KC705 Evaluation Board for the Kintex-7 FPGA

User Guide

UG810 (v1.9) February 4, 2019

XILINX

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
02/04/2019	1.9	Updated the Electrostatic Discharge Caution section. In the DDR3 Memory Module, added information about configuration. Updated Appendix C, Xilinx Design Constraints and Appendix F, Regulatory and Compliance Information.
07/10/2018	1.8.1	Editorial updates only. No technical content updates.
03/20/2018	1.8	In Table 1-1, Quad SPI Flash Memory, and [Ref 6], added Micron MT25QL128ABA8ESF-0SIT as a possible part for U7. In Table 1-24, the I2C addresses were updated for the FMC HPC and FMC LPC device rows.
07/08/2016	1.7	Updated VRP/VRN resistor connection information in DDR3 Memory Module. Moved the Additional Resources and Legal Notices appendix to the end of the book.
08/26/2015	1.6.2	In Table 1-9, the I/O standard for SYSCLK_N and SYSCLK_P were updated to LVDS. In Table 1-27, under Directional Pushbutton Switches, the I/O standard for GPIO_SW_C was updated to LVCMOS25. Updated the #USB UART section of Appendix C, Xilinx Design Constraints.
04/13/2015	1.6.1	In HPC Connector J22, the GTX clock count changed from 1 to 2. Updated links.
12/08/2014	1.6	Added a note about jumper header locations below Table 1-1. Changed Table 1-5 heading J1 DDR3 Memory to U58 BPI Flash Memory. Parts PC28F00AP30TF and N25Q128A13BSF40F changed from Numonyx to Micron. Described J11 and J12 connections in User SMA Clock Input. Made these updates in Programmable User Clock Source: XTP186 became XTP204, RDF0175 became RDF0194, XTP187 became XTP203, and RDF0176 became RDF0193. Corrected the device in the heading of Table 1-20 from CP2013 to CP2103. Updated I2C Bus Switch. Updated Table 1-24 I2C devices. In Table 1-28, J22 pin G7 connects to FPGA U1 pin C27. Replaced Table A-3, *KC705 Default Jumper Settings* and added Figure A-3 to show jumper locations. Replaced the constraints file in Appendix C, Xilinx Design Constraints. Added information about ordering the custom ATX cable to Appendix F, Regulatory and Compliance Information, [Ref 21].
07/11/2014	1.5	Corrected MGT Quad connection information in GTX Transceivers and a connection in Table 1-10. Added MGTREFCLK1 - PCIE_CLK from P1 to Quad 115 in GTX Transceivers. Updated Table 1-4, Table 1-5, Table 1-6, Table 1-7, Table 1-9, Table 1-18, Table 1-21, Table 1-23, Table 1-27, Table 1-28, and Table 1-29. Added table footnotes regarding I/O standard and pins prior to board revision 1.1 to Table 1-14. Clarified default jumper positions in Table 1-15. Corrected the J2 C19 pin number in Table 1-29. In Figure 1-39, changed pin names VBATT to VCCBATT and POUC_B to PUDC_B. Removed three pins from See the Kintex-7 KC705 Evaluation Kit product page Documentation tab for the latest versions of the FPGA pins constraints files (XDC files). (PACKAGE _PIN R8, R7, and W8). The Appendix C title changed to Master Constraints File Listing and the constraints file in Appendix C was replaced. The Declaration of Conformity link in Appendix F was updated.

Date	Version	Revision
07/18/2013	1.4	Revised the format of Table 1-20 and added the I/O standard column. Revised the FPGA U1 pin for FMC_HPC_CLK0_M2C_N in Table 1-28 to C27 on page 59. Revised the descriptions of the functions for SW13 position 3 and position 5 in Table A-2. In Appendix C, Xilinx Design Constraints, changed appendix title from Master UCF Listing to Master Board Constraints, replaced references to the term UCF with the term XDC and replaced the KC705 Board UCF Listing with the See the Kintex-7 KC705 Evaluation Kit product page Documentation tab for the latest versions of the FPGA pins constraints files (XDC files)..
05/10/2013	1.3	Updated Figure 1-1 to show v 1.1 board. Updated Table 1-1: callout 1 to identify Fansink, callouts 25and 26 pointing to User I/O. Added Table 1-9 Clock Source to FPGA U1 Connections. Updated Programmable User Clock Source, page 30 to include I2C address. Updated Table 1-17 for naming pins 18 and 19. Added Note to Table 1-14. Updated I2C Bus Switch to show TI device instead of NXP Semiconductor, deleted; updated [Ref 20]. Added Figure 1-27 Rotary Switch, and Figure 1-28 GPIO SMAs J13 and J14. Added Note to Appendix C, Xilinx Design Constraints. Updated Appendix D, Board Setup, step 1 of installation procedure. Updated Appendix F, Additional Resources to include CE PC Test reference.
12/10/2012	1.2	Replaced direct, inline links to external references in the body text with indirect references to the links in a numbered list in Appendix G, Additional Resources and Legal Notices. Revised the value for frequency jitter for the System Clock Source. Reset conditions are added to Jitter Attenuated Clock Revised jumper information for SFP_RS1 in Table 1-15. Revised contents and organization of Appendix F, Additional Resources.
04/05/2012	1.1	Updated links from Table 1-1. Revised the JTAG configuration mode USB cable description under FPGA Configuration. Added Encryption Key Backup Circuit and Table 1-4. Added links to User SMA Clock Input in Table 1-8. Added link to Si570 device vendor on page 31. Added Ethernet PHY Status LEDs and Figure 1-23. Updated Power On/Off Slide Switch SW15 and added Figure 1-31. Revised FPGA Mezzanine Card Interface and Table 1-28 and Table 1-29. Added description of power module cooling requirement to Power Management. Added Cooling Fan Control. Updated Table 1-35. Added references to Documents, page 85. Added Appendix E, Compliance with European Union Directives and Standards, Appendix D, Board Setup, and Appendix E, Board Specifications.
01/23/2012	1.0	Initial Xilinx release.

Chapter 1

KC705 Evaluation Board Features

Overview

The KC705 evaluation board for the Kintex®-7 FPGA provides a hardware environment for developing and evaluating designs targeting the Kintex-7 XC7K325T-2FFG900C FPGA. The KC705 board provides features common to many embedded processing systems, including a DDR3 SODIMM memory, an 8-lane PCI Express® interface, a tri-mode Ethernet PHY, general purpose I/O, and a UART interface. Other features can be added by using FPGA Mezzanine Cards (FMCs) attached to either of two VITA-57 FPGA mezzanine connectors provided on the board. High pin count (HPC) and low pin count (LPC) FMCs are provided. See KC705 Board Features for a complete list of features. The details for each feature are described in Feature Descriptions.

Additional Information

See Appendix G, Additional Resources and Legal Notices for references to documents, files, and resources relevant to the KC705 board.

KC705 Board Features

- Kintex-7 XC7K325T-2FFG900C FPGA
- 1 GB DDR3 memory SODIMM
- 128 MB Linear Byte Peripheral Interface (BPI) flash memory
- 128 Mb Quad Serial Peripheral Interface (SPI) flash memory
- Secure Digital (SD) connector
- USB JTAG via Digilent module
- Clock generation
  - Fixed 200 MHz LVDS oscillator (differential)
  - Inter-integrated circuit (I2C) programmable LVDS oscillator (differential)
  - SMA connectors (differential)
  - SMA connectors for GTX transceiver clocking

- GTX transceivers
  - FMC HPC connector (four GTX transceivers)
  - FMC LPC connector (one GTX transceiver)
  - SMA connectors (one pair each for TX, RX, and REFCLK)
  - PCI Express (eight lanes)
  - Small form-factor pluggable plus (SFP+) connector
  - Ethernet PHY SGMII interface (RJ-45 connector)
- PCI Express endpoint connectivity
  - Gen1 8-lane (x8)
  - Gen2 8-lane (x8)
- SFP+ Connector
- 10/100/1000 tri-speed Ethernet PHY
- USB-to-UART bridge
- High-Definition Multimedia Interface ™ (HDMI) technology codec
- I2C bus
  - I2C mux
  - I2C EEPROM (1 KB)
  - USER I2C programmable LVDS oscillator
  - DDR3 SODIMM socket
  - HDMI codec
  - FMC HPC connector
  - FMC LPC connector
  - SFP+ connector
  - I2C programmable jitter-attenuating precision clock multiplier
- Status LEDs
  - Ethernet status
  - Power good
  - FPGA INIT
  - FPGA DONE
- User I/O
  - USER LEDs (eight GPIO)

  - User pushbuttons (five directional)
  - CPU reset pushbutton
  - User DIP switch (4-pole GPIO)
  - User edge drive rotary encoder switch
  - User SMA GPIO connectors (one pair)
  - LCD character display (16 characters x 2 lines)
- Switches
  - Power on/off slide switch
  - FPGA_PROG_B pushbutton switch
- VITA 57.1 FMC HPC Connector
- VITA 57.1 FMC LPC Connector
- Power management
  - PMBus voltage and current monitoring via TI power controller
- XADC header
- Configuration options
  - Linear BPI flash memory
  - Quad SPI flash memory
  - USB JTAG configuration port
  - Platform cable header JTAG configuration port

The KC705 board block diagram is shown in Figure 1-1. The KC705 board schematics are available for download from the Kintex-7 FPGA KC705 Evaluation Kit website.

Electrostatic Discharge Caution

CAUTION! *ESD can damage electronic components when they are improperly handled, and can result in total or intermittent failures. Always follow ESD-prevention procedures when removing and replacing components.*

To prevent ESD damage:

- Use an ESD wrist or ankle strap and ensure that it makes skin contact. Connect the equipment end of the strap to an unpainted metal surface on the chassis.

- Avoid touching the adapter against your clothing. The wrist strap protects components from ESD on the body only.
- Handle the adapter by its bracket or edges only. Avoid touching the printed circuit board or the connectors.
- Put the adapter down only on an anti-static surface such as the bag supplied in your kit.
- If you are returning the adapter to Xilinx Product Support, place it back in its anti-static bag immediately.

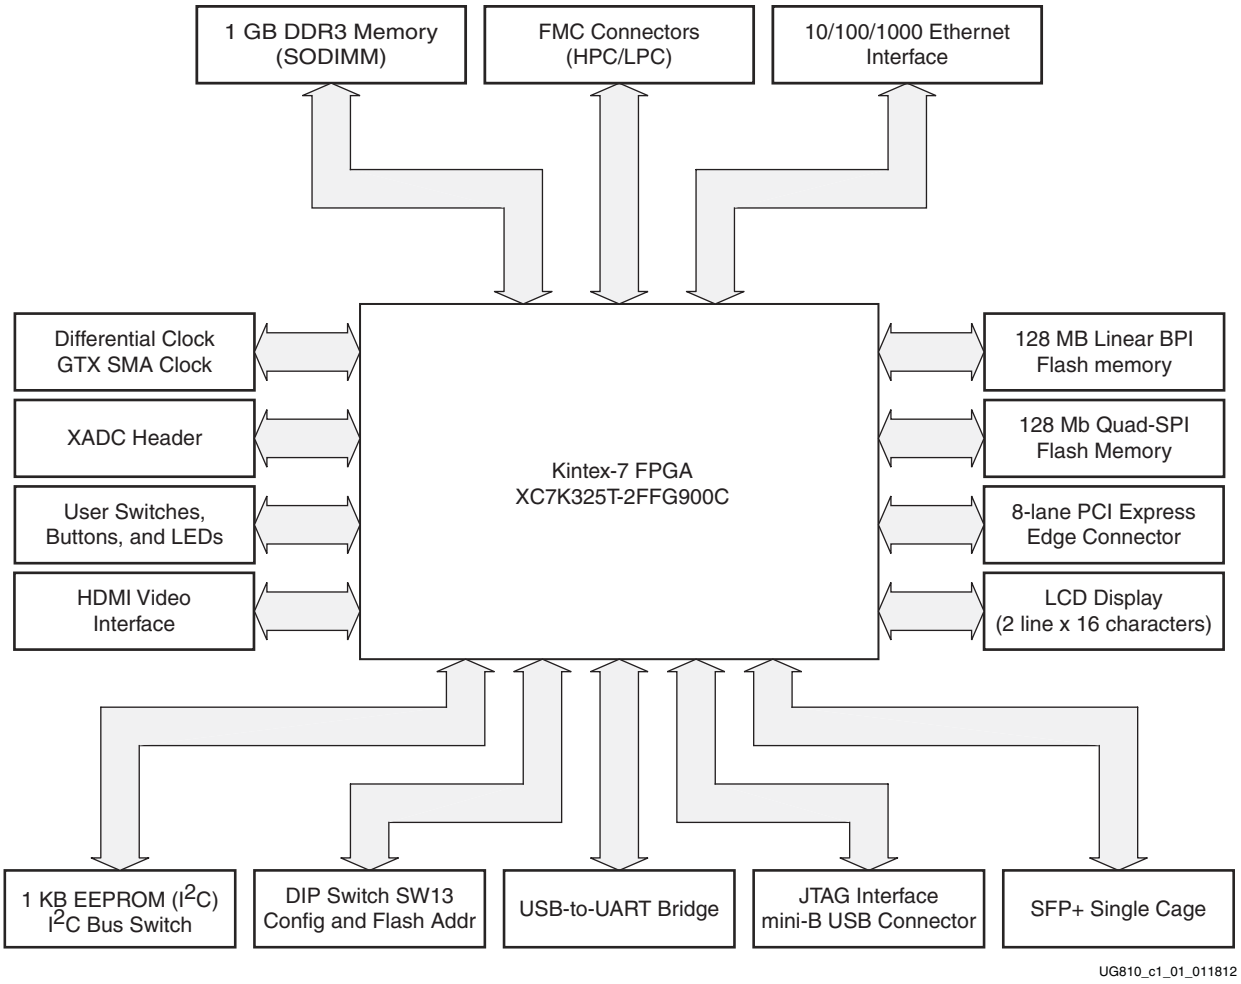

Figure 1-1: **KC705 Board Block Diagram**

Feature Descriptions

The following figure shows the KC705 board. Each numbered feature that is referenced in Figure 1-2 is described in the sections that follow.

