## 14.11.154 STREAM_B_LPE_AUD_HDMI_CTS_DP_MAUD—Offset 65810h

Audio HDMI CTS Register (DP Maud)

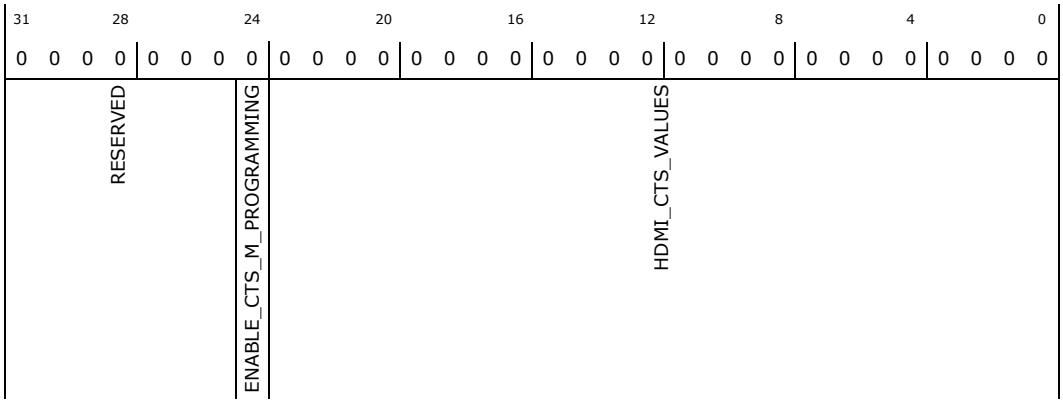
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65810h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 24 | 0b<br>RW | **ENABLE_CTS_M_PROGRAMMING:** 1 = Enable CTS/M programming<br>0 = Disable CTS/M programming |
| 23:0 | 0b<br>RW | **HDMI_CTS_VALUES:** These are bits [23:0] of programmable HDMI CTS values (or DP Maud) that is pre-calculated to achieve desired audio sample rates with a particular pixel clocks configuration.<br>Audio function must be disabled when changing this field. Bit 24 also need to write to 1 to enable this field. |

## 14.11.155 STREAM_B_LPE_AUD_HDMI_N_DP_NAUD—Offset 65814h

Audio HDMI N Register (DP Naud)

### Access Method

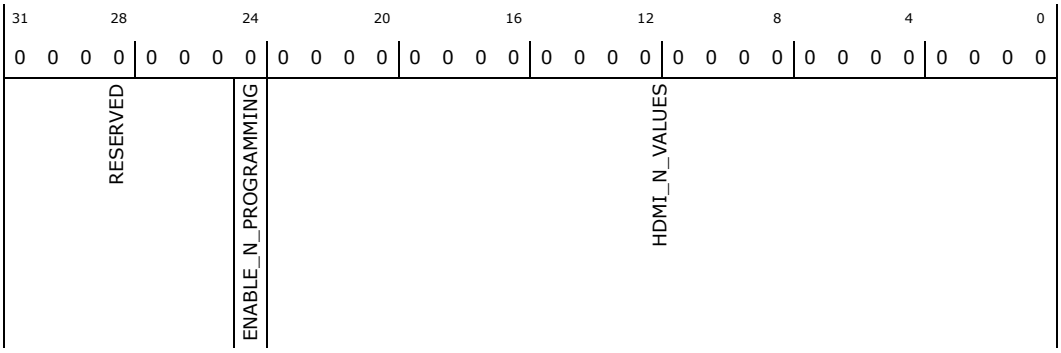
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65814h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0b<br>RW | **RESERVED:** Reserved. |
| 24 | 0b<br>RW | **ENABLE_N_PROGRAMMING:** 1 = Enable N programming<br>0 = Disable N programming |
| 23:0 | 0b<br>RW | **HDMI_N_VALUES:** These are bits [23:0] of programmable HDMI N (or DP Naud) values that is pre-calculated to achieve desired audio sample rates with a particular pixel clocks configuration.<br>Audio function must be disabled when changing this field. Bit 24 also need to write to 1 to enable this field. |

## 14.11.156 STREAM_B_LPE_AUD_BUFFER_CONFIG—Offset 65820h

LPE Audio buffer config

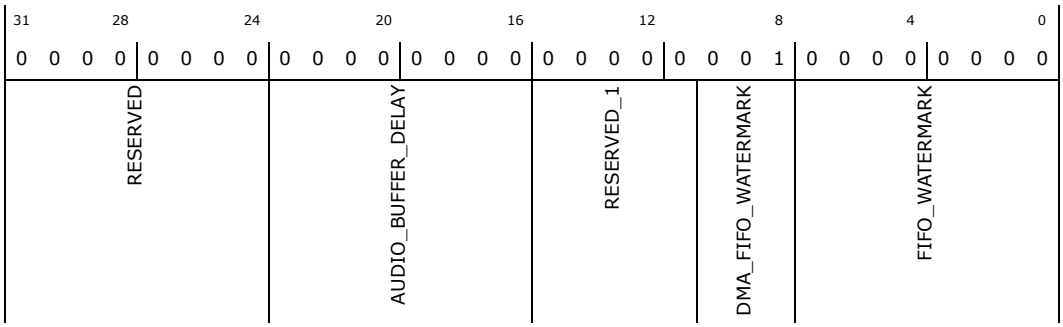
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65820h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000100h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Reserved. |
| 23:16 | 0b<br>RW | **AUDIO_BUFFER_DELAY:** This field specifies a delay in number of video frames that the audio controller will count off when audio enable bit is set before start transmitting audio sample. |
| 15:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10:8 | 001b<br>RW | **DMA_FIFO_WATERMARK:** Audio unit has a 8x64 bytes fifo for pre-fetching and staging audio samples. This register provides a watermark value in SWORDs (64B). When enable and sample buffer is available audio unit will fetch samples until this FIFO is full then it waits until HDMI/DP packet assembler drains the samples to a level less or equal the watermark setting then it will start fetching the samples again.<br>Default value is 1 cacheline (SW). |
| 7:0 | 0b<br>RW | **FIFO_WATERMARK:** Audio unit has a 96x8 bytes fifo for pre-fetching and staging audio samples. This register provides a watermark value in DWORDs. When enable and sample buffer is available audio unit will fetch samples until this FIFO occupancy is above the watermark then it waits until HDMI packet assembler drains the samples to a level less or equal the watermark setting then it will start fetching the samples again |

## 14.11.157 STREAM_B_LPE_AUD_BUF_CH_SWP—Offset 65824h

Audio Sample Swapping

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65824h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

## 14.11.158 STREAM_B_LPE_AUD_BUF_A_ADDR—Offset 65840h

Address for Audio Buffer A

### Access Method

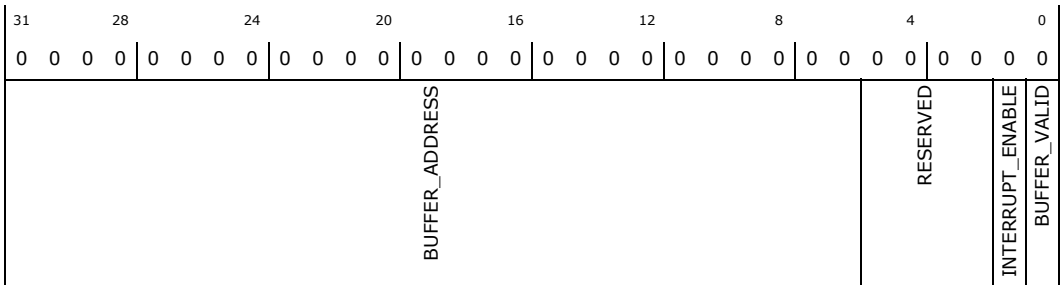
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65840h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |
| 5:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1 | 0b<br>RW | **INTERRUPT_ENABLE:** If enable hardware will generate an interrupt when it is done fetching this buffer |
| 0 | 0b<br>RW | **BUFFER_VALID:** . This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.11.159 STREAM_B_LPE_AUD_BUF_A_LENGTH—Offset 65844h

Length for Audio Buffer A

### Access Method

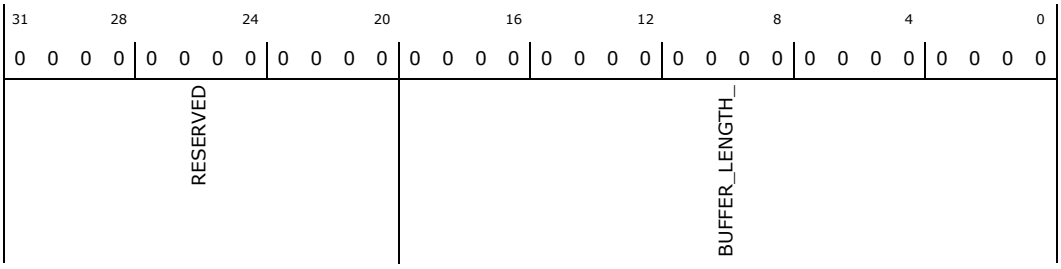
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65844h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.160 STREAM_B_LPE_AUD_BUF_B_ADDR—Offset 65848h

Address for Audio Buffer B

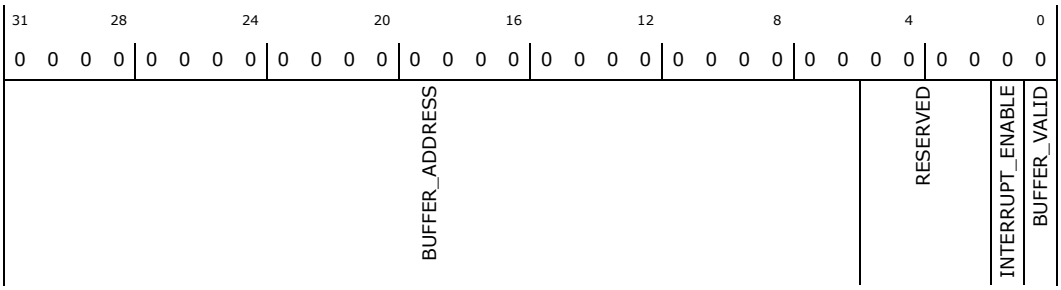
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65848h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

### Default: 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |
| 5:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1 | 0b<br>RW | **INTERRUPT_ENABLE:** If enable hardware will generate an interrupt when it is done fetching this buffer |
| 0 | 0b<br>RW | **BUFFER_VALID:** . This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.11.161 STREAM_B_LPE_AUD_BUF_B_LENGTH—Offset 6584Ch

Length for Audio Buffer B

### Access Method

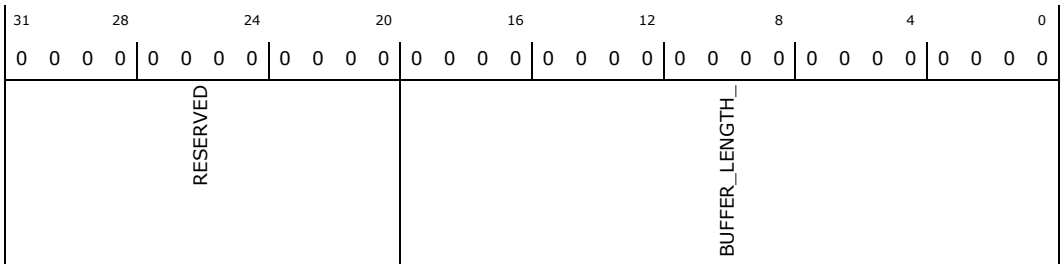
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6584Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.162 STREAM_B_LPE_AUD_BUF_C_ADDR—Offset 65850h

Address for Audio Buffer C

### Access Method

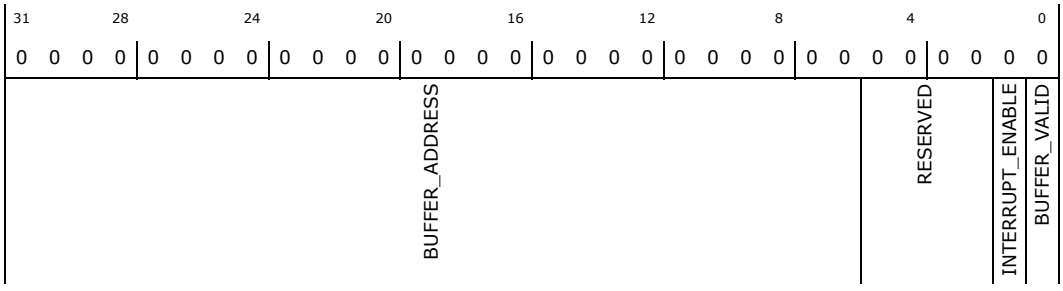
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65850h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |
| 5:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1 | 0b<br>RW | **INTERRUPT_ENABLE:** If enable hardware will generate an interrupt when it is done fetching this buffer |
| 0 | 0b<br>RW | **BUFFER_VALID:** . This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.11.163 STREAM_B_LPE_AUD_BUF_C_LENGTH—Offset 65854h

Length for Audio Buffer C

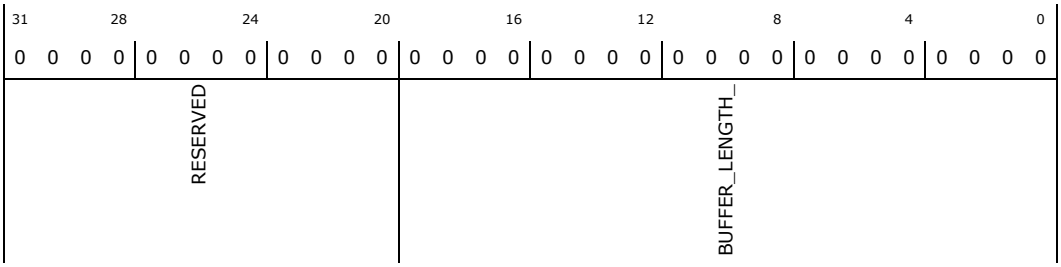
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65854h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.164 STREAM_B_LPE_AUD_BUF_D_ADDR—Offset 65858h

Address for Audio Buffer D

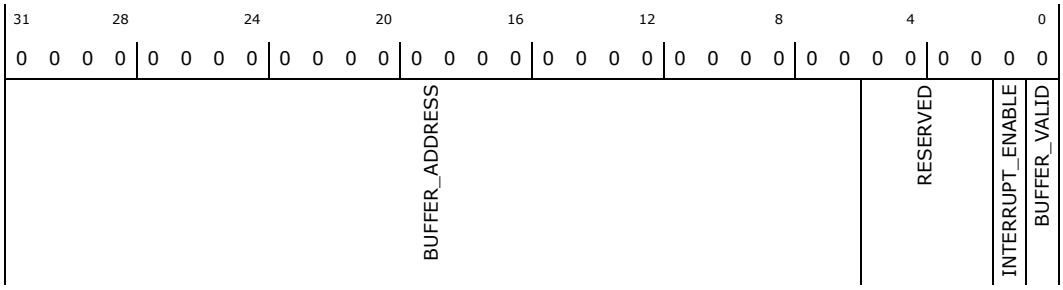
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65858h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **BUFFER_ADDRESS:** . This is physical address of audio sample buffer A, need to 64-byte aligned. |
| 5:2 | 0b<br>RW | **RESERVED:** Reserved. |
| 1 | 0b<br>RW | **INTERRUPT_ENABLE:** If enable hardware will generate an interrupt when it is done fetching this buffer |
| 0 | 0b<br>RW | **BUFFER_VALID:** . This bit is set by S/W when the mem_addr is written and is cleared by H/W when done reading the data from memory |

## 14.11.165 STREAM_B_LPE_AUD_BUF_D_LENGTH—Offset 6585Ch

Length for Audio Buffer D

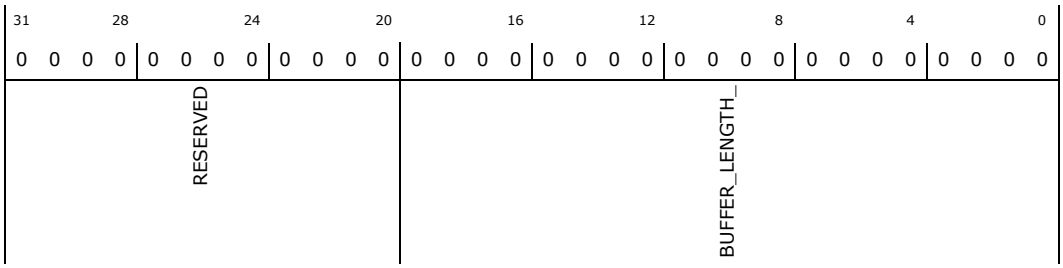
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 6585Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0b<br>RW | **RESERVED:** Reserved. |
| 19:0 | 0b<br>RW | **BUFFER_LENGTH_:** This field shows the remaining length of data that needs to be read from memory; Initially set by S/W for total of bytes that are valid and is decremented by H/W as reads are issued. Software must end buffer at the boundary of a audio sample with all of channel values of that sample are valid. |

## 14.11.166 STREAM_B_LPE_AUD_CNTL_ST—Offset 65860h

LPE Audio Control State Register

### Access Method

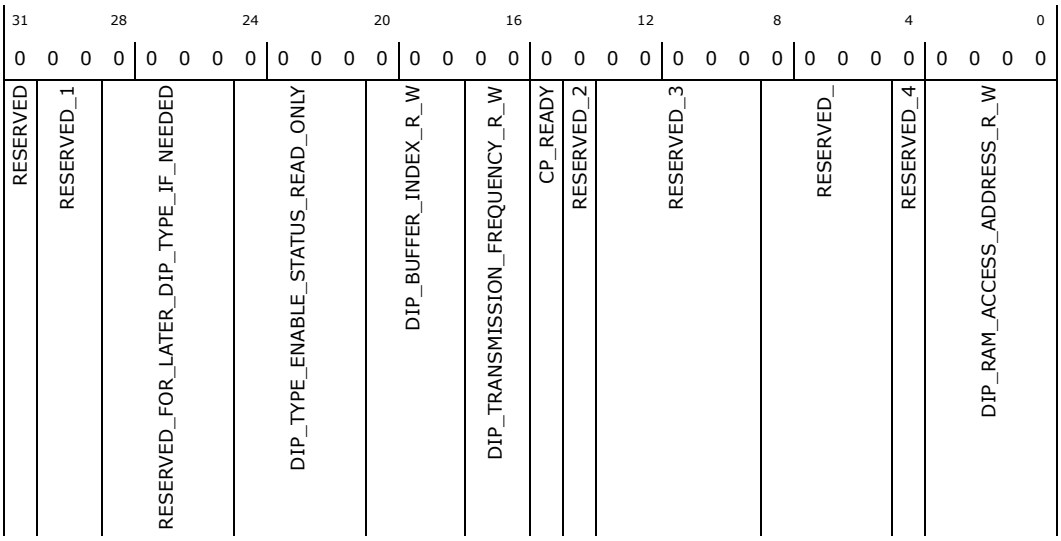
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65860h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **RESERVED:** Reserved. |
| 30:29 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 28:25 | 0b<br>RW | **RESERVED_FOR_LATER_DIP_TYPE_IF_NEEDED:** Must be 0. |
| 24:21 | 0b<br>RO | **DIP_TYPE_ENABLE_STATUS_READ_ONLY:** These bits reflects the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling an DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP.<br>XXX1 = Audio DIP enable status (Default = disabled)<br>XX1X = Generic 1 (ACP) DIP enable status (Default = disabled)<br>X1XX = Generic 2 DIP enable status, can be used by ISRC1 or ISRC2 (Default = disabled)<br>1XXX = Reserved<br>AccessType: Read Only |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 20:18 | 0b<br>RW | **DIP_BUFFER_INDEX_R_W:** This field is used during read or write of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0 s.<br>000 = (Default) Audio DIP (31 bytes of address space, 13 bytes of data)<br>001 = Generic 1 (ACP) Data Island Packet (31 bytes of address space, 11 bytes of data)<br>010 = Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data)<br>011 = Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data)<br>1XX = reserved |
| 17:16 | 0b<br>RW | **DIP_TRANSMISSION_FREQUENCY_R_W:** These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written.When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18.<br>00 = Disabled (Default)<br>01 = once per frame<br>10 = Send once<br>11 = Best effort (Send at least every other vsync) |
| 15 | 0b<br>RW | **CP_READY:** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced.<br>0 = CP request pending or not ready to receive requests (default)<br>1 = CP request ready<br>CP_ready bit is programmable through Bit 14 for [DevCL, DevBLC].<br>CP_ready bit is programmable through Bit 15 for [DevCTG].<br>Bit 15 Reserved for [DevCL, DevBLC]. |
| 14 | 0b<br>RW | **RESERVED_2:** ELD valid: This R/W bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit.<br>0 = ELD data invalid (default, when writing ELD data, set 0 by software)<br>1 = ELD data valid (Set by video software only)<br>ELD bit is programmable through Bit 13 for [DevCL, DevBLC].<br>ELD bit is programmable through Bit 14 for [DevCTG]. |
| 13:9 | 0b<br>RW | **RESERVED_3:** ELD buffer size (read only)10000 = This field reflects the size of the ELD buffer in DWORDs<br>13:9 reflects ELD buffer size for [DevCTG].<br>12:9 reflects ELD buffer size for [DevCL, DevBLC]. |
| 8:5 | 0b<br>RW | **RESERVED_:** ELD access address (R/W): Selects the DWORD address for access to the ELD buffer (48 bytes). The value wraps back to zero when incremented past the max addressing value 0xF. This field change takes effect immediately after being written. The read value indicates the current access address. |
| 4 | 0b<br>RW | **RESERVED_4:** ELD ACK: Acknowledgement from the audio driver that ELD read has been completed |
| 3:0 | 0b<br>RW | **DIP_RAM_ACCESS_ADDRESS_R_W:** Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address. |

## 14.11.167 STREAM_B_LPE_AUD_HDMI_STATUS—Offset 65864h

LPE Audio Status

### Access Method

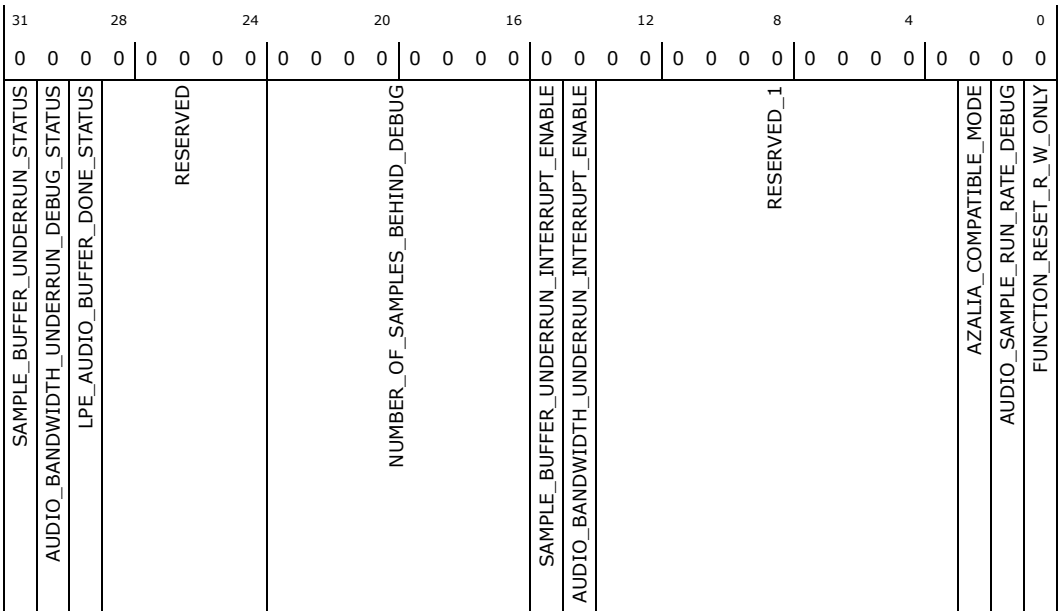
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65864h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW/1C | **SAMPLE_BUFFER_UNDERRUN_STATUS:** This bit indicates an underrun in the sample buffer to HDMI/DP controller when it needs to send. This bit is set at the last line of active video when there are no more sample in any valid buffers and HDMI/DP audio unit has not satisfied number of audio samples intended in that video frame.<br>Clearing this status bit is accomplished by writing a 1 to this bit through MMIO.<br>AccessType: One to Clear |
| 30 | 0b<br>RW/1C | **AUDIO_BANDWIDTH_UNDERRUN_DEBUG_STATUS:** This bit indicates an underrun of audio samples at HDMI audio packet assembly even there is still available sample buffers. Audio bandwidth underrun should not happen in normal functionality but it may happen when audio setting is unappropriate and/or memory bus was blocked by other clients, etc... This bit is set at the last line of active video when there is valid samples in a valid buffer and HDMI audio unit has not satisfied number of audio samples intended in that video frame<br>Clearing this status bit is accomplished by writing a 1 to this bit through MMIO.<br>AccessType: One to Clear |
| 29 | 0b<br>RW/1C | **LPE_AUDIO_BUFFER_DONE_STATUS:** This bit is set when a LPE audio buffer is completed transferred all of its data to LPE audio unit. This bit is clear when write 1 to it<br>AccessType: One to Clear |
| 28:24 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23:16 | 0b<br>RO | **NUMBER_OF_SAMPLES_BEHIND_DEBUG:** This field is read only to get the number of audio samples that controller needs to load and send at the time of reading.<br>AccessType: Read Only |
| 15 | 0b<br>RW | **SAMPLE_BUFFER_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line buffer underrun interrupt when sample buffer underrun status is detected<br>0 = LPE sample Buffer Underrun Interrupt Disabled<br>1 = LPE sample Buffer Underrun Interrupt Enabled |
| 14 | 0b<br>RW | **AUDIO_BANDWIDTH_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line bandwidth underrun interrupt when bandwidth underrun status is detected<br>0 = LPE Bandwidth Underrun Interrupt Disabled<br>1 = LPE Bandwidth Underrun Interrupt Enabled |
| 13:3 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 2 | 0b<br>RW | **AZALIA_COMPATIBLE_MODE:** This bit is to enable the vucp, PR, ECC to be generated in the Azalia way<br>0 = Disable Azalia compatible mode on vucp, PR, ECC<br>1 = Enable Azalia compatible mode on vucp, PR, ECC |
| 1 | 0b<br>RW | **AUDIO_SAMPLE_RUN_RATE_DEBUG:** When set it allows to fetch sample 128 times than the real sample rate to allow a faster drain of sample bufferes. |
| 0 | 0b<br>RW | **FUNCTION_RESET_R_W_ONLY:** Write 1 to this bit will reset hardware within audio unit without needs of reset the full display controller. The FIFO and pointers will be reset and audio registers will be reset to default values. Write 0 will put the unit back to idle and ready to be programmed again. |

## 14.11.168 STREAM_B_LPE_AUD_HDMIW_INFOFR—Offset 65868h

Audio HDMI Data Island Packet Data

### Access Method

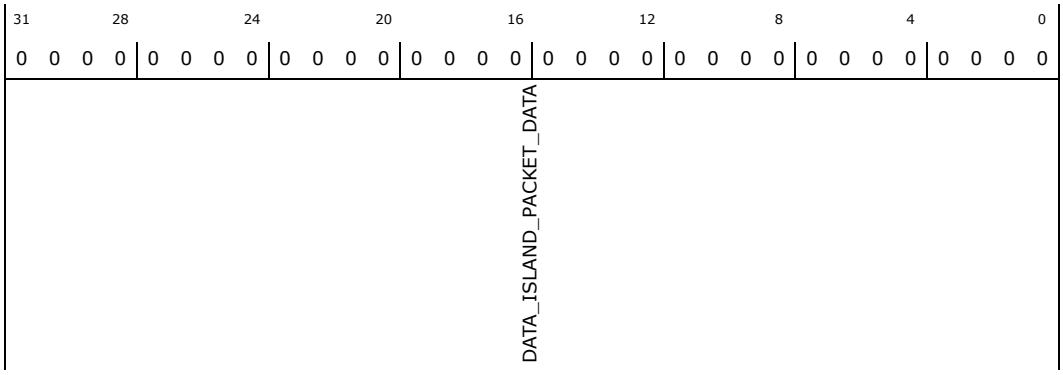
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 65868h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **DATA_ISLAND_PACKET_DATA:** When read, this returns the current value at the location specified in the Video DIP buffer index select and Video DIP RAM access address fields. The index used to address the RAM is incremented after each read or write of this register. DIP data can be read at any time. Data should be loaded into the RAM before enabling the transmission through the DIP type enable bit. Accesses to this register are on a per-DWORD basis |

