**About Microsemi**

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 4,800 employees globally. Learn more at [www.microsemi.com](http://www.microsemi.com).

# 1 Revision History

---

The revision history describes the changes that were implemented in the document since initial release. The changes are listed by revision, starting with the most current publication.

## 1.1 Revision 4

The following is a summary of the substantive changes in revision 4 of this document, dated July 2016.

- Item 1. Added footnote 1 to [Table 2](#), page 9.
- Item 2. Modified turnaround time in [Table 9](#), page 12.

## 1.2 Initial Release

Revision 3 of this document, dated June 2016, was the initial release of the production version of the datasheet.

## 1.3 Preliminary and Advanced Information

Revision 2 of this document, dated February 2016, was a preliminary datasheet. Such preliminary datasheets may be based on simulation or initial characterization and are subject to change.

Revision 1, dated September 2015, was the first publication of this document. This Advanced Datasheet version contained initial estimated information based on simulation, other products, devices, or speed grades. Such advanced information can be used as estimates, but not for production, as the data is not fully characterized.

## 2 Overview

---

### 2.1 Introduction

The ZL70550 ultra-low-power RF transceiver provides efficient wireless communications for applications where power consumption is of primary importance. With combined ultralow transmit, receive, and sleep currents, the ZL70550 device is best-in-class for a wide range of high- and low-duty-cycle applications. The transceiver's small size and ultralow power requirements make it feasible to operate the device with a single coin-cell battery or with energy-harvesting sources in extremely small form factors. The built-in support for Microsemi's highly efficient and powerful Z-Star protocol allows users to rapidly develop ultra-low-power wireless applications.

### 2.2 Features and Specifications

The ZL70550 RF transceiver features include:

- Ultralow power
  - Typical TX current (with 50- $\Omega$  match):
    - < 2.75 mA at -10 dBm;
    - < 5.3 mA at 0 dBm
  - Typical RX current: < 2.4 mA (low  $I_{RX}$  mode)
  - Sleep current: < 10 nA typical
  - Supply: 1.71 V to 3.6 V
- Operating frequency range: 779 MHz to 965 MHz
  - North American ISM band: 902 MHz to 928 MHz
  - European SRD band: 863 MHz to 870 MHz
  - Chinese band: 779 MHz to 787 MHz
  - Japanese bands: 916 MHz to 930 MHz and 950 MHz to 956 MHz
- Sensitivity and data rate:
  - Raw data rate: 200 kbit/s, 100 kbit/s, or 50 kbit/s
  - Typical sensitivity:
    - 106 dBm typical at 50 kbit/s at 3.2 mA and with FEC
    - 103 dBm typical at 50 kbit/s at 2.4 mA and with FEC
    - 99 dBm typical at 200 kbit/s at 3.2 mA and without FEC
    - 95 dBm typical at 200 kbit/s at 2.4 mA and without FEC
- Very few external components
  - Matching network, crystal, decoupling capacitors, and bias resistor
  - Standard interface: SPI bus
- Optional built-in MAC
  - Microsemi Z-Star or user protocol support
  - Transmit and receive buffer
  - Automatic CSMA packet transfers
  - Efficient header optimized for small or large payloads
  - Optional preamble, frame sync, length, FEC, and CRC
- RoHS compliant

## 2.2.1 Block Diagram

Figure 1 • ZL70550 RF Transceiver Block Diagram

## 2.3 Target Applications

End applications may include:

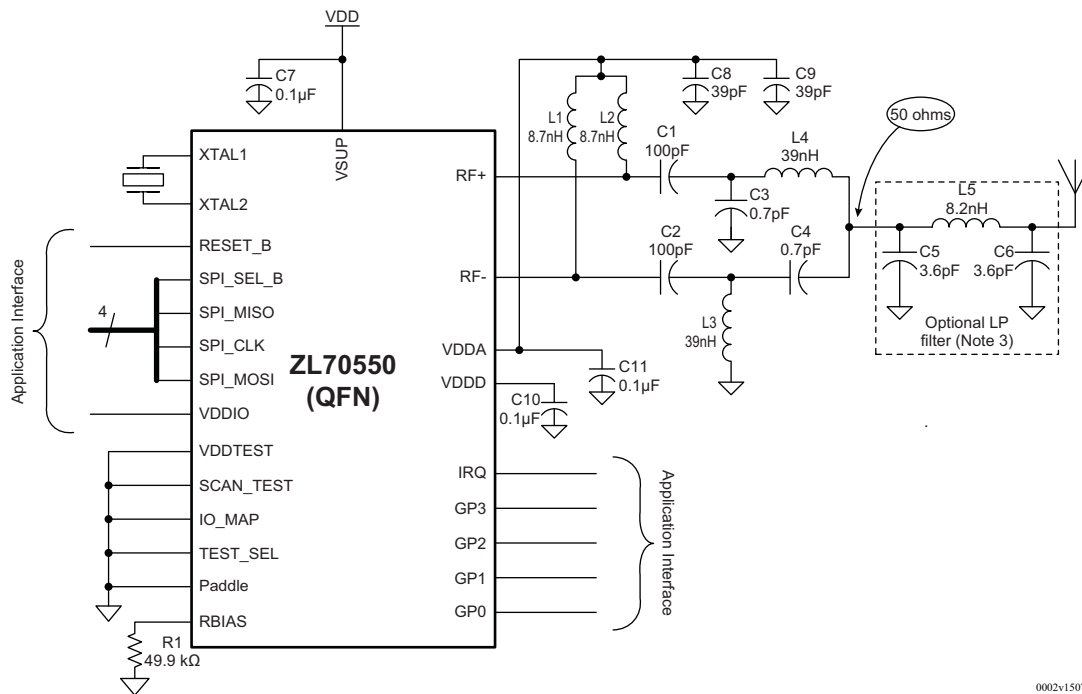

- Medical monitoring
- Industrial/building/home automation
- Security
- Smart cities
- Advanced metering infrastructure
- Asset management
- Energy harvesting
- Voice/compressed-audio communications

## 2.3.1 Typical Application Diagram

The following figure is representative of a 50-Ω single-ended implementation (refer to Figure 2, page 4). An optional low-pass filter on the output is recommended to attenuate second and third harmonic spurious emissions to meet regulatory standards.

**Figure 2 • 50-Ω Single-Ended Application Example with Optional Low-Pass Filter**

0002v1507.1

### Notes:

1. This schematic is based on the REMOTE550 board from the ZLE70550 Application Development Kit.
2. C3, C4, L3, and L4 values may change if the layout differs from the REMOTE550 board layout. To ensure optimal performance, please do not deviate from the REMOTE550 board layout.
3. L1 and L2 are optimized for tuning over the middle to upper frequency range (863MHz to 965MHz). Changing L1 and L2 to approximately 12nH allows tuning over the lower to middle frequency range (779MHz to 868MHz).
4. The optional low-pass filter reduces the transmitter spurious emissions by approximately 16dB for the second harmonic and 23dB for the third harmonic. Another option would be to replace this circuit with a SAW filter to attenuate spurious emissions and to provide protection against blockers.
5. Use Murata part number GCM155R71C104KA55D or equivalent for C10 and C11.

## 3 Functional Descriptions

The ultra-low-power ZL70550 RF transceiver enables RF telemetry in applications powered by coin-cell batteries or energy harvesting, where wireless telemetry was previously unfeasible. End applications may include wireless sensors, medical monitoring, industrial/home automation, or smart cities.

With a typical peak/average current consumption below 2.4mA in receive and 2.75mA in transmit, and with an upper data rate of 200kbit/s, the ZL70550 device enables bidirectional RF links over a distance of more than 100 meters (based on antenna gain and matching loss).

The output power is programmable and can be reduced to -25dBm to save power in cases where the link budget allows it, or can be increased up to 0dBm for more range or to allow for system losses such as a very small antenna or body tissue absorption.

To achieve the minimum possible power consumption, the ZL70550 device offers many automatic calibrations, all available to the user via the SPI bus.

In addition to its ultralow power consumption, the ZL70550 device also includes a highly flexible Media Access Controller (MAC) that offers four different packet modes of operation ranging from automatic packet transactions to low-level direct modulation via a serial clock and data.

### 3.1 MAC Packet Modes

The three different packet modes in which the ZL70550 MAC state machine operates, as well as a direct modulation mode where users have full control over their own packet or streaming protocols, are described in [Table 1](#), page 5. These packet modes give users tremendous flexibility in defining their own packet parameters and transaction capabilities, ranging from a user-defined bit stream to fully automated multipacket transactions based on Microsemi's Z-Star protocol.