Note: The image in Figure 1-2 is for reference only and might not reflect the current revision of the board.

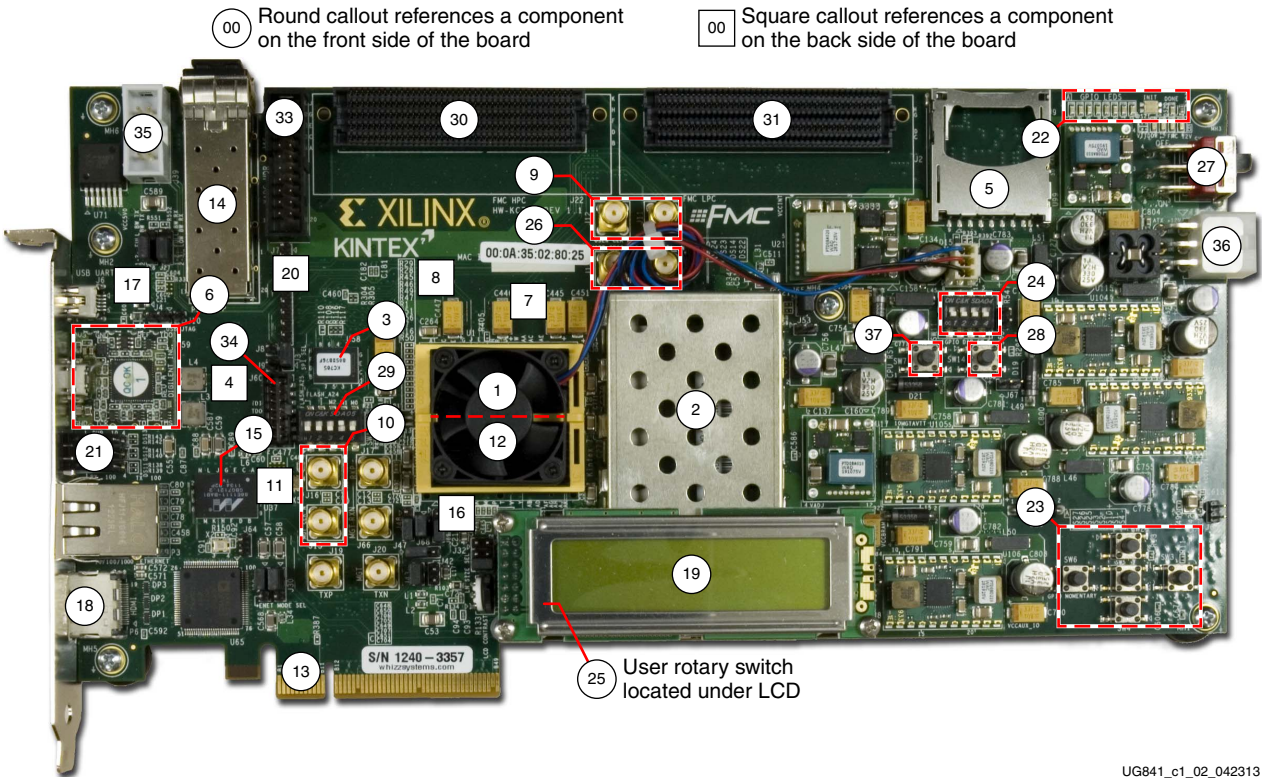

Figure 1-2: **KC705 Board Components**

Table 1-1: **KC705 Board Component Descriptions**

Callout	Reference Designator	Component Description	Notes	Schematic 0381397 Page Number
1	U1	Kintex-7 FPGA (Located under fansink)	XC7K325T-2FFG900C, Radian INC3001-7_1.5BU_LI98

37	SW7	CPU Reset Pushbutton	E-Switch TL3301EP100QG	35

Note: Jumper header locations are identified in Appendix A, Default Switch and Jumper Settings.

Kintex-7 FPGA

[Figure 1-2, callout 1]

The KC705 board is populated with the Kintex-7 XC7K325T-2FFG900C FPGA.

For further information on Kintex-7 FPGAs, see *7 Series FPGAs Overview* (DS180) [Ref 1].

FPGA Configuration

The KC705 board supports three of the five 7 series FPGA configuration modes:

- Master SPI flash memory using the onboard Quad SPI flash memory
- Master BPI flash memory using the onboard Linear BPI flash memory
- JTAG using a standard-A to micro-B USB cable for connecting the host PC to the KC705 board configuration port

Each configuration interface corresponds to one or more configuration modes and bus widths as listed in Table 1-2. The mode switches M2, M1, and M0 are on SW13 positions 3, 4, and 5 respectively as shown in the figure below.

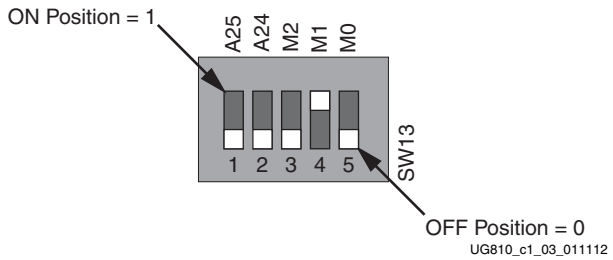

Figure 1-3: **SW13 Default Settings**

The default mode setting is M[2:0] = 010, which selects Master BPI at board power-on. Refer to the Configuration Options for detailed information about the mode switch SW13.

Table 1-2: **KC705 Board FPGA Configuration Modes**

Configuration Mode	SW13 DIP Switch Settings (M[2:0])	Bus Width	CCLK Direction
Master SPI	001	x1, x2, x4	Output
Master BPI	010	x8, x16	Output
JTAG	101	x1	Not applicable

For full details on configuring the FPGA, see *7 Series FPGAs Configuration User Guide (UG470)* [Ref 3].

Encryption Key Backup Circuit

FPGA U1 implements bitstream encryption key technology. The KC705 board provides the encryption key backup battery circuit shown in Figure 1-4. The rechargeable 1.5V lithium button-type battery B1 is soldered to the board with the positive output connected to FPGA U1 VCCBATT pin C10. The battery supply current I_{BATT} specification is 150 nA max when board power is off. B1 is charged from the VCCAUX_IO 2.0V rail through a series diode with a typical forward voltage drop of 0.38V and 4.7 kΩ current limit resistor. The nominal charging voltage is 1.62V.

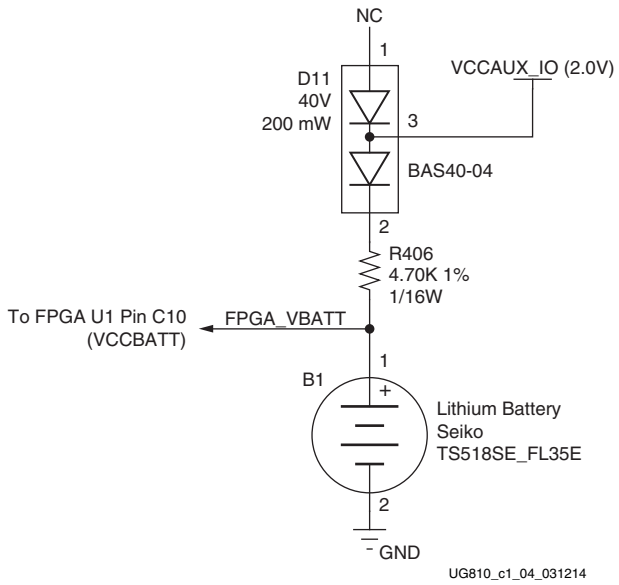

Figure 1-4: **Encryption Key Backup Circuit**

I/O Voltage Rails

There are 10 I/O banks available on the Kintex-7 device. The voltages applied to the FPGA I/O banks used by the KC705 board are listed in the table below.

Table 1-3: **I/O Voltage Rails**

U1 FPGA Bank	Power Supply Rail Net Name	Voltage
Bank 0	VCC2V5_FPGA	2.5V
Bank 12(1)	VADJ_FPGA	2.5V (default)
Bank 13(1)	VADJ_FPGA	2.5V (default)
Bank 14	VCC2V5_FPGA	2.5V
Bank 15	VCC2V5_FPGA	2.5V
Bank 16(1)	VADJ_FPGA	2.5V (default)
Bank 17(1)	VADJ_FPGA	2.5V (default)
Bank 18(1)	VADJ_FPGA	2.5V (default)
Bank 32	VCC1V5_FPGA	1.5V
Bank 33	VCC1V5_FPGA	1.5V
Bank 34	VCC1V5_FPGA	1.5V

Notes:

1. The VADJ_FPGA rail can support 1.8V, 2.5V, or 3.3V. For more information on VADJ_FPGA, see Power Management.

DDR3 Memory Module

[Figure 1-2, callout 2]

The memory module at J1 is a 1 GB DDR3 small outline dual-inline memory module (SODIMM). It provides volatile synchronous dynamic random access memory (SDRAM) for storing user code and data.

- Part number: MT8JTF12864HZ-1G6G1 (Micron Technology)
- Configuration: 1GB (128 Mb x 64)
- Supply voltage: 1.5V
- Datapath width: 64 bits
- Data rate: Up to 1,600 MT/s

The KC705 XC7K325T FPGA memory interface performance is documented in the *Kintex-7 FPGAs Data Sheet: DC and AC Switching Characteristics* (DS182) [Ref 2].

The DDR3 interface is implemented across I/O banks 32, 33, and 34. Each bank is a 1.5V high-performance (HP) bank. The VRP/VRN DCI resistor connection to bank 33 is cascaded to the data interface banks 32 and 34 by adding the DCI cascade constraint to the XDC:

```
# Set DCI_CASCADE
set_property slave_banks {32 34} [get_iobanks 33]
```

An external 0.75V reference VTTREF is provided for data interface banks 32 and 34. Any interface connected to these banks that requires a reference voltage must use this FPGA voltage reference. The connections between the DDR 3 memory and the FPGA are listed in the following table.

Table 1-4: **DDR3 Memory Connections to the FPGA**

U1 FPGA Pin	Net Name	I/O Standard	J1 DDR3 Memory	
			Pin Number	Pin Name
AH12	DDR3_A0	SSTL15	98	A0

The KC705 DDR3 SODIMM interface adheres to the constraints guidelines documented in the DDR3 Design Guidelines section of *7 Series FPGAs Memory Interface Solutions User Guide* (UG586) [Ref 4]. The KC705 DDR3 SODIMM interface is a 40Ω impedance implementation. Other memory interface details are available in UG586 and *7 Series FPGAs Memory Resources User Guide* (UG473) [Ref 5] . For more information about the Micron MT8JTF12864HZ-1G6G1 part, see [Ref 6].