## 14.11.169 PIPEA_DSL—Offset 70000h

Pipe A Display Scan Line

### Access Method

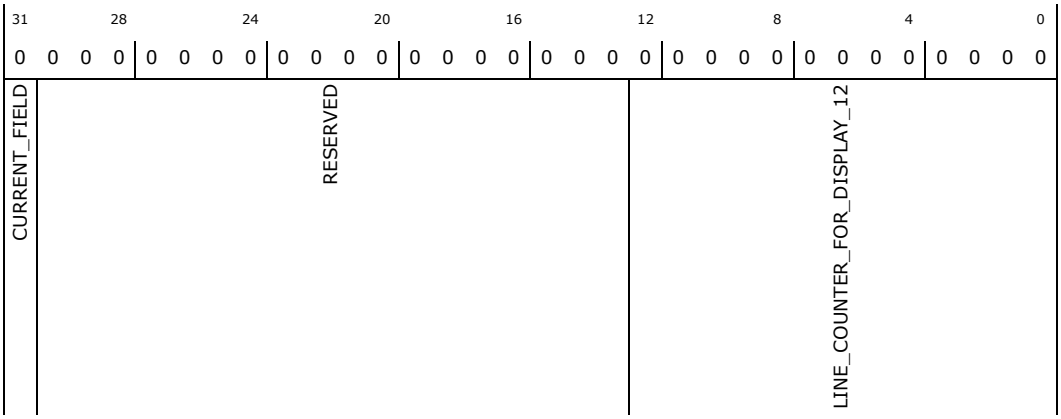
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70000h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RO | **CURRENT_FIELD:** [DevBLC, DevCTG, DevCDV] Provides read back of the current field being displayed on display pipe A.<br>Non-TV mode:<br>0 = first field (odd field)<br>1 = second field (even field)<br>TV mode:<br>1 = first field (odd field)<br>0 = second field (even field)<br>[DevBW] and [DevCL] Reserved: Read only. |
| 30:13 | 0b<br>RO | **RESERVED:** Read only. |
| 12:0 | 0b<br>RO | **LINE_COUNTER_FOR_DISPLAY_12:** 0]: Provides read back of the display pipe A vertical line counter. This is an indication of the current display scan line to be used by software to synchronize with the display. |

## 14.11.170 PIPEA_SLC—Offset 70004h

Pipe A Display Scan Line Count Range Compare

### Access Method

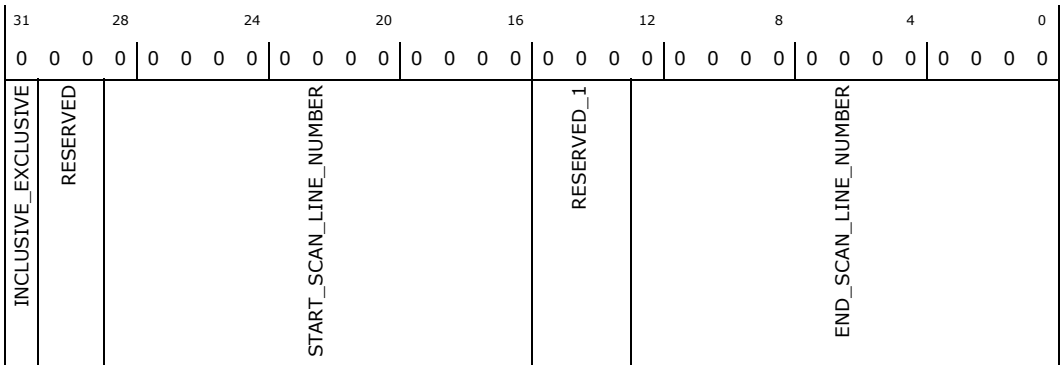
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70004h

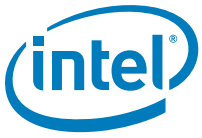
**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **INCLUSIVE_EXCLUSIVE:** 1 = Inclusive: within the range.<br>0 = Exclusive: outside of the range. |
| 30:29 | 0b<br>RW | **RESERVED:** Read only. |
| 28:16 | 0b<br>RW | **START_SCAN_LINE_NUMBER:** [DevBLC, DevCTG, DevCDV] This field specifies the starting scan line number of the Scan Line Window.<br>Format = U16 in scan lines, where scan line 0 is the first line of the display frame. Range = [0,Display Buffer height in lines-1].<br>[DevBW, DevCL] End Scan Line Number: This field specifies the ending scan line number of the Scan Line Window.<br>Format = U16 in scan lines, where scan line 0 is the first line of the display frame. Range = [0, Display Buffer height in lines-1]. |
| 15:13 | 0b<br>RW | **RESERVED_1:** Read only. |
| 12:0 | 0b<br>RW | **END_SCAN_LINE_NUMBER:** [DevBLC, DevCTG, DevCDV] This field specifies the ending scan line number of the Scan Line Window.<br>Format = U16 in scan lines, where scan line 0 is the first line of the display frame. Range = [0, Display Buffer height in lines-1].<br>[DevBW] and [DevCL] Start Scan Line Number: This field specifies the starting scan line number of the Scan Line Window.<br>Format = U16 in scan lines, where scan line 0 is the first line of the display frame. Range = [0,Display Buffer height in lines-1]. |



### 14.11.171 PIPEACONF—Offset 70008h

Pipe A Configuration Register

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70008h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| PIPE_A_ENABLE | PIPE_STATE | DSI_PLL_LOCK_LOCK | FRAME_START_DELAY | | | | DISPLAY_PORT_AUDIO_ONLY_MODE | FORCE_BORDER | PIPE_A_GAMMA_UNIT_MODE | INTERLACED_MODE | | | MIPI_DISPLAY_SELF_REFRESH_MODE_FOR_MIPI_A_REFRESH | DISPLAY_OVERLAY_PLANES_OFF | CURSOR_PLANES_OFF | REFRESH_RATE_CXSR_MODE_ASSOCIATION | | | | COLOR_CORRECTION_MATRIX_ENABLE_ON_PIPE_A_1_COLOR_CORRECTION_COEFFICIENTS_ARE_ENABLED_TO_PERFORM_COLOR_CORRECTION_0_COLOR_CORRECTION_COEFFICIENTS_ARE_DISABLED_ | DISPLAYPORT_POWER_MODE_SWITCH_DEVVLVP | COLOR_RANGE_SELECT | S3D_SPRITE_ORDER | S3D_SPRITE_INTERLEAVING_FORMAT | | RESERVED | | | BITS_PER_COLOR | | | DITHERING_ENABLE | DITHERING_TYPE | | DDA_RESET_TEST_MODE | RESERVED_1 |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **PIPE_A_ENABLE:** Setting this bit to the value of one, turns on pipe A. This must be done before any planes are enabled on this pipe. Changing it to a zero should only be done when all planes that are assigned to this pipe have been disabled. Turning the pipe enable bit off disables the timing generator in this pipe. Plane disable occurs after the next VBLANK event after the plane is disabled. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption will be at it s lowest state when disabled. A separate bit controls the DPLL enable for this pipe. Pipe timing registers should contain valid values before this bit is enabled.<br>0 = Disable<br>1 = Enable |
| 30 | 0b<br>RO | **PIPE_STATE:** This bit indicates the actual state of the pipe. Since there can be some delay between disabling the pipe and the pipe actually shutting off, this bit indicates the true current state of the pipe.<br>0 = Disabled<br>1 = Enabled<br>AccessType: Read Only |
| 29 | 0b<br>RO | **DSI_PLL_LOCK_LOCK:** This bit indicates the clocks from DSI PLL are locked.<br>0 = Unlocked<br>1 = Locked<br>AccessType: Read only |
| 28:27 | 0b<br>RW | **FRAME_START_DELAY:** (TEST MODE) Used to delay the frame start signal that is sent to the display planes. Normal operation uses the default 00 value and test modes can use the delayed frame start to shorten the test time. Care must be taken to insure that there are enough lines during VBLANK to support this setting.<br>00 = Frame Start occurs on the first HBLANK after the start of VBLANK<br>01 = Frame Start occurs on the second HBLANK after the start of VBLANK<br>10 = Frame Start occurs on the third HBLANK after the start of VBLANK<br>11 = Frame Start occurs on the forth HBLANK after the start of VBLANK |
| 26 | 0b<br>RW | **DISPLAY_PORT_AUDIO_ONLY_MODE:** [DevVLVP] Setting this bit to 1 indicates the DisplayPort will output audio only.<br>0 = DisplayPort will output Video or Video and Audio<br>1 = DisplayPort will output Audio only |
| 25 | 0b<br>RW | **FORCE_BORDER:** : (TEST MODE)0 = Normal Operation<br>1 = Color information is ignored and border color is substituted during active region |
| 24 | 0b<br>RW | **PIPE_A_GAMMA_UNIT_MODE:** This bit selects which mode the pipe gamma correction logic works in. In the palette mode, it behaves as a 3X256x8 RAM lookup. VGA and indexed mode operation should use the palette in 8-bit mode. In the 10-bit gamma mode, it will act as a piecewise linear interpolation. Other gamma units such as in the overlay or sprite are unaffected by this bit.<br>0 = 8-bit Palette Mode<br>1 = 10-bit Gamma Mode |
| 23:21 | 0b<br>RW | **INTERLACED_MODE:** These bits are used for software control of interlaced behavior. They are updated immediately if the pipe is off, or in the vertical blank after programming if pipe is enabled.<br>0xx = Progressive<br>100 = Interlaced embedded panel using programmable vertical sync shift. (2x)<br>101 = Interlaced using vertical sync shift. Backup option to 110 setting. (2x)<br>110 = Interlaced with VSYNC/HSYNC Field Indication using legacy vertical sync shift. Used for SDVO.<br>111 = Interlaced with Field 0 Only using legacy vertical sync shift. Not used<br>Note: VGA display modes, sDVO line stall, and Panel fitting do not work while in interlaced modes<br>Setting the Interlaced embedded panel mode causes hardware to automatically modify the output to match the specifications of panels that support interlaced mode. |
| 20 | 0b<br>RW | **MIPI_DISPLAY_SELF_REFRESH_MODE_FOR_MIPI_A_REFRESH:** 0 = Normal Operation, display controller generate timing and refresh display panel at refresh rate<br>1 = Display self-refresh mode. Display controller update frame buffer in display module on demand only |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19 | 0b<br>RW | **DISPLAY_OVERLAY_PLANES_OFF:** This bit when set will cause all enabled Display and overlay planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the screen becomes blank. Setting the bit back to a zero will then allow the display and overlay planes to resume on the following VBLANK.<br>0 = Normal Operation<br>1 = Planes assigned to this pipe are disabled. |
| 18 | 0b<br>RW | **CURSOR_PLANES_OFF:** This bit when set will cause all enabled cursor planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the cursor(s) no longer appear on the screen. Setting the bit back to a zero will then allow the cursor planes to resume on the following VBLANK.<br>0 = Normal Operation<br>1 = Planes assigned to this pipe are disabled. |
| 17:16 | 0b<br>RW | **REFRESH_RATE_CXSR_MODE_ASSOCIATION:** These bits select how refresh rates are tied to big FIFO mode on pipe A. When they are set to anything other than 00, bits 23:21 of this register must be programmed to 0xx. Switching between 01 and 10 settings directly is not allowed. Software must program this field to 00 before switching. Software is responsible for enabling this mode only for integrated dispay panels that support corresponding mode.<br>00 Default no dynamic refresh rate change enabled. Software control only.<br>01 Progressive-to-progressive refresh rate change enabled and tied to big FIFO mode. Pixel clock values set in FPA0/FPA1 settings in the DPLLA control register and FPA0/FPA1 divider registers. FPA0 is tied to non-big-FIFO mode<br>10 Progressive-to-interlaced refresh rate change enabled and tied to big FIFO mode. Pixel clock value does not change in this case. Scaling must be disabled in this mode. Uses programmable VS shift<br>11 Reserved |

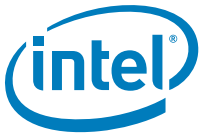
| 14 | 0b<br>RW/1C | **SPRITE_A_FLIP_DONE_INTERRUPT_STATUS:** MMIO Flip Event is completed on Sprite A<br>0 = Sprite A Flip Not Done<br>1 = Sprite A Flip Done<br>AccessType: One to Clear |
| 13 | 0b<br>RW/1C | **CRC_ERROR_INTERRUPT_STATUS:** This sticky status bit is set when a Pipe A CRC error is detected. It is cleared by a write of a one. For this bit to be meaningful, the pipe and pixel clock should be enabled and running.<br>0 = No CRC error has occurred<br>1 = CRC Error Detected<br>AccessType: One to Clear |
| 12 | 0b<br>RW/1C | **CRC_DONE_INTERRUPT_STATUS:** This sticky status bit is set when Pipe A CRC calculation and compare are complete. It is cleared by a write of a one. For this bit to be meaningful, the pipe and pixel clock should be enabled and running.<br>0 = CRC Not Done<br>1 = CRC Done<br>AccessType: One to Clear |
| 11 | 0b<br>RW/1C | **GMBUS_INTERRUPT_STATUS:** This status bit will be set on a GMBUS event. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set.<br>0 = GMBUS event has not occurred<br>1 = GMBUS event has occurred<br>AccessType: One to Clear |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10 | 0b<br>RW/1C | **PLANE_A_FLIP_DONE_INTERRUPT_STATUS:** Async/Sync Flip Event is completed on Display Plane A<br>0 = Plane A Flip Not Done<br>1 = Plane A Flip Done<br>AccessType: One to Clear |
| 9 | 0b<br>RW/1C | **VERTICAL_SYNC_INTERRUPT_STATUS:** This bit provides a sticky status that is set when a pipe A vertical sync occurs, cleared by a write of a 1. For interlaced timing modes, this occurs once per field, when in progressive, it occurs once per frame. For this bit to be meaningful, the pipe and pixel clock should be enabled and running.<br>0 = Vertical Sync has not occurred<br>1 = Vertical Sync has occurred<br>AccessType: One to Clear |
| 8 | 0b<br>RW/1C | **DISPLAY_LINE_COMPARE_INTERRUPT_STATUS:** Set when a pipe A compare match occurs, cleared by a write of a 1.<br>0 = Display Line Compare has not been satisfied<br>1 = Display Line Compare has been satisfied<br>AccessType: One to Clear |
| 7 | 0b<br>RW/1C | **DPST_EVENT_STATUS:** [DevCL, DevCTG, DevCDV]: This bit is cleared when a write to this register occurs with this bit as a one. Writes with this bit as a zero has no effect on the value of the bit. Multiple DPST events (Histogram or Phase In) can cause this bit to be asserted, determination of which event occurred is done in the DPST registers.<br>0 = DPST Interrupt has not occurred on pipe A<br>1 = DPST Interrupt has occurred on pipe A<br>AccessType: One to Clear |
| 6 | 0b<br>RW/1C | **PIPE_A_PANEL_SELF_REFRESH_STATUS:** This bit indicates interrupt is generated by the PSR controller and intends to send interrupt to SW driver when the PSR interrupt enable bit (70028h bit 22) is set. This is cleared when a write to this register occurs with this bit as a one. Write with this bit as a zero has no effect on the value of the bit.<br>0 = PSR Interrupt has not occurred on pipe A<br>1 = PSR interrupt has occurred on pipe A<br>AccessType: One to Clear |
| 5 | 0b<br>RW/1C | **ODD_FIELD_INTERRUPT_STATUS:** This status bit will be set on a Odd field VBLANK event. This bit should only be used when this pipe is in an interlaced display timing. For synchronization with register updates, the actual event will occur one line after the start of VBLANK. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set.<br>Note: This bit will not be set when pipe is in Interlaced with Field 0 Only using legacy vertical sync shift mode.<br>0 = Odd Field Vertical Blank has not occurred<br>1 = Odd Field Vertical Blank has occurred<br>AccessType: One to Clear |
| 4 | 0b<br>RW/1C | **EVEN_FIELD_INTERRUPT_STATUS:** This status bit will be set on a even field VBLANK event. This bit should only be used when this pipe is in an interlaced display timing. For synchronization with register updates, the actual event will occur one line after the start of VBLANK. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set.<br>Note: This bit will not be set when pipe is in Interlaced with Field 0 Only using legacy vertical sync shift mode.<br>0 = Even Field Vertical Blank has not occurred<br>1 = Even Field Vertical Blank has occurred<br>AccessType: One to Clear |
| 3 | 0b<br>RW/1C | **PERFORMANCE_MONITOR_EVENT_INTERRUPT:** AccessType: One to Clear |
| 2 | 0b<br>RW/1C | **START_OF_VERTICAL_BLANK_INTERRUPT_STATUS:** This status bit will be set at the beginning of a VBLANK event. At this point, the double buffered display registers flip, taking their new values. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set.<br>In MIPI DSR mode, GPIO TE trigger sets the Vblank Interrupt status<br>0 = Start of Vertical Blank has not occurred<br>1 = Start of Vertical Blank has occurred<br>AccessType: One to Clear |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RW/1C | **FRAMESTART_INTERRUPT_STATUS:** This status bit will be set on a VBLANK event, when the frame start occurs. The display registers are updated at the start of vertical blank, but the new register data is not utilized by the display pipeline until the point in the vertical blank period when the frame start occurs, which is the event that triggers this bit. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set.<br>0 = Vertical Blank has not occurred<br>1 = Vertical Blank has occurred<br>AccessType: One to Clear |
| 0 | 0b<br>RW/1C | **PIPE_A_HORIZONTAL_BLANK_STATUS:** 0 = Pipe A Horizontal Blank has not occurred<br>1 = Pipe A Horizontal Blank has occurred<br>AccessType: One to Clear |

## 14.11.194 CURACNTR—Offset 70080h

Cursor A Control Register

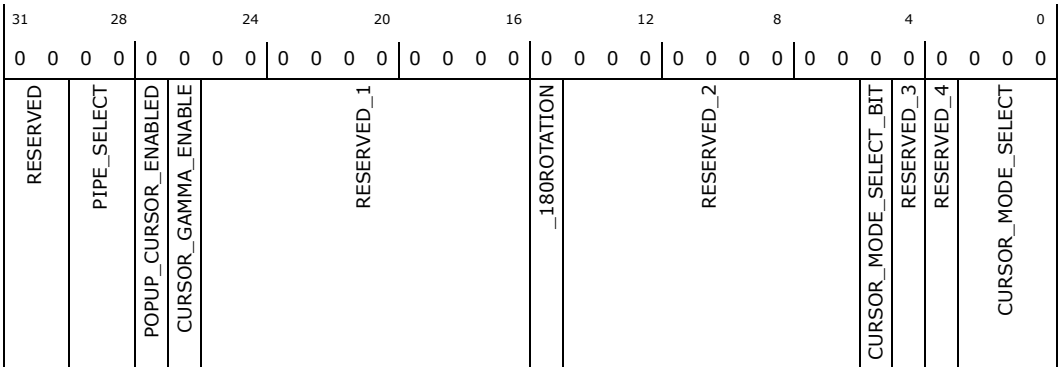
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70080h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0b<br>RW | **RESERVED:** Write as zero. |
| 29:28 | 0b<br>RW | **PIPE_SELECT:** [DevBW, DevCL, DevCDV] A state machine handles the synchronization of the switch to both vertical blank signals. So as far as the software is concerned, when both display pipes are being used, it can be switched at any time; the hardware will synchronize the switch.<br>00 = HW cursor is attached to Display Pipe A. This is the default after reset. 01 = HW cursor is attached to Display Pipe B.<br>10 = Reserved for pipe C<br>11 = Reserved for pipe D<br>[DevBLC] and [DevCTG] Reserved: Write as zero. |
| 27 | 0b<br>RW | **POPUP_CURSOR_ENABLED:** . This bit should be turned on when using Cursor A as a popup cursor. When in popup mode, hardware interprets the cursor base address as a physical address instead of a graphics address.0 = Cursor A is hi-res<br>1 = Cursor A is popup |
| 26 | 0b<br>RW | **CURSOR_GAMMA_ENABLE:** This bit only has an effect when using the cursor in a non-VGA mode. In VGA pop-up operation, the cursor data will always bypass the gamma (palette) unit.<br>0 = Cursor pixel data bypasses gamma correction or palette (default).<br>1 = Cursor pixel data is gamma to be corrected in the pipe. |
| 25:16 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 15 | 0b<br>RW | **_180ROTATION:** This mode causes the cursor to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image. Only 32 bits per pixel cursors can be rotated. This field must be zero when the cursor format is 2 bits per pixel.<br>0 = No rotation<br>1 = 180 Rotation of 32 bit per pixel cursors |
| 14:6 | 0b<br>RW | **RESERVED_2:** Reserved. |
| 5 | 0b<br>RW | **CURSOR_MODE_SELECT_BIT:** See following table. |
| 4 | 0b<br>RW | **RESERVED_3:** Reserved. |
| 3 | 0b<br>RW | **RESERVED_4:** Reserved. |
| 2:0 | 0b<br>RW | **CURSOR_MODE_SELECT:** These three bits together with bit 5 select the mode for cursor as shown in the following table. |

## 14.11.195 CURABASE—Offset 70084h

Cursor A Base Address Register

### Access Method

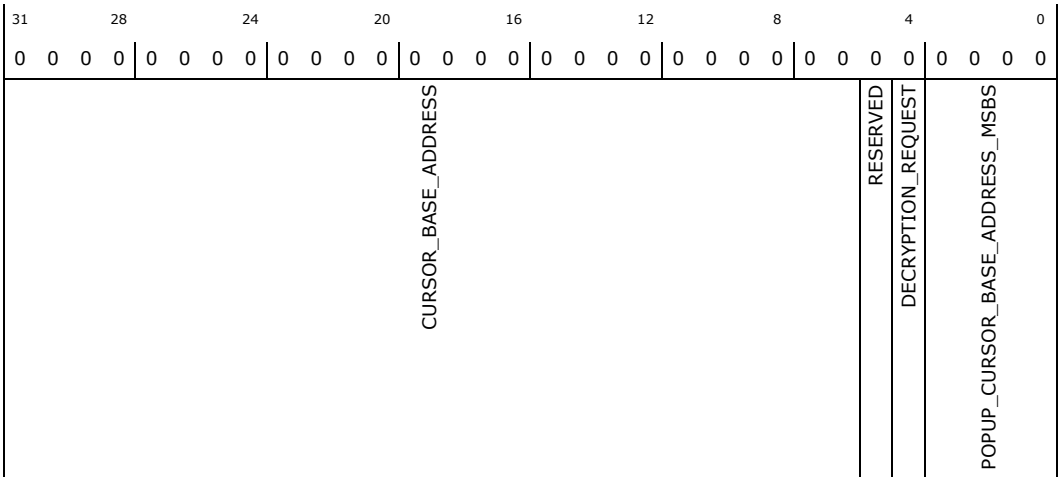
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70084h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **CURSOR_BASE_ADDRESS:** . This field specifies bits 31:6 of the graphics address of the base of the cursor. On [DevBW] and [DevCL] if the cursor is a popup, this field specifies bits 31:6 of the physical address of the base of the cursor, and bits 35:32 of the address are specified in the LSBs of this register. Popup cursor mode is selected within the CURACNTR register.The cursor surface address must be 4K byte aligned. The cursor must be in linear memory, it cannot be tiled. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the cursor data in its unrotated orientation and the cursor surface address.<br>A write to this register also acts as a trigger event to force the update of active registers from the staging registers on the next display event. Each cursor register is double-buffered. The CPU writes to a set of holding registers. The active registers are updated from the holding registers following the leading edge of the vertical blank pulse. The update is postponed until the next vblank if a write cycle is active to any of the cursor registers at the time of the vblank. The update is also postponed if a write sequence is in progress.<br>It is assumed that if the cursor mode is changed, the cursor image will also be changed. To prevent the cursor from appearing when it is only partially programmed, the active registers will not be updated until both the cursor control and base address registers have been programmed. If the cursor control register is written, the cursor base address must also be written before the change will be effective. However, the base address register may be changed (e.g., to change the shape of the cursor) without also writing to the control register. If both are to be written, the control register must be written first. |
| 5 | 0b<br>RW | **RESERVED:** MBZ |
| 4 | 0b<br>RW | **DECRYPTION_REQUEST:** This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.<br>0 = Decryption request disabled (default)<br>1 = Decryption request enabled |
| 3:0 | 0b<br>RW | **POPUP_CURSOR_BASE_ADDRESS_MSBS:** ([DevBW] and [DevCL] Only). This field specifies bits 35:32 of the popup cursor physical address. If popup mode is not selected, this field is ignored. |

## 14.11.196 CURAPOS—Offset 70088h

Cursor A Position Register

### Access Method

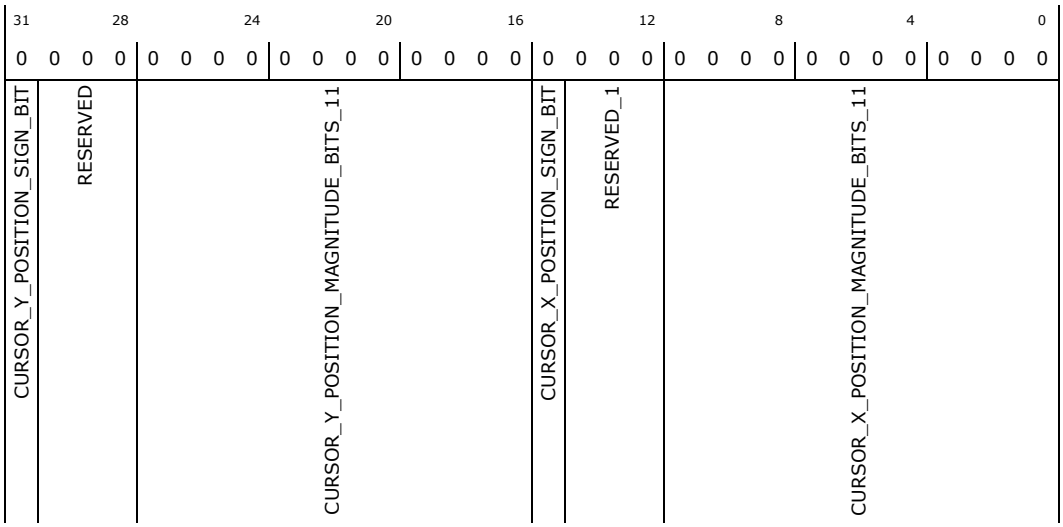
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70088h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **CURSOR_Y_POSITION_SIGN_BIT:** This bit provides the sign bit of a signed 13-bit value that specifies the horizontal position of cursor. (default is 0). For normal high resolution display modes, the cursor must have at least a single pixel positioned over the active screen. For use as a VGA Popup, the entire cursor must be positioned over the active area of the VGA image. |
| 30:28 | 0b<br>RW | **RESERVED:** Write as zero. |
| 27:16 | 0b<br>RW | **CURSOR_Y_POSITION_MAGNITUDE_BITS_11:** 0: This register provides the magnitude bits of a signed 12-bit value that specifies the vertical position of cursor. The sign bit of this value is provided by bit 31of this register. (default is 0). For use as a VGA Popup, the entire cursor must be positioned over the active area of the VGA image. Enabling the border in VGA (VGA Border Enable bit in the VGA Config register) includes the border in what is considered the active area .<br>For HDMI modes where the vertical zoom is greater than 1x, the position is specified using the zoomed grid.<br>When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the end of the active video area in the unrotated orientation. |
| 15 | 0b<br>RW | **CURSOR_X_POSITION_SIGN_BIT:** This bit provides the sign bit of a signed 13-bit value that specifies the horizontal position of cursor. (default is 0). ). For normal high resolution display modes, the cursor must have at least a single pixel positioned over the active screen. For use as a VGA Popup, the entire cursor must be positioned over the active area of the VGA image. Enabling the border in VGA (VGA Border Enable bit in the VGA Config register) includes the border in what is considered the active area . |
| 14:12 | 0b<br>RW | **RESERVED_1:** Write as zero. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:0 | 0b<br>RW | **CURSOR_X_POSITION_MAGNITUDE_BITS_11:** 0: These 12 bits provide the signed 13-bit value that specifies the horizontal position of cursor. The sign bit is provided by bit 15 of this register. (default is 0)<br>For HDMI modes where the horizontal zoom is greater than 1x, the position is specified using the zoomed grid.<br>When performing 180 rotation, this field specifies the horizontal position of the lower right corner relative to the end of the active video area in the unrotated orientation. |