**Table 1 • Packet Modes of Operation**

| Packet Mode | Description  | Pre/Frm Sync | FEC | PHY Header | Auto-Length | MAC Header | CRC |
|-------------|--|--------------|-----|------------|-------------|------------|-----|
| Raw bit     | Optional serial clock and data (TX/RX buffer or GP3..0 pins) | No           | No  | No         | No          | No         | No  |
| Raw         | Compatible with ZL70251 MAC with optional FEC and CRC        | Yes          | Opt | No         | No          | No         | Opt |
| User        | User-defined packet (no MAC header)                          | Yes          | Opt | Yes        | Yes         | No         | Opt |
| Z-Star      | Fully functional MAC based on Microsemi's Z-Star protocol    | Yes          | Opt | Yes        | Yes         | Yes        | Yes |

### 3.1.1 Raw Bit Packet Mode

In raw bit mode, raw bits are transmitted without preamble, frame sync pattern, header, or CRC. If these properties are needed, then they must be encoded in the bit stream. The bit stream may be sourced from the TX buffer, from the GP3..0 pins, or generated from an internal pattern generator.

On the receiver side, the bit stream is received without frame synchronization or byte alignment. The received data either can be placed in the receive buffer or can be output with a clock on the GP3..0 pins.

Raw bit mode has two basic applications. First, it can be used for raw bit error testing using the GP3..0 pins. Second, it can be used for applications where the packet framing is not desired, or for data rates not supported by the ZL70550 device. There are limitations to this second case.

### 3.1.2 Raw Packet Mode

In raw packet mode, packets are transmitted without a MAC header, similar to the ZL70251 device. The CRC is optional but requires either a fixed-length packet or length information in the packet such that the application processor can dynamically extract the length from the beginning of the packet and change the RX packet length before the end of the packet is received.

The packet format is shown in Figure 3, page 6. If raw packet mode is used, then the TX and RX packet lengths are controlled by *tx\_buf\_len* and *rx\_frm\_len*, respectively. During reception, users may update *rx\_frm\_len*, providing this occurs before the end of the packet. Usually this requires users to embed the packet length as the first byte of the payload. The packet may optionally be terminated if the RSSI drops below the RSSI threshold setting or if a SPI Abort command is executed. In all cases, *rx\_frm\_len* indicates the length of the received packet.

Figure 3 • Packet Format, Raw Packet Mode

0010w1606.1

### 3.1.3 User Packet Mode

In user packet mode, packets are transmitted with a PHY header and optional FEC and CRC. The basic packet format is shown in Figure 4, page 7. The PHY header contains the length of the packet, which is used by the receiver to terminate the packet and calculate the CRC. The format of the PHY header in the received packet is flexible in that the length may be located at a programmable offset from the beginning of the PHY frame. It may be of various lengths and either MSB or LSB first.

For automatic PHY header generation on the transmit side, single-byte PHY headers are supported with LSB first by setting *tx\_auto\_hdr* equal to 1. For other formats, the PHY header must come from the transmit buffer.

Figure 4 • Packet Format, User Packet Mode

### 3.1.4 Z-Star Packet Mode

In Z-Star packet mode, packets are transmitted with a MAC header, a PHY header, either a 16-bit or 32-bit CRC (also known as a Frame Check Sequence (FCS)), and an option for using FEC. The basic packet format is shown in Figure 5, page 8. Z-Star packet mode supports the MAC layer of the Z-Star protocol as defined in the Z-Star protocol specification. The ZL70550 hardware performs the following Z-Star MAC functions:

- Automatic CSMA algorithm with random back off (LBT)
- Transmitting a packet with or without automatic acknowledgment reception
- Programmable automatic retransmissions
- Data request (node request to hub for data)
- Sniff with automatic packet reception or sleep (supports mesh networking)

The ZL70550 Z-Star MAC is a highly optimized and ultra-low-power protocol supporting a node/hub star network ideally suited for wireless sensor networks (WSNs) or Internet of things (IoT) applications. It is also highly flexible to support point-to-point transactions or other topologies. The combination of the highly optimized Z-Star MAC protocol and the best-in-class, ultra-low-power radio make the ZL70550 device the radio of choice where power efficiency is paramount.

Figure 5 • Packet Format, Z-Star Packet Mode

0008v1606.0

## 4 Electrical Specifications

Voltages are with respect to ground (VSS) unless otherwise stated.

### 4.1 Absolute Maximum Ratings

**Table 2 • Absolute Maximum Ratings**

| Parameter                                      | Symbol            | Limits (Note 1)       |                         | Unit | Notes                       |
|--|-------------------|-----------------------|-------------------------|------|-----------------------------|
|  |                   | Min.                  | Max.                    |      |                             |

1. Performance is not guaranteed outside these limits. Application of voltage beyond the stated absolute maximum rating may permanently damage the device or cause reduced reliability.
2. Application of voltage beyond the stated absolute maximum rating may cause permanent damage to the device or cause reduced reliability.
3. Applies to digital interface pins including GP3.0, IRQ, RESET\_B, SPI\_CLK, SPI\_MISO, SPI\_MOSI, SPI\_SEL\_B, IO\_MAP, SCAN\_TEST, and TEST\_SEL.
4. Applies to analog interface pins, including RBIAS, XTAL1, and XTAL2.
5. Applies to RF interface pins, including RF+, RF-, TX+, TX-, RX+, and RX-.
6. Applied one at a time. Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied.