Linear BPI Flash Memory

[Figure 1-2, callout 3]

The Linear BPI flash memory located at U58 provides 128 MB of nonvolatile storage that can be used for configuration or software storage. The data, address, and control signals are connected to the FPGA. The BPI flash memory device is packaged in a 64-pin BGA.

- Part number: PC28F00AP30TF (Micron)
- Supply voltage: 2.5V
- Datapath width: 16 bits (26 address lines and 7 control signals)
- Data rate: Up to 33 MHz

The Linear BPI flash memory can synchronously configure the FPGA in Master BPI mode at the 33 MHz data rate supported by the PC28F00AP30TF flash memory by using a configuration bitstream generated with BitGen options for synchronous configuration and for configuration clock division. The fastest configuration method uses the external 66 MHz oscillator connected to the FPGA EMCCLK pin with a bitstream that has been built to divide the configuration clock by two. The division is necessary to remain within the synchronous read timing specifications of the flash memory.

Multiple bitstreams can be stored in the Linear BPI flash memory. The two most significant address bits (A25, A24) of the flash memory are connected to DIP switch SW13 positions 1 and 2 respectively, and to the RS1 and RS0 pins of the FPGA. By placing valid XC7K325T bitstreams at four different offset addresses in the flash memory, 1 of the 4 bitstreams can be selected to configure the FPGA by appropriately setting the DIP switch SW13. The connections between the BPI flash memory and the FPGA are listed in the table below.

Table 1-5: **BPI Flash Memory Connections to the FPGA**

Additional FPGA bitstreams can be stored and used for configuration by setting the Warm Boot Start Address (WBSTAR) register contained in 7 series FPGAs. More information is available in the reconfiguration and multiboot section in *7 Series FPGAs Configuration User Guide* (UG470) [Ref 3]. The configuration section in this document provides details on the Master BPI configuration mode.

The following figure shows the connections of the linear BPI flash memory on the KC705 board.

For more information about the Micron PC28F00AP30TF part, see [Ref 6].

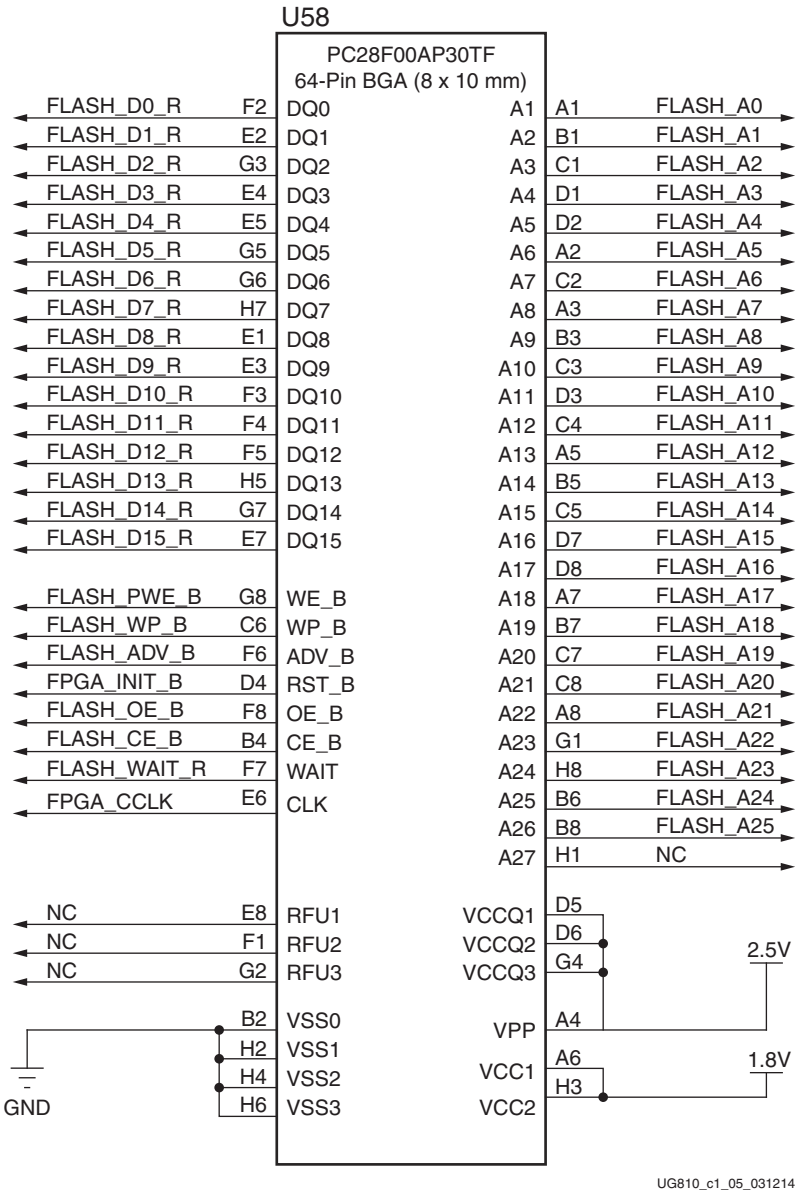

Figure 1-5: **128 MB Linear Flash Memory (U58)**

Quad SPI Flash Memory

[Figure 1-2, callout 4]

The Quad SPI flash memory located at U7 on the back side of the board provides 128 Mb of nonvolatile storage that can be used for configuration and data storage.

- Part number: Micron N25Q128A13BSF40F or MT25QL128ABA8ESF-0SIT
- Supply voltage: 2.8V
- Datapath width: 4 bits
- Data rate: Various depending on Single/Dual/Quad mode and CCLK rate

Four data lines and the FPGA CCLK pin are wired to the Quad SPI flash memory. A common chip select (FPGA_FCS) shared between the Linear BPI flash memory and the Quad SPI flash memory is controlled by the configuration mode settings on DIP switch SW13 position 5 (M0) and a one-of-two demultiplexer device U64. If mode pin M0 = 1, the SPI flash memory device is selected. If mode pin M0 = 0, the Linear BPI flash memory device is selected. The connections between the SPI flash memory and the FPGA are listed in the following table.

Table 1-6: **Quad SPI Flash Memory Connections to the FPGA**

U1 FPGA Pin	Net Name	I/O Standard	J1 DDR3 Memory	
			Pin Number	Pin Name
P24	FLASH_D0	LVCMOS25	15	DQ0
R25	FLASH_D1	LVCMOS25	8	DQ1
R20	FLASH_D2	LVCMOS25	9	DQ2
R21	FLASH_D3	LVCMOS25	1	DQ3
B10	FPGA_CCLK	N/A	16	C
U19	QSPI_IC_CS_B(1)	LVCMOS25	7	S_B

Notes:
1. FPGA_FCS connected to FPGA U1 pin U19 becomes QSPI_IC_CS_B through U64 and J3.

The configuration section of *7 Series FPGAs Configuration User Guide* (UG470) [Ref 3] provides details on using the Quad SPI flash memory. Figure 1-6 shows the connections of the Quad SPI flash memory on the KC705 board.

For more information about the Micron N25Q128A13BSF40F or MT25QL128ABA8ESF-0SIT parts, see [Ref 6].

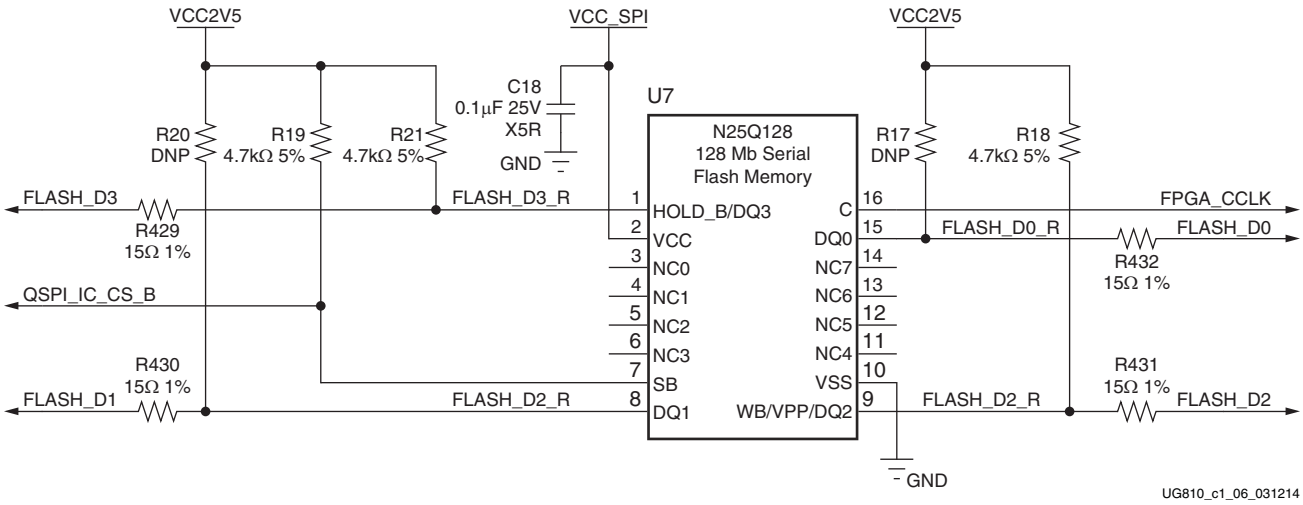

Figure 1-6: **128 Mb Quad SPI Flash Memory**

SD Card Interface

[Figure 1-2, callout 5]

The KC705 board includes a secure digital input/output (SDIO) interface to provide user-logic access to general purpose nonvolatile SDIO memory cards and peripherals. The SD card slot is designed to support 50 MHz high speed SD cards.

The SDIO signals are connected to I/O bank 12 which has its VCCO set to VADJ. A Texas Instruments I TXB0108 8-bit bidirectional voltage-level translator is used between the FPGA and the SD card connector (U9).

The following figure shows the connections of the SD card interface on the KC705 board.

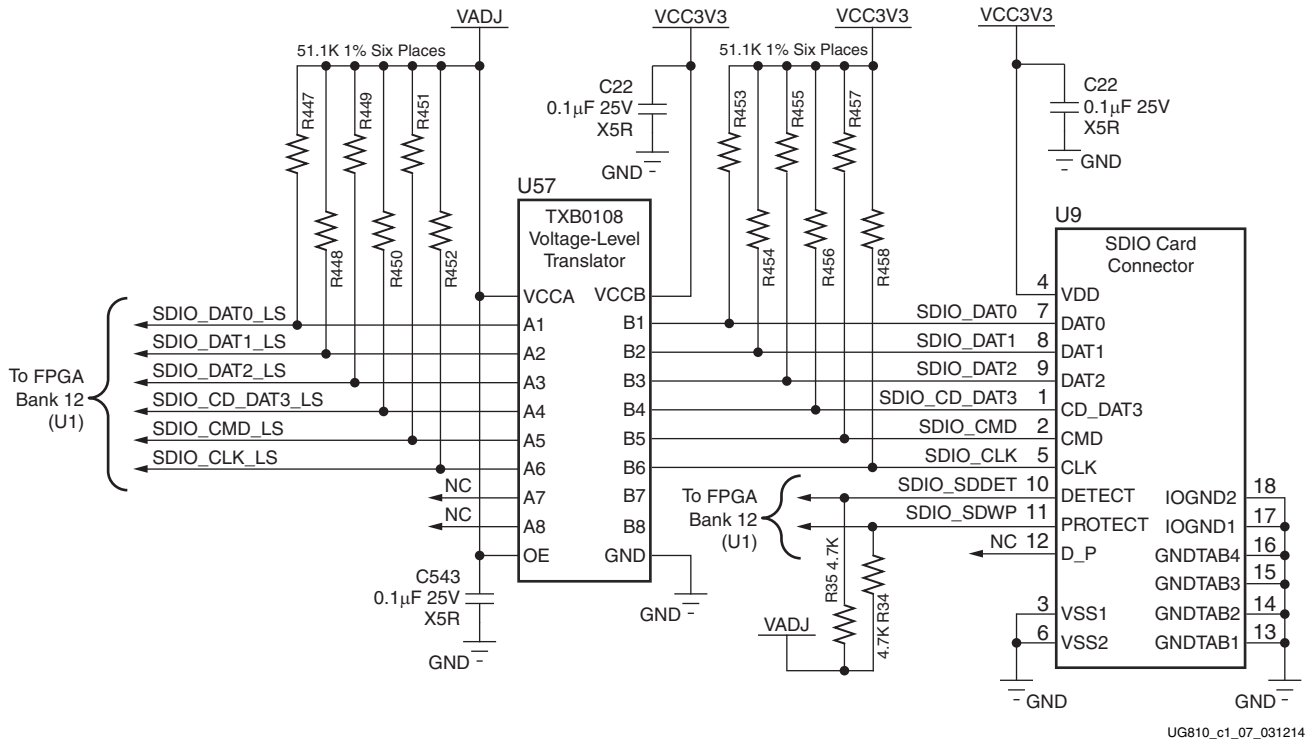

Figure 1-7: **SD Card Interface**

The following table lists the SD card interface connections to the FPGA.