## 14.11.197 CURAPALET_0—Offset 70090h

Cursor A Palette registers (4 Registers)

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

The update is postponed until the next vblank if a write cycle is active to any of the cursor registers at the time of the vblank. The update is also postponed if a write sequence is in progress.<br>It is assumed that if the cursor mode is changed, the cursor image will also be changed. To prevent the cursor from appearing when it is only partially programmed, the active registers will not be updated until both the cursor control and base address registers have been programmed. If the cursor control register is written, the cursor base address must also be written before the change will be effective. However, the base address register may be changed (e.g., to change the shape of the cursor) without also writing to the control register. If both are to be written, the control register must be written first. |

## 14.11.212 DSPALINOFF—Offset 70184h

Display A Linear Offset Register

### Access Method

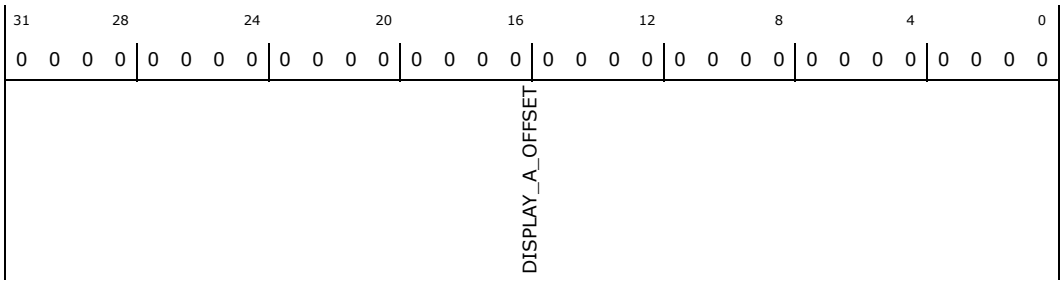
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70184h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **DISPLAY_A_OFFSET:** This register provides the panning offset into the display A plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

## 14.11.213 DSPASTRIDE—Offset 70188h

Display A Stride Register

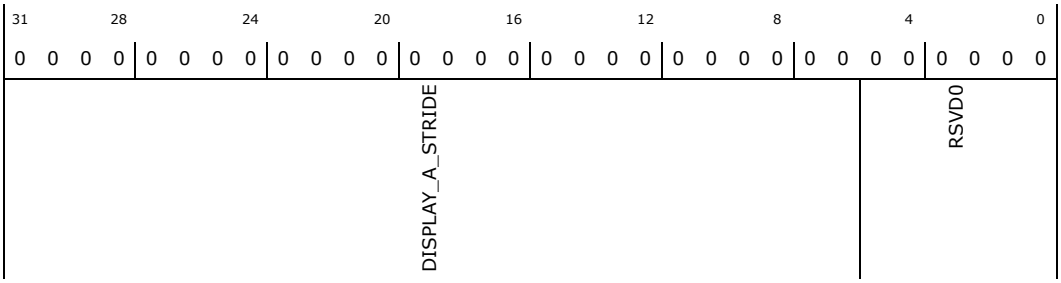
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70188h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **DISPLAY_A_STRIDE:** This is the stride for display A in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 512 byte aligned. This value is used to determine the line to line increment for the display. This register is updated either through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.<br>[DevBW, DevCL, DevCDV] The display stride must be power of 2 when doing Asynch Flips.<br>[DevBW, DevCL, DevCDV] The display stride must be 8KB or greater when doing Asynch Flips together with 180 rotation.<br>The value in this register is updated through the command streamer during a synchronous flip. |
| 5:0 | 0b<br>RO | **RSVD0:** Reserved |

## 14.11.214 DSPAKEYVAL—Offset 70194h

Sprite Color Key Value Register

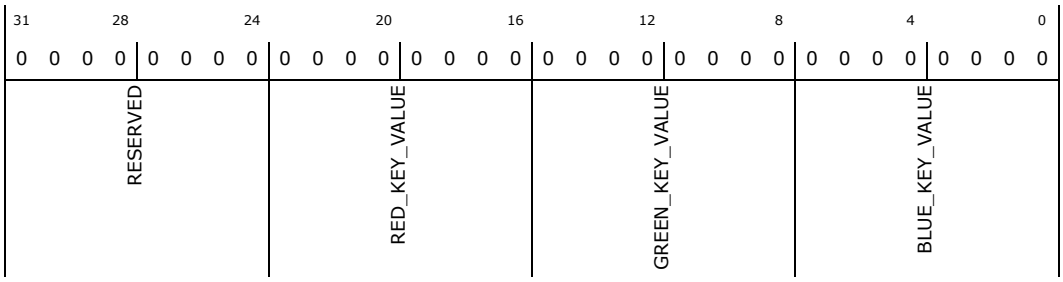
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 70194h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |

## 14.11.216 DSPASURF—Offset 7019Ch

Display A Surface Base Address Register

### Access Method

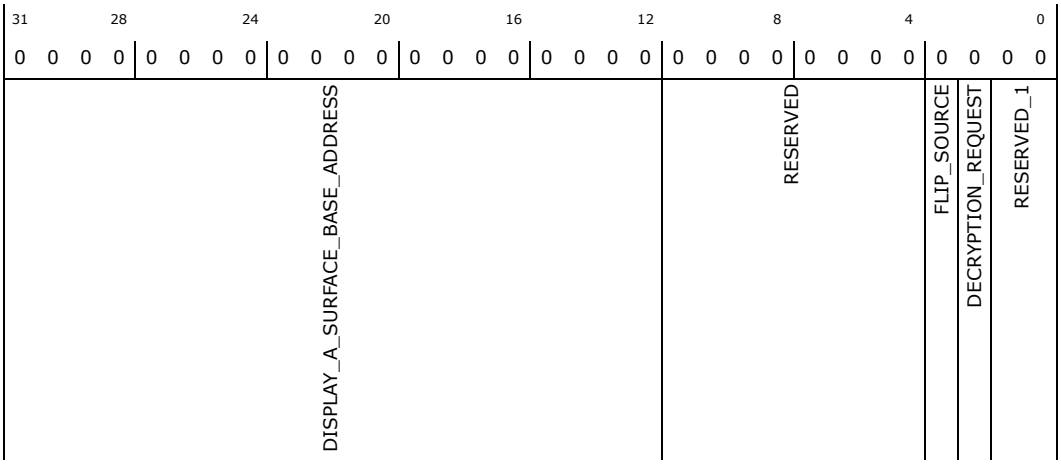
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7019Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0b<br>RW | **DISPLAY_A_SURFACE_BASE_ADDRESS:** . This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPATILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPALINOFF register.This address must be 4K aligned. When performing asynchronous flips and the display surface is in tiled memory, this address must be 256K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. [DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |
| 11:4 | 0b<br>RW | **RESERVED:** Reserved. |
| 3 | 0b<br>RW | **FLIP_SOURCE:** Project:<br>All<br><br>Default Value:<br>0b<br><br>This bit indicates if the source of the flip is CS or BCS so display can send the flip done response to the appropriate destination.<br><br>ValueNameDescriptionProject<br>0b<br>CS<br>Flip source is CS<br>All<br><br>1b<br>BCS<br>Flip source is BCS<br>All |
| 2 | 0b<br>RW | **DECRYPTION_REQUEST:** Project:<br>All<br><br>Default Value:<br>0b<br><br>This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register. |
| 1:0 | 0b<br>RW | **RESERVED_1:** MBZ |

## 14.11.217 DSPATILEOFF—Offset 701A4h

Display A Tiled Offset Register

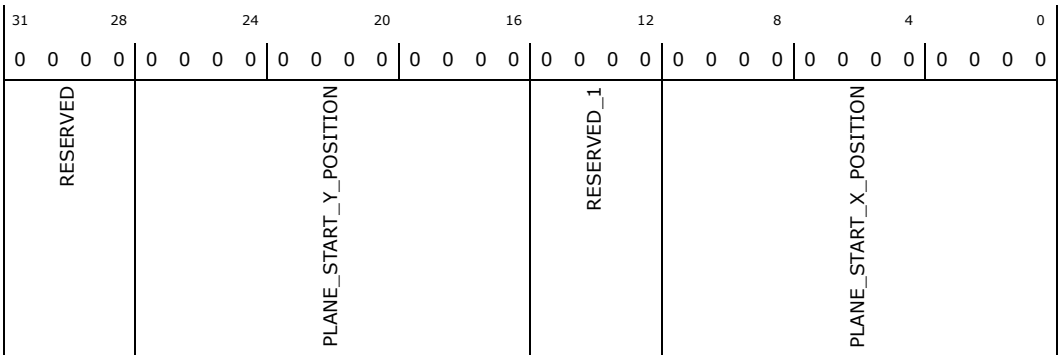
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 701A4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **PLANE_START_Y_POSITION:** These 12 bits specify the vertical position in lines of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **PLANE_START_X_POSITION:** These 12 bits specify the horizontal offset in pixels of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the horizontal position of the lower right corner relative to the start of the active display plane in the unrotated orientation. [DevBW, DevCL, DevCDV] When display stride is 16KB and doing Asynch Flips, do not program the offset to give pans of 7680 to 8191 bytes. |

## 14.11.218 DSPASURFLIVE—Offset 701ACh

Display A Live Surface Base Address Register [DevCTG-B, DevCDV]

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 701ACh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

## 14.11.242 PIPEBCONF—Offset 71008h

Pipe B Configuration Register

### Access Method

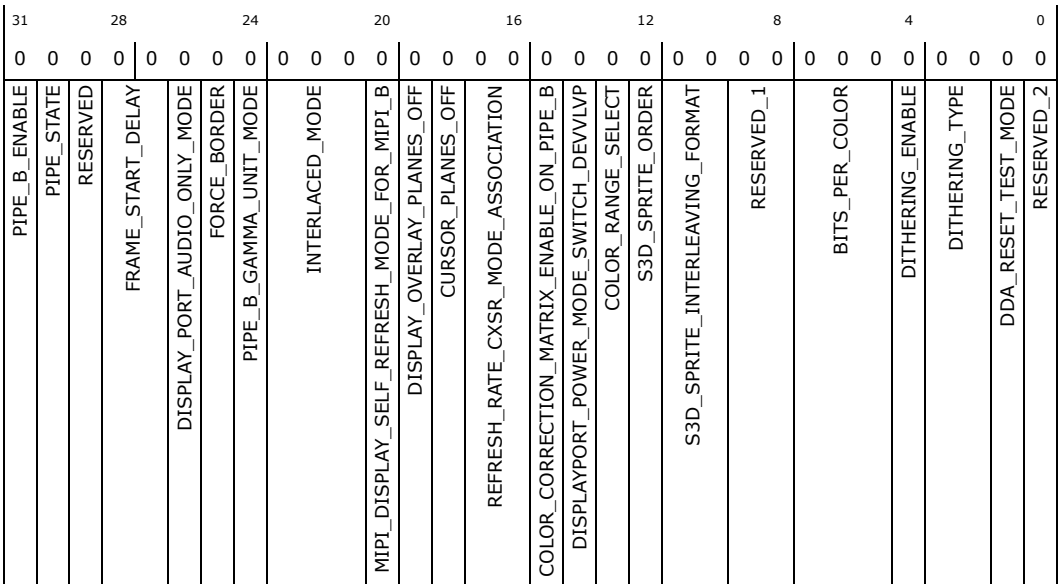
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71008h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

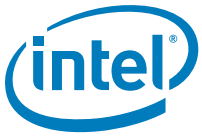
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **PIPE_B_ENABLE:** Setting this bit to the value of one, turns on pipe B. This must be done before any planes are enabled on this pipe. Changing it to a zero should only be done when all planes that are assigned to this pipe have been disabled. Turning the pipe enable bit off disables the timing generator in this pipe. Plane disable occurs after the next VBLANK event after the plane is disabled. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption will be at its lowest state when disabled. A separate bit controls the DPLL enable for this pipe. Pipe timing registers should contain valid values before this bit is enabled.<br>Disabling the Pipe and changing the timing registers and re-enabling the pipe before the next VBLANK will cause the mode change to occur at the end of the current frame. This requires no wait on the software s part. On the other hand, if this is the disabling of the pipe, that does require a software wait for VBLANK to occur.<br>Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption is at it s lowest state.<br>1 = Enable<br>0 = Disable |
| 30 | 0b<br>RO | **PIPE_STATE:** This bit indicates the actual state of the pipe. Since there can be some delay between disabling the pipe and the pipe actually shutting off, this bit indicates the true current state of the pipe.<br>0 = Disabled<br>1 = Enabled<br>AccessType: Read Only |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 29 | 0b<br>RW | **RESERVED:** Write as zero. |
| 28:27 | 0b<br>RW | **FRAME_START_DELAY:** Used to delay the frame start signal that is sent to the display planes. Normal operation uses the default 00 value and test modes can use the delayed frame start to shorten the test time. This would be set to 00 for normal operation.<br>00 = Frame Start occurs on the first HBLANK after the start of VBLANK<br>01 = Frame Start occurs on the second HBLANK after the start of VBLANK<br>10 = Frame Start occurs on the third HBLANK after the start of VBLANK<br>11 = Frame Start occurs on the forth HBLANK after the start of VBLANK |
| 26 | 0b<br>RW | **DISPLAY_PORT_AUDIO_ONLY_MODE:** [DevVLVP] Setting this bit to 1 indicates the DisplayPort will output audio only.<br>0 = DisplayPort will output Video or Video and Audio<br>1 = DisplayPort will output Audio only |
| 25 | 0b<br>RW | **FORCE_BORDER:** : (TEST MODE)0 = Normal Operation<br>1 = Color information is ignored and border color is substituted during active region |
| 24 | 0b<br>RW | **PIPE_B_GAMMA_UNIT_MODE:** . This bit selects which mode the pipe gamma correction logic works in. In the palette mode, it behaves as a 3X256x8 RAM lookup. VGA and indexed mode operation should use the palette in 8-bit mode. In the 10-bit gamma mode, it will act as a piecewise linear interpolation. Other gamma units such as in the overlay and sprite are unaffected by this bit.0 = 8-bit Palette Mode<br>1 = 10-bit Gamma Mode |
| 23:21 | 0b<br>RW | **INTERLACED_MODE:** These bits are used for software control of interlaced behavior. They are updated immediately if the pipe is off, or in the vertical blank after programming if pipe is enabled.<br>0xx = Progressive<br>100 = Interlaced embedded panel using programmable vertical sync shift (2x)<br>101 = Interlaced using vertical sync shift. Backup option to setting 110. (2x)<br>110 = Interlaced with VSYNC/HSYNC Field Indication using legacy vertical sync shift. Used for SDVO.<br>111 = Interlaced with Field 0 Only using legacy vertical sync shift. Not used.<br>Note: VGA display modes, sDVO line stall, and Panel fitting do not work while in interlaced modes<br>Setting the Interlaced embedded panel mode causes hardware to automatically modify the output to match the specifications of panels that support interlaced mode. |
| 20 | 0b<br>RW | **MIPI_DISPLAY_SELF_REFRESH_MODE_FOR_MIPI_B:** .0 = Normal Operation, display controller generate timing and refresh display panel at refresh rate<br>1 = Display self-refresh mode. Display controller update frame buffer in display module on demand only |
| 19 | 0b<br>RW | **DISPLAY_OVERLAY_PLANES_OFF:** . This bit when set will cause all enabled Display and overlay planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the screen becomes blank. Setting the bit back to a zero will then allow the display and overlay planes to resume on the following VBLANK.0 = Normal Operation<br>1 = Planes assigned to this pipe are disabled. |
| 18 | 0b<br>RW | **CURSOR_PLANES_OFF:** . This bit when set will cause all enabled cursor planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the screen becomes blank. Setting the bit back to a zero will then allow the cursor planes to resume on the following VBLANK. 0 = Normal Operation<br>1 = Planes assigned to this pipe are disabled. |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17:16 | 0b<br>RW | **REFRESH_RATE_CXSR_MODE_ASSOCIATION:** These bits select how refresh rates are tied to CxSR on pipe B. When they are set to anything other than 00, bits 23:21 of this register must be programmed to 0xx. Switching between 01 and 10 settings directly is not allowed. Software must program this field to 00 before switching. Software is responsible for enabling this mode only for integrated dispay panels that support corresponding mode.<br>00 Default no dynamic refresh rate change enabled. Software control only.<br>01 Progressive-to-progressive refresh rate change enabled and tied to CxSR. Pixel clock values set in FPB0/FPB1 settings in the DPLLB control register and FPB0/FPB1 divider registers.<br>10 Progressive-to-interlaced refresh rate change enabled and tied to CxSR. Pixel clock value does not change in this case. Scaling must be disabled in this mode. Uses programmable VS shift<br>11 Reserved |
| 15 | 0b<br>RW | **COLOR_CORRECTION_MATRIX_ENABLE_ON_PIPE_B:** 1 = Color Correction Coefficients are enabled to perform color correction<br>0 = Color Correction Coefficients are disabled |
| 14 | 0b<br>RW | **DISPLAYPORT_POWER_MODE_SWITCH_DEVVLVP:** This bit selects the software controlled progressive to progressive power saving mode (software controlled DRRS). Hardware Controlled Refresh Rate Select must be disabled when enabling this. Link and data M/N 1 values are used for normal settings, M/N 2 values are used for low power settings.<br>0 Normal progressive refresh rate (default)<br>1 Low Power progressive refresh rate |
| 13 | 0b<br>RW | **COLOR_RANGE_SELECT:** [DevVLVP]: This bit is used to select the color range of RBG outputs.<br>0 = Apply full 0-255 color range to the output (Default)<br>1 = Apply 16-235 color range to the output |
| 12 | 0b<br>RW | **S3D_SPRITE_ORDER:** This bit controls the blending order of the sprite planes for S3D support:<br>0 = Sprite C first. The first line or pixel comes from Sprite C (default)<br>1 = Sprite D first. The first line or pixel comes from Sprite D |
| 11:10 | 0b<br>RW | **S3D_SPRITE_INTERLEAVING_FORMAT:** These bits control the Sprite C/D interleaving format in S3D mode<br>00 = No interleaving<br>01 = Line interleaving<br>10 = Pixel interleaving<br>11 = Reserved |
| 9:8 | 0b<br>RW | **RESERVED_1:** [DevCDV, DevVLVP] MBZ<br>Scrambling enable [DevCTG]: This bit enables scrambling for DisplayPort. Software must set this bit appropriately when enabling a DisplayPort output.<br>00 = Scrambling disabled (Default)<br>01 = Scrambling enabled, no SR after initialization at loop 2 of training<br>10 - RESERVED<br>11 = Scrambling and SR enabled. Scrambling is reset every 512 BS symbols. |
| 7:5 | 0b<br>RW | **BITS_PER_COLOR:** [DevCTG, DevCDV, DevVLVP]: This field selects the number of bits per color sent to a receiver device connected to this port. Color format takes place on the Vblank after being written. Color format change can be done independent of a pixel clock change.<br>Selecting a pixel color depth higher or lower than the pixel color depth of the frame buffer results in dithering the output stream.<br>For further details on Display Port fixed frequency programming to accommodate these formats refer to DP Frequency Programming in DPLL section of Bspec.<br>000 = 8 bits per color (Default)<br>001 = 10 bits per color<br>010 = 6 bits per color<br>011 = RESERVED<br>1xx = RESERVED |
| 4 | 0b<br>RW | **DITHERING_ENABLE:** [DevCTG, DevCDV]: This bit enables dithering for DisplayPort 6bpc or 8bpc modes<br>0 Dithering disabled (Default)<br>1 Dithering enabled<br>Programming Note: Dithering should only be enabled for 8bpc or 6bpc. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:2 | 0b<br>RW | **DITHERING_TYPE:** [DevCTG, DevCDV]: This bit selects dithering type for DisplayPort 6bpc or 8bpc modes<br>00 - Spatial only (default)<br>01- Spatio-Temporal 1<br>10- Spatio-Temporal 2 (testmode)<br>11- Temporal only (testmode) |
| 1 | 0b<br>RW | **DDA_RESET_TEST_MODE:** [DevCTG, DevCDV]:<br>0 Do not reset DDA<br>1 Reset DDA every 8th display frame |
| 0 | 0b<br>RW | **RESERVED_2:** Write as zero |

## 14.11.247 PIPEBFRAMECOUNT—Offset 71040h

Pipe B Frame Counter

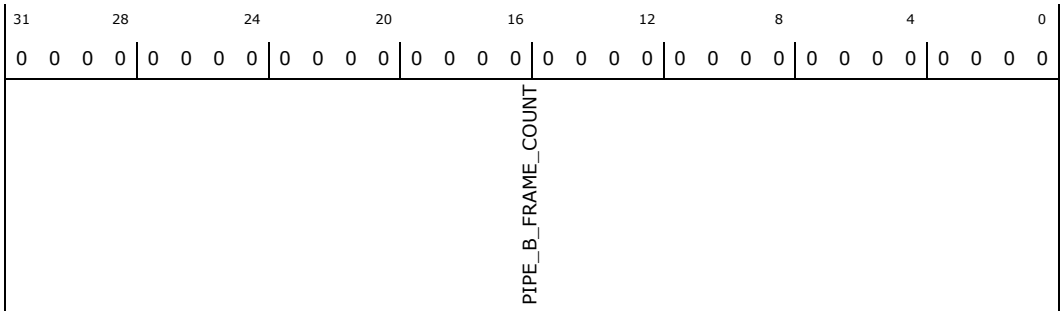
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71040h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **PIPE_B_FRAME_COUNT:** Provides read back of the display pipe frame counter. This counter increments on every start of vertical blank and rolls over back to 0 after 2^32 frames |

## 14.11.248 PIPEBFLIPCOUNT—Offset 71044h

Pipe B Flip Counter

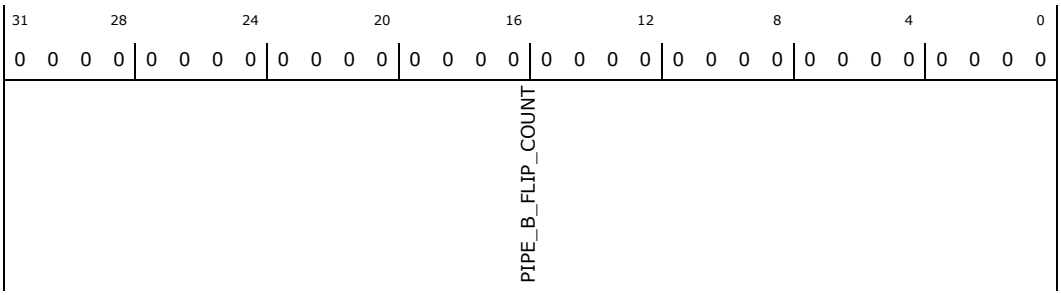
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71044h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **PIPE_B_FLIP_COUNT:** Provides read back of the display pipe flip counter. This counter increments on each flip of the surface of the primary plane on this pipe. This includes command streamer asynchronous and synchronous flips and any MMIO writes to the primary plane surface address. It rolls over back to 0 after 2^32 flips. |

## 14.11.249 PIPEBMSAMISC—Offset 71048h

Pipe B MSA MISC

### Access Method

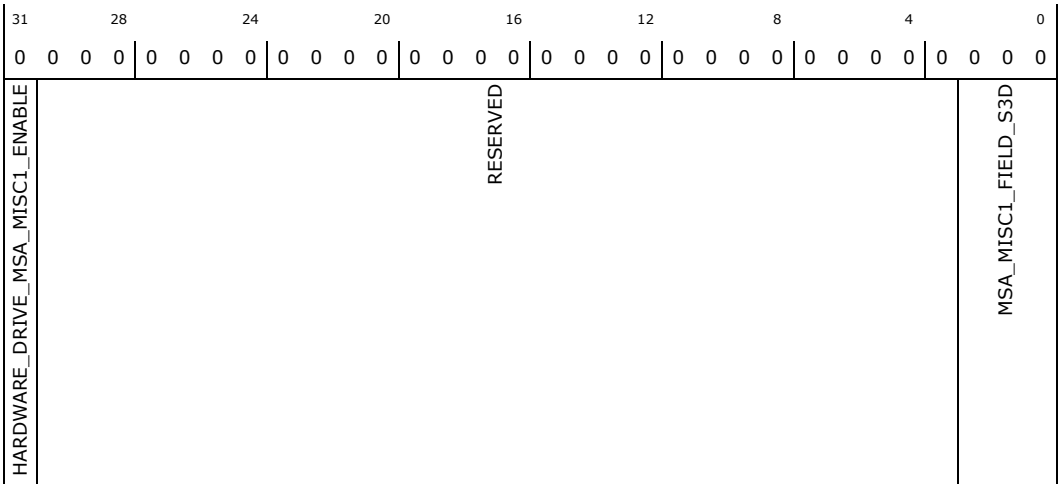
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71048h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

Ignore alpha.<br>1111 = 32-bit RGBA (8:8:8:8) pixel format (with pre-multiplied color format) |
| 25:24 | 01b<br>RO | **PIPE_SELECT:** Plane B always ties to Pipe B.<br>Reserved<br>AccessType: Read Only |
| 23 | 0b<br>RW | **KEY_WINDOW_ENABLE:** This applies only to devices with a Display Plane C. It determines what area of the screen the source key compare should be applied. This bit is set to one when the color key is used as a destination key for display C. Display plane C must be enabled on the same pipe and display A should not be enabled on this pipe for this to be used. The function is only effective when display C is enabled and defined by Z-order to be behind display B.<br>0 = If keying is enabled, it applies to the entire display B plane<br>1 = If keying is enabled, it applies only to the intersection between display B and display C<br>[DevBLC] and [DevCTG]: Reserved |
| 22 | 0b<br>RW | **SOURCE_KEY_ENABLE:** When used as a sprite or a secondary this enables source color keying. Sprite pixel values that match the key will become transparent. Source keying allows a plane that is behind (below) this plane to show through where the display B data matches the display B key. This function is overloaded to provide display C destination keying when combined with the key window enable bit.. Setting this bit is not allowed when the display pixel format includes an alpha channel.<br>0 = Sprite source key is disabled (default)<br>1 = Sprite source key is enabled.<br>[DevBLC] and [DevCTG]: Reserved<br>In destination keying, primary plane pixel will be made transparent when blending with sprite pixel as the destination if the primary src key matches with the primary pixel value. |
| 21:20 | 0b<br>RW | **PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. Asynchronous flips are not used in this mode.<br>Programming Notes:<br>Asynchronous flips are not permitted when pixel multiply is enabled.<br>00 = No duplication<br>01 = Line/pixel Doubling<br>10 = Reserved<br>11 = Pixel Doubling only |
| 19:16 | 0b<br>RW | **RESERVED:** Write as zero |
| 15 | 0b<br>RW | **_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image.<br>[DevCL] Do not enable 180 rotation together with Frame Buffer Compression<br>0 = No rotation<br>1 = 180 rotation |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 14 | 0b<br>RW | **RESERVED_1:** [DevBW, DevCL, DevCDV]<br>[DevBLC, DevCTG] Display B Trickle Feed Enable:<br>0 = Trickle Feed Enabled - Display B data requests are sent whenever there is space in the Display Data Buffer.<br>1 = Trickle Feed Disabled - Display B data requests are sent in bursts.<br>Note: On mobile products this bit will be ignored such that Trickle Feed is always disabled.<br>[DevELK] Must always be programmed disabled |
| 13 | 0b<br>RW | **RESERVED_2:** [DevBW, DevCL, DevCDV]<br>[DevBLC, DevCTG] Display B Data Buffer Partitioning Control:<br>0 = Display B Data Buffer will encompass Sprite B buffer space when Sprite B is disabled.<br>1 = Display B Data Buffer will not use Sprite B buffer space when Sprite B is disabled.<br>Note: When in C3xR Max FIFO mode, this bit will be ignored. |
| 12:11 | 0b<br>RW | **RESERVED_3:** Reserved. |
| 10 | 0b<br>RW | **TILED_SURFACE:** This bit indicates that the display B surface data is in tiled memory. The tile pitch is specified in bytes in the DSPBSTRIDE register. Only X tiling is supported for display surfaces.<br>When this bit is set, it affects the hardware interpretation of the DSPBLINOFF, DSPBTILEOFF, and DSPBSURF registers.<br>0 = Display B surface uses linear memory<br>1 = Display B surface uses X-tiled memory |
| 9 | 0b<br>RW | **RESERVED_4:** [DevBW, DevCL, DevCDV] Write as zero<br>[DevBLC, DevCTG] Asynchronous Surface Address Update Enable: This bit will enable asynchronous updates of the surface address when written by MMIO. The surface address will change with the next TLB request or when start of vertical blank is reached. Updates during vertical blank may not complete until after the first few active lines are displayed.<br>Restrictions:<br>No command streamer initiated surface address updates are allowed when this bit is enabled.<br>Only one asynchronous update may be made per frame. Must wait for vertical blank before again writing the surface address register.<br>0 = DSPBSURF MMIO writes will update synchronous to start of vertical blank (default)<br>1 = DSPBSURF MMIO writes will update asynchronously |
| 8:1 | 0b<br>RW | **RESERVED_5:** Write as zero |
| 0 | 0b<br>RW | **S3D_FORCE_DISPLAY_B_BOTTOM:** This bit will force the display B plane to be on the bottom of any sprite planes in the Z order.<br>0 = Display B Z-order is determined by the other control bits in pipe B<br>1 = Display B is forced to be on the bottom of any sprite planes in Z-order in pipe B |