#### 4.1.1 Recommended Operating Conditions

The recommended operating conditions define the nominal conditions for the device. This means that a specified parameter is valid for the recommended operating conditions stated in [Table 3](#), page 9, unless otherwise noted.

**Table 3 • Recommended Operating Conditions**

| Parameter             | Symbol            | Limits (Note 1) |      |      | Unit | Notes |
|-----------------------|-------------------|-----------------|------|------|------|-------|
|                       |                   | Min.            | Typ. | Max. |      |       |
| Supply voltage        | V <sub>DDOP</sub> | 1.71            |      | 3.6  | V    |       |
| VDDIO                 | V <sub>DDIO</sub> | 1.71            |      | 3.5  | V    |       |
| Operating temperature | T <sub>OP</sub>   | -40             | 25   | 85   | °C   |       |

1. Performance is not guaranteed outside these limits. Application of voltage beyond the stated absolute maximum rating may permanently damage the device or cause reduced reliability.

## 4.2 Electrical Characteristics

### 4.2.1 Voltage Regulators

**Table 4 • Voltage Regulators**

| Parameter            | Symbol           | Limits |      |      | Unit | Note   |
|----------------------|------------------|--------|------|------|------|--------|
|                      |                  | Min.   | Typ. | Max. |      |        |
| Output voltage range | V <sub>DDA</sub> | 1.46   | 1.52 | 1.57 | V    | Note 1 |
| Output voltage range | V <sub>DDD</sub> | 1.20   | 1.25 | 1.30 | V    | Note 1 |

- Do not connect external circuits to these pins. V<sub>DDA</sub> and V<sub>DDD</sub> are regulated supplies for the internal analog and digital circuits, respectively, of the ZL70550 device.

### 4.2.2 Digital Interface

**Table 5 • Digital I/O AC and DC Specifications**

| Parameter                     | Symbol            | Limits                   |                          | Unit | Note                 |
|-------------------------------|-------------------|--------------------------|--------------------------|------|----------------------|
|                               |                   | Min.                     | Max.                     |      |                      |
| High-level output voltage     | V <sub>OH</sub>   | V <sub>DD</sub> - 0.2    |                          | V    |                      |
| Low-level output voltage      | V <sub>OL</sub>   | V <sub>SS</sub> + 0.2    |                          | V    |                      |
| High-level input voltage      | V <sub>IH</sub>   | V <sub>DDIO</sub> × 0.85 | V <sub>DDIO</sub>        | V    |                      |
| Low-level input voltage       | V <sub>IL</sub>   | V <sub>SSD</sub>         | V <sub>DDIO</sub> × 0.15 | V    |                      |
| High-level output current     | I <sub>OH</sub>   | 1                        |                          | mA   |                      |
| Low-level output current      | I <sub>OL</sub>   | 1                        |                          | mA   |                      |
| Input leakage current         | I <sub>LEAK</sub> | -10                      | 10                       | nA   | Note 1               |
| Output rise time (20% to 80%) | T <sub>R</sub>    | 35                       |                          | ns   | Load of 120pF at 1mA |
| Output fall time (80% to 20%) | T <sub>F</sub>    | 35                       |                          | ns   | Load of 120pF at 1mA |

- Assumes that the GP3..0 pins are tied low and *not* in use. The GP3..0 pins have higher leakage above 2.7V.

## 4.2.3 Performance Characteristics

The specified performance of the ZL70550 device is valid over a supply range of 1.8V to 3.5V.

### 4.2.3.1 General RF Parameters

**Table 6 • General Characteristics**

| Parameter                       | Limits |      |      | Unit   | Note                                  |
|---------------------------------|--------|------|------|--------|---------------------------------------|
|                                 | Min.   | Typ. | Max. |        |                                       |
| Operating frequency range       | 779    |      | 965  | MHz    |                                       |
| Reference frequency             |        | 24   |      | MHz    | See Note 1                            |
| Symbol rate                     |        | 200  |      | kbit/s | 300-kHz channel bandwidth             |
|                                 |        | 100  |      | kbit/s | 300-kHz channel bandwidth             |
|                                 |        | 50   |      | kbit/s | 300-kHz channel bandwidth             |
| Channel separation              |        | 300  |      | kHz    | Note 2                                |
| Crystal oscillator startup time |        |      | 1    | ms     |                                       |
| Modulation index                | 0.45   | 0.5  | 0.55 |        | Based on a raw data rate of 200kbit/s |

1. In order to save power and reduce the number of external components, the crystal oscillator has a 3-pF load instead of a typical 8-pF or 10-pF load (refer to [Table 11](#), page 14). The 3-pF load is representative of the pin and PCB parasitic capacitance.
2. This is not an occupied bandwidth. It is based on the typical channel bandwidth; however, other channel bandwidths can be programmed.