Table 1-7: **SDIO Connections to the FPGA**

U1 FPGA Pin	Schematic Net Name	I/O Standard	U57 Level Shifter		U9 SDIO Connector	
			Pin Name (A)	Pin Name (B)	Pin Number	Pin Name
Y21	SDIO_SDWP	LVCMOS25	N/A	N/A	11	SDWP

USB JTAG Module

[Figure 1-2, callout 6]

JTAG configuration is provided through a Digilent onboard USB-to-JTAG configuration logic module (U59) where a host computer accesses the KC705 board JTAG chain through a standard-A plug (host side) to micro-B plug (KC705 board side) USB cable.

A 2-mm JTAG header (J60) is also provided in parallel for access by Xilinx® download cables such as the Platform Cable USB II and the Parallel Cable IV.

The JTAG chain of the KC705 board is illustrated in Figure 1-8. JTAG configuration is allowed at any time regardless of FPGA mode pin settings. JTAG initiated configuration takes priority over the configuration method selected through the FPGA mode pin settings at SW13.

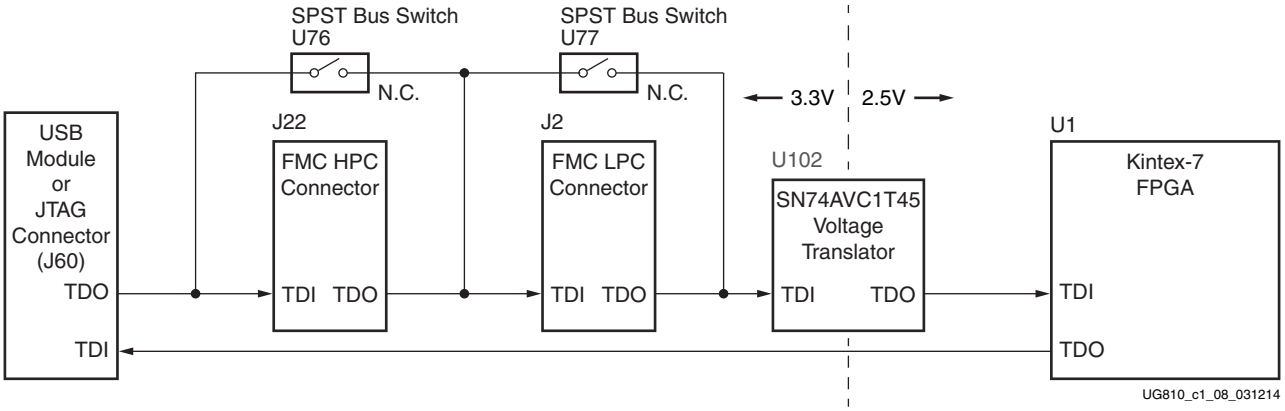

Figure 1-8: **JTAG Chain Block Diagram**

When an FMC card is attached to the KC705 board, it is automatically added to the JTAG chain through electronically controlled single-pole single-throw (SPST) switches U76 and U77. The SPST switches are in a normally closed state and transition to an open state when an FMC mezzanine card is attached. Switch U76 adds an attached FMC HPC mezzanine card to the FPGAs JTAG chain as determined by the FMC_HPC_PRSNT_M2C_B signal. Switch U77 adds an attached FMC HPC mezzanine card to the FPGAs JTAG chain as determined by the FMC_LPC_PRSNT_M2C_B signal. The attached FMC card must implement a TDI-to-TDO connection via a device or bypass jumper for the JTAG chain to be completed to the FPGA U1.

The JTAG connectivity on the KC705 board allows a host computer to download bitstreams to the FPGA using the Xilinx software. In addition, the JTAG connector allows debug tools or a software debugger to access the FPGA.

The Xilinx software tool can also indirectly program the Linear BPI or the Quad SPI flash memory. To accomplish this, the software configures the FPGA with a temporary design to access and program the BPI or Quad SPI flash memory device.

The JTAG circuit is shown in the figure below.

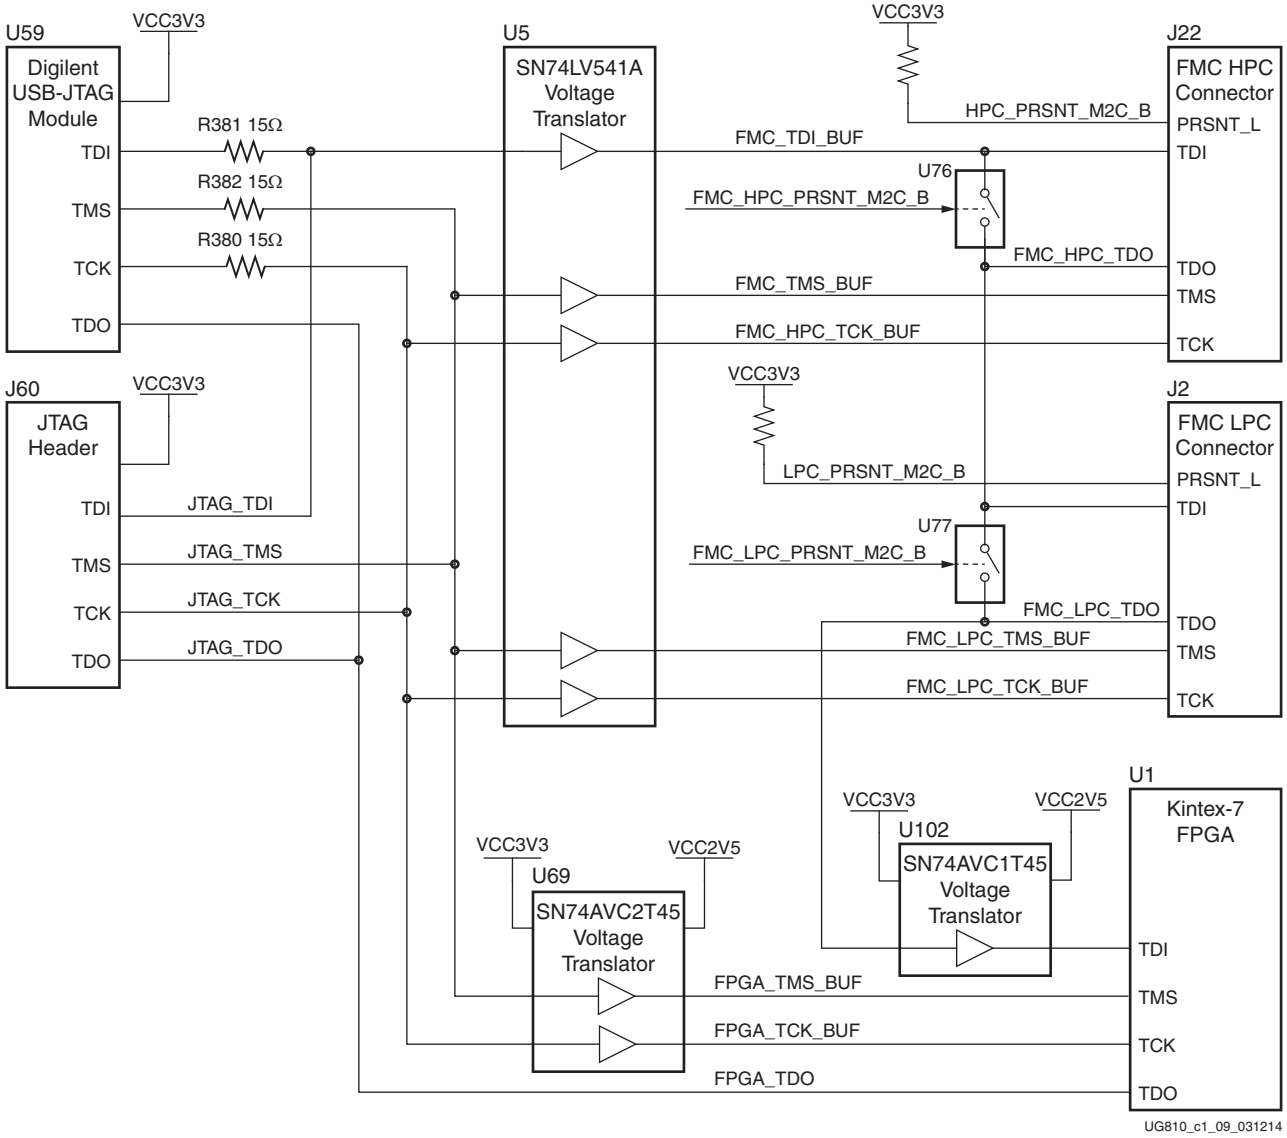

Figure 1-9: **JTAG Circuit**

Clock Generation

The following table lists the five clock sources available for the FPGA fabric on the KC705 board.

Table 1-8: **KC705 Board Clock Sources**

Clock Name	Reference	Description
System Clock	U6	SiT9102 2.5V LVDS 200 MHz Fixed Frequency Oscillator (Si Time). See System Clock Source.
User Clock	U45	Si570 3.3V LVDS I2C Programmable Oscillator (Silicon Labs). Default power-on frequency 156.250 MHz. See Programmable User Clock Source.
User SMA Clock (differential pair)	J11	USER_SMA_CLOCK_P (net name). See User SMA Clock Input.
	J12	USER_SMA_CLOCK_N (net name) See User SMA Clock Input
GTX SMA REF Clock (differential pair)	J16	SMA_MGT_REFCLK_P (net name). See GTX SMA Clock Input.
	J15	SMA_MGT_REFCLK_N (net name). See GTX SMA Clock Input.
Jitter Attenuated Clock	U70	Si5324C LVDS precision clock multiplier/jitter attenuator (Silicon Labs). See Jitter Attenuated Clock.

The following table lists the pin-to-pin connections from each clock source to the FPGA.

Table 1-9: **Clock Source to FPGA U1 Connections**

Clock Source Pin	Schematic Net Name	I/O Standard	U1 FPGA Pin
U6.5	SYSCLK_N	LVDS	AD11
U6.4	SYSCLK_P	LVDS	AD12
U45.5	USER_CLOCK_N	LVDS_25	K29
U45.4	USER_CLOCK_P	LVDS_25	K28
J12.1	USER_SMA_CLOCK_N	LVDS_25	K25
J11.1	USER_SMA_CLOCK_P	LVDS_25	L25
J15.1	SMA_MGT_REFCLK_N	N/A (MGT REFCLK INPUT)	J7
J16.1	SMA_MGT_REFCLK_P	N/A (MGT REFCLK INPUT)	J8
U70.29	Si5326_OUT_N	N/A (MGT REFCLK INPUT)	L7
U70.28	Si5326_OUT_P	N/A (MGT REFCLK INPUT)	L8

System Clock Source

[Figure 1-2, callout 7]

The KC705 board has a 2.5V LVDS differential 200 MHz oscillator (U6) soldered onto the back side of the board and wired to an FPGA MRCC clock input on bank 33. This 200 MHz signal pair is named SYSCLK_P and SYSCLK_N, which are connected to FPGA U1 pins AD12 and AD11 respectively.

- Oscillator: Si Time SiT9102AI-243N25E200.00000 (200 MHz)
- PPM frequency jitter: 50 ppm
- Differential Output

The system clock circuit is shown in the figure below.