## 14.11.252 DSPBLINOFFSET—Offset 71184h

Display B/Sprite Linear Offset Register

### Access Method

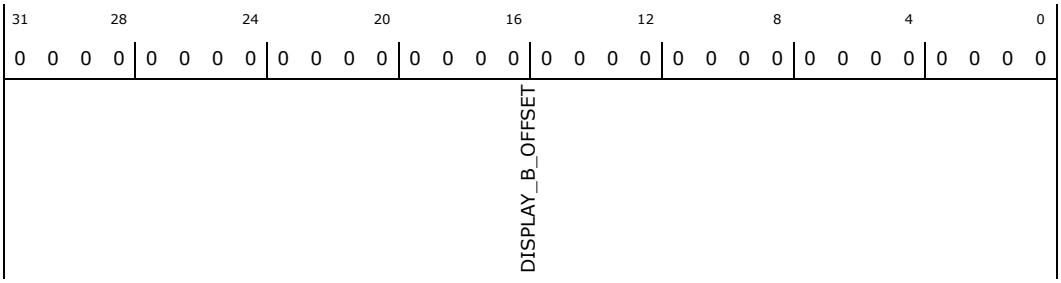
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71184h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **DISPLAY_B_OFFSET:** This register provides the panning offset into the display B plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

## 14.11.253 DSPBSTRIDE—Offset 71188h

Display B/Sprite Stride Register

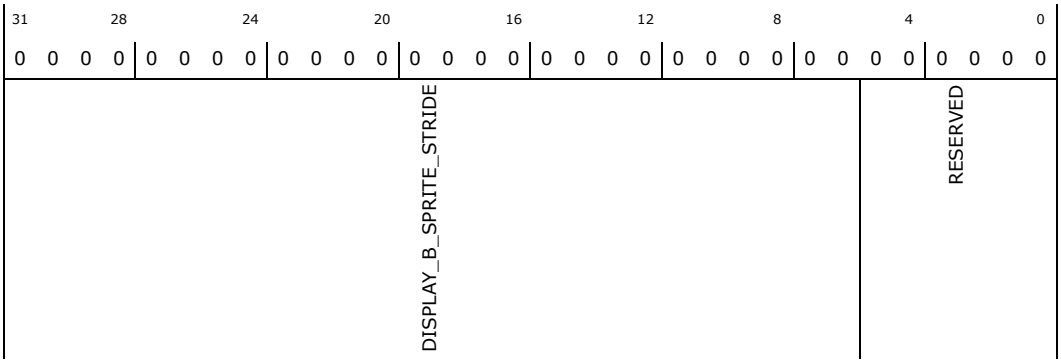
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71188h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **DISPLAY_B_SPRITE_STRIDE:** This is the stride for display B/Sprite in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 512 byte aligned. The maximum value for this register is fixed. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.<br>[DevBW, DevCL, DevCDV] The display stride must be power of 2 when doing Asynch Flips.<br>[DevBW, DevCL, DevCDV] The display stride must be 8KB or greater when doing Asynch Flips together with 180 rotation.<br>The value in this register is updated through the command streamer during a synchronous flip. |
| 5:0 | 0b<br>RW | **RESERVED:** Reserved. |

## 14.11.254 DSPBKEYVAL—Offset 71194h

Sprite Color Key Value Register

### Access Method

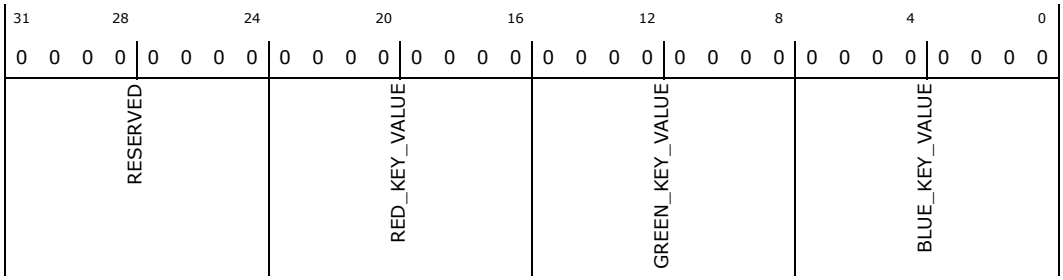
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71194h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** reserved |
| 23:16 | 0b<br>RW | **RED_KEY_VALUE:** Specifies the color key value for the sprite red/Cr channel. |
| 15:8 | 0b<br>RW | **GREEN_KEY_VALUE:** Specifies the color key value for the sprite green/Y channel. |
| 7:0 | 0b<br>RW | **BLUE_KEY_VALUE:** Specifies the color key value for the sprite blue/Cb channel. |

## 14.11.255 DSPBKEYMSK—Offset 71198h

Sprite Color Key Mask Register

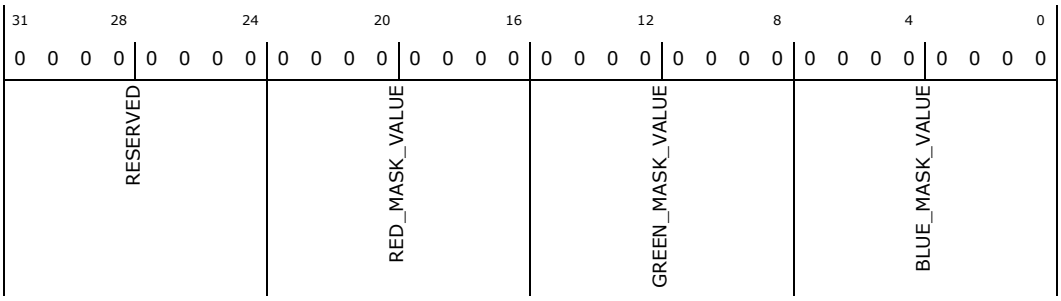
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71198h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** reserved |
| 23:16 | 0b<br>RW | **RED_MASK_VALUE:** Specifies the color key mask for the sprite red/Cr channel. |

## 14.11.257 DSPBTILEOFF—Offset 711A4h

Display B Tiled Offset Register

### Access Method

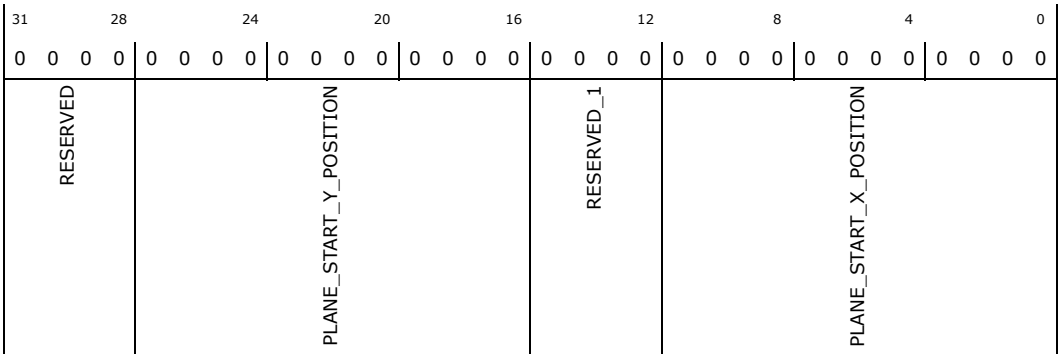
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 711A4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **PLANE_START_Y_POSITION:** These 12 bits specify the vertical position in lines of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:0 | 0b<br>RW | **PLANE_START_X_POSITION:** These 12 bits specify the horizontal offset in pixels of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the horizontal position of the lower right corner relative to the start of the active display plane in the unrotated orientation. [DevBW, DevCL, DevCDV] When display stride is 16KB and doing Asynch Flips, do not program the offset to give pans of 7680 to 8191 bytes. |

## 14.11.258 DSPBSURFLIVE—Offset 711ACh

Display B Live Surface Base Address Register [DevCTG-B, DevCDV]

### Access Method

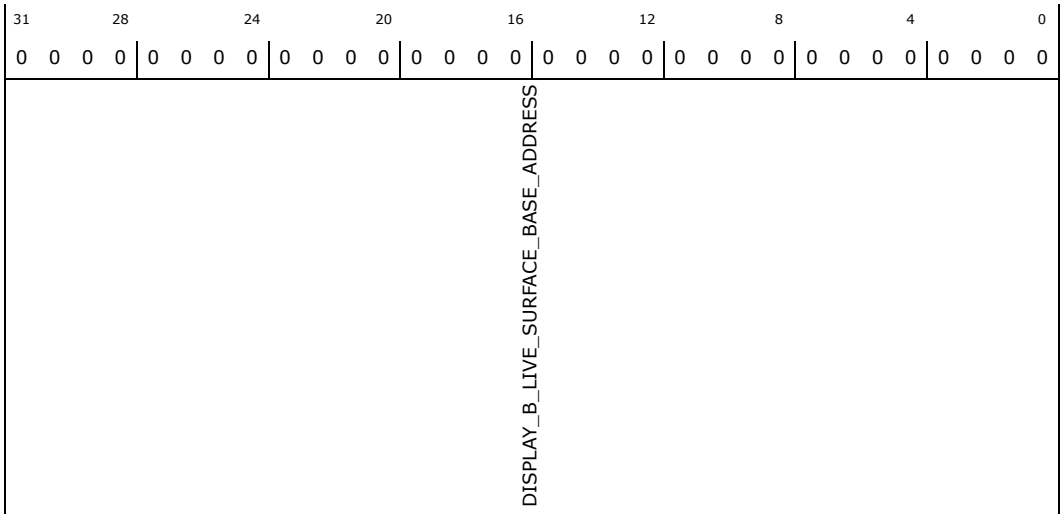
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 711ACh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RO | **DISPLAY_B_LIVE_SURFACE_BASE_ADDRESS:** . This gives the live value of the surface base address as being currently used for the plane. |

## 14.11.259 DSPBFLPQSTAT—Offset 71200h

Flip Queue Status Register

### Access Method

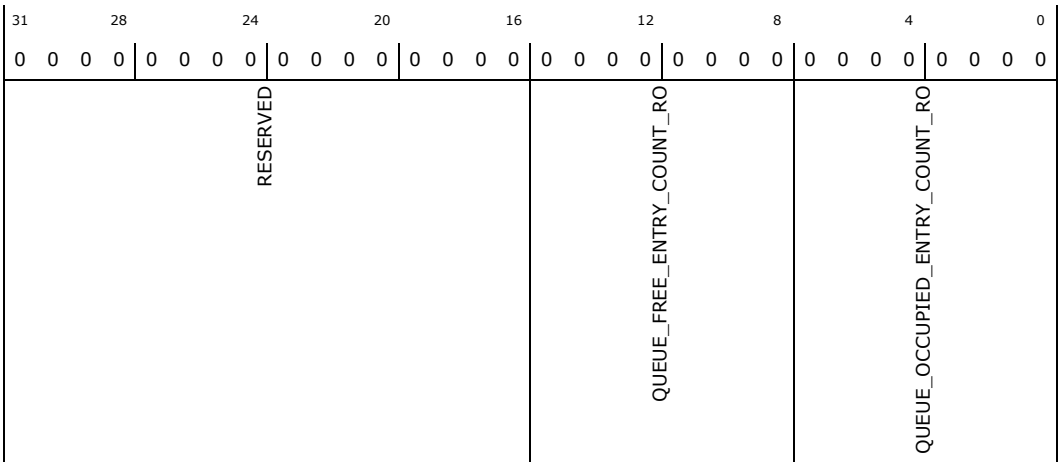
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 71200h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

| 15:8 | 0b<br>RO | **QUEUE_FREE_ENTRY_COUNT_RO:** This value indicates the number of free entries in the queue at the time that the register was read. The total number of entries in the queue is the sum of the occupied entry count and the free entry count. |
| 7:0 | 0b<br>RO | **QUEUE_OCCUPIED_ENTRY_COUNT_RO:** This value indicates the number of occupied entries in the queue at the time that the register was read. The total number of entries in the queue is the sum of the occupied entry count and the free entry count. |

## 14.11.260 VGACNTRL—Offset 71400h

VGA Display Plane Control Register

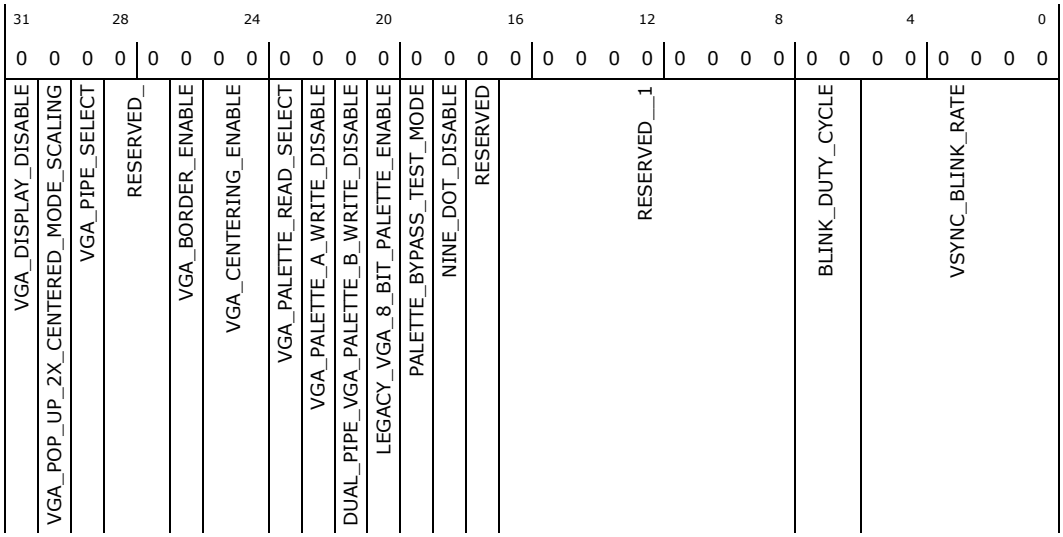
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

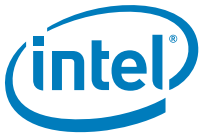
**Offset:** [GTTMMADR_LSB + 180000h] + 71400h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **VGA_DISPLAY_DISABLE:** This bit will disable the VGA compatible display mode. It has no effect on VGA register or A0000-BFFFF memory aperture accesses which are controlled by the PCI configuration and VGA register settings. VGA display should only be enabled if all display planes other than VGA are disabled. After enabling the VGA, most display planes need to stay disabled, only the VGA popup (cursor A) can be enabled. The VGA display is never trusted. No secrets are allowed in the pre-allocated memory and VGA is limited to access only that memory. During trusted operation (when registers are locked via Lock), this bit will always act as if it was set to a one (disabled VGA display).<br>VGA 132 Column text mode is not supported.<br>0 = VGA Display Enabled<br>1 = VGA Display Disabled |
| 30 | 0b<br>RW | **VGA_POP_UP_2X_CENTERED_MODE_SCALING:** When this bit is set to a one, the VGA and pop-up data is scaled using pixel doubling in both the horizontal and vertical direction for use on un-scaled flat panel displays. Setting this bit allows the VGA to run at higher dot clock frequencies and creates a larger (4x the size) image for better quality on larger displays. It is intended for use in one of the centering modes when not using the internal panel fitting. Do not use it for native VGA modes or when internal panel fitting is used to scale VGA.<br>In the situations where it is used, for 1280 wide or larger panels this bit should be set. For exactly 1280 wide panels, the Nine-dot disable bit should also be set. This operation is in addition to the VGA functions that double the pixels and lines.<br>0 = VGA display is normal size<br>1 = VGA and VGA popup data is doubled in the horizontal and vertical direction. |
| 29 | 0b<br>RW | **VGA_PIPE_SELECT:** This bit only applies to devices with dual pipe support. For devices with a single display pipe, this bit will be ignored. For dual pipe devices, this bit determines which pipe is to receive the VGA display data. This must be changed only when the VGA display is in the disabled state via the VGA display disable bit or during the write to enable VGA display.<br>0 = Selects Assigns the VGA display to Pipe A<br>1 = Selects Assigns the VGA display to Pipe B |
| 28:27 | 0b<br>RW | **RESERVED_:** Software must preserve the contents of these bits. |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 26 | 0b<br>RW | **VGA_BORDER_ENABLE:** This bit determines if the VGA border areas during VGA centering modes are included in the active display area and do or do not appear on integrated TV encoder output and devices that use centering such as on DVO connected flat panel, TV displays, or integrated panels.<br>For use with the internal panel fitting logic, the border if enabled will be scaled along with the pixel data. Setting this bit allows the popup to be positioned overlapping the border area of the image.<br>0 = VGA Border areas are not included in the image size calculations for centering only active area.<br>1 = VGA Border areas are enabled and is passed to the display pipe for display and used in the image size calculation for centering modes |
| 25:24 | 0b<br>RW | **VGA_CENTERING_ENABLE:** VGA centering modes use the pipe timing generators to determine the actual display timings. This would normally correspond to the display panel size and timings. The VGA registers determine the centered VGA image height and width. The VGA border may or may not be considered in the calculation selected by the VGA Border Enable bit. For a proper image, the VGA image size should not exceed the pipe timing generator active rectangle. When using the internal panel fitting logic, the horizontal image size needs to be less than or equal to 2048 pixels to generate a proper image. The VGA image will either be centered within the pipe timing rectangle or appear in the upper left corner.<br>Upper left corner centered mode is generally used for external panel scaling where the DVO stall signal is used and is always used for internal panel fitting operation. When panel fitter is enabled on the same pipe as VGA this register setting is ignored and upper left corner centered mode is always selected. When centering is disabled, the VGA CRTC registers determine the display timing compatible with legacy VGA devices for driving CRT like devices.<br>00 = VGA centering is disabled, VGA operates in Native VGA mode or when driving integrated TV<br>01 = VGA centering is enabled, VGA image appears in the center of the larger rectangle<br>10 = VGA centering is enabled, VGA image appears in the upper left corner of the larger rectangle<br>11 = VGA centering is enabled, VGA image appears in the upper left corner of the larger rectangle |
| 23 | 0b<br>RW | **VGA_PALETTE_READ_SELECT:** This bit only applies to dual display pipe devices and determines which palette VGA palette read accesses will occur from.<br>0 = VGA palette reads will access Palette A (default).<br>1 = VGA palette reads will access Palette B<br>VGA palette reads are reads from I/O address 0x3c9. |
| 22 | 0b<br>RW | **VGA_PALETTE_A_WRITE_DISABLE:** This determines which palette the VGA palette writes will have as a destination.<br>One or both palettes can be the destination. If both are disabled, writes will not affect the palette RAM contents.<br>0 = VGA palette writes will update Palette A (default).<br>1 = VGA palette writes will not update Palette A<br>VGA palette writes are writes to I/O address 0x3C9h. |
| 21 | 0b<br>RW | **DUAL_PIPE_VGA_PALETTE_B_WRITE_DISABLE:** This determines which palette the VGA palette writes will have as a destination. One or both palettes can be the destination. If both are disabled, writes will not affect the palette RAM contents.<br>0 = VGA palette writes will update Palette B (default).<br>1 = VGA palette writes will not update Palette B<br>VGA palette writes are writes to I/O address 0x3C9h. |
| 20 | 0b<br>RW | **LEGACY_VGA_8_BIT_PALETTE_ENABLE:** This bit only affects reads and writes to the palette through VGA I/O addresses. In the 6-bit mode, the 8-bits of data are shifted up two bits on the write (upper two bits are lost) and shifted two bits down on the read. It provides backward compatibility for original VGA programs (in it s default state) as well as VESA VBE support for 8-bit palette. It does not affect palette accesses through the palette register MMIO path.<br>0 = 6-bit DAC (default).<br>1 = 8-bit DAC. |
| 19 | 0b<br>RW | **PALETTE_BYPASS_TEST_MODE:** 0 = Pass VGA data through the palette for translation (Normal Operation)<br>1 = Bypass the palette for allowing testing without loading palette both VGA and popup data will bypass the palette in this mode. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18 | 0b<br>RW | **NINE_DOT_DISABLE:** Prevents DOS applications from setting the VGA display into a real 9-dot per character operation mode, instead the device emulates that using 8-dots per character. This is intended to provide VGA compatibility on DVI type connectors and integrated panels where there would otherwise not be room for the 720 horizontal pixels or 1440 pixels when horizontally doubled. The VGA register bit SR01(0) functionality is disabled. VGA panning control handles the pseudo 9-dot mode when both this bit is set and SR01(0) is clear.<br>0 = Enable use of 9-dot enable bit in VGA registers<br>1 = Ignore the 9-dot per character bit and always use 8 |
| 17 | 0b<br>RW | **RESERVED:** Reserved. |
| 16:8 | 0b<br>RW | **RESERVED__1:** Software must preserve the contents of these bits. |
| 7:6 | 0b<br>RW | **BLINK_DUTY_CYCLE:** Controls the VGA text mode blink duty cycle relative to the cursor blink duty cycle.<br>00 = 100% Duty Cycle, Full Cursor Rate (Default)<br>01 = 25% Duty Cycle, Cursor Rate<br>10 = 50% Duty Cycle, Cursor Rate<br>11 = 75% Duty Cycle, Cursor Rate |
| 5:0 | 0b<br>RW | **VSYNC_BLINK_RATE:** Controls the VGA blink rate in terms of the number of VSYNCs per on/off cycle. These bits are programmed with the (VSYNCs/cycle)/2-1. The proper programming of this register is determined by the VSYNC rate that the display requires when in a VGA display mode. |

## 14.11.277 SPACNTR—Offset 72180h

Sprite A Control Register

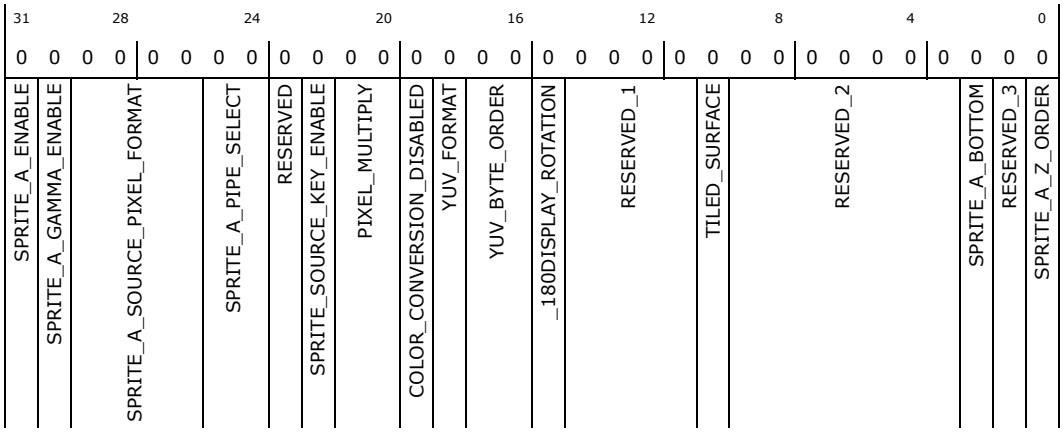
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72180h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SPRITE_A_ENABLE:** This bit will enable or disable the Sprite A. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable |
| 30 | 0b<br>RW | **SPRITE_A_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite A data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite A logic is disabled by loading the default values into those registers.<br>When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed.<br>0 = Sprite A pixel data bypasses the display pipe gamma correction logic (default).<br>1 = Sprite A pixel data is gamma corrected in the pipe gamma correction logic |
| 29:26 | 0b<br>RW | **SPRITE_A_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite A. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter).<br>0000 = YUV 4:2:2 packed (see byte order below).<br>0001 = Reserved<br>0010 = 8-bpp Indexed.<br>0011 = Reserved.<br>0100 = Reserved.<br>0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible).<br>0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha.<br>0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel.<br>1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha.<br>1001 = 32-bit RGBA (10:10:10:2) pixel format<br>1010 = Reserved.<br>1011 = Reserved.<br>1100 = Reserved.<br>1101 = Reserved.<br>1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha.<br>1111 = 32-bit RGBA (8:8:8:8) |
| 25:24 | 0b<br>RW | **SPRITE_A_PIPE_SELECT:** Sprite A always ties to pipe A.<br>Reserved. |
| 23 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 22 | 0b<br>RW | **SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite A pixel format includes an alpha channel.<br>[DevBW] Erratum: This bit must always be set to 0 when Sprite A pixel format is YUV<br>0 = Sprite source key is disabled (default)<br>1 = Sprite source key is enabled.<br>Each sprite has built in source keying enabled/disabled. If the source keying is disabled and no alpha blending is enabled, the pixels are tagged as opaque.<br>If sprite source keying is enabled and no alpha blending is enabled, it works as follows:<br>For YUV sprite data, each yuv channel data is compared with the corresponding channel s key color Low and High (each channel inrange can be masked out). If all three channels are in range between the low and high key values, it is considered source compared.<br>For RGB sprite data, each 24-bit RGB pixel data is compared with the 24-bit key value (note it only uses the 24-bit Low key value for comparison). Each 24-bit has to be equal (each bit comparison can also be masked out) for the source compared.<br>If the sprite source data compare and matches, then the sprite data will be tagged as transparent when blending with its destination pixel.<br>If the sprite source data does not compare, then the sprite data will be tagged as opaque when blending with its destination pixel. |
| 21:20 | 0b<br>RW | **PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V).<br>00 = No line/Pixel duplication<br>01 = Line/Pixel Doubling<br>10 = Line Doubling only<br>11 = Pixel Doubling only |
| 19 | 0b<br>RW | **COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions.<br>0 = Pixel data is sent through the conversion logic (only applies to YUV formats)<br>1 = Pixel data is not sent through the YUV-)RGB conversion logic. |
| 18 | 0b<br>RW | **YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB.<br>0 = ITU-R Recommendation BT.601<br>1 = ITU-R Recommendation BT.709 |
| 17:16 | 0b<br>RW | **YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored.<br>00 = YUYV<br>01 = UYVY<br>10 = YVYU<br>11 = VYUY |
| 15 | 0b<br>RW | **_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner.<br>0 = No rotation<br>1 = 180 rotation |
| 14:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10 | 0b<br>RW | **TILED_SURFACE:** This bit indicates that the Sprite A surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces.<br>When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers.<br>0 = Sprite A surface uses linear memory<br>1 = Sprite A surface uses X-tiled memory |

