Functional Description

The WCMA4008C1X is a high-performance CMOS static RAM organized as 512K words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable (\overline{CE}), an active

LOW Output Enable (\overline{OE}), and three-state drivers. This device has an automatic power-down feature that reduces power consumption by more than 99% when deselected.

Writing to the device is accomplished by taking Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{18}).

Reading from the device is accomplished by taking Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) HIGH for read. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE} LOW, and \overline{WE} LOW).

The WCMA4008C1X is available in a standard 32-pin 450-mil-wide body width SOIC.

Notes:

4. Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
5. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
6. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
7. The internal write time of the memory is defined by the overlap of \overline{CE} LOW, and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.

Read Cycle No.1^[9, 10]

Read Cycle No. 2 ($\overline{\text{OE}}$ Controlled)^[10, 11]

Notes:

8. Full Device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min)}$ $\geq 100 \mu s$ or stable at $V_{CC(min)}$ $\geq 100 \mu s$.
9. Device is continuously selected. $\overline{\text{OE}}, \overline{\text{CE}} = V_{IL}$.
10. $\overline{\text{WE}}$ is HIGH for read cycle.
11. Address valid prior to or coincident with $\overline{\text{CE}}$ transition LOW.

Write Cycle No. 1 (\overline{CE} Controlled)^[12]

Write Cycle No. 2 (\overline{WE} Controlled, \overline{OE} HIGH During Write)^[12, 13]

Notes:

12. If \overline{CE} goes HIGH simultaneously with \overline{WE} going HIGH, the output remains in a high-impedance state.
13. Data I/O is high-impedance if $\overline{OE} = V_{IH}$.
14. During this period the I/Os are in the output state and input signals should not be applied.