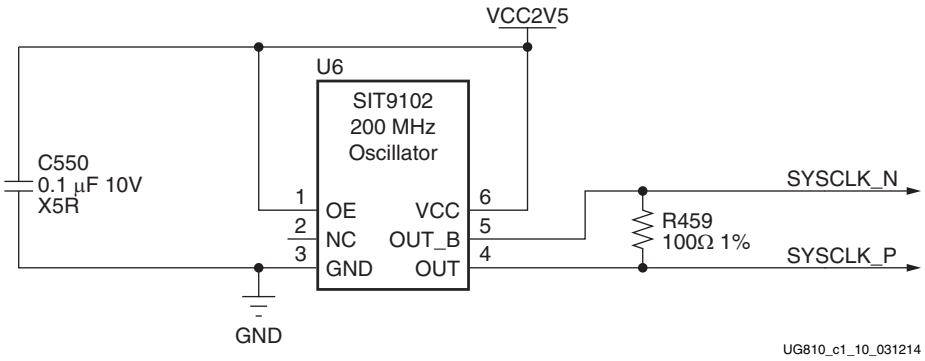

Figure 1-10: **System Clock Source**

For more about the Si Time SiT9102, see [Ref 7].

Programmable User Clock Source

[Figure 1-2, callout 8]

The KC705 board has a programmable low-jitter 3.3V differential oscillator (U45) the FPGA MRCC inputs of bank 15. This USER_CLOCK_P and USER_CLOCK_N clock signal pair are connected to FPGA U1 pins K28 and K29 respectively. On power-up the user clock defaults to an output frequency of 156.250 MHz. User applications can change the output frequency within the range of 10 MHz to 810 MHz through an I2C interface. Power cycling the KC705 board reverts the user clock to its default frequency of 156.250 MHz.

- Programmable Oscillator: Silicon Labs Si570BAB0000544DG (10 MHz - 810 MHz)
- Differential Output
- I2C address `0x5D`

The user clock circuit is shown in the figure below.

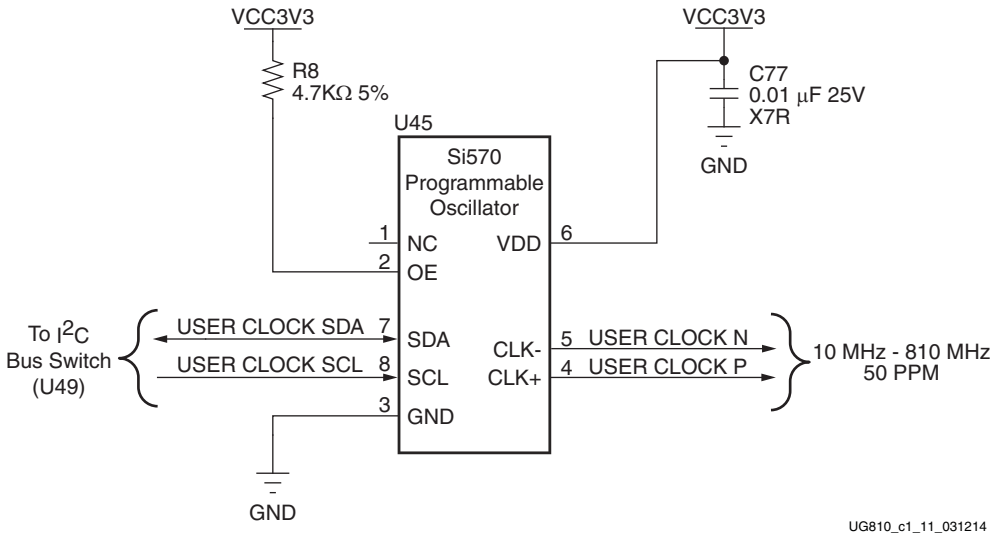

Figure 1-11: **User Clock Source**

For more information about the Silicon Labs Si570, see [Ref 8].

Reference design files are available to demonstrate how to program the Si570 programmable oscillator. See these files and presentations:

- XTP186, *KC705 Si570 Programming* [Ref 9]
- RDF0175, *KC705 Si570 Programming Design Files* [Ref 10]
- XTP187, *KC705 Si570 Fixed Frequencies* [Ref 11]
- RDF0176, *KC705 Si570 Fixed Frequencies Design Files* [Ref 12]

User SMA Clock Input

[Figure 1-2, callout 9]

An external high-precision clock signal can be provided to the FPGA bank 15 by connecting differential clock signals through the onboard 50Ω SMA connectors J11 (P) and J12 (N). The differential clock has signal names are USER_SMA_CLOCK_P and USER_SMA_CLOCK_N, which are connected to FPGA U1 pins L25 and K25, respectively. J11 (P) and J12 (N) are connected directly to the noted FPGA pins (no series capacitors and no external parallel

termination resistor). The user-provided 2.5V differential clock circuit is shown in the figure below.

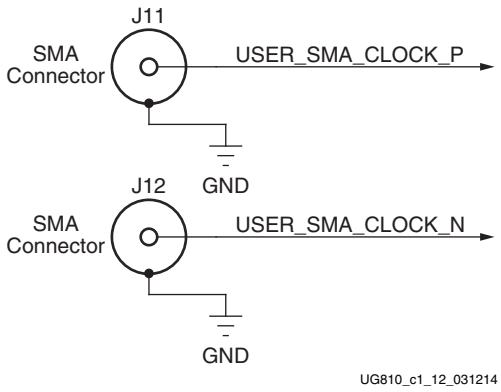

Figure 1-11: **User SMA Clock Source**

GTX SMA Clock Input

[Figure 1-2, callout 10]

The KC705 board includes a pair of SMA connectors for a GTX clock wired to GTX Quad bank 117. This differential clock has signal names SMA_MGT_REFCLK_P and SMA_REFCLK_N, which are connected to FPGA U1 pins J8 and J7 respectively. Figure 1-12 shows this AC-coupled clock circuit.

- External user-provided GTX reference clock on SMA input connectors
- Differential Input

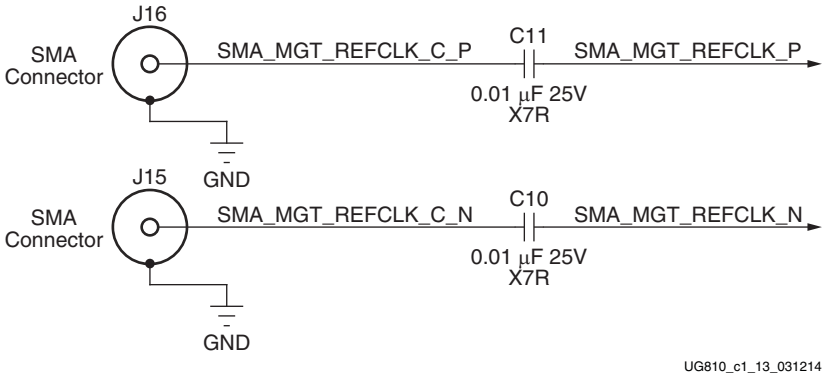

Figure 1-12: **GTX SMA Clock Source**

Jitter Attenuated Clock

[Figure 1-2, callout 11]

The KC705 board includes a Silicon Labs Si5324 jitter attenuator U70 on the back side of the board. FPGA user logic can implement a clock recovery circuit and then output this clock to a differential I/O pair on I/O bank 13 (REC_CLOCK_C_P, FPGA U1 pin W27 and REC_CLOCK_C_N, FPGA U1 pin W28) for jitter attenuation. The jitter attenuated clock (SI5326_OUT_C_P, SI5326_OUT_C_N) is then routed as a reference clock to GTX Quad 116 inputs MGTREFCLK0P (FPGA U1 pin L8) and MGTREFCLK0N (FPGA U1 pin L7).

The Silicon Labs Si5324 U70 pin 1 reset net SI5326_RST must be driven High to enable the device. U70 pin 1 net SI5326_RST is level-shifted to VADJ by U75 and is connected to U1 bank 12 pin AE20. An active-Low input performs an external hardware reset of the device. This resets all internal logic to a known state and forces the device registers to their default value. The clock outputs are disabled during reset. The part must be programmed after a reset or power-up to get a clock output. The reset pin 1 has a weak internal pull-up.

The primary purpose of this clock is to support CPRI/OBSAI applications that perform clock recovery from a user-supplied SFP/SFP+ module and use the jitter attenuated recovered clock to drive the reference clock inputs of a GTX transceiver. The jitter attenuated clock circuit is shown in Figure 1-13.

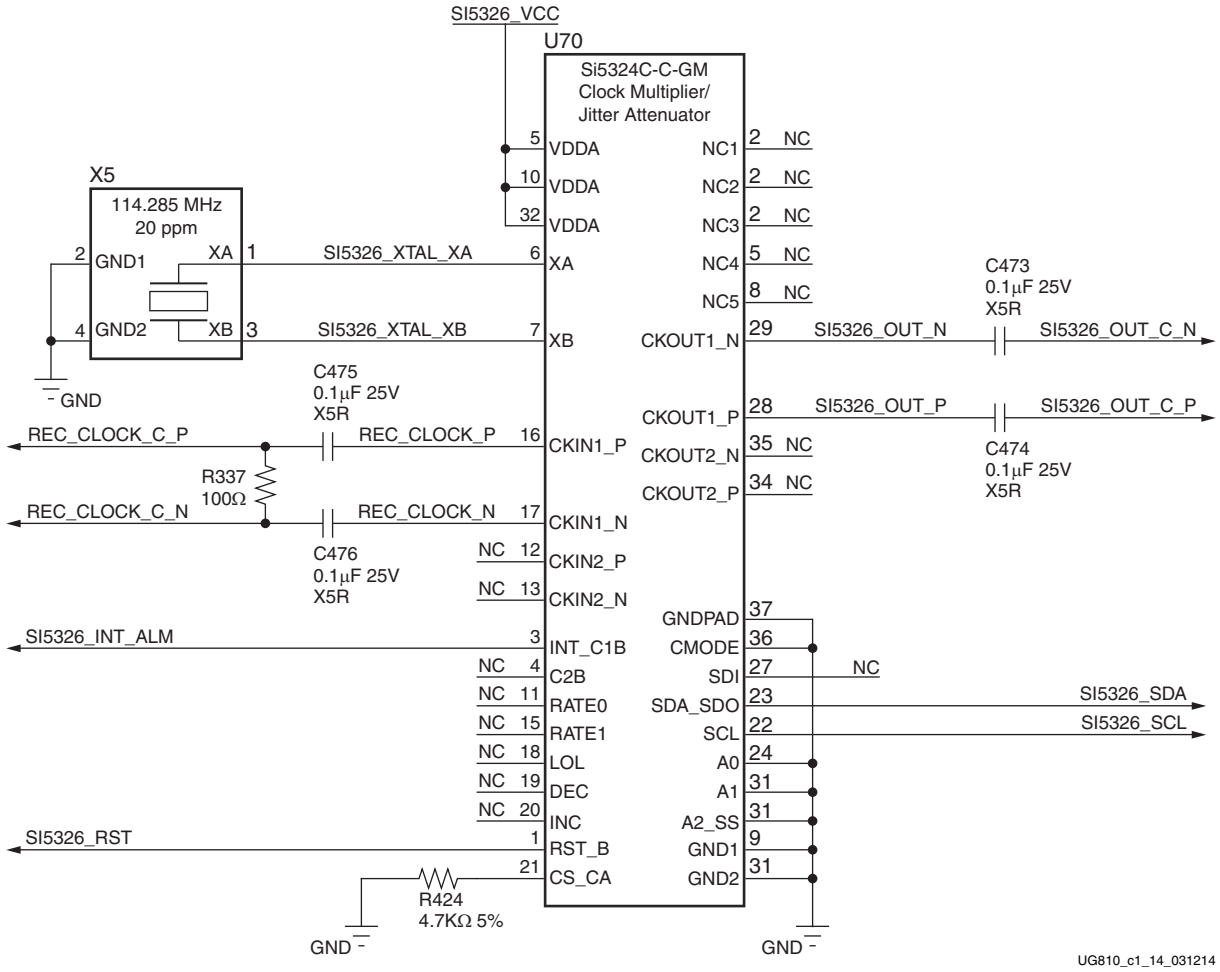

Figure 1-13: **Jitter Attenuated Clock**

For more information about the Silicon Labs Si5324, see [Ref 8].