## 14.11.278 SPALINOFF—Offset 72184h

Sprite A Linear Offset Register

### Access Method

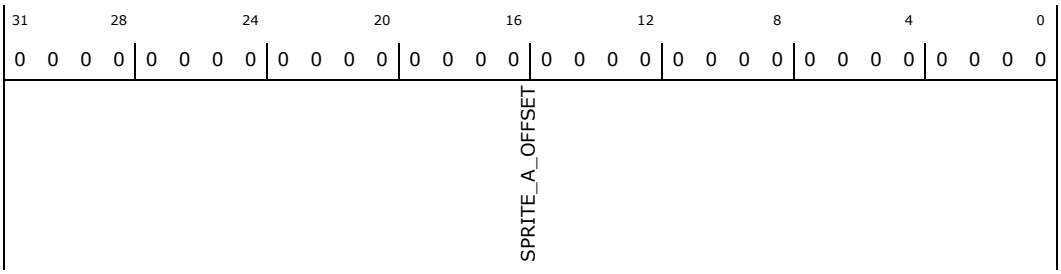
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72184h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **SPRITE_A_OFFSET:** This register provides the panning offset into the Sprite A plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

## 14.11.279 SPASTRIDE—Offset 72188h

Sprite A Stride Register

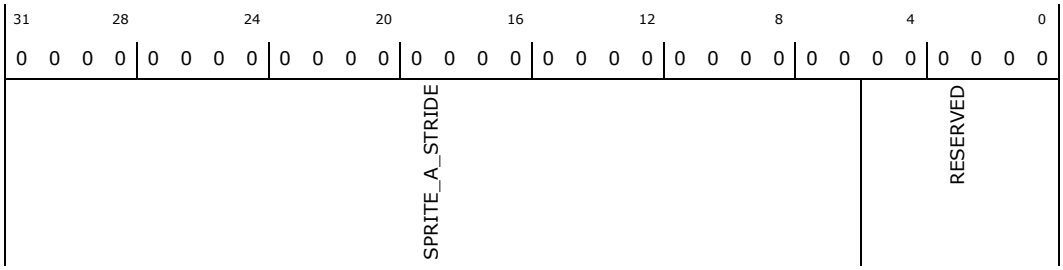
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72188h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **SPRITE_A_STRIDE:** This is the stride for Sprite A in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes. |
| 5:0 | 0b<br>RW | **RESERVED:** Reserved. |

## 14.11.280 SPAPOS—Offset 7218Ch

Sprite A Position Register

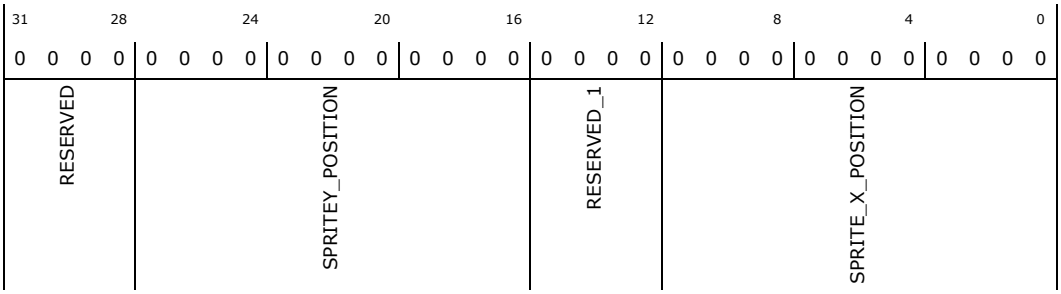
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7218Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **SPRITEY_POSITION:** These 12 bits specify the vertical position in lines of the sprite (upper left corner) relative to the beginning of the active video area. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_X_POSITION:** These 12 bits specify the horizontal position in pixels of the sprite (upper left corner) relative the beginning of the active video area. When performing 180 rotation, this field specifies the horizontal position of the original lower right corner relative to the original end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |

## 14.11.281 SPASIZE—Offset 72190h

Sprite A Height and Width Register

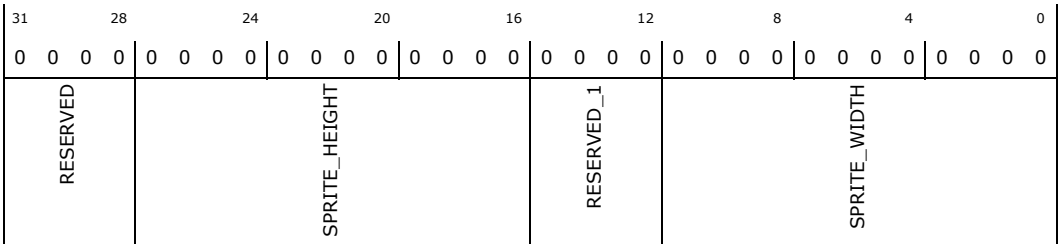
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72190h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27:16 | 0b<br>RW | **SPRITE_HEIGHT:** This register field is used to specify the height of the sprite in lines. The value in the register is the height minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_WIDTH:** This register field is used to specify the width of the sprite in pixels. This does not have to be the same as the stride but should be less than or equal to the stride (converted to pixels). The value in the register is the width minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image.<br>The sprite width is limited to even values when YUV source pixel format is used (actual width, not the width minus one value). |

## 14.11.282 SPAKEYMINVAL—Offset 72194h

Sprite A Color Key Min Value Register

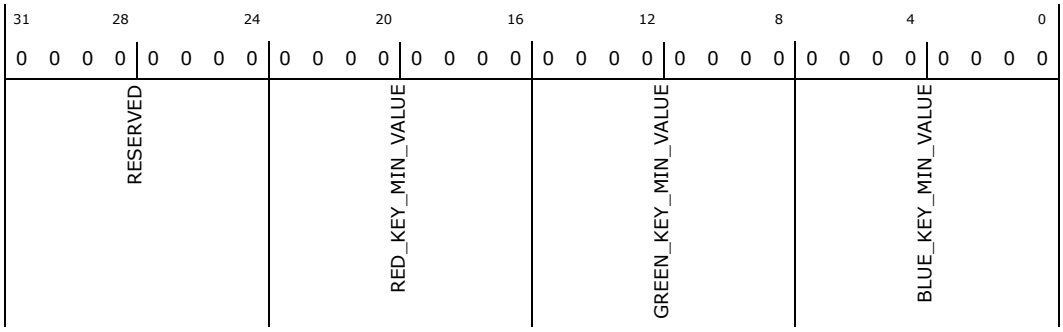
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72194h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Write as zero |
| 23:16 | 0b<br>RW | **RED_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite red/Cr channel. |
| 15:8 | 0b<br>RW | **GREEN_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite green/Y channel. |
| 7:0 | 0b<br>RW | **BLUE_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite blue/Cb channel. |

## 14.11.283 SPAKEYMSK—Offset 72198h

Sprite A Color Key Mask Register

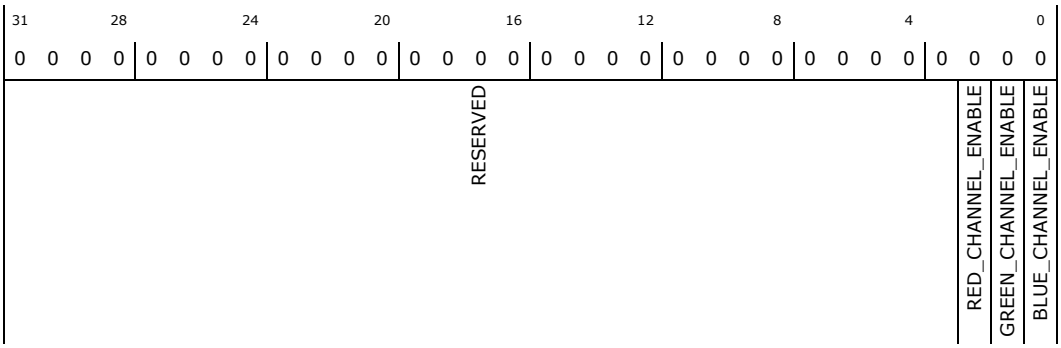
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72198h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0b<br>RW | **RESERVED:** Write as zero |
| 2 | 0b<br>RW | **RED_CHANNEL_ENABLE:** Specifies the source color key enable for the red/Cr channel. |

## 14.11.289 SPACLRC0—Offset 721D0h

Sprite A Color Correction 0 Register

### Access Method

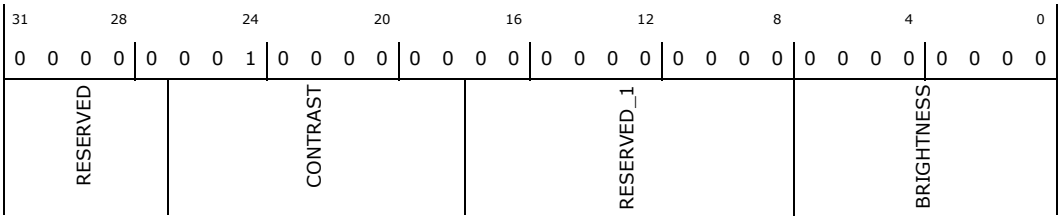
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 721D0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 01000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 26:18 | 001000000b<br>RW | **CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal.<br>Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary . |
| 17:8 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 7:0 | 0b<br>RW | **BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255].<br>Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0. |

## 14.11.290 SPACLRC1—Offset 721D4h

Sprite A Color Correction 1 Register

### Access Method

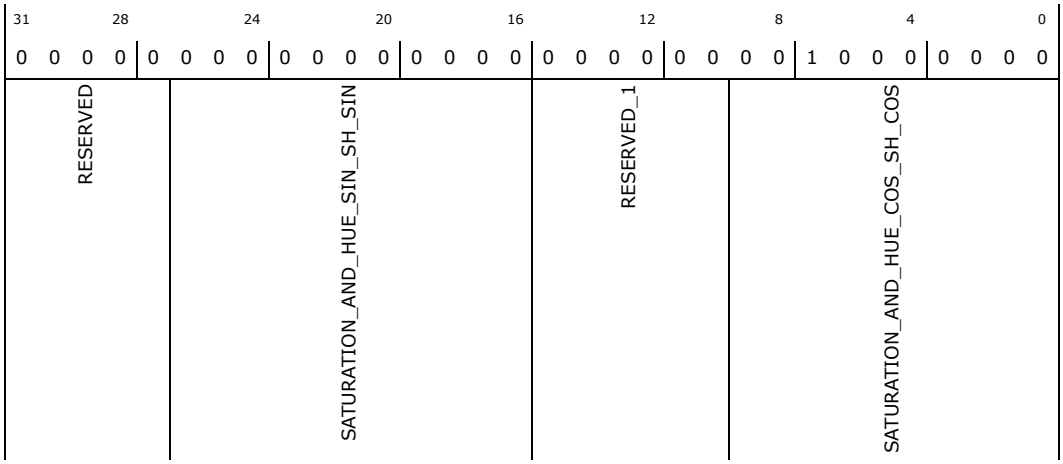
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 721D4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000080h



| Bit Range | Default & Access | Field Name (ID): Description |

## 14.11.297 SPBCNTR—Offset 72280h

Sprite B Control Register

### Access Method

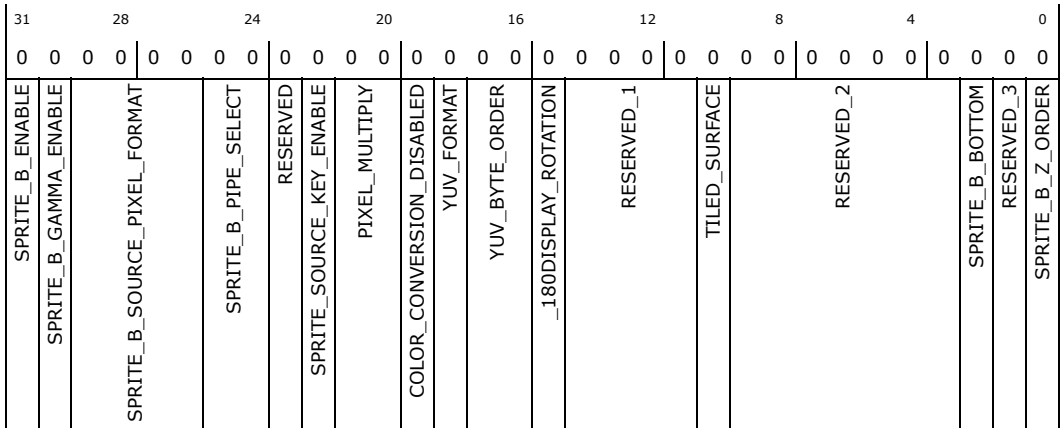
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72280h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SPRITE_B_ENABLE:** This bit will enable or disable the Sprite B. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 30 | 0b<br>RW | **SPRITE_B_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite B data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite B logic is disabled by loading the default values into those registers.<br>When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed.<br>0 = Sprite B pixel data bypasses the display pipe gamma correction logic (default).<br>1 = Sprite B pixel data is gamma corrected in the pipe gamma correction logic |
| 29:26 | 0b<br>RW | **SPRITE_B_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite B. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter).<br>0000 = YUV 4:2:2 packed (see byte order below).<br>0001 = Reserved<br>0010 = 8-bpp Indexed.<br>0011 = Reserved.<br>0100 = Reserved.<br>0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible).<br>0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha.<br>0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel.<br>1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha.<br>1001 = 32-bit RGBA (10:10:10:2) pixel format<br>1010 = Reserved.<br>1011 = Reserved.<br>1100 = Reserved.<br>1101 = Reserved.<br>1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha.<br>1111 = 32-bit RGBA (8:8:8:8) |
| 25:24 | 0b<br>RW | **SPRITE_B_PIPE_SELECT:** Sprite B always ties to Pipe A.<br>Reserved |
| 23 | 0b<br>RW | **RESERVED:** Reserved. |
| 22 | 0b<br>RW | **SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite B pixel format includes an alpha channel.<br>[DevBW] Erratum: This bit must always be set to 0 when Sprite B pixel format is YUV<br>0 = Sprite source key is disabled (default)<br>1 = Sprite source key is enabled. |
| 21:20 | 0b<br>RW | **PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V).<br>00 = No line/Pixel duplication<br>01 = Line/Pixel Doubling<br>10 = Line Doubling only<br>11 = Pixel Doubling only |
| 19 | 0b<br>RW | **COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions.<br>0 = Pixel data is sent through the conversion logic (only applies to YUV formats)<br>1 = Pixel data is not sent through the YUV-)RGB conversion logic. |
| 18 | 0b<br>RW | **YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB.<br>0 = ITU-R Recommendation BT.601<br>1 = ITU-R Recommendation BT.709 |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17:16 | 0b<br>RW | **YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored.<br>00 = YUYV<br>01 = UYVY<br>10 = YVYU<br>11 = VYUY |
| 15 | 0b<br>RW | **_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner.<br>0 = No rotation<br>1 = 180 rotation |
| 14:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10 | 0b<br>RW | **TILED_SURFACE:** This bit indicates that the Sprite B surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces.<br>When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers.<br>0 = Sprite B surface uses linear memory<br>1 = Sprite B surface uses X-tiled memory |
| 9:3 | 0b<br>RW | **RESERVED_2:** Write as zero |
| 2 | 0b<br>RW | **SPRITE_B_BOTTOM:** This bit will force the Sprite B plane to be on the bottom of the Z order. If the plane is marked as trusted, it only applies to the Z order of the trusted planes.<br>0 = Sprite B Z order is determined by the other control bits<br>1 = Sprite B is forced to be on the bottom of the Z order. |
| 1 | 0b<br>RW | **RESERVED_3:** Reserved. |
| 0 | 0b<br>RW | **SPRITE_B_Z_ORDER:** With Sprite A and B z-order, bottom control bits, Sprite B plane is placed in a specific z-order among other planes in pipe A.<br>Display Pipe A Z-orders<br>SA<br>zorderSA<br>bottomSB<br>zorderSB<br>bottomResulting Pipe Z-order (from bottom to top)Source Keying<br>0000PA SA SB CAPA in Black<br>1000PA SB SA CAPA in Black<br>0001SB PA SA CAuse src keying on SB<br>0011SB PA SA CAuse src keying on SB<br>1001SB SA PA CAuse src keying on SA<br>1011SB SA PA CAuse src keying on SA<br>0100SA PA SB CAuse src keying on SA<br>1100SA PA SB CAuse src keying on SA<br>0110SA SB PA CAuse src keying on SB<br>1110SA SB PA CAuse src keying on SB<br>0: Sprite B z-order is disabled<br>1: Sprite B z-order is enabled |

## 14.11.298 SPBLINOFF—Offset 72284h

Sprite B Linear Offset Register

### Access Method

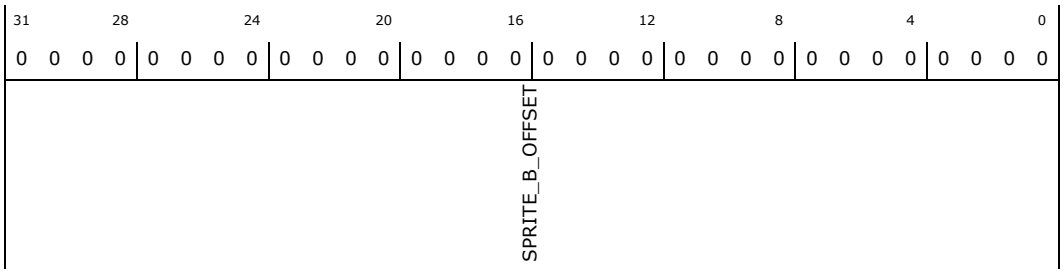
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72284h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **SPRITE_B_OFFSET:** This register provides the panning offset into the Sprite B plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

## 14.11.299 SPBSTRIDE—Offset 72288h

Sprite B Stride Register

### Access Method

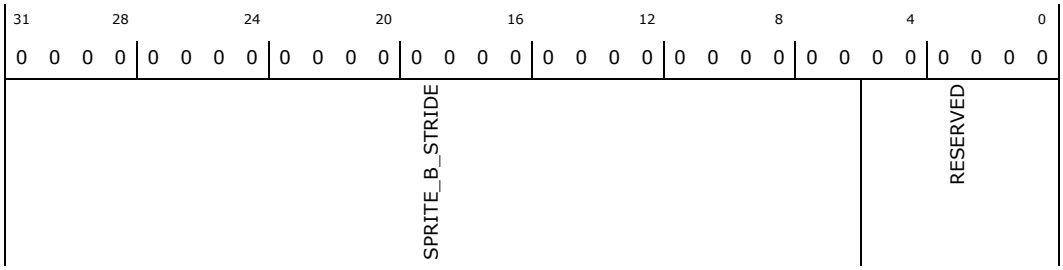
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72288h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **SPRITE_B_STRIDE:** This is the stride for Sprite B in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes. |
| 5:0 | 0b<br>RW | **RESERVED:** Reserved. |

## 14.11.300 SPBPOS—Offset 7228Ch

Sprite B Position Register

### Access Method

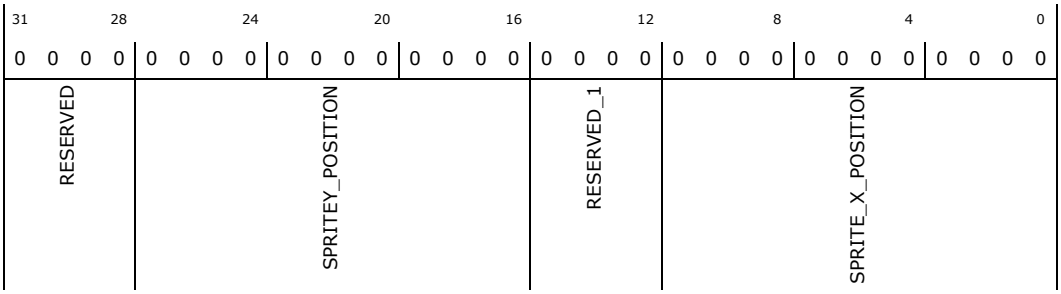
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7228Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **SPRITEY_POSITION:** These 12 bits specify the vertical position in lines of the sprite (upper left corner) relative to the beginning of the active video area. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_X_POSITION:** These 12 bits specify the horizontal position in pixels of the sprite (upper left corner) relative the beginning of the active video area. When performing 180 rotation, this field specifies the horizontal position of the original lower right corner relative to the original end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |

## 14.11.301 SPBSIZE—Offset 72290h

Sprite B Height and Width Register

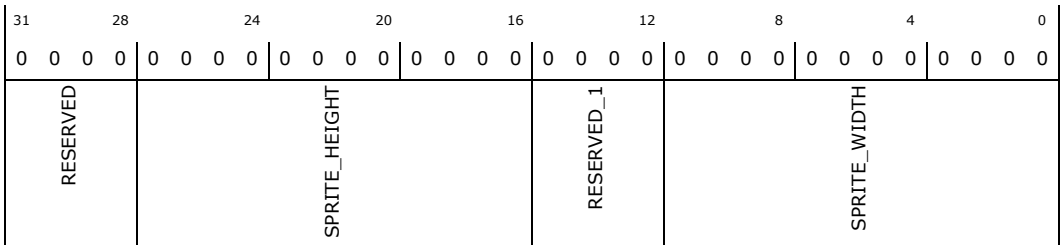
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72290h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **SPRITE_HEIGHT:** This register field is used to specify the height of the sprite in lines. The value in the register is the height minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_WIDTH:** This register field is used to specify the width of the sprite in pixels. This does not have to be the same as the stride but should be less than or equal to the stride (converted to pixels). The value in the register is the width minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image.<br>The sprite width is limited to even values when YUV source pixel format is used (actual width, not the width minus one value). |

## 14.11.302 SPBKEYMINVAL—Offset 72294h

Sprite B Color Key Min Value Register

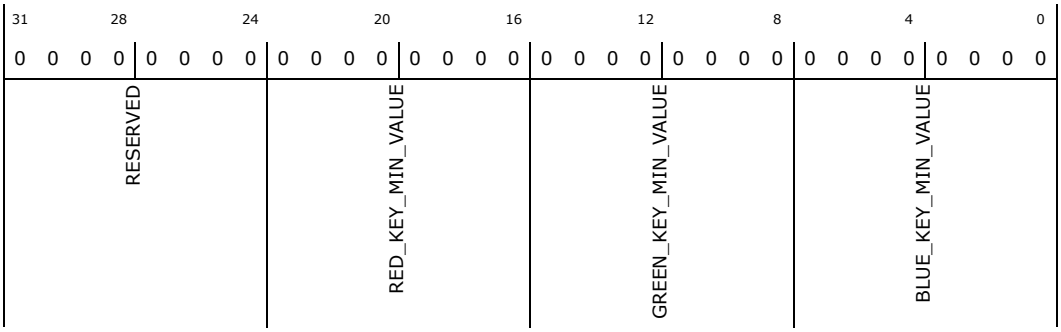
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72294h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Write as zero |
| 23:16 | 0b<br>RW | **RED_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite red/Cr channel. |
| 15:8 | 0b<br>RW | **GREEN_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite green/Y channel. |
| 7:0 | 0b<br>RW | **BLUE_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite blue/Cb channel. |

## 14.11.303 SPBKEYMSK—Offset 72298h

Sprite B Color Key Mask Register

### Access Method

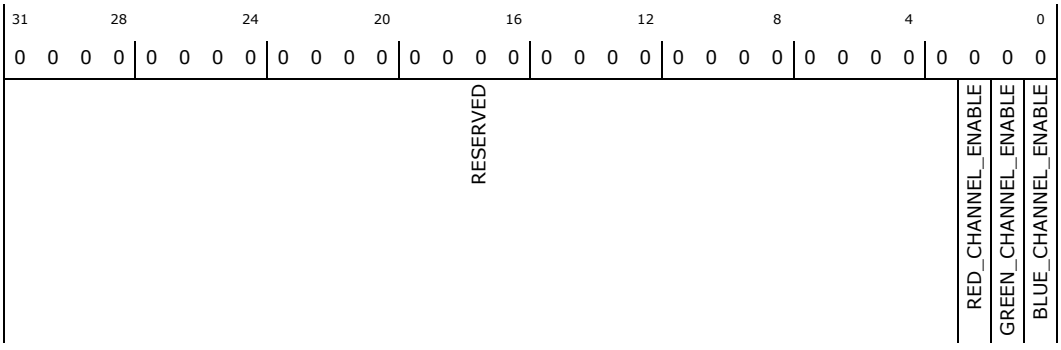
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72298h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0b<br>RW | **RESERVED:** Write as zero |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0b<br>RW | **RED_CHANNEL_ENABLE:** Specifies the source color key enable for the red/Cr channel. |
| 1 | 0b<br>RW | **GREEN_CHANNEL_ENABLE:** Specifies the source color key enable for the green/Y channel. |
| 0 | 0b<br>RW | **BLUE_CHANNEL_ENABLE:** Specifies the source color key enable for the blue/Cb channel |

## 14.11.304 SPBSURF—Offset 7229Ch

Sprite B Surface Address Register

### Access Method

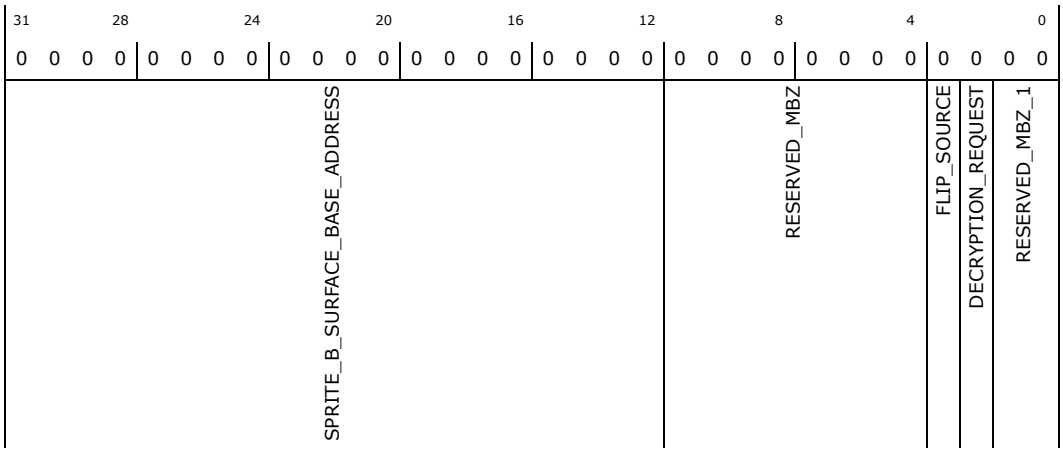
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7229Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0b<br>RW | **SPRITE_B_SURFACE_BASE_ADDRESS:** This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPCTILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPCLINOFF register.<br>This address must be 4K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT.<br>If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA .<br>The value in this register is updated through the command streamer during synchronous flips.<br>[DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27:16 | 0b<br>RW | **PLANE_START_Y_POSITION:** These 12 bits specify the vertical position in lines of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **PLANE_START_X_POSITION:** These 12 bits specify the horizontal offset in pixels of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the horizontal position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |

## 14.11.307 SPBCONTALPHA—Offset 722A8h

Sprite B Constant Alpha Register

### Access Method

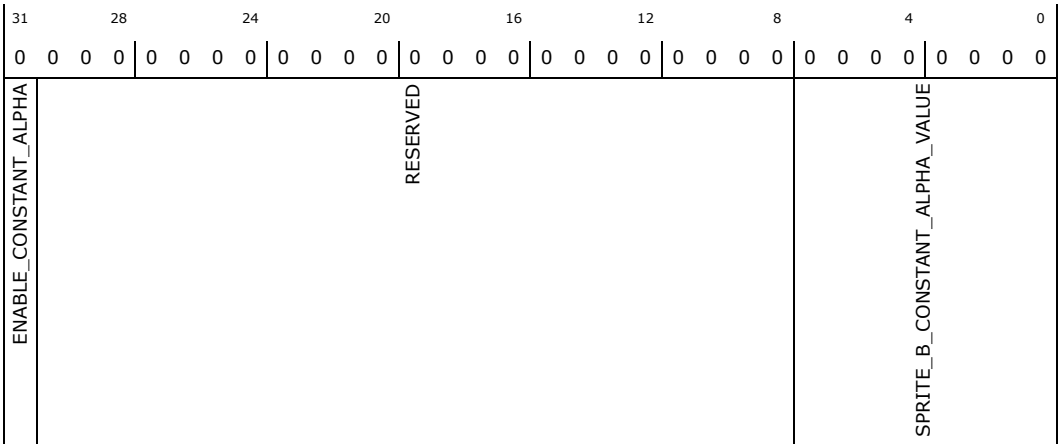
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 722A8h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **ENABLE_CONSTANT_ALPHA:** Sprite B Sprite constant alpha provides a way to apply an alpha value to all video sprite pixels. Each pixel color channel is multiplied by the constant alpha before proceeding to the blender. This can be used to create fade out effects. This is intended for CE device use where the video sprite might still be used to generate video output.<br>0 Sprite B Sprite Constant Alpha is disabled<br>1 Sprite B Sprite Constant Alpha is enabled |
| 30:8 | 0b<br>RW | **RESERVED:** : MBZ |
| 7:0 | 0b<br>RW | **SPRITE_B_CONSTANT_ALPHA_VALUE:** This field provides the alpha value when constant alpha is enabled. A value of FF means fully opaque and a value of zero means fully transparent. Values in between those values allow for a blending of sprite with other surfaces. |