### 4.2.3.2 Current Consumption

**Table 7 • Current Consumption**

| Parameter                       | Symbol      | Limits |      |      | Unit    | Note                            |
|---------------------------------|-------------|--------|------|------|---------|---------------------------------|
|                                 |             | Min.   | Typ. | Max. |         |                                 |
| SLEEP state current             | $I_{SLEEP}$ |        | 10   | 50   | nA      | Partial register retention only |
| IDLE state current              | $I_{IDLE}$  |        | 200  | 300  | $\mu$ A | Crystal oscillator running only |
|                                 |             |        | 2.4  |      | mA      | LNA gain=8'h0F, LNA bias=8'h05  |
| RX state current                | $I_{RX}$    |        | 3.2  |      | mA      | LNA gain=8'h0F, LNA bias=8'h29  |
|                                 |             |        | 5.3  |      | mA      | 0dBm into a 50- $\Omega$ load   |
| TX state current (CW on 916MHz) | $I_{TX}$    |        | 2.75 |      | mA      | -10dBm into a 50- $\Omega$ load |
|                                 |             |        | 2.4  |      | mA      |                                 |
| RSSI sniff current              | $I_{SNIFF}$ |        | 2.4  |      | mA      |                                 |

### 4.2.3.3 Synthesizer

**Table 8 • Synthesizer**

| Parameter             | Symbol                      | Limits |      |      | Unit   | Note                            |
|-----------------------|-----------------------------|--------|------|------|--------|---------------------------------|
|                       |                             | Min.   | Typ. | Max. |        |                                 |
| Phase noise at 100kHz | $\Phi_{\text{SYNTH\_100k}}$ |        | -92  |      | dBc/Hz | CW observed from PA             |
| Reference spurs       | $\Psi_{\text{SYNTH\_CLRS}}$ |        | -60  |      | dBc    | At 300kHz (25°C);<br>CW from PA |

### 4.2.3.4 Transmitter

**Table 9 • Transmitter RF Characteristics**

| Parameter                      | Condition          | Limits |      |      | Unit | Note  |
|--------------------------------|--------------------|--------|------|------|------|---|
|                                |                    | Min.   | Typ. | Max. |      |   |
| Output power                   | PA=maximum setting |        | 0    |      | dBm  | Measured on ADK (50Ω match); no SAW filter (for typical values refer to <a href="#">Figure 7</a> , page 15) |
|                                | PA=minimum setting |        | -25  |      | dBm  |   |
| Spurious emissions             |                    |        |      | -33  | dBm  |   |
| TX-RX or RX-TX turnaround time |                    |        | 820  |      | μs   | Programmable<br>Highest data rate<br>See Note 1   |