GTX Transceivers

[Figure 1-2, callout 12]

The KC705 board provides access to 16 GTX transceivers:

- Eight of the GTX transceivers are wired to the PCI Express® x8 endpoint edge connector (P1) fingers
- Four of the GTX transceivers are wired to the FMC HPC connector (J22)
- One GTX is wired to the FMC LPC connector (J2)
- One GTX is wired to SMA connectors (RX: J17, J18 TX: J19, J20)
- One GTX is wired to the SFP/SFP+ Module connector (P5)
- One GTX is used for the SGMII connection to the Ethernet PHY (U37)

The GTX transceivers in 7 series FPGAs are grouped into four channels described as Quads. The reference clock for a Quad can be sourced from the Quad above or Quad below the GTX Quad of interest. There are four GTX Quads on the KC705 board with connectivity as shown here:

- Quad 115:
  - Contains 4 GTX transceivers for PCI Express lanes 4-7
  - MGTREFCLK1 - PCIE_CLK from P1
- Quad 116:
  - MGTREFCLK0 - Si5326 jitter attenuator
  - MGTREFCLK1 - FMC LPC GBT clock 0
  - Contains 4 GTX transceivers for PCIe lanes 0-3
- Quad 117:
  - MGTREFCLK0 - SGMII clock
  - MGTREFCLK1 - SMA clock
  - Contains 4 GTX transceivers with one allocated for: SMA, SGMII, SFP, and FMC LPC (DP0)
- Quad 118:
  - MGTREFCLK0 - FMC HPC GBT clock 0
  - MGTREFCLK1 - FMC HPC GBT clock 1
  - Contains 4 GTX transceivers for FMC HPC (DP0 - DP3)

The following table lists the GTX interface connections to the FPGA (U1).

Table 1-10: **GTX Interface Connections for FPGA U1**

Transceiver Bank	Associated Net Name	Connections
MGT_BANK_115	GTXE2_CHANNEL_X0Y0	PCIe7
	GTXE2_CHANNEL_X0Y1	PCIe6
	GTXE2_CHANNEL_X0Y2	PCIe5
	GTXE2_CHANNEL_X0Y3	PCIe4
	MGTREFCLK0	N/C
	MGTREFCLK1	PCIe_CLK

Table 1-10: **GTX Interface Connections for FPGA U1 *(Cont'd)***

	GTXE2_CHANNEL_X0Y13	FMC HPC DP1
	GTXE2_CHANNEL_X0Y14	FMC HPC DP2
	GTXE2_CHANNEL_X0Y15	FMC HPC DP3
	MGTREFCLK0	FMC HPC GBT_CLK0
	MGTREFCLK1	FMC HPC GBT_CLK1

For more information on the GTX transceivers, see *7 Series FPGAs GTX Transceivers User Guide* (UG476) [Ref 13].

PCI Express Edge Connector

[Figure 1-2, callout 13]

The 8-lane PCI Express edge connector performs data transfers at the rate of 2.5 GT/s for a Gen1 application and 5.0 GT/s for a Gen2 application. The PCIe transmit and receive signal datapaths have a characteristic impedance of 85Ω ±10%. The PCIe clock is routed as a 100Ω differential pair. The 7 series FPGAs GTX transceivers are used for multi-gigabit per second serial interfaces.

The XC7K325T-2FFG900C FPGA (-2 speed grade) included with the KC705 board supports up to Gen2 x8.

The PCIe clock is input from the edge connector. It is AC coupled to the FPGA through the MGTREFCLK1 pins of Quad 115. PCIE_CLK_Q0_P is connected to FPGA U1 pin U8, and the _N net is connected to pin U7. The PCI Express clock circuit is shown in Figure 1-14.

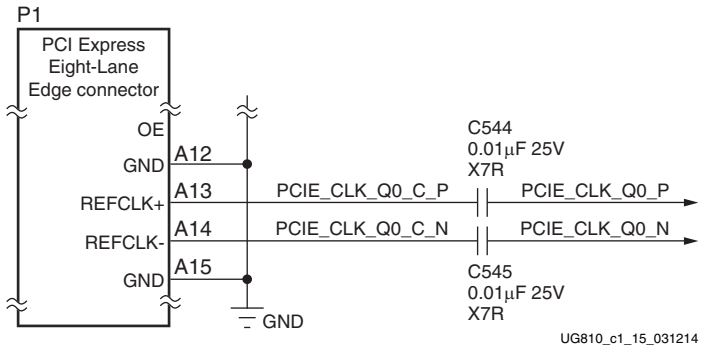

Figure 1-14: **PCI Express Clock**

PCIe lane width/size is selected via jumper J32 (Figure 1-15). The default lane size selection is 8-lane (J32 pins 5 and 6 jumpered).

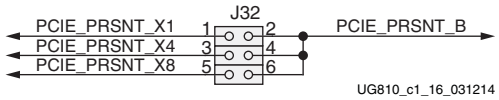

Figure 1-15: **PCI Express Lane Size Select Jumper J32**

The following table lists the PCIe edge connector connections.

Table 1-11: **PCIe Edge Connector Connections**

Schematic Net Name	FPGA Pin (U1)	PCIe Edge Connector Pin	PCIe Edge Pin Name	Function	FFG900 Placement

For more information, see the *7 Series FPGAs GTX Transceivers User Guide* (UG476) [Ref 13] and the *7 Series FPGAs Integrated Block for PCI Express LogiCORE IP Product Guide* (PG054) [Ref 14].

SFP/SFP+ Connector

[Figure 1-2, callout 14]

The KC705 board contains a small form-factor pluggable (SFP+) connector and cage assembly that accepts SFP or SFP+ modules. The figure below shows the SFP+ module connector circuitry.

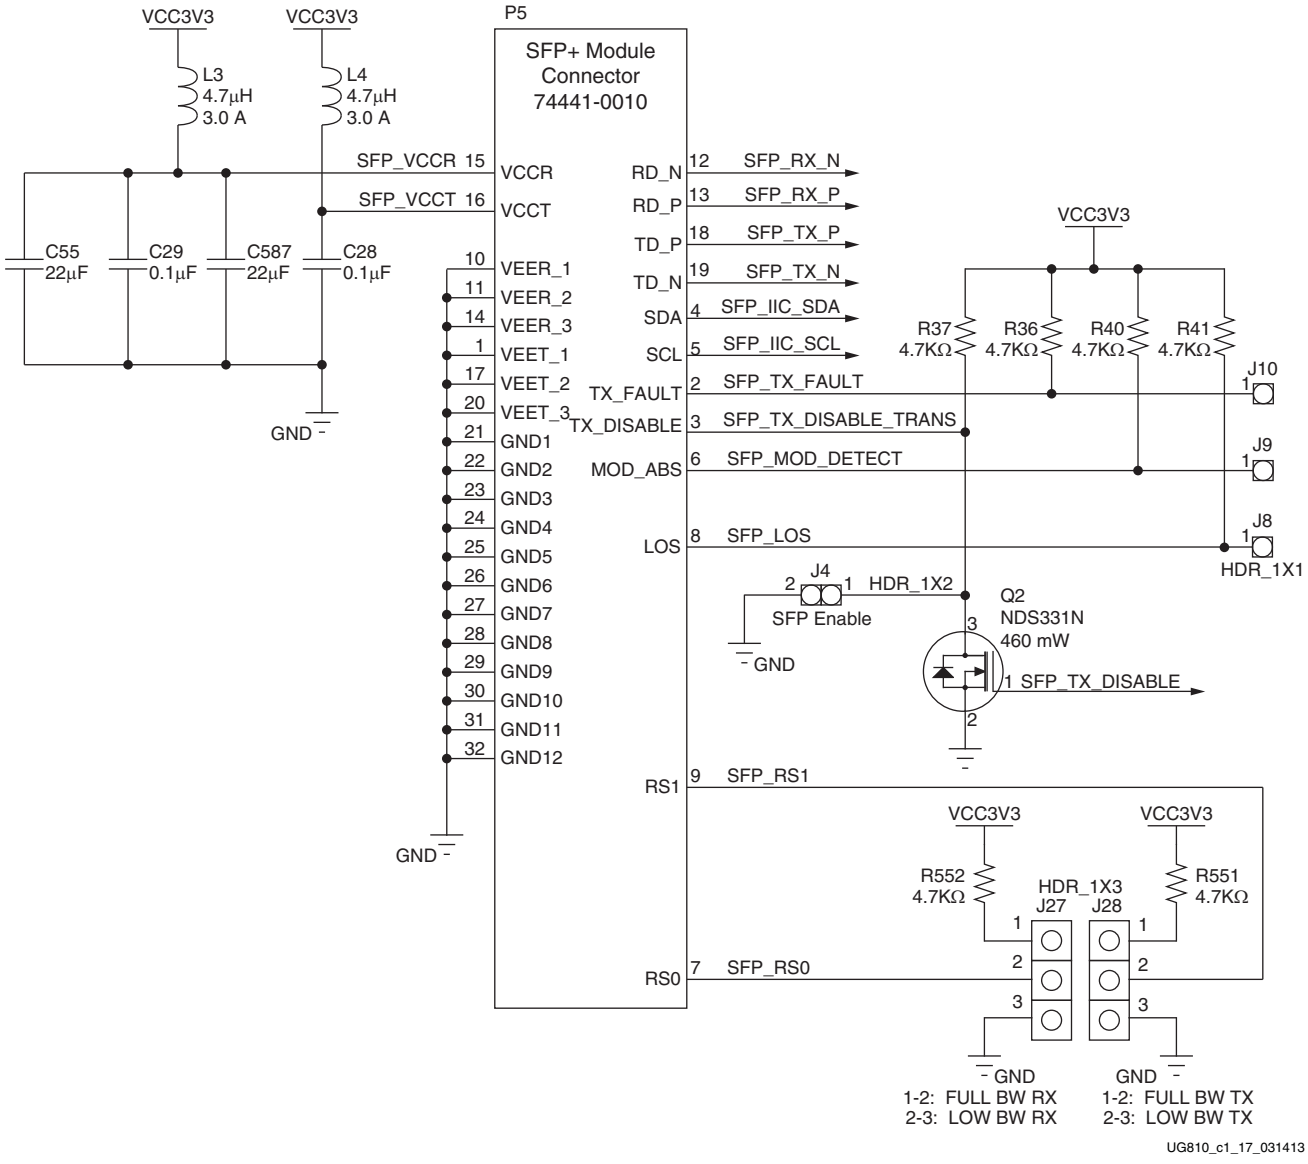

Figure 1-16: **SFP+ Module Connector**

The following table lists the SFP+ module RX and TX connections to the FPGA.

Table 1-14: **FPGA U1 to SFP+ Module Connections**

FPGA Pin (U1)	Schematic Net Name	SFP+ Pin (P5)	SFP+ Pin Name (P5)
G3	SFP_RX_N	12	RD_N(1)
G4	SFP_RX_P	13	RD_P(1)
H1	SFP_TX_N	19	TX_N(2)
H2	SFP_TX_P	18	TX_P(2)
Y20	SFP_TX_DISABLE_TRANS(3)	3	TX_DISABLE

Notes:

1. On KC705 boards prior to Rev 1.1, SFP+ connector P5 pin 18 RD_P is connected to net SFP_RX_N, and pin 19 RD_N is connected to net SFP_RX_P.
2. On KC705 boards prior to Rev 1.1, SFP+ connector P5 pin 18 TD_P is connected to net SFP_TX_N, and pin 19 TD_N is connected to net SFP_TX_P.
3. SFP_TX_DISABLE_TRANS I/O standard = LVCMOS25.

The following table lists the SFP+ module control and status connections to the FPGA.

Table 1-15: **SFP+ Module Control and Status**

SFP Control/Status Signal	Board Connection
SFP_TX_FAULT	Test Point J10
	High = Fault
	Low = Normal Operation
SFP_TX_DISABLE	**Jumper J4**
	Off = FP Disabled
	On = SFP Enabled
SFP_MOD_DETECT	Test Point J9
	High = Module Not Present
	Low = Module Present
SFP_RS0	**Jumper J27**
	Jumper Pins 1-2 = Full RX Bandwidth
	Jumper Pins 2-3 = Reduced RX Bandwidth
SFP_RS1	**Jumper J28**
	Jumper Pins 1-2 = Full TX Bandwidth
	Jumper Pins 2-3 = Reduced TX Bandwidth

Table 1-15: **SFP+ Module Control and Status *(Cont'd)***

SFP Control/Status Signal	Board Connection
SFP_LOS	Test Point J8
	High = Loss of Receiver Signal
	Low = Normal Operation

Notes:
1. Default jumper shunt positions are shown in bold text.