## 14.11.308 SPBLIVESURF—Offset 722ACh

Sprite B Live Surface Address Register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 722ACh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

## 14.11.309 SPBCLRC0—Offset 722D0h

Sprite B Color Correction 0 Register

### Access Method

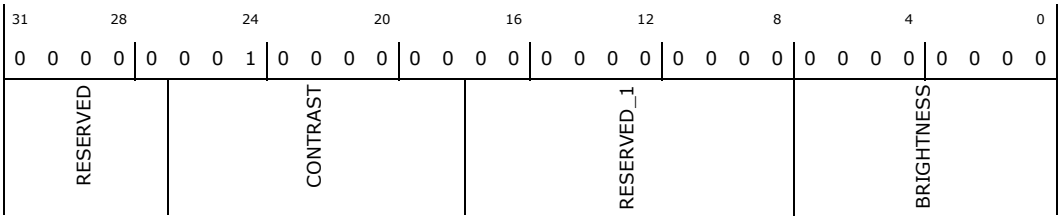
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 722D0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 01000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 26:18 | 001000000b<br>RW | **CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal.<br>Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary . |
| 17:8 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 7:0 | 0b<br>RW | **BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255].<br>Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0. |

## 14.11.310 SPBCLRC1—Offset 722D4h

Sprite B Color Correction 1 Register

### Access Method

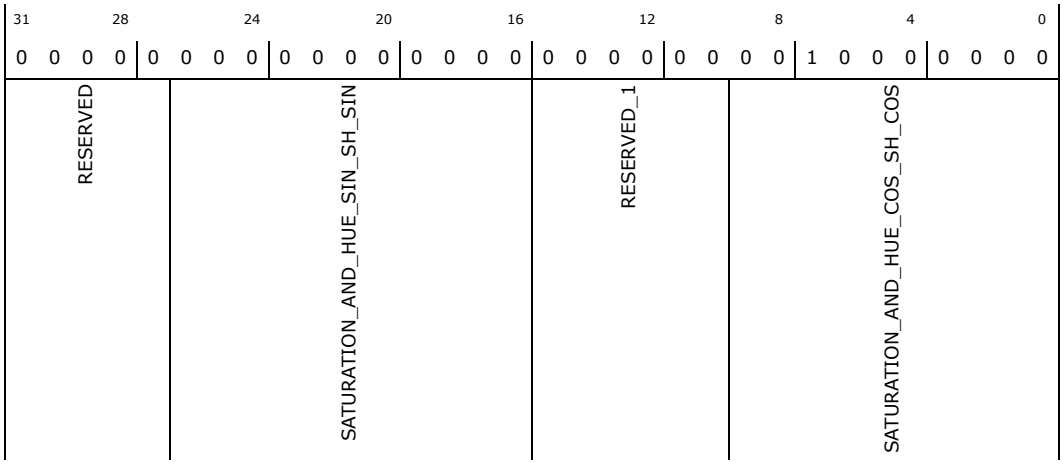
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 722D4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000080h



| Bit Range | Default & Access | Field Name (ID): Description |

## 14.11.317 SPCCNTR—Offset 72380h

Sprite C Control Register

### Access Method

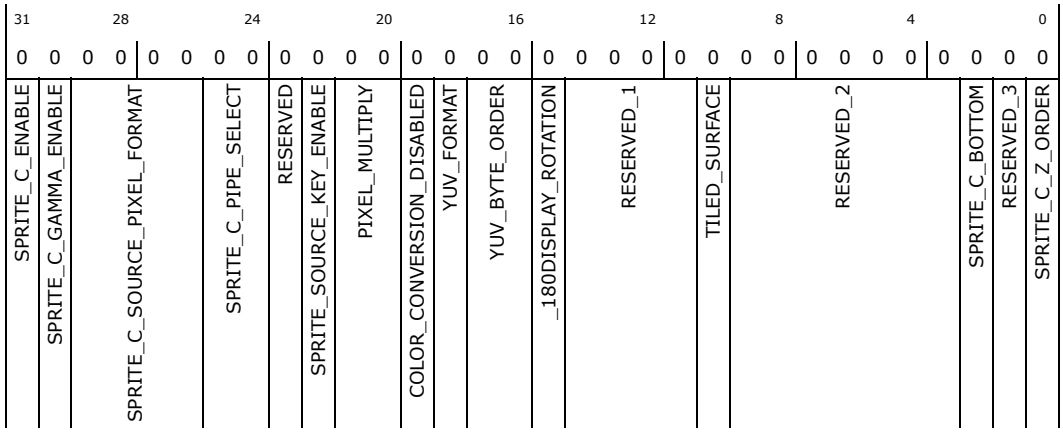
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72380h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SPRITE_C_ENABLE:** This bit will enable or disable the Sprite C. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 30 | 0b<br>RW | **SPRITE_C_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite C data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite C logic is disabled by loading the default values into those registers.<br>When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed.<br>0 = Sprite C pixel data bypasses the display pipe gamma correction logic (default).<br>1 = Sprite C pixel data is gamma corrected in the pipe gamma correction logic |
| 29:26 | 0b<br>RW | **SPRITE_C_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite C. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter).<br>0000 = YUV 4:2:2 packed (see byte order below).<br>0001 = Reserved<br>0010 = 8-bpp Indexed.<br>0011 = Reserved.<br>0100 = Reserved.<br>0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible).<br>0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha.<br>0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel.<br>1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha.<br>1001 = 32-bit RGBA (10:10:10:2) pixel format<br>1010 = Reserved.<br>1011 = Reserved.<br>1100 = Reserved.<br>1101 = Reserved.<br>1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha.<br>1111 = 32-bit RGBA (8:8:8:8) |
| 25:24 | 0b<br>RW | **SPRITE_C_PIPE_SELECT:** Sprite C always ties to Pipe B<br>Reserved. |
| 23 | 0b<br>RW | **RESERVED:** Reserved. |
| 22 | 0b<br>RW | **SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite C pixel format includes an alpha channel.<br>[DevBW] Erratum: This bit must always be set to 0 when Sprite C pixel format is YUV<br>0 = Sprite source key is disabled (default)<br>1 = Sprite source key is enabled. |
| 21:20 | 0b<br>RW | **PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V).<br>00 = No line/Pixel duplication<br>01 = Line/Pixel Doubling<br>10 = Line Doubling only<br>11 = Pixel Doubling only |
| 19 | 0b<br>RW | **COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions.<br>0 = Pixel data is sent through the conversion logic (only applies to YUV formats)<br>1 = Pixel data is not sent through the YUV-)RGB conversion logic. |
| 18 | 0b<br>RW | **YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB.<br>0 = ITU-R Recommendation BT.601<br>1 = ITU-R Recommendation BT.709 |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17:16 | 0b<br>RW | **YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored.<br>00 = YUYV<br>01 = UYVY<br>10 = YVYU<br>11 = VYUY |
| 15 | 0b<br>RW | **_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner.<br>0 = No rotation<br>1 = 180 rotation |
| 14:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10 | 0b<br>RW | **TILED_SURFACE:** This bit indicates that the Sprite C surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces.<br>When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers.<br>0 = Sprite C surface uses linear memory<br>1 = Sprite C surface uses X-tiled memory |
| 9:3 | 0b<br>RW | **RESERVED_2:** Write as zero |

If the plane is marked as trusted, it only applies to the Z order of the trusted planes.<br>0 = Sprite C Z order is determined by the other control bits<br>1 = Sprite C is forced to be on the bottom of the Z order. |
| 1 | 0b<br>RW | **RESERVED_3:** Reserved. |
| 0 | 0b<br>RW | **SPRITE_C_Z_ORDER:** With Sprite C and D z-order, bottom control bits, Sprite C plane is placed in a specific z-order among other planes in pipe B.<br>Display Pipe B Z-orders<br>SC<br>zorderSC<br>bottomSD<br>zorderSD<br>bottomResulting Pipe Z-order (from bottom to top)Source Keying<br>0000PB SC SD CBPB in Black<br>1000PB SD SC CBPB in Black<br>0001SD PB SC CBuse src keying on SD<br>0011SD PB SC CBuse src keying on SD<br>1001SD SC PB CBuse src keying on SC<br>1011SD SC PB CBuse src keying on SC<br>0100SC PB SD CBuse src keying on SC<br>1100SC PB SD CBuse src keying on SC<br>0110SC SD PB CBuse src keying on SD<br>1110SC SD PB CBuse src keying on SD<br>0101Not Allowed<br>0111Not Allowed<br>1101Not Allowed<br>1111Not Allowed<br>1010Not Allowed<br>1011Not Allowed<br><br>0: Sprite C z-order is disabled<br>1: Sprite C z-order is enabled |

## 14.11.318 SPCLINOFF—Offset 72384h

Sprite C Linear Offset Register

### Access Method

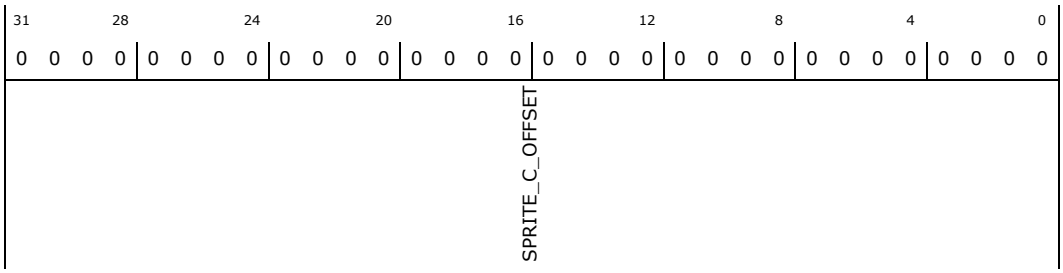
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72384h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **SPRITE_C_OFFSET:** This register provides the panning offset into the Sprite C plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

## 14.11.319 SPCSTRIDE—Offset 72388h

Sprite C Stride Register

### Access Method

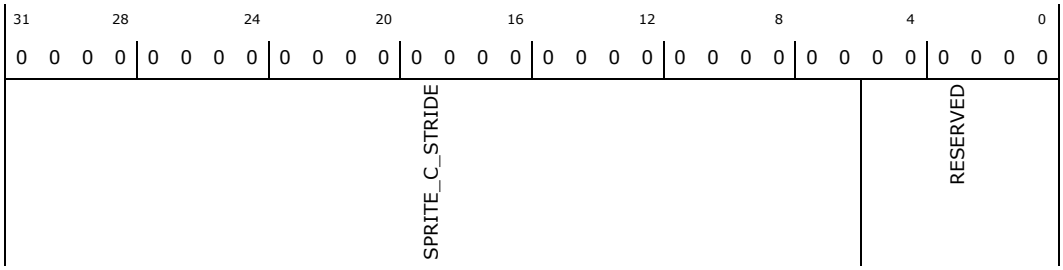
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72388h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **SPRITE_C_STRIDE:** This is the stride for Sprite C in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes. |
| 5:0 | 0b<br>RW | **RESERVED:** Reserved. |

## 14.11.320 SPCPOS—Offset 7238Ch

Sprite C Position Register

### Access Method

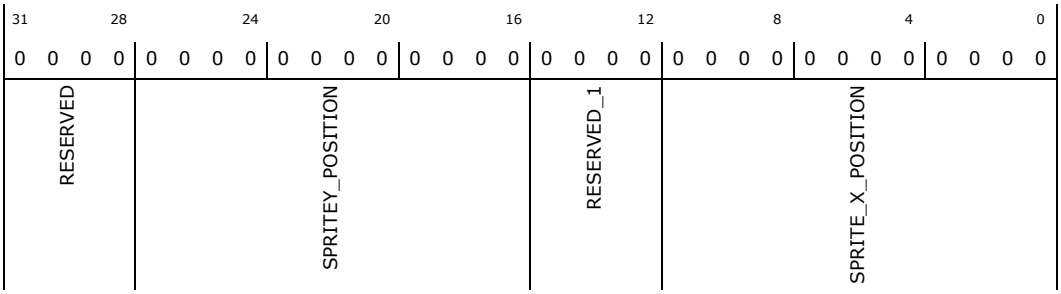
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7238Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **SPRITEY_POSITION:** These 12 bits specify the vertical position in lines of the sprite (upper left corner) relative to the beginning of the active video area. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_X_POSITION:** These 12 bits specify the horizontal position in pixels of the sprite (upper left corner) relative the beginning of the active video area. When performing 180 rotation, this field specifies the horizontal position of the original lower right corner relative to the original end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |

## 14.11.321 SPCSIZE—Offset 72390h

Sprite C Height and Width Register

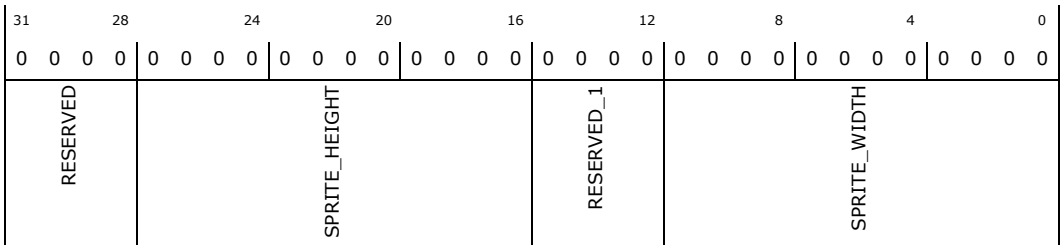
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72390h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **SPRITE_HEIGHT:** This register field is used to specify the height of the sprite in lines. The value in the register is the height minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_WIDTH:** This register field is used to specify the width of the sprite in pixels. This does not have to be the same as the stride but should be less than or equal to the stride (converted to pixels). The value in the register is the width minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image.<br>The sprite width is limited to even values when YUV source pixel format is used (actual width, not the width minus one value). |

## 14.11.322 SPCKEYMINVAL—Offset 72394h

Sprite C Color Key Min Value Register

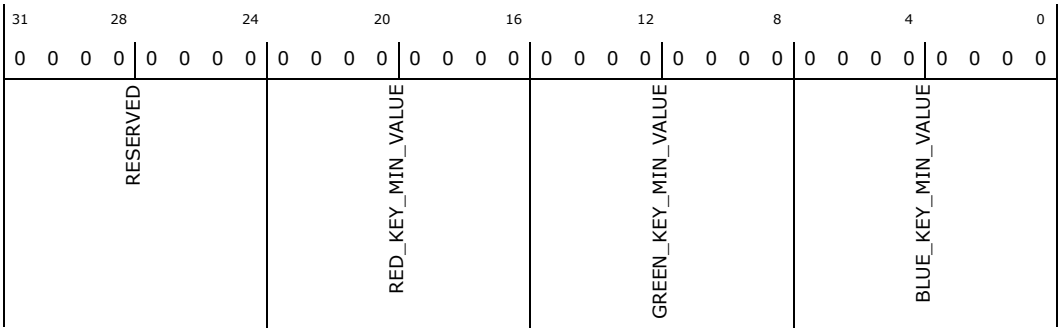
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72394h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Write as zero |
| 23:16 | 0b<br>RW | **RED_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite red/Cr channel. |
| 15:8 | 0b<br>RW | **GREEN_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite green/Y channel. |
| 7:0 | 0b<br>RW | **BLUE_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite blue/Cb channel. |

## 14.11.323 SPCKEYMSK—Offset 72398h

Sprite C Color Key Mask Register

### Access Method

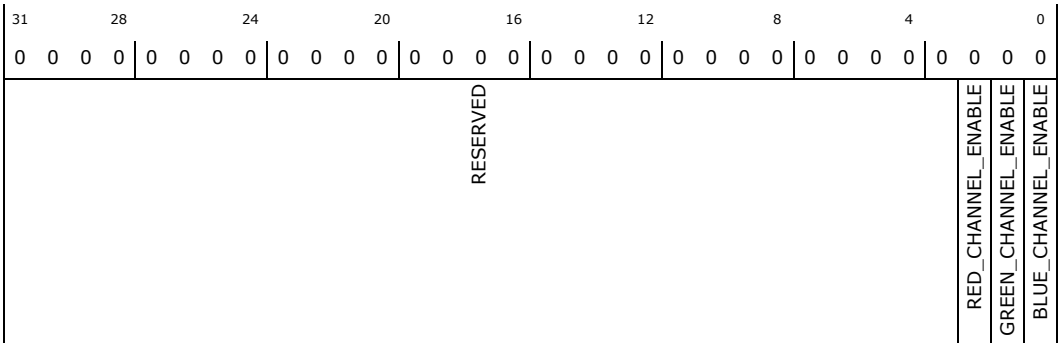
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72398h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0b<br>RW | **RESERVED:** Write as zero |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0b<br>RW | **RED_CHANNEL_ENABLE:** Specifies the source color key enable for the red/Cr channel. |
| 1 | 0b<br>RW | **GREEN_CHANNEL_ENABLE:** Specifies the source color key enable for the green/Y channel. |
| 0 | 0b<br>RW | **BLUE_CHANNEL_ENABLE:** Specifies the source color key enable for the blue/Cb channel |

## 14.11.324 SPCSURF—Offset 7239Ch

Sprite C Surface Address Register

### Access Method

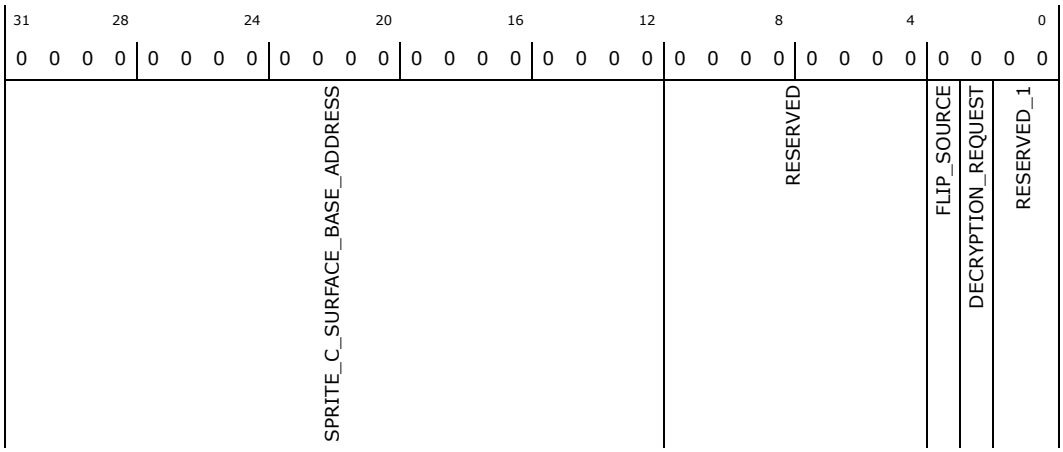
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7239Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0b<br>RW | **SPRITE_C_SURFACE_BASE_ADDRESS:** This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPCTILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPCLINOFF register.<br>This address must be 4K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT.<br>If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA .<br>The value in this register is updated through the command streamer during synchronous flips.<br>[DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |

## 14.11.329 SPCCLRC0—Offset 723D0h

Sprite C Color Correction 0 Register

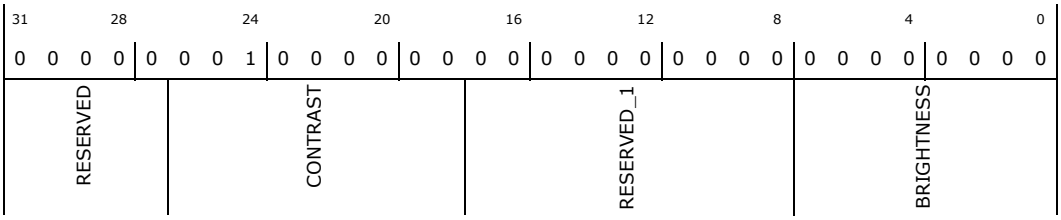
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 723D0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 01000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 26:18 | 001000000b<br>RW | **CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal.<br>Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary . |
| 17:8 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 7:0 | 0b<br>RW | **BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255].<br>Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0. |

## 14.11.330 SPCCLRC1—Offset 723D4h

Sprite C Color Correction 1 Register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 723D4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

## 14.11.340 SPDCNTR—Offset 72480h

Sprite D Control Register

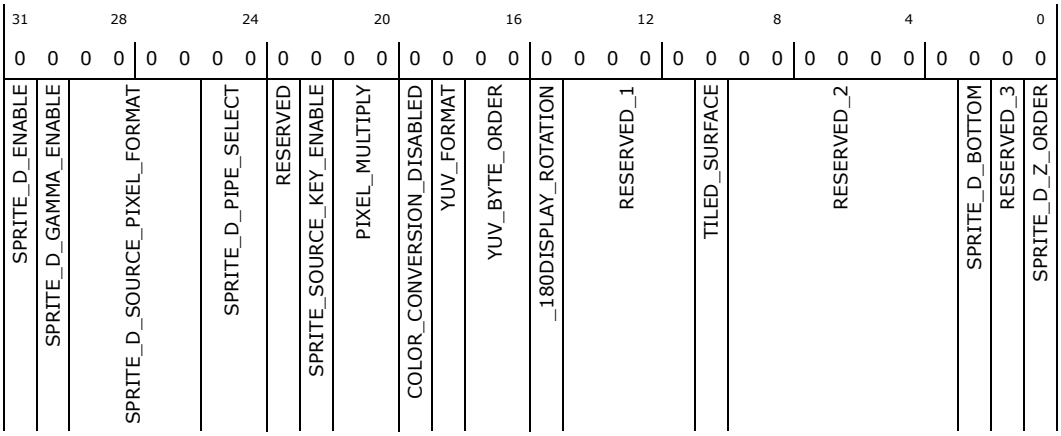
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72480h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **SPRITE_D_ENABLE:** This bit will enable or disable the Sprite D. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable |
| 30 | 0b<br>RW | **SPRITE_D_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite D data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite D logic is disabled by loading the default values into those registers.<br>When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed.<br>0 = Sprite D pixel data bypasses the display pipe gamma correction logic (default).<br>1 = Sprite D pixel data is gamma corrected in the pipe gamma correction logic |
| 29:26 | 0b<br>RW | **SPRITE_D_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite D. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter).<br>0000 = YUV 4:2:2 packed (see byte order below).<br>0001 = Reserved<br>0010 = 8-bpp Indexed.<br>0011 = Reserved.<br>0100 = Reserved.<br>0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible).<br>0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha.<br>0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel.<br>1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha.<br>1001 = 32-bit RGBA (10:10:10:2) pixel format<br>1010 = Reserved.<br>1011 = Reserved.<br>1100 = Reserved.<br>1101 = Reserved.<br>1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha.<br>1111 = 32-bit RGBA (8:8:8:8) |
| 25:24 | 0b<br>RW | **SPRITE_D_PIPE_SELECT:** Sprite D always ties to Pipe B.<br>Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23 | 0b<br>RW | **RESERVED:** Reserved. |
| 22 | 0b<br>RW | **SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite D pixel format includes an alpha channel.<br>[DevBW] Erratum: This bit must always be set to 0 when Sprite D pixel format is YUV<br>0 = Sprite source key is disabled (default)<br>1 = Sprite source key is enabled. |
| 21:20 | 0b<br>RW | **PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V).<br>00 = No line/Pixel duplication<br>01 = Line/Pixel Doubling<br>10 = Line Doubling only<br>11 = Pixel Doubling only |
| 19 | 0b<br>RW | **COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions.<br>0 = Pixel data is sent through the conversion logic (only applies to YUV formats)<br>1 = Pixel data is not sent through the YUV-)RGB conversion logic. |
| 18 | 0b<br>RW | **YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB.<br>0 = ITU-R Recommendation BT.601<br>1 = ITU-R Recommendation BT.709 |
| 17:16 | 0b<br>RW | **YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored.<br>00 = YUYV<br>01 = UYVY<br>10 = YVYU<br>11 = VYUY |
| 15 | 0b<br>RW | **_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner.<br>0 = No rotation<br>1 = 180 rotation |
| 14:11 | 0b<br>RW | **RESERVED_1:** Reserved. |
| 10 | 0b<br>RW | **TILED_SURFACE:** This bit indicates that the Sprite D surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces.<br>When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers.<br>0 = Sprite D surface uses linear memory<br>1 = Sprite D surface uses X-tiled memory |
| 9:3 | 0b<br>RW | **RESERVED_2:** Write as zero |
| 2 | 0b<br>RW | **SPRITE_D_BOTTOM:** This bit will force the Sprite D plane to be on the bottom of the Z order. If the plane is marked as trusted, it only applies to the Z order of the trusted planes.<br>0 = Sprite D Z order is determined by the other control bits<br>1 = Sprite D is forced to be on the bottom of the Z order. |
| 1 | 0b<br>RW | **RESERVED_3:** Reserved. |

| 0 | 0b<br>RW | **SPRITE_D_Z_ORDER:** With Sprite C and D z-order, bottom control bits, Sprite D plane is placed in a specific z-order among other planes in pipe B.<br>Display Pipe B Z-orders<br>SC<br>zorderSC<br>bottomSD<br>zorderSD<br>bottomResulting Pipe Z-order (from bottom to top)Source Keying<br>0000PB SC SD CBPB in Black<br>1000PB SD SC CBPB in Black<br>0001SD PB SC CBuse src keying on SD<br>0011SD PB SC CBuse src keying on SD<br>1001SD SC PB CBuse src keying on SC<br>1011SD SC PB CBuse src keying on SC<br>0100SC PB SD CBuse src keying on SC<br>1100SC PB SD CBuse src keying on SC<br>0110SC SD PB CBuse src keying on SD<br>1110SC SD PB CBuse src keying on SD<br>0101Not Allowed<br>0111Not Allowed<br>1101Not Allowed<br>1111Not Allowed<br>1010Not Allowed<br>1011Not Allowed<br><br>0: Sprite D z-order is disabled<br>1: Sprite D z-order is enabled |

## 14.11.341 SPDLINOFF—Offset 72484h

Sprite D Linear Offset Register

### Access Method

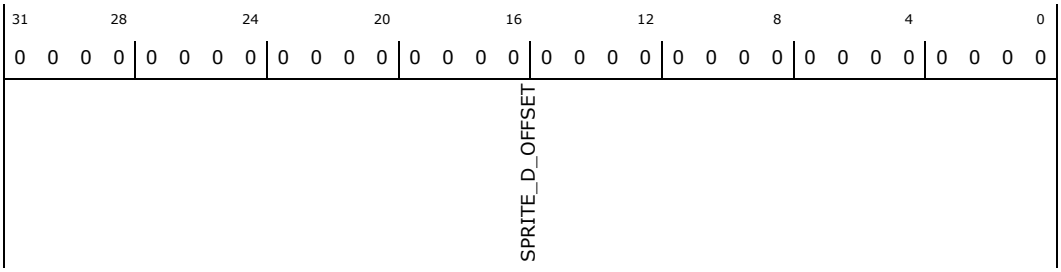
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72484h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0b<br>RW | **SPRITE_D_OFFSET:** This register provides the panning offset into the Sprite D plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