1. Last bit of previous packet to first bit of subsequent packet header.

### 4.2.3.5 Receiver

**Table 10 • Receiver RF Characteristics**

| Parameter                              | Limits |         |      | Unit | Note  |
|--|--------|---------|------|------|---|
|  | Min.   | Typ.    | Max. |      |   |
| Sensitivity at 25°C, 1.8V              |        | -106    |      | dBm  | 50kbit/s with $I_{RX}=3.2\text{mA}$ (LNA gain=8'h0F, LNA bias=8'h29) with FEC   |
|  |        | -103    |      | dBm  | 50kbit/s with $I_{RX}=2.4\text{mA}$ (LNA gain=8'h0F, LNA bias=8'h05) with FEC   |
|  |        | -99     |      | dBm  | 200kbit/s with $I_{RX}=3.2\text{mA}$ (LNA gain=8'h0F, LNA bias=8'h29) without FEC   |
|  |        | -95     |      | dBm  | 200kbit/s with $I_{RX}=2.4\text{mA}$ (LNA gain=8'h0F, LNA bias=8'h05) without FEC   |
| Maximum input power                    | -34    |         |      | dBm  | 200kbit/s with $I_{RX}=2.4\text{mA}$ (LNA gain=8'h0F, LNA bias=8'h05) with FEC  |
| Cascaded voltage gain                  |        | 30      |      | dB   | LNA and mixer; programmable, with five settings in 3-dB to 4-dB steps ( $I_{RX}=2.4\text{mA}$ )                                 |
| IF center frequency                    |        | 600     |      | kHz  | (300kHz × 2)  |
| RSSI range                             |        | 42      |      | dB   | Linear range ( $\pm 1$ LSB)<br>Digital, 32 levels of 2dB  |
| RSSI resolution                        |        | 2       |      | dB   | Note 1  |
| RSSI accuracy                          |        | $\pm 2$ |      | dB   | Note 2  |
| Listen Before Talk (LBT) minimum level |        |         | -100 | dB   |   |
| Adjacent channel rejection             |        | 11      |      | dB   | Relative to sensitivity<br>Desired channel 3dB above the sensitivity limit; 300-kHz channel spacing with a modulated interferer |
| Alternate channel rejection            |        | 25      |      | dB   | Relative to sensitivity<br>Desired channel 3dB above the sensitivity limit; 600-kHz channel spacing with a modulated interferer |
| Blocker rejection                      | 11     |         |      | dB   | At $\pm 2\text{MHz}$ , EN300 200 limits   |
|  | 31     |         |      | dB   | At $\pm 10\text{MHz}$ , EN300 200 limits  |
| 1-dB compression                       |        | -43     |      | dBm  | LNA gain=8'h0F  |
| Third-order input intercept point      |        | -36     |      | dBm  | LNA gain=8'h0F  |

1. Nominal ADC quantization. The average RSSI results have seven bits rather than five if the averaging length is four or more. The accuracy in this case is  $\pm 0.5\text{dB}$  due to the dithering/averaging of noise at lower levels where LBT thresholds are set.
2. Calibrated at one LNA gain, one temperature and one input level (for LBT).

### 4.2.3.6 Crystal Oscillator

All frequency-related specifications are based on the crystal oscillator performance, which, in turn, is dependent on the crystal specifications. The ZL70550 device specifications assume that the crystal specifications listed in the following table are met or exceeded (refer to Table 11, page 14). The crystal oscillator is trimmable to  $\pm 5$ ppm at room temperature when attached to a crystal meeting the specifications in Table 11, page 14.

**Table 11 • Crystal Specifications**

| Parameter                    | Limits |      |      | Unit    | Note                             |
|------------------------------|--------|------|------|---------|----------------------------------|
|                              | Min.   | Typ. | Max. |         |                                  |
| Frequency                    |        | 24   |      | MHz     |                                  |
| Frequency tolerance          | -30    |      | 30   | ppm     |                                  |
| Stability with temperature   | -25    |      | 25   | ppm     | Over operating temperature       |
| Operating temperature range  | -40    | 25   | 85   | °C      |                                  |
| Equivalent series resistance | 12     |      | 130  | ohm     |                                  |
| Motional resistance          | 0      | 1    | 17   | ohm     |                                  |
| Shunt capacitance            | 1.4    | 1.65 | 1.9  | pF      | Note 1                           |
| Motional capacitance         | 3.2    | 3.35 | 3.5  | fF      | Note 1                           |
| Load capacitance             |        | 3    |      | pF      | Note 2                           |
| Drive level                  |        |      | 50   | $\mu$ W |                                  |
| Aging                        | -3     |      | 3    | ppm     | First year only; none thereafter |

1. A low shunt capacitance and high motional capacitance is best as it results in a larger trim range.
2. In order to save power, the crystal oscillator presents a 3-pF load instead of the typical 8-pF or 10-pF load. A slight frequency pull, on the order of 100ppm to 150ppm, would result if using a standard crystal without additional external load capacitors. Such a deviation has no effect on the operation of the device and is generally not a problem for most applications, providing all ZL70550 devices have the same frequency pull (within trimmable range). If the deviation is not acceptable and power is critical, a special cut crystal may be used (that is, slightly slower to compensate for the pull). Microsemi is engaging with crystal manufacturers in developing custom crystals that operate at 24MHz with only a 3-pF load.

**Figure 6 • Crystal Oscillator Circuit**

0026-Xtal diagram-v1606.0

## 4.3 Transmit Power Characteristics

The following figures illustrate the relationship between TX power, PA trim setting, and current consumption (refer to [Figure 7](#), page 15, and [Figure 8](#), page 15). These measurements were made on the REMOTE550 board from a ZL70550 Application Development Kit (ADK) at room temperature and with a supply voltage of 1.8V. The figures include the losses of the matching network (approximately 2 dB to 3dB).