10/100/1000 Tri-Speed Ethernet PHY

[Figure 1-2, callout 15]

The KC705 board utilizes the Marvell Alaska PHY device (88E1111) U37 for Ethernet communications at 10, 100, or 1000 Mb/s. The board supports MII, GMII, RGMII, and SGMII interfaces from the FPGA to the PHY (Table 1-16). The PHY connection to a user-provided Ethernet cable is through a Halo HFJ11-1G01E RJ-45 connector (P3) with built-in magnetics.

Table 1-16: **PHY Default Interface Mode**

Mode	Jumper Settings		
	J29	J30	J64
GMII/MII to copper (default)	Jumper over pins 1-2	Jumper over pins 1-2	No jumper
SGMII to copper, no clock	Jumper over pins 2-3	Jumper over pins 2-3	No jumper
RGMII	Jumper over pins 1-2	No jumper	Jumper on

On power-up, or on reset, the PHY is configured to operate in GMII mode with PHY address `0b00111` using the settings shown in the table below. These settings can be overwritten via software commands passed over the MDIO interface.

Table 1-17: **Board Connections for PHY Configuration Pins**

Pin	Connection on Board	Bit[2] Definition and Value	Bit[1] Definition and Value	Bit[0] Definition and Value
CFG0	V_{CC} 2.5V	PHYADR[2] = 1	PHYADR[1] = 1	PHYADR[0] = 1
CFG1	Ground	ENA_PAUSE = 0	PHYADR[4] = 0	PHYADR[3] = 0
CFG2	V_{CC} 2.5V	ANEG[3] = 1	ANEG[2] = 1	ANEG[1] = 1
CFG3	V_{CC} 2.5V	ANEG[0] = 1	ENA_XC = 1	DIS_125 = 1
CFG4	V_{CC} 2.5V	HWCFG_MD[2] = 1	HWCFG_MD[1] = 1	HWCFG_MD[0] = 1
CFG5	V_{CC} 2.5V	DIS_FC = 1	DIS_SLEEP = 1	HWCFG_MD[3] = 1
CFG6	PHY_LED_RX	SEL_BDT = 0	INT_POL = 1	75/50Ω= 0

SGMII GTX Transceiver Clock Generator

[Figure 1-2, callout 16]

An Integrated Circuit Systems ICS844021I chip (U2) generates a high-quality, low-jitter, 125 MHz LVDS clock from a 25 MHz crystal (X3). This clock is sent to FPGA U1, bank 117 GTX transceiver (clock pins G8 (P) and G7 (N)) driving the SGMII interface. Series AC coupling capacitors are present to allow the clock input of the FPGA to set the common mode voltage. The following figure shows the Ethernet SGMII clock source.

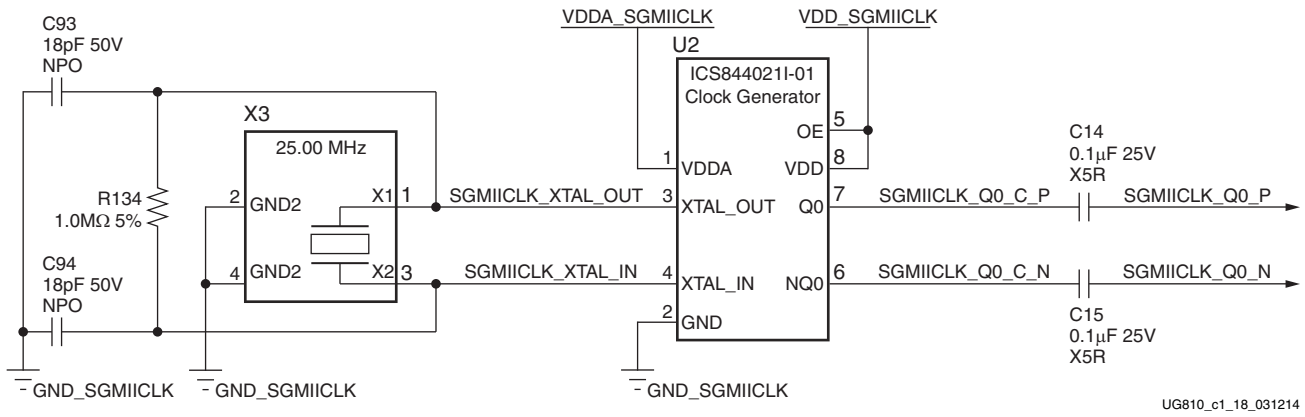

Figure 1-17: **Ethernet 125 MHz SGMII GTX Clock**

The following table shows the connections and pin numbers for the M88E1111 PHY.

Table 1-18: **Ethernet PHY Connections**

U1 FPGA Pin	Schematic Net Name	I/O Standard	M88E1111 (U37)	
			Pin Number	Pin Name
J21	PHY_MDIO	LVCMOS25	M1	MDIO
R23	PHY_MDC	LVCMOS25	L3	MDC
N30	PHY_INT	LVCMOS25	L1	INT_B

H6	SGMII_RX_P	LVCMOS25	A7	SOUT_P
H5	SGMII_RX_N	LVCMOS25	A8	SOUT_N

Details about the tri-mode Ethernet MAC core are provided in *LogiCORE IP Tri-Mode Ethernet MAC User Guide* (PG051) [Ref 15].

For more information about the Marvell 88E1111, see [Ref 16].

For more information about the ICS 844021-01, see [Ref 17].

USB-to-UART Bridge

[Figure 1-2, callout 17]

The KC705 board contains a Silicon Labs CP2103GM USB-to-UART bridge device (U12) which allows a connection to a host computer with a USB port. The USB cable is supplied in the Evaluation Kit (standard-A plug to host computer, mini-B plug to KC705 board

connector J6). The CP2103GM is powered by the USB 5V provided by the host PC when the USB cable is plugged into the USB port on the KC705 board.

Xilinx UART IP is expected to be implemented in the FPGA fabric. The FPGA supports the USB-to-UART bridge using four signal pins: Transmit (TX), Receive (RX), Request to Send (RTS), and Clear to Send (CTS).

Silicon Labs provides royalty-free Virtual COM Port (VCP) drivers for the host computer. These drivers permit the CP2103GM USB-to-UART bridge to appear as a COM port to communications application software (for example, Tera Term or HyperTerm) that runs on the host computer. The VCP device drivers must be installed on the host PC prior to establishing communications with the KC705 board.

The following table shows the USB signal definitions at J6:

Table 1-19: **USB J6 Mini-B Receptacle Pin Assignments and Signal Definitions**

USB Receptacle Pins (J6)	Receptacle Pin Name	Schematic Net Name	Description	U12 Pin (CP2103GM)	U12 Pin Name (CP2103GM)
1	VBUS	USB_VBUS	+5V from host system - U12 CP2103 power	7, 8	REGIN, VBUS
2	D_N	USB_D_N	Bidirectional differential serial data (N-side)	4	D-
3	D_P	USB_D_P	Bidirectional differential serial data (P-side)	3	D+
4	GND	USB_GND	Signal ground	2, 29	GND, GND

The following table shows the USB connections between the FPGA and the UART.

Table 1-20: **FPGA to UART Connections**

FPGA U1				Schematic Net Name	CP2103 Device U12		
Pin	Function	Direction	I/O Standard		Pin	Function	Direction
L27	RTS	Output	LVCMOS25	USB_CTS	22	CTS	Input
K23	CTS	Input	LVCMOS25	USB_RTS	23	RTS	Output
K24	TX	Output	LVCMOS25	USB_RX	24	RXD	Input
M19	RX	Input	LVCMOS25	USB_TX	25	TXD	Output

For more information about the CP2103GM and to download the VCP drivers, see [Ref 8].

HDMI Video Output

[Figure 1-2, callout 18]

The KC705 board provides a High-Definition Multimedia Interface (HDMI) video output using the Analog Devices ADV7511KSTZ-P HDMI transmitter (U65). The HDMI output is provided on a Molex 500254-1927 HDMI type-A connector (P6). The ADV7511 is wired to support 1080P 60Hz, YCbCr 4:2:2 encoding via 16-bit input data mapping.

The KC705 board supports the following HDMI device interfaces:

- 18 data lines
- Independent VSYNC, HSYNC
- Single-ended input CLK
- Interrupt Out Pin to FPGA
- I2C
- SPDIF

The following figure shows the HDMI codec circuit.

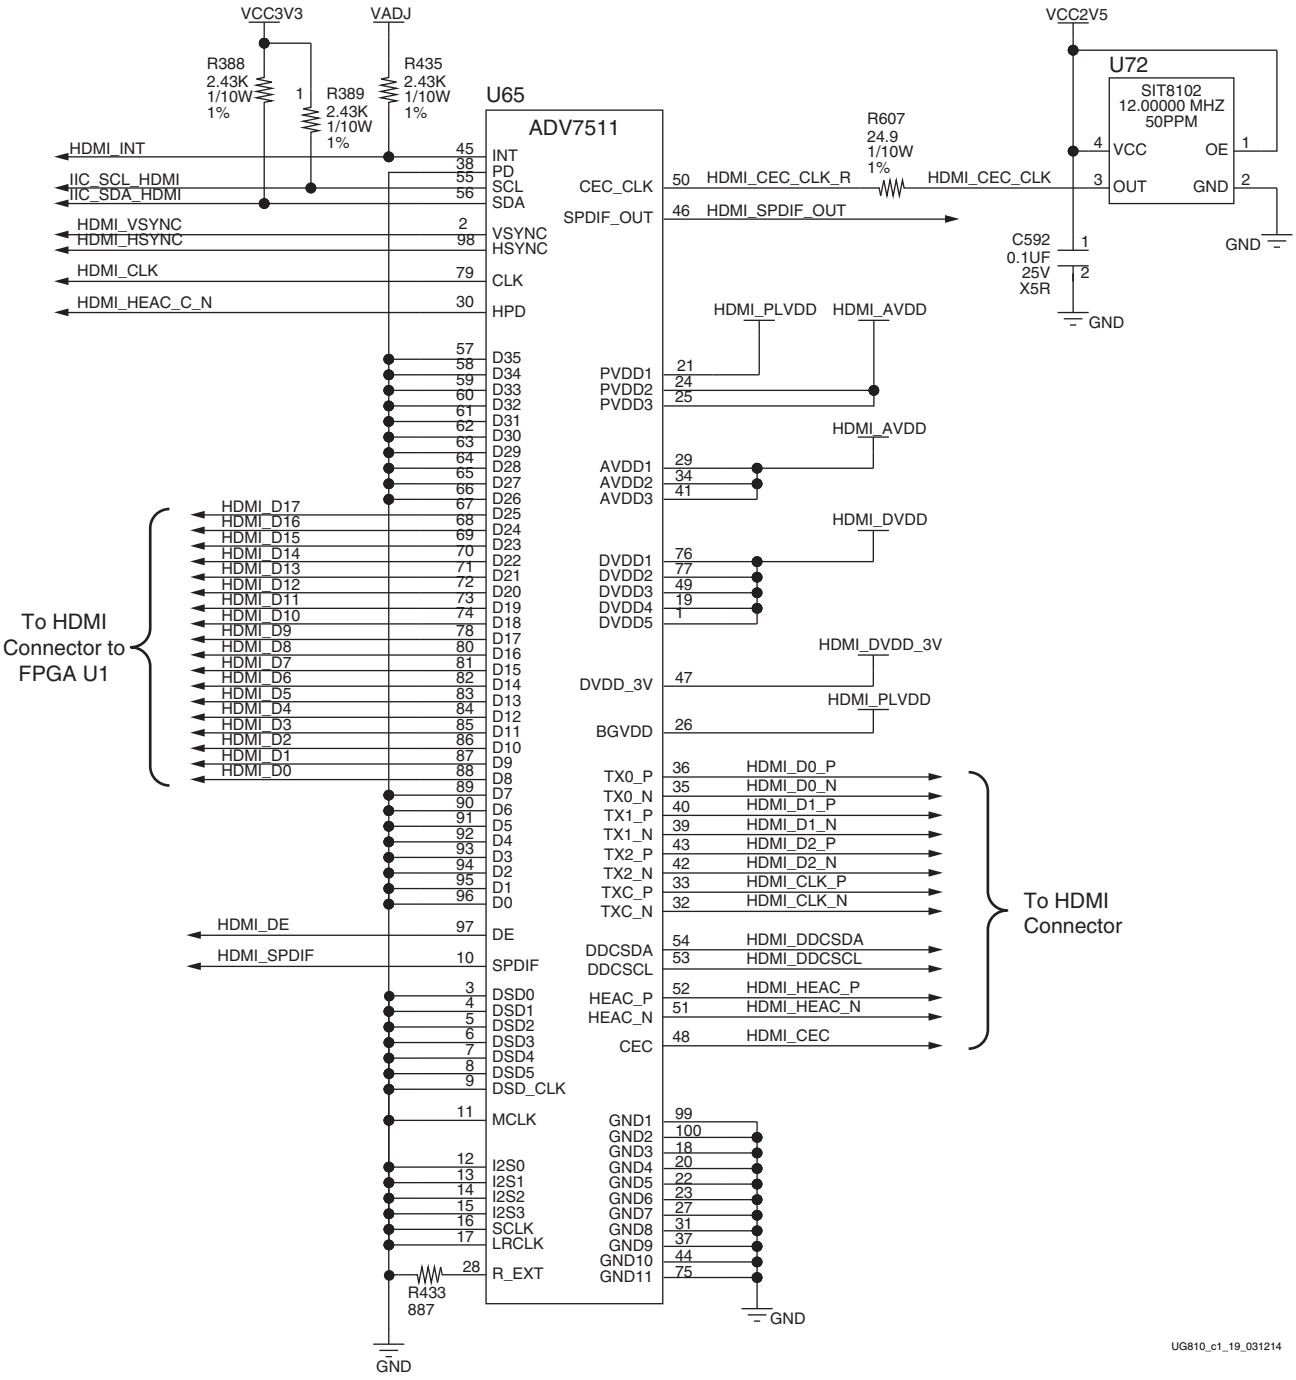

Figure 1-18: **HDMI Codec Circuit**

The following table lists the connections between the codec and the FPGA.