## 14.11.342 SPDSTRIDE—Offset 72488h

Sprite D Stride Register

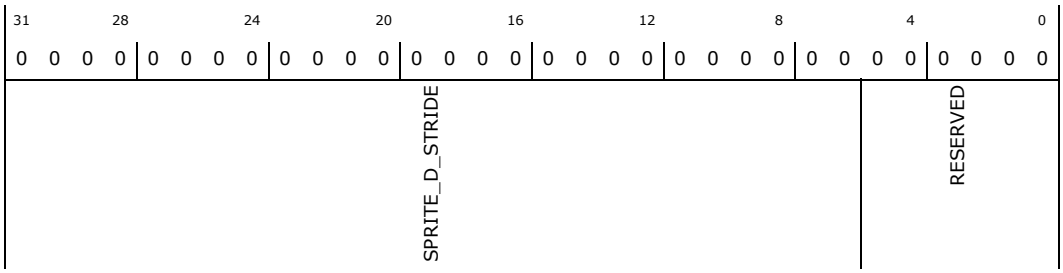
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72488h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0b<br>RW | **SPRITE_D_STRIDE:** This is the stride for Sprite D in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes. |
| 5:0 | 0b<br>RW | **RESERVED:** Reserved. |

## 14.11.343 SPDPOS—Offset 7248Ch

Sprite D Position Register

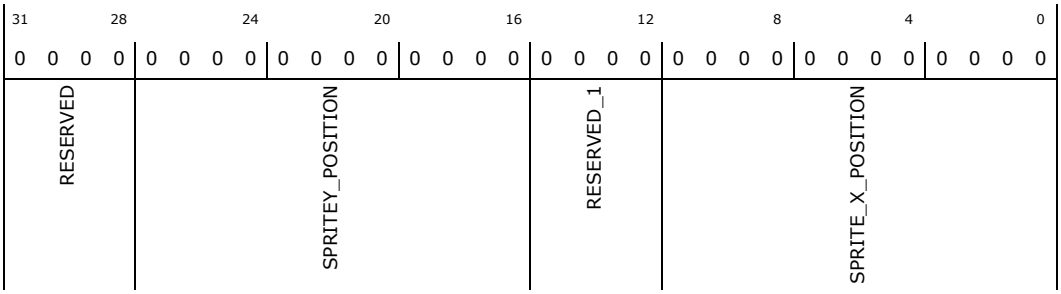
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7248Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **SPRITEY_POSITION:** These 12 bits specify the vertical position in lines of the sprite (upper left corner) relative to the beginning of the active video area. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_X_POSITION:** These 12 bits specify the horizontal position in pixels of the sprite (upper left corner) relative the beginning of the active video area. When performing 180 rotation, this field specifies the horizontal position of the original lower right corner relative to the original end of the active video area in the unrotated orientation. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |

## 14.11.344 SPDSIZE—Offset 72490h

Sprite D Height and Width Register

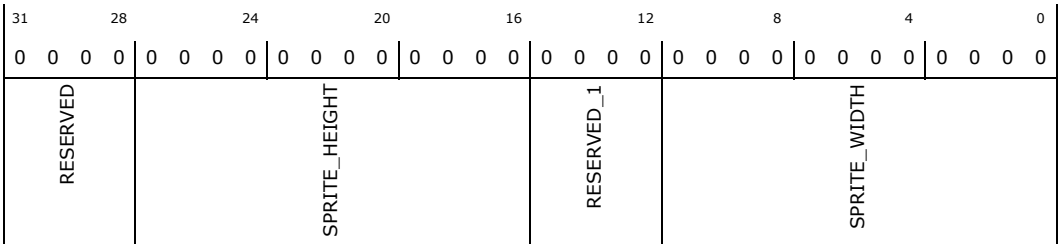
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72490h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 27:16 | 0b<br>RW | **SPRITE_HEIGHT:** This register field is used to specify the height of the sprite in lines. The value in the register is the height minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **SPRITE_WIDTH:** This register field is used to specify the width of the sprite in pixels. This does not have to be the same as the stride but should be less than or equal to the stride (converted to pixels). The value in the register is the width minus one. The defined sprite rectangle must always be completely contained within the displayable area of the screen image.<br>The sprite width is limited to even values when YUV source pixel format is used (actual width, not the width minus one value). |

## 14.11.345 SPDKEYMINVAL—Offset 72494h

Sprite D Color Key Min Value Register

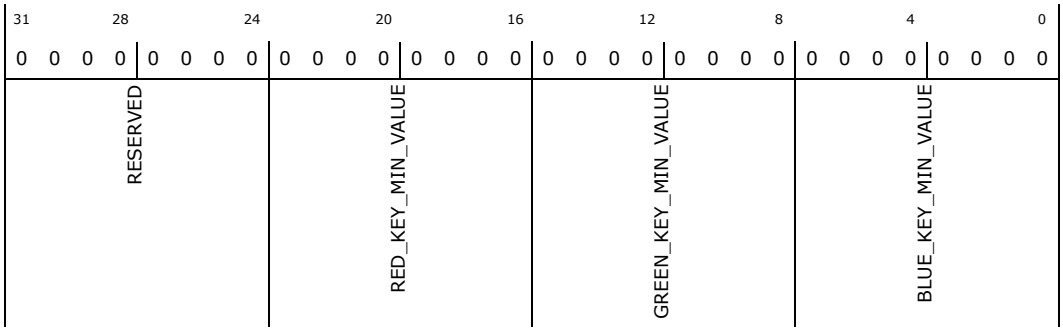
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72494h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0b<br>RW | **RESERVED:** Write as zero |
| 23:16 | 0b<br>RW | **RED_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite red/Cr channel. |
| 15:8 | 0b<br>RW | **GREEN_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite green/Y channel. |
| 7:0 | 0b<br>RW | **BLUE_KEY_MIN_VALUE:** Specifies the color key minimum value for the sprite blue/Cb channel. |

## 14.11.346 SPDKEYMSK—Offset 72498h

Sprite D Color Key Mask Register

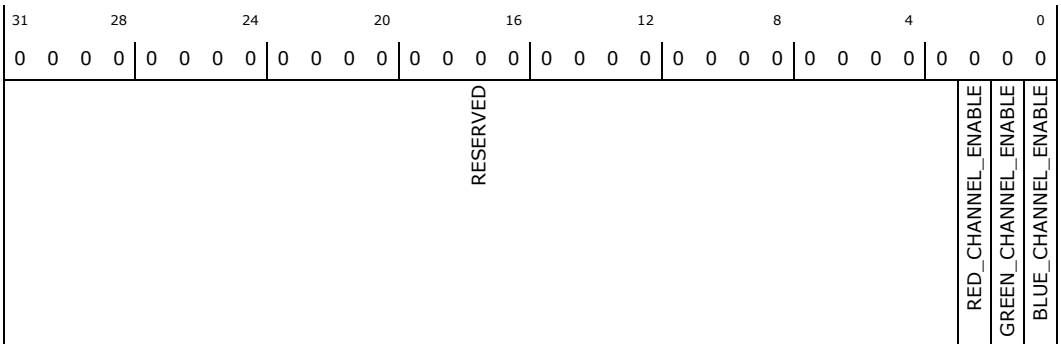
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 72498h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0b<br>RW | **RESERVED:** Write as zero |
| 2 | 0b<br>RW | **RED_CHANNEL_ENABLE:** Specifies the source color key enable for the red/Cr channel. |
| 1 | 0b<br>RW | **GREEN_CHANNEL_ENABLE:** Specifies the source color key enable for the green/Y channel. |
| 0 | 0b<br>RW | **BLUE_CHANNEL_ENABLE:** Specifies the source color key enable for the blue/Cb channel |

## 14.11.347 SPDSURF—Offset 7249Ch

Sprite D Surface Address Register

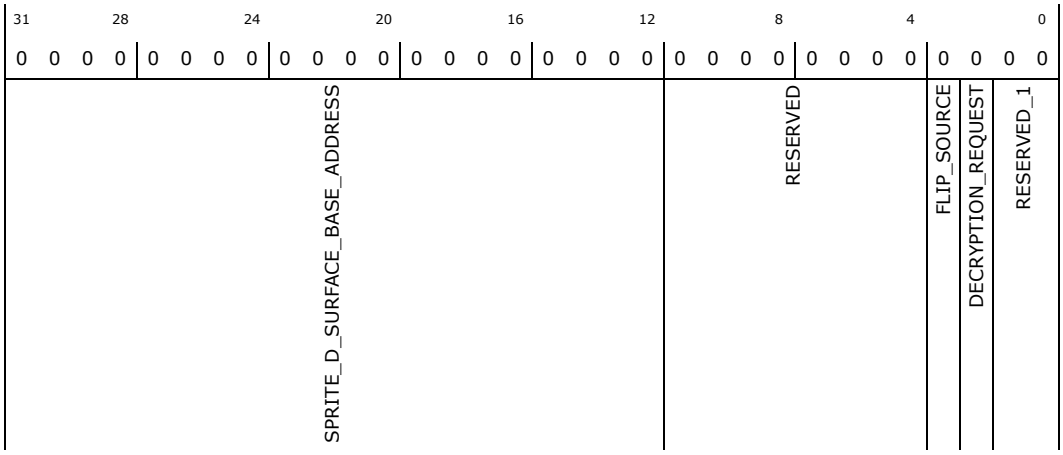
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 7249Ch

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0b<br>RW | **SPRITE_D_SURFACE_BASE_ADDRESS:** This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPCTILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPCLINOFF register.<br>This address must be 4K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT.<br>If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA .<br>The value in this register is updated through the command streamer during synchronous flips.<br>[DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |

## 14.11.349 SPDTILEOFF—Offset 724A4h

Sprite D Tiled Offset Register

### Access Method

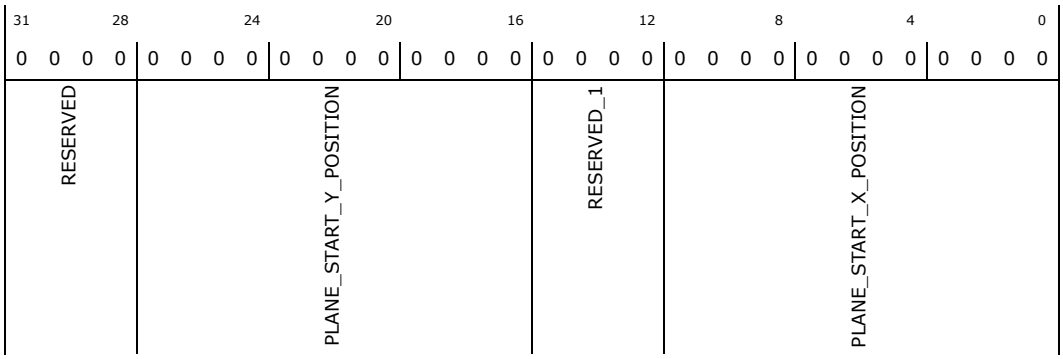
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 724A4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0b<br>RW | **RESERVED:** Write as zero |
| 27:16 | 0b<br>RW | **PLANE_START_Y_POSITION:** These 12 bits specify the vertical position in lines of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |
| 15:12 | 0b<br>RW | **RESERVED_1:** Write as zero |
| 11:0 | 0b<br>RW | **PLANE_START_X_POSITION:** These 12 bits specify the horizontal offset in pixels of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the horizontal position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |

## 14.11.350 SPDCONTALPHA—Offset 724A8h

Sprite D Constant Alpha Register

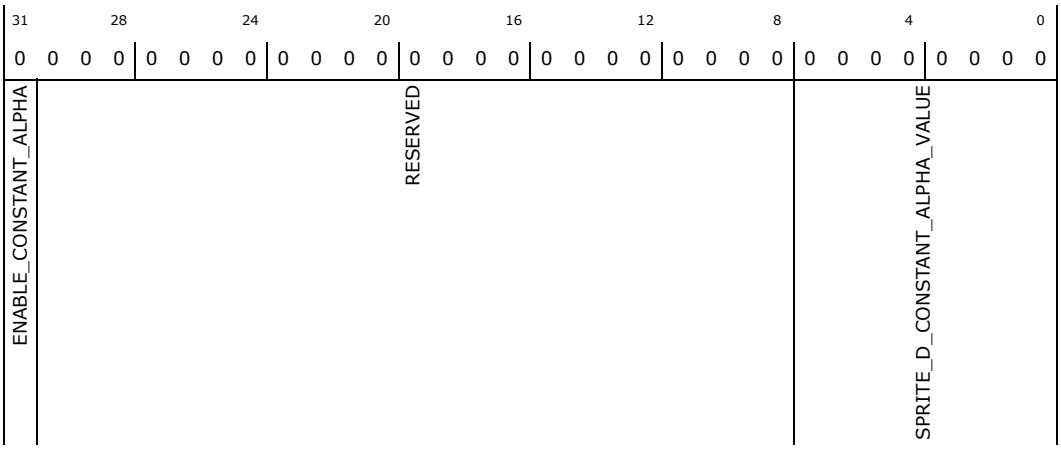
### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 724A8h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **ENABLE_CONSTANT_ALPHA:** Sprite D Sprite constant alpha provides a way to apply an alpha value to all video sprite pixels. Each pixel color channel is multiplied by the constant alpha before proceeding to the blender. This can be used to create fade out effects. This is intended for CE device use where the video sprite might still be used to generate video output.<br>0 Sprite D Constant Alpha is disabled<br>1 Sprite D Constant Alpha is enabled |
| 30:8 | 0b<br>RW | **RESERVED:** : MBZ |
| 7:0 | 0b<br>RW | **SPRITE_D_CONSTANT_ALPHA_VALUE:** This field provides the alpha value when constant alpha is enabled. A value of FF means fully opaque and a value of zero means fully transparent. Values in between those values allow for a blending of sprite with other surfaces. |

## 14.11.351 SPDLIVESURF—Offset 724ACh

Sprite D Live Surface Address Register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 724ACh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

## 14.11.352 SPDCLRC0—Offset 724D0h

Sprite D Color Correction 0 Register

### Access Method

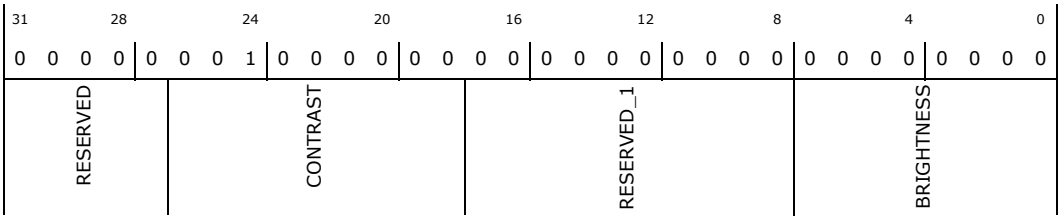
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 724D0h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 01000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0b<br>RW | **RESERVED:** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 26:18 | 001000000b RW | **CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal.<br>Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary . |
| 17:8 | 0b RW | **RESERVED_1:** Reserved. |
| 7:0 | 0b RW | **BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255].<br>Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0. |

## 14.11.353 SPDCLRC1—Offset 724D4h

Sprite D Color Correction 1 Register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 724D4h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000080h

## 14.11.360 PCSRC—Offset 73000h

Performance Counter Source Register

### Access Method

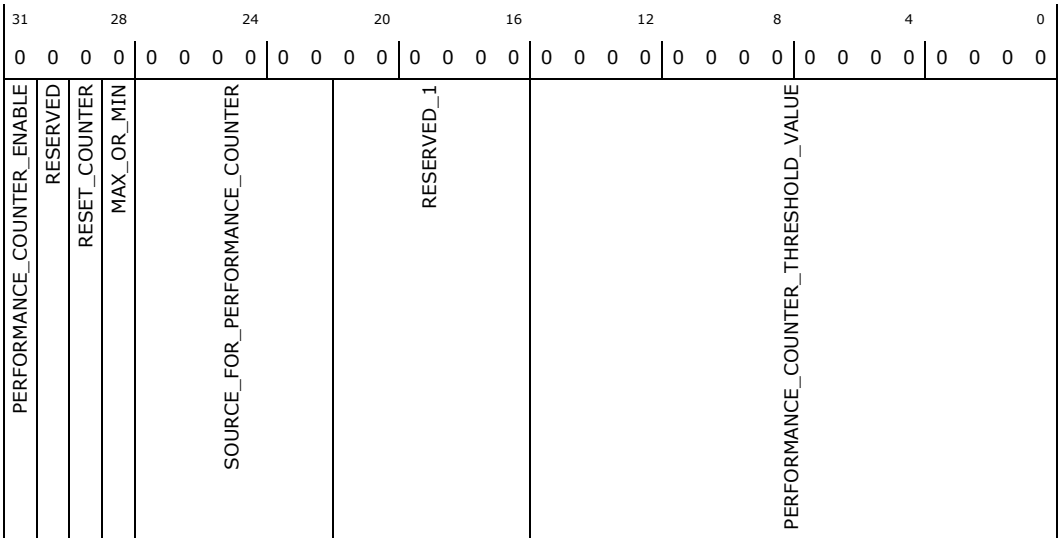
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 73000h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **PERFORMANCE_COUNTER_ENABLE:** This bit enables the performance counter.<br>0 = Performance counter is disabled<br>1 = Performance counter is enabled. |
| 30 | 0b<br>RW | **RESERVED:** Reserved. |
| 29 | 0b<br>RW | **RESET_COUNTER:** This bit indicates when the counter will be reset.<br>1 = Reset after each frame, summing all events in the frame<br>0 = Reset after each event within the frame |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28 | 0b<br>RW | **MAX_OR_MIN:** This bit tells whether the stored counter value for an event is the maximum or the minimum value. The previous value is used to do the compare.<br>0 = Stored value is the maximum latency<br>1 = Stored value is the minimum latency |
| 27:22 | 0b<br>RW | **SOURCE_FOR_PERFORMANCE_COUNTER:** These bits indicate the source for the performance counter.<br>000000 = Overlay Register Request Latency [DevBW] and [DevCL]<br>000001 = VGA Font Request Latency<br>000010 = VGA Character Request Latency<br>000011 = Display A FIFO Status<br>000100 = Display B FIFO Status<br>000101 = Sprite A FIFO Status<br>000110 = Cursor A FIFO Status<br>000111 = Cursor B FIFO Status<br>001000 = Display Steamer A TLB Latency<br>001001 = Display Streamer B TLB Latency<br>001010 = Sprite Streamer A TLB Latency<br>001011 = Cursor Streamer A TLB Latency<br>001100 = Cursor Streamer B TLB Latency<br>001101 = Overlay Streamer TLB Latency [DevBW] and [DevCL]<br>001110 = Display Steamer A Request Latency<br>001111 = Display Streamer B Request Latency<br>010000 = Sprite Streamer A Request Latency<br>010001 = Cursor Streamer A Request Latency<br>010010 = Cursor Streamer B Request Latency<br>010011 = Overlay Streamer Request Latency [DevBW] and [DevCL]<br>010100 = Display A Command Request Latency<br>010101 = Display B Command Request Latency<br>010110 = Sprite A Command Request Latency<br>010111 = Cursor A Command Request Latency<br>011000 = Cursor B Command Request Latency<br>011001 = Overlay Command Request Latency [DevBW] and [DevCL]<br>011010 = DPFC Dummy Read [DevCTG]<br>011011 = DPFC Self Refresh [DevCTG]<br>011100 = Sprite B FIFO status<br>011101 = Sprite C FIFO status<br>011110 = Sprite D FIFO status<br>011111 = Sprite B TLB Request Latency<br>100000 = Sprite C TLB Request Latency<br>100001 = Sprite D TLB Request Latency<br>100010 = Sprite B Request Latency<br>100011 = Sprite C Request Latency<br>100100 = Sprite D Request Latency<br>100101 = Sprite B Command Request Latency<br>100110 = Sprite C Command Request Latency<br>100111 = Sprite D Command Request Latency<br>101000 = SR exit to data HP Put (measure the latency from the SRexit failing edge to the first data HP Put. This event shall be measured by either planeA, SpriteA, SpriteB, or CurA in pipeA)<br>101001 = InSR to data HP Put (measure the latency from any data request made during inSR is active to the first data HP Put. This event shall be measured by either planeA, SpriteA, SpriteB, or CurA in pipeA)<br>101010 = SR exit to TLB HP Put (measure the latency from the SRexit failing edge to the first TLB HP Put. This event shall be measured by either planeA, SpriteA, SpriteB, or CurA in pipeA )<br>101011 = InSR to TLB HP Put (measure the latency from any TLB request made during inSR is active to the first TLB HP Put. This event shall be measured by either planeA, SpriteA, SpriteB, or CurA in pipeA ) |
| 21:16 | 0b<br>RW | **RESERVED_1:** Write as zero. |
| 15:0 | 0b<br>RW | **PERFORMANCE_COUNTER_THRESHOLD_VALUE:** This value is used to compare against the performance counter. If the performance counter matches this value, an interrupt is generated if the interrupt bit is enabled. When the source selected is DDB FIFO status, the threshold value is used to program the value needed to monitor in the DDB FIFO. No interrupt is generated in this condition. |

## 14.11.361 PCSTAT—Offset 73004h

Performance Counter Status Register

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 73004h

This event shall be measured by either planeB, SpriteC, SpriteD, or CurB in pipeB ) |
| 22:16 | 0b<br>RO | **RESERVED:** Write as zero. |
| 15:0 | 0b<br>RO | **PERFORMANCE_COUNTER_VALUE:** This is the value of the performance counter for the source indicated in the source field. |

## 14.12 Memory Mapped Registers (Read Only)

### Table 174. Summary of Display Memory Mapped I/O Registers—GTTMMADR_LSB

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| 3BA–3BAh | 1 | "ST01 (ST01_MDA)—Offset 3BAh" on page 1035 | 00h |
| 3C2–3C2h | 1 | "ST00—Offset 3C2h" on page 1036 | 00h |
| 3C7–3C7h | 1 | "DACSTATE—Offset 3C7h" on page 1037 | 00h |
| 3DA–3DAh | 1 | "ST01 (ST01_CGA)—Offset 3DAh" on page 1038 | 00h |

### 14.12.1 ST01 (ST01_MDA)—Offset 3BAh

Input Status 1

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3BAh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h

| 7 | | | 4 | | | | 0 |
|---|---|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| RESERVED_AS_PER_VGA_SPECIFICATION | RESERVED | VIDEO_FEEDBACK_1_0 | | VER_TI_CAL_RETRACE_VIDEO | RESERVED_1 | | DIS_PLAY_ENA_BLE_OUTPUT |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RO | **RESERVED_AS_PER_VGA_SPECIFICATION:** Read as 0s. |
| 6 | 0b<br>RO | **RESERVED:** Read as 0. |
| 5:4 | 0b<br>RO | **VIDEO_FEEDBACK_1_0:** These are diagnostic video bits that are selected by the Color Plane Enable Register. These bits that are programmably connected to 2 of the 8 color bits sent to the palette. Bits 4 and 5 of the Color Plane Enable Register (AR12) selects which two of the 8 possible color bits become connected to these 2 bits of this register. The current software normally does not use these 2 bits. They exist for EGA compatibility. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0b<br>RO | **VER_TI_CAL_RETRACE_VIDEO:** 0 = VSYNC inactive (Indicates that a vertical retrace interval is not taking place).<br>1 = VSYNC active (Indicates that a vertical retrace interval is taking place).<br>Note:<br>VGA pixel generation is not locked to the display output but is loosely coupled. A VSYNC indication may not occur during the actual VSYNC going to the display but during the VSYNC that is generated as part of the VGA pixel generation. The exact relationship will vary with the VGA display operational mode. This status bit will remain active when the VGA is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now it is incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to.<br>Bits 4 and 5 of the Vertical Retrace End Register (CR11) previously could program this bit to generate an interrupt at the start of the vertical retrace interval. This ability to generate interrupts at the start of the vertical retrace interval is a feature that is largely unused by legacy software. Interrupts are not supported through the VGA register bits. |
| 2:1 | 0b<br>RO | **RESERVED_1:** Read as 0s. |
| 0 | 0b<br>RO | **DIS_PLAY_ENA_BLE_OUTPUT:** Display Enable is a status bit (bit 0) in VGA Input Status Register 1 that indicates when either a horizontal retrace interval or a vertical retrace interval is taking place. This was used with the IBM* EGA graphics system (and the ones that preceded it, including MDA and CGA). In those cases, it was important to check the status of this bit to ensure that one or the other retrace intervals was taking place before reading from or writing to the frame buffer. In these earlier systems, reading from or writing to frame buffer at times outside the retrace intervals meant that the CRT controller would be denied access to the frame buffer. This resulted in either snow or a flickering display. This bit provides compatibility with software designed for those early graphics controllers. This bit is currently used in DOS applications that access the palette to prevent the sparkle associated with read and write accesses to the palette ram with the same address on the same clock cycle.<br>This status bit will remain active when the VGA display is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now considered incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. When in panel fitting VGA or centered VGA operation, the meaning of these bits will not be consistent with native VGA timings.<br>0 = Active display data is being sent to the display. Neither a horizontal retrace interval or a vertical retrace interval is currently taking place.<br>1 = Either a horizontal retrace interval (horizontal blanking) or a vertical retrace interval (vertical blanking) is currently taking place. |

## 14.12.2 ST00—Offset 3C2h

Input Status 0

### Access Method

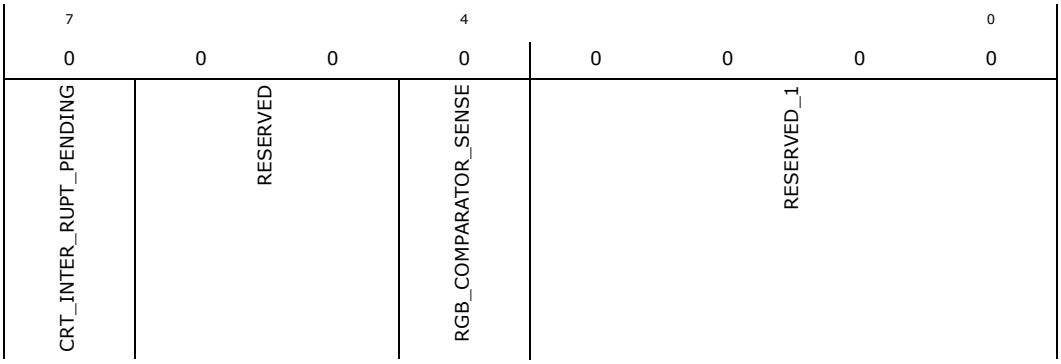
**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C2h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RO | **CRT_INTER_RUPT_PENDING:** This bit is here for EGA compatibility and will always return zero. Note that the generation of interrupts was originally enabled, through bits [4,5] of the Vertical Retrace End Register (CR11). This ability to generate interrupts at the start of the vertical retrace interval is a feature that is typically unused by DOS software and therefore is only supported through other means for use under a operating system support.<br>0 = CRT (vertical retrace interval) interrupt is not pending.<br>1 = CRT (vertical retrace interval) interrupt is pending |
| 6:5 | 0b<br>RO | **RESERVED:** Read as 0s. |
| 4 | 0b<br>RO | **RGB_COMPARATOR_SENSE:** This bit returns the state of the output of the RGB output comparator(s). Video BIOS uses this bit during POST to determine whether the display is connected and if it is a color or monochrome CRT. BIOS blanks the screen or clears the frame buffer to display only black. Next, BIOS outputs a ramp to the D-to-A converters to test for the presence of a color display by determining which code cause the comparator to switch. Finally, if the BIOS does not detect any termination resistors on Red or Blue, it tests for the presence of a display using the Green signal. The result of each such test is read via this bit.<br>0 = Below threshold<br>1 = Above threshold |
| 3:0 | 0b<br>RO | **RESERVED_1:** Read as 0s. |