### 4.3.1 Transmit Power vs. PA Trim Value

**Figure 7 • TX Power vs. PA Trim Value**

### 4.3.2 Transmit Power vs. Current Consumption

**Figure 8 • TX Power vs. Current Consumption**

# 5 Pin Descriptions

The ZL70550 device is available in two package options, a 32-pin QFN and a 29-pin CSP. The pins are described in this section.

## 5.1 Pin Diagrams

The following illustrations are representations of the QFN and CSP packages, respectively, for the ZL70550 device.

**Figure 9 • Footprint (top view) for 32-Pin QFN**

**Figure 10 • Footprint (bottom view) for 29-Pin CSP Package**

## 5.2 Pin Lists

The pinouts for the QFN and CSP packages of the ZL70550 device are listed in [Table 12](#), page 17, and [Table 13](#), page 18, respectively.

Connect the QFN center pad/paddle to the ground plane of the PCB. A minimum of four vias between the SMD pad and the ground plane are recommended to ensure reliable performance.

For the QFN, pins 18 and 23 must be connected to the PCB ground plane as well (refer to [Table 12](#), page 17).

**Table 12 • Pinout for 32-Pin QFN**

| Pin Name <sup>1</sup> | Pin Number | Pin Name <sup>1</sup> | Pin Number |
|-----------------------|------------|-----------------------|------------|
| GP2                   | 1          | GND                   | 18         |
| RESET_B               | 2          | NC                    | 19         |
| GP1                   | 3          | NC                    | 20         |

## 5.3 Functional Pin Descriptions

The following table shows the functional pin descriptions for the ZL70550 device.

Table 14 • Overview of ZL70550 Interconnects

| Symbol  | I/O | Type | Description  |
|---|-----|------|--|
| <i>Interconnects Available on All Package Options</i> |     |      |  |
| GP0   | I/O | A/D  | Analog and digital test bus input and output. General-purpose use for digital I/O.   |
| GP1   | I/O | A/D  | Analog and digital test bus input and output. General-purpose use for digital I/O.   |
| GP2   | I/O | A/D  | Analog and digital test bus input and output. General-purpose use for digital I/O.   |
| GP3   | I/O | A/D  | Analog and digital test bus input and output. General-purpose use for digital I/O.   |
| IO_MAP  | I   | D    | Connect to ground. Used for device testing only.   |
| IRQ   | O   | D    | Interrupt output.  |
| NC  | N/A | N/A  | No connection (do not ground pin).   |
| RBIAS   | I   | A    | Bias setting resistor used to trim the internal current reference. Use a 49.9-kohm resistor ( $\pm 1\%$ ) to ground.   |
| RESET_B   | I   | D    | Asynchronous reset (active low) with a minimum low period of 100ns. When low, the ZL70550 is in reset and all circuits are off. When transitioning from low to high, all registers are set to their power-on-reset values, the crystal oscillator starts up, all other circuits are disabled, and the ZL70550 enters into the <b>IDLE</b> state. |
| SCAN_TEST   | I   | D    | Connect to ground. Used for device testing only.   |
| SPI_CLK   | I   | D    | SPI bus clock input.   |