## 14.12.3 DACSTATE—Offset 3C7h

DAC State Register

### Access Method

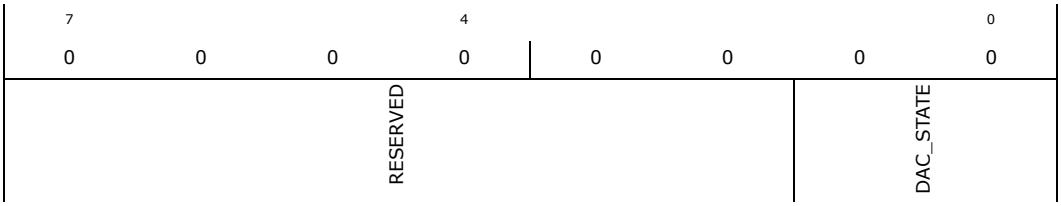
**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C7h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RO | **RESERVED_AS_PER_VGA_SPECIFICATION:** Read as 0s. |
| 6 | 0b<br>RO | **RESERVED:** Read as 0. |
| 5:4 | 0b<br>RO | **VIDEO_FEEDBACK_1_0:** These are diagnostic video bits that are selected by the Color Plane Enable Register. These bits that are programmably connected to 2 of the 8 color bits sent to the palette. Bits 4 and 5 of the Color Plane Enable Register (AR12) selects which two of the 8 possible color bits become connected to these 2 bits of this register. The current software normally does not use these 2 bits. They exist for EGA compatibility. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0b<br>RO | **VER_TI_CAL_RETRACE_VIDEO:** 0 = VSYNC inactive (Indicates that a vertical retrace interval is not taking place).<br>1 = VSYNC active (Indicates that a vertical retrace interval is taking place).<br>Note:<br>VGA pixel generation is not locked to the display output but is loosely coupled. A VSYNC indication may not occur during the actual VSYNC going to the display but during the VSYNC that is generated as part of the VGA pixel generation. The exact relationship will vary with the VGA display operational mode. This status bit will remain active when the VGA is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now it is incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to.<br>Bits 4 and 5 of the Vertical Retrace End Register (CR11) previously could program this bit to generate an interrupt at the start of the vertical retrace interval. This ability to generate interrupts at the start of the vertical retrace interval is a feature that is largely unused by legacy software. Interrupts are not supported through the VGA register bits. |
| 2:1 | 0b<br>RO | **RESERVED_1:** Read as 0s. |
| 0 | 0b<br>RO | **DIS_PLAY_ENA_BLE_OUTPUT:** Display Enable is a status bit (bit 0) in VGA Input Status Register 1 that indicates when either a horizontal retrace interval or a vertical retrace interval is taking place. This was used with the IBM* EGA graphics system (and the ones that preceded it, including MDA and CGA). In those cases, it was important to check the status of this bit to ensure that one or the other retrace intervals was taking place before reading from or writing to the frame buffer. In these earlier systems, reading from or writing to frame buffer at times outside the retrace intervals meant that the CRT controller would be denied access to the frame buffer. This resulted in either snow or a flickering display. This bit provides compatibility with software designed for those early graphics controllers. This bit is currently used in DOS applications that access the palette to prevent the sparkle associated with read and write accesses to the palette ram with the same address on the same clock cycle.<br>This status bit will remain active when the VGA display is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now considered incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. When in panel fitting VGA or centered VGA operation, the meaning of these bits will not be consistent with native VGA timings.<br>0 = Active display data is being sent to the display. Neither a horizontal retrace interval or a vertical retrace interval is currently taking place.<br>1 = Either a horizontal retrace interval (horizontal blanking) or a vertical retrace interval (vertical blanking) is currently taking place. |

## 14.13 Memory Mapped Registers (Write Only)

### Table 175. Summary of Display Memory Mapped I/O Registers—GTTMMADR_LSB

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| 3BA–3BAh | 1 | "FCR (FCR_MDA_Write)—Offset 3BAh" on page 1041 | 00h |
| 3C2–3C2h | 1 | "MSR (MSR_Write)—Offset 3C2h" on page 1042 | 00h |
| 3C7–3C7h | 1 | "DACRX—Offset 3C7h" on page 1043 | 00h |
| 3DA–3DAh | 1 | "FCR (FCR_CGA_Write)—Offset 3DAh" on page 1044 | 00h |

### 14.13.1 FCR (FCR_MDA_Write)—Offset 3BAh

Feature Control

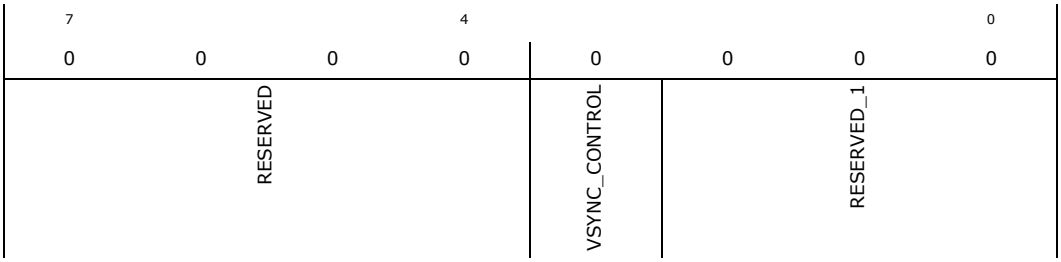
#### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3BAh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0b<br>RW | **RESERVED:** Read as 0. |
| 3 | 0b<br>RW | **VSYNC_CONTROL:** This bit is provided for compatibility only and has no other function. Reads and writes to this bit have no effect other than to change the value of this bit. The previous definition of this bit selected the output on the VSYNC pin.<br>0 = Was used to set VSYNC out put on the VSYNC pin (default).<br>1 = Was used to set the log i cal 'OR' of VSYNC and Display Ena ble output on the VSYNC pin. This capability was not typically very useful.. |
| 2:0 | 0b<br>RW | **RESERVED_1:** Read as 0. |

## 14.13.2 MSR (MSR_Write)—Offset 3C2h

Miscellaneous Output

### Access Method

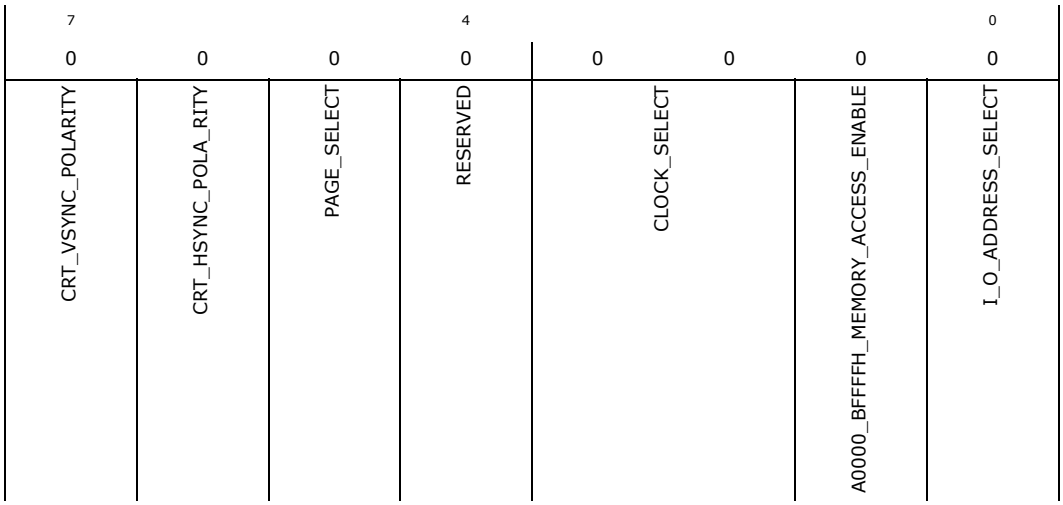
**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C2h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **CRT_VSYNC_POLARITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode. Sync polarity was used in VGA to signal the monitor how many lines of active display are being generated.<br>0 = Positive Polarity (default).<br>1 = Negative Polarity. |
| 6 | 0b<br>RW | **CRT_HSYNC_POLA_RITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode.<br>0 = Positive Polarity (default).<br>1 = Negative Polarity |
| 5 | 0b<br>RW | **PAGE_SELECT:** In Odd/Even Memory Map Mode 1 (GR6), this bit selects the upper or lower 64 KB page in dis play mem ory for CPU access:<br>0 = Upper page (default)<br>1 = Lower page.<br>Selects between two 64KB pages of frame buffer memory during standard VGA odd/ even modes (modes 0h through 5h). Bit 1 of register GR06 can also program this bit in other modes. Note that this bit is would normally set to 1 by the software. |
| 4 | 0b<br>RW | **RESERVED:** Read as 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:2 | 0b<br>RW | **CLOCK_SELECT:** These bits can select the dot clock source for the CRT interface. The bits should be used to select the dot clock in standard native VGA modes only. When in the centering or upper left corner modes, these bits should be set to have no effect on the clock rate. The actual frequencies that these bits select, if they have any affect at all, is programmable through the DPLL registers that default to the standard values used for VGA.<br>00 = CLK0, 25.175 MHz (for standard VGA modes with 640 pixel (8-dot) horizontal resolution) (default)<br>01 = CLK1, 28.322 MHz. (for standard VGA modes with 720 pixel (9-dot) horizontal resolution)<br>10 = Was used to select an external clock (now unused)<br>11 = Reserved |
| 1 | 0b<br>RW | **A0000_BFFFFH_MEMORY_ACCESS_ENABLE:** VGA Compatibility bit enables access to local video memory (frame buffer) at A0000(BFFFFh. When disabled, accesses to VGA memory are blocked in this region. This bit is independent of and does not block CPU access to the video linear frame buffer at other addresses. Note that it is typical for AGP chipsets to shadow this register to allow proper steering of memory accesses to the proper bus.<br>0 = Prevent CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture (default).<br>1 = Allow CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture. This memory must be mapped as UC by the CPU; see VGA Host Access Memory Munging in Display and Overlay Functions. |
| 0 | 0b<br>RW | **I_O_ADDRESS_SELECT:** This bit selects 3Bxh or 3Dxh as the I/O address for the CRT Controller re gisters, the Feature Control Register (FCR), and Input Status Register 1 (ST01). Presently ignored (whole range is claimed), but will ignore 3Bx for color configuration or 3Dx for monochrome. Note that it is typical in AGP chipsets to shadow this bit and properly steer I/O cycles to the proper bus for operation where a MDA exists on another bus such as ISA.<br>0 = Select 3Bxh I/O address (MDA emulation) (default).<br>1 = Select 3Dxh I/O address (CGA emulation). |

## 14.13.3 DACRX—Offset 3C7h

Palette Read Index Register

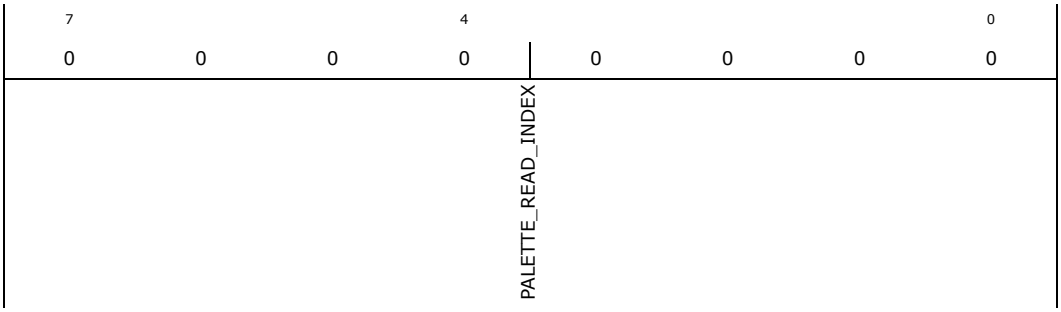
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3C7h

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0b<br>WO | **PALETTE_READ_INDEX:** The 8-bit index value programmed into this register chooses which of 256 standard color data positions within the palette are to be made accessible for being read from via the Palette Data Register (DACDATA). The index value held in this register is automatically incremented when all three bytes of the color data position selected by the current index have been read. A write to this register will abort a uncompleted palette write sequence. This register allows access to the palette even when running non-VGA display modes. |

## 14.13.4 FCR (FCR_CGA_Write)—Offset 3DAh

Feature Control

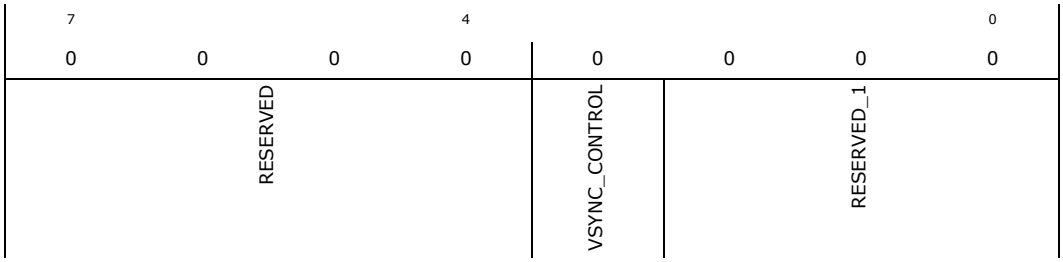
### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [GTTMMADR_LSB + 180000h] + 3DAh

**GTTMMADR_LSB Type:** PCI Configuration Register (Size: 32 bits)
**GTTMMADR_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h

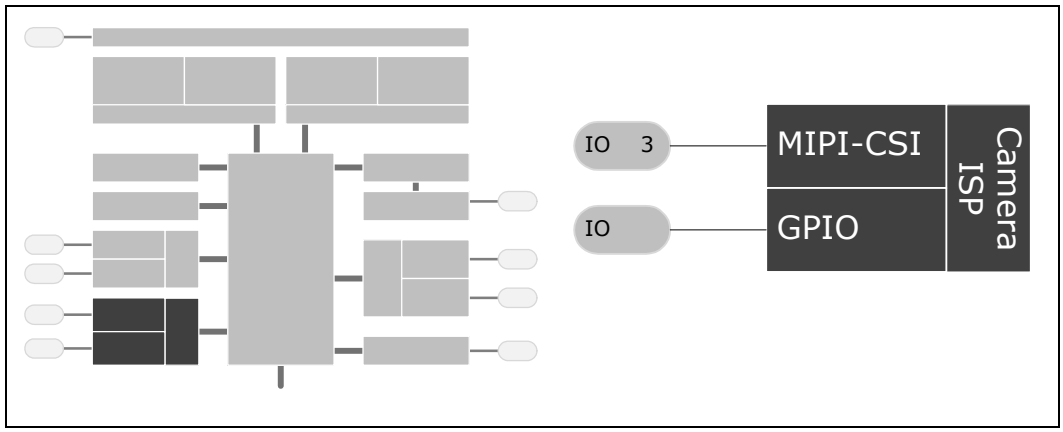


| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0b<br>RW | **RESERVED:** Read as 0. |
| 3 | 0b<br>RW | **VSYNC_CONTROL:** This bit is provided for compatibility only and has no other function. Reads and writes to this bit have no effect other than to change the value of this bit. The previous definition of this bit selected the output on the VSYNC pin.<br>0 = Was used to set VSYNC out put on the VSYNC pin (default).<br>1 = Was used to set the log i cal 'OR' of VSYNC and Display Ena ble output on the VSYNC pin. This capability was not typically very useful.. |
| 2:0 | 0b<br>RW | **RESERVED_1:** Read as 0. |

# 15 MIPI-Camera Serial Interface (CSI) and ISP

***Note:*** The MIPI CSI and controller front end interfaces with three sensors and is capable of simultaneously acquiring three streams, one from each sensor. These three streams are presented to the ISP.

***Note:*** If a 1-lane sensor needs to be connected to a MIPI-CSI port, that port must use a 1-lane port configuration.



## 15.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

### Table 176. CSI Signals

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **MCSI1_CLKP/N** | I V1P24S | **Clock Lane:** MIPI CSI input clock lane 0 for port 1. |
| **MCSI1_DP/N[3:0]** | I V1P24S | **Data Lanes:** Four MIPI CSI Data Lanes (0-3) for port 1. Lanes 2 and 3 can optionally used as data lanes for port 3. |
| **MCSI2_CLKP/N** | I V1P24S | **Clock Lane:** MIPI CSI input clock lane 0 for port 2. |
| **MCSI2_DP/N[0]** | I V1P24S | **Data Lane:** Single MIPI CSI Data Lanes for port 2. |
| **MCSI3_CLKP/N** | I V1P24S | **Clock Lane:** MIPI CSI input clock lane 0 for port 3. |
| **MCSI_RCOMP** | I/O | **Resistor Compensation:** This is for pre-driver slew rate compensation for the MIPI CSI Interface. Contact your Intel representative for details. |

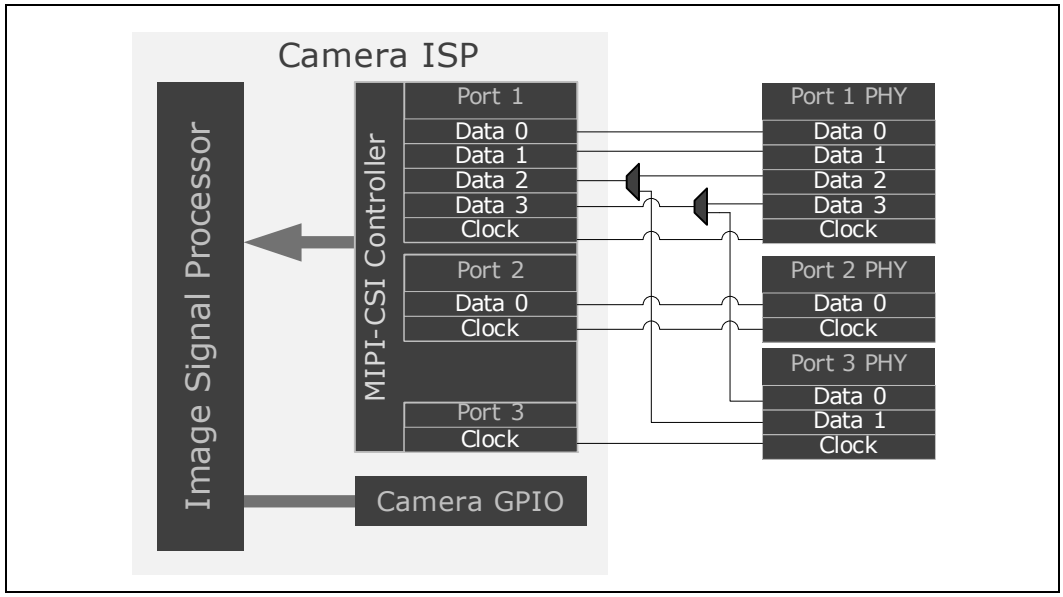
### Table 177. GPIO Signals (Sheet 1 of 2)

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **MCSI_GPIO[00]** | I/O V1P8S | Output from shutter switch when its pressed halfway. This switch state is used to trigger the Auto focus LED for Xenon Flash or Torch mode for LED Flash |
| **MCSI_GPIO[01]** | I/O V1P8S | Output from shutter switch when its pressed full way. This switch state is used to trigger Xenon flash or LED Flash |
| **MCSI_GPIO[02]** | I/O V1P8S | Active high control signal to Xenon Flash to start charging the Capacitor |
| **MCSI_GPIO[03]** | I/O V1P8S | Active low output from Xenon Flash to indicate that the capacitor is fully charged and is ready to be triggered |
| **MCSI_GPIO[04]** | I/O V1P8S | Active high Xenon Flash trigger / Enables Torch Mode on LED Flash IC |
| **MCSI_GPIO[05]** | I/O V1P8S | Enables Red Eye Reduction LED for Xenon / Triggers STROBE on LED Flash IC / |
| **MCSI_GPIO[06]** | I/O V1P8S | Camera Sensor 0 Strobe Output to SoC to indicate beginning of capture / Active high signal to still camera to power down the device. |
| **MCSI_GPIO[07]** | I/O V1P8S | Camera Sensor 1 Strobe Output to SoC to indicate beginning of capture / Active high signal to still camera to power down the device. |

**Table 177. GPIO Signals (Sheet 2 of 2)**

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **MCSI_GPIO[08]** | I/O V1P8S | Active high signal to video camera to power down the device. |
| **MCSI_GPIO[09]** | I/O V1P8S | Active low output signal to reset digital still camera #0. |
| **MCSI_GPIO[10]** | I/O V1P8S | Active low output signal to reset digital still camera #1 |
| **MCSI_GPIO[11]** | I/O V1P8S | Active low output signal to reset digital video camera |

**Figure 94. Camera Connectivity**



## 15.2 Features

- Integrated MIPI-CSI 2.0 interface
- Image Signal Processor (ISP) with DMA and local SRAM
- Imaging data is received by the MIPI-CSI interface and is relayed to the ISP for processing
- Up to five MIPI-CSI 2.0 data lanes
  - — Each lane can operate at up to 1GT/s. resulting in roughly 800 Mbit/s of actual pixels
- The MIPI-CSI interface supports lossless compressed image streams to increases the effective bandwidth without losing data

- Up to 24MP sensors supported, and full HD 1080p60
  - — Can also support Stereo HD 1080p30
- Up to 3 cameras can be operated simultaneously
  - — Stereoscopic Captures
  - — Front + Back Camera Usage

### 15.2.1 Imaging Capabilities

The following table summarizes imaging capabilities.

**Table 178. Imaging Capabilities**

| Feature | Capabilities |
|---|---|
| Sensor interface | Configurable MIPI-CSI2 interfaces.<br>3 sensors: x2, x2, x1 or x3, x1, x1<br>2 sensors: x4, x1 |
| Simultaneous sensors | Up to 3 simultaneous sensors |
| 2D Image capture | 24MP @ 15fps |
| 2D video capture | Up to 1080p60 |
| Input formats (Sensor -> SoC) | RAW 8, 10, 12, 14, RGB444, 565, 888, YUV420, 422, JPEG. |
| Output formats (SoC -> Sensor) | YUV422, YUV420, RAW |
| Special Features | Image and video stabilization<br>Low light noise reduction<br>Burst mode capture<br>Memory to memory processing<br>3A (Auto Exposure (AE), Auto White Balance (AWB) and Auto Focus (AF))<br>High Dynamic Range (HDR)<br>Multi-focus<br>Zero shutter lag |

### 15.2.2 Simultaneous Acquisition

All three cameras can be active at the same time.

SoC will support on-the-fly processing for only one image at a time. While this image is being processed on-the-fly, images from the other two cameras are saved to DRAM for later processing.

### 15.2.3 Primary Camera Still Image Resolution

Maximum still image resolution for the primary camera in post-processing mode is limited by the resolution of the sensors. Currently 24 Mpixel sensors are supported.

Maximum primary camera on-the-fly still image resolution for primary camera is 16 Mpixel at 18 fps.

Higher resolution, or higher frame rates are supported as long as the product of resolution and frame rate does not exceed 288 Mpixels/s (= 16 Mpixels * 18 fps).

Maximum primary camera on-the-fly stereoscopic still image resolution for primary camera is 8 Mpixel for each of the left and right images at 18 fps. The number of Mpixels can be increased by decreasing the frame rate.

### 15.2.4 Burst Mode Support

The SoC supports capturing multiple images back to back at maximum sensor resolution. At least 5 images must be captured in burst mode. The maximum number of images that can be so captured is limited only by available system memory. These images need not be processed on-the-fly.

### 15.2.5 Continuous Mode Capture

SoC supports capturing images and saving them to DRAM in a ring of frame buffers continuously at maximum sensor resolution. These images must then be fetched and processed on-the-fly by the ISP. This adds a round trip to memory for every frame and increases the bandwidth requirements.

### 15.2.6 Secondary Camera Still Image Resolution

Maximum secondary camera still image resolution is 4 Mpixel at 15 fps.

### 15.2.7 Primary Camera Video Resolution

Maximum primary camera video resolution is 1080p60.

Maximum primary camera dual video resolution is 1080p30.

Maximum stereo resolution is 1080p30.

### 15.2.8 Secondary Camera Video Resolution

Maximum secondary camera video resolution is 1080p30.

### 15.2.9 Bit Depth

Capable of processing 14-bit images at the stated performance levels.

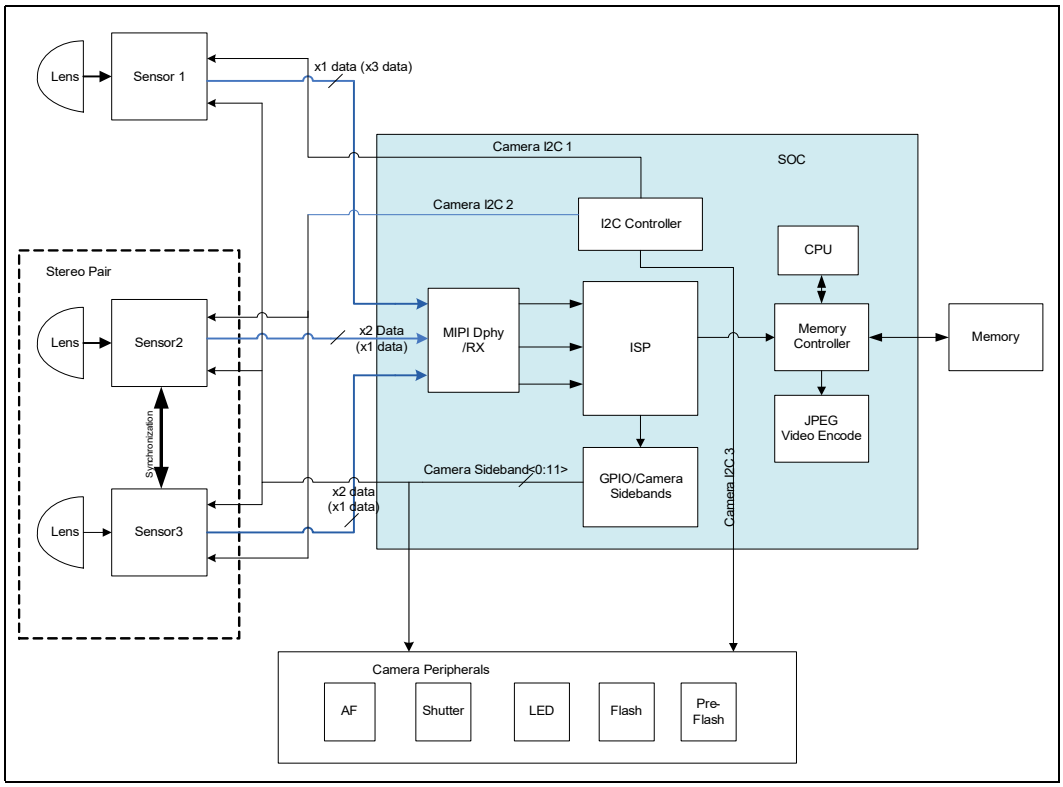
Capable of processing 18-bit images at half the performance levels, i.e. process on-the-fly 16 Mpixel 18-bit images at 7 fps instead of 15 fps.

Capable of processing up to 18-bit precision.

The higher precision processing will be employed mainly for high dynamic range imaging (HDR).

## 15.3 Imaging Subsystem Integration

**Figure 95. Image Processing Components**

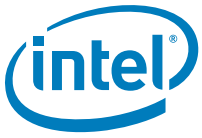


### 15.3.1 CPU Core

The CPU core augments the signal processing capabilities of the hardware to perform post-processing on images such as auto focus, auto white balance, and auto exposure. The CPU also runs the drivers that control the GPIOs and $I^2C$ for sensor control.

### 15.3.2 Imaging Signal Processor (ISP)

The ISP (Imaging Signal Processor) includes a 64-way vector processor enabling high quality camera functionality. Key features include support of three camera sensors.



#### 15.3.2.1 MIPI-CSI-2 Ports

The SoC has three MIPI clock lanes and five MIPI data lanes. The Analog Front End (AFE) and Digital Physical Layer (DPHY) take these lanes and connects them to three virtual ports. Two data lanes are dedicated to each of the rear facing cameras and the remaining one data lane is connected to the front facing camera. The MIPI interfaces follow the MIPI-CSI-2 specifications as defined by the MIPI Alliance. They support YUV420, YUV422, RGB444, RGB555, RGB565, RGB 888 and RAW 8b/10b/12b. Both MIPI ports support compression settings specified in MIPI-CSI-2 draft specification 1.01.00 Annex E. The compression is implemented in Hardware with support for Predictor 1 and Predictor 2. Supported compression schemes:

- 12-8-12
- 12-7-12
- 12-6-12
- 10-8-10
- 10-7-10
- 10-6-10

The data compression schemes above use an X-Y-Z naming convention where X is the number of bits per pixel in the original image, Y is the encoded (compressed) bits per pixel and Z is the decoded (uncompressed) bits per pixel.