**Table 14 • Overview of ZL70550 Interconnects (continued)**

| Symbol  | I/O | Type | Description   |
|---|-----|------|---|
| SPI_MISO  | O   | D    | SPI bus data output. This output is tri-stated when SPI_SEL_B is high and driven when SPI_SEL_B is low.   |
| SPI_MOSI  | I   | D    | SPI bus data input.   |
| SPI_SEL_B                                       | I   | D    | SPI bus select input (active low). When low, the SPI_MISO output buffer is enabled.   |
| TEST_SEL  | I   | D    | Connect to ground. Used for device testing only.  |
| VDDA  | O   | A    | 1.52-volt regulator output used to power most on-chip analog circuits. Connect a 100-nF X7R ceramic capacitor between VDDA and ground.  |
| VDDD  | O   | A/D  | 1.25-volt regulator output used to power most on-chip digital circuits. Connect a 100-nF X7R ceramic capacitor between VDDD and ground.   |
| VDDIO   | I   | A/D  | Power supply input to the internal level shifters (1.71 volts to 3.6 volts). Controls the digital signaling level for all ZL70550 digital I/O.  |
| VDDTEST   | I   | A    | Connect to ground. Used for device testing only.  |
| VSUP  | I   | A/D  | Supply voltage (1.71 volts to 3.6 volts).   |
| XTAL1   | I   | A    | Crystal connection to the gate (input) of the crystal oscillator. Can also be driven with an external clock source.   |
| XTAL2   | O   | A    | Crystal connection to the drain (output) of the crystal oscillator.   |
| <b>RF and Ground Connections on QFN Package</b> |     |      |   |
| Paddle/GND                                      | I   | A/D  | Ground connection.  |
| GND   | I   | A/D  | Ground connection.  |
| RF+   | I/O | A    | RF positive (TX/RX). TX+ and RX+ are bonded together.   |
| RF-   | I/O | A    | RF negative (TX/RX). TX- and RX- are bonded together.   |
| <b>RF and Ground Connections on CSP Package</b> |     |      |   |
| RX+   | I   | A    | Receiver RF positive input. This input is AC coupled and is connected to an internal shunt capacitor that can be used for automatic tuning to antennas or matching networks that connect directly to the receiver inputs. |
| RX-   | I   | A    | Receiver RF negative input. This input is AC coupled and is connected to an internal shunt capacitor that can be used for automatic tuning to antennas or matching networks that connect directly to the receiver inputs. |
| TX+   | O   | A    | Transmitter RF positive output. Requires external biasing to VDDA.  |
| TX-   | O   | A    | Transmitter RF negative output. Requires external biasing to VDDA.  |
| VSSA  | I   | A    | Ground connection.  |
| VSSA2   | I   | A    | Ground connection.  |
| VSSD  | I   | A    | Ground connection.  |
| VSSD2   | I   | A    | Ground connection.  |

# 6 Package Information

## 6.1 Drawing and Markings for 32-Pin QFN Package

Figure 11 • Package Drawing and Package Dimensions for 32-Pin QFN

| Common Dimensions |         |         |         |
|-------------------|---------|---------|---------|
| Symbol            | Minimum | Nominal | Maximum |
| A                 | 0.8     | 0.9     | 1.0     |
| A1                | 0       | 0.02    | 0.05    |
| A3                |         | 0.2     |         |
| b                 | 0.20    | 0.25    | 0.30    |
| D                 |         | 5.00    |         |
| E                 |         | 5.00    |         |
| e                 |         | 0.50    |         |
| J                 | 3.40    | 3.50    | 3.60    |
| K                 | 3.40    | 3.50    | 3.60    |
| L                 | 0.35    | 0.40    | 0.45    |

**Notes:**

1. Dimensioning and tolerances conform to ASME Y14.5M. – 1994.
2. All dimensions are in millimeters.
3. Not to scale.

Figure 12 • Markings for 32-Pin QFN

Pin 1 Corner

0006v1602.0

**Notes:**

1. YY = Last two digits of year of encapsulation
2. WW = Week number of encapsulation
3. ZZ = Assembly lot sequence code
4. A = Assigned Assembly Site Identifier
5. F = Fab code
6. R = Product revision code
7. e3 = Denotes Pb-free

## 6.2 Drawing and Markings for 29-Pin CSP Package

Figure 13 • Package Drawing and Package Dimensions for 29-Pin CSP

0005v1606.0

| Common Dimensions (mm) |         |         |         |
|------------------------|---------|---------|---------|
| Symbol                 | Minimum | Nominal | Maximum |
| A                      |         | 0.317   |         |
| A1                     |         | 0.115   |         |
| b <sup>1</sup>         |         | 0.150   |         |
| D                      |         | 1.99    |         |
| E                      |         | 3.085   |         |

**Notes:**

1. UBM diameter
2. For pin coordinates, refer to Table 15, page 22

**Table 15 • Pin Coordinates for PCB Layout for 29-Pin CSP (top-down view)**

| Ball | Distance from Center of Die in $\mu\text{m}$ |              |
|------|--|--------------|
|      | X Coordinate                                 | Y Coordinate |
| A1   | 1347.0050                                    | 800.5200     |
| A2   | 887.0050                                     | 800.5200     |
| A3   | 487.0050                                     | 800.5200     |

## 7 Ordering Information

---

The ZL70550 RF transceiver is available in two package options.

**Table 16 • Ordering and Package Overview**

| Ordering Code                                       | Temp Range (°C) | Package    | Delivery Form | Pb-Free          |
|---|-----------------|------------|---------------|------------------|
| ZL70550LDF1   | -40 to 85       | 32-pin QFN | Tape and reel | YES <sup>1</sup> |
| ZL70550UGB4<br>(contact Microsemi for availability) | -40 to 85       | 29-pin CSP | Tape and reel | YES <sup>2</sup> |

1. Matte tin.

2. Sn/Ag (97.5 percent tin, 2.5 percent silver).

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