Table 1-21: **FPGA to HDMI Codec Connections (ADV7511)**

U1 FPGA Pin	Schematic Net Name	I/O Standard	ADV7511 (U65)	
			Pin Number	Pin Name
B23	HDMI_D0	LVCMOS25	88	D8
A23	HDMI_D1	LVCMOS25	87	D9
E23	HDMI_D2	LVCMOS25	86	D10
D23	HDMI_D3	LVCMOS25	85	D11
F25	HDMI_D4	LVCMOS25	84	D12
E25	HDMI_D5	LVCMOS25	83	D13
E24	HDMI_D6	LVCMOS25	82	D14
D24	HDMI_D7	LVCMOS25	81	D15

33	HDMI_CLK_P	10
32	HDMI_CLK_N	12
54	HDMI_DDCSDA	16
53	HDMI_DDCSCL	15
52	HDMI_HEAC_P	14
51	HDMI_HEAC_N	19
48	HDMI_CRC	13

For more information about the ADV7511KSTZ-P part, see [Ref 18].

LCD Character Display

[Figure 1-2, callout 19]

A 2-line by 16-character display is provided on the KC705 board (Figure 1-19).

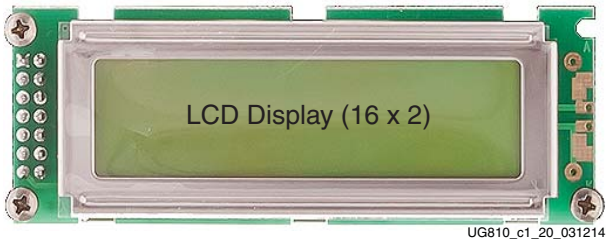

Figure 1-19: **LCD Display**

The character display runs at 5.0V and is connected to the FPGA's 1.5V HP bank 33 through a Texas Instruments TXS0108E 8-bit bidirectional voltage level translator (U10). The figure below shows the LCD interface circuit.

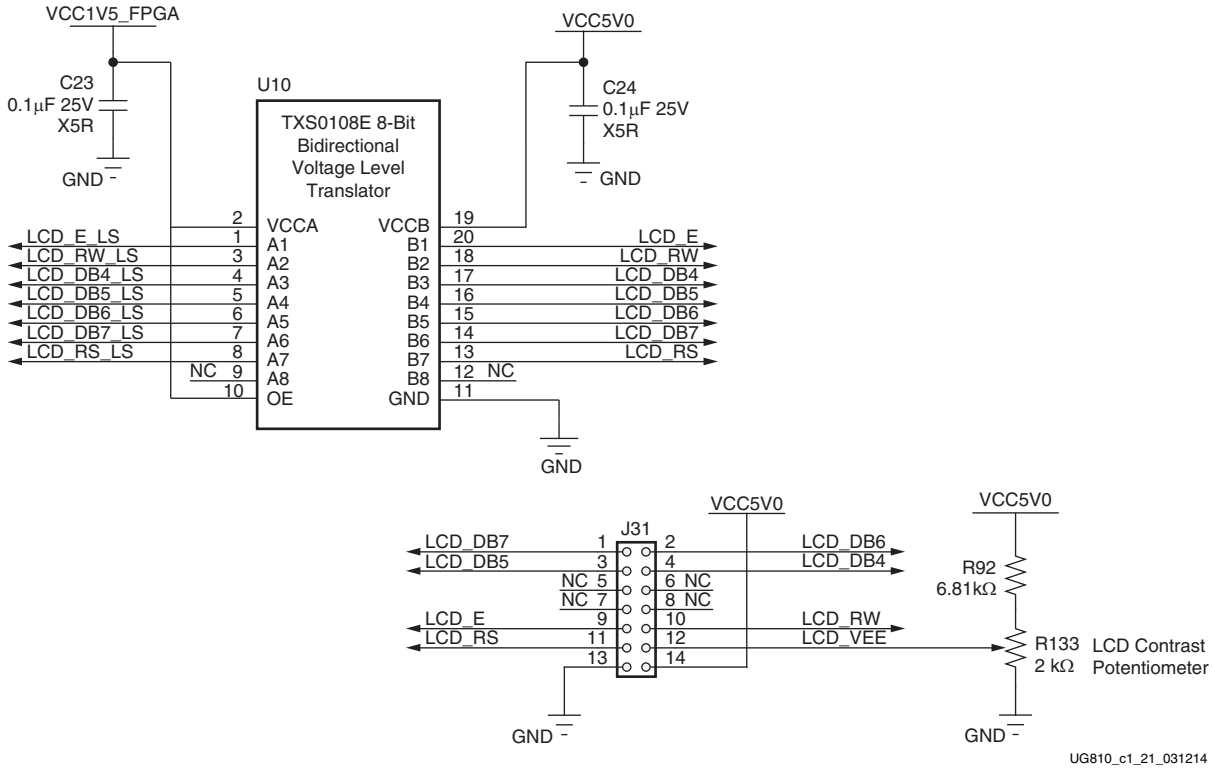

Figure 1-20: **LCD Interface Circuit**

The KC705 board base board uses a male Samtec MTLW-107-07-G-D-265 2x7 header (J31) with 0.025-inch square posts on 0.100-inch centers for connecting to a Samtec SLW-107-01-L-D female socket on the LCD display panel assembly. The LCD header is shown in the figure below.

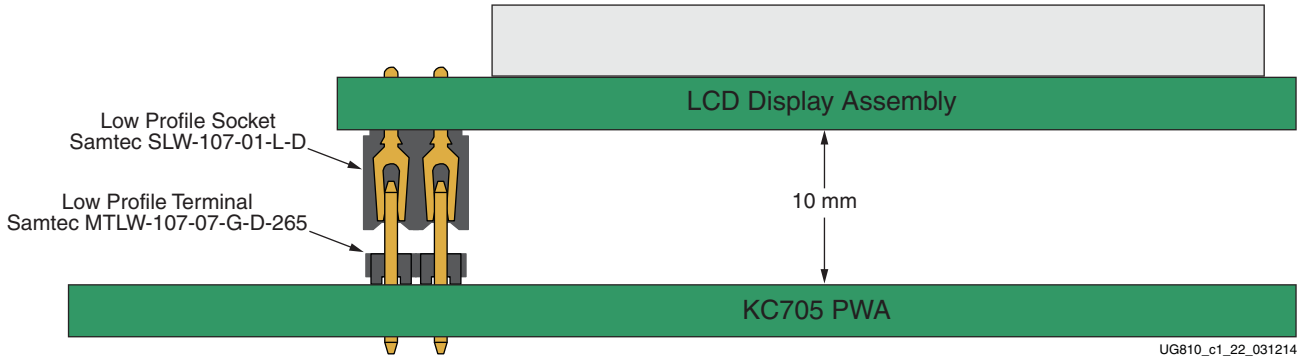

Figure 1-21: **LCD Header Details**

The following table lists the connections between the FPGA and the LCD header.

Table 1-23: **FPGA to LCD Header Connections**

FPGA Pin (U1)	Schematic Net Name	I/O Standard	LCD Header Pin (J31)
AA13	LCD_DB4_LS	LVCMOS15	4
AA10	LCD_DB5_LS	LVCMOS15	3
AA11	LCD_DB6_LS	LVCMOS15	2

For more information about the Displaytech S162D LCD, see [Ref 19].

I2C Bus Switch

[Figure 1-2, callout 20]

The KC705 board implements a single I2C port on the FPGA (IIC_SDA_MAIN, IIC_SDA_SCL), which is routed through a TI PCA9548 1-to-8 channel I2C switch (U49). U49 pin 24 net IIC_MUX_RESET_B is connected to U1 bank 15 pin P23. This is an active-Low signal and must be driven High (FPGA U1 pin P23) to enable I2C bus transactions between the FPGA U1 and the other components on the I2C bus. The I2C switch can operate at speeds up to 400 kHz. The U49 bus switch at I2C address `0x74/0b01110100` must be addressed and configured to select the desired target back-side device.

The KC705 board I2C bus topology is shown in the figure below.

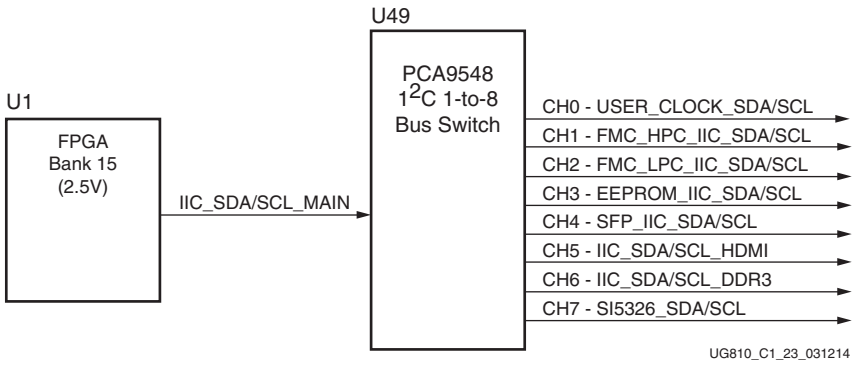

Figure 1-22: **I2C Bus Topology**

User applications that communicate with devices on one of the downstream I2C buses must first set up a path to the desired bus through the U49 bus switch at I2C address `0x74/0b01110100`.

The following table lists the address for each device on the I2C bus.

Table 1-24: **I2C Devices**

I2C Device	I2C Switch Position	I2C Address
Si570 Clock	0	0b1011101
FMC HPC	1	0bXXXXXXX
FMC LPC	2	0bXXXXXXX
IIC EEPROM	3	0b1010100
SFP Module	4	0b1010000
ADV7511 HDMI	5	0b0111001
DDR3 SODIMM	6	0b1010000, 0b0011000
Si5324 Clock	7	0b1101000

For more information about the TI PCA9548 part, see [Ref 20].

Status LEDs

[Figure 1-2, callout 21]

The following table defines the status LEDs. For user controlled LEDs, see User I/O.

Table 1-25: **Status LEDs**

Reference Designator	Signal Name	Color	Description
DS14	PWRCTL1_VCC4A_PG	Green	FMC power good
DS20	FPGA_DONE	Green	FPGA configured successfully
DS21	FPGA_INIT_B	Green/red	GREEN: FPGA initialization successful, RED: FPGA initialization in progress
DS22	VCC12_P_IN	Green	12V power ON
DS23	PWRCTL_PWRGOOD	Green	UCD9248 power controllers (U55, U56) power good
DS24	LINEAR_POWER_GOOD	Green	TPS51200 (U33) VTTDDR Power Good

Ethernet PHY Status LEDs

[Figure 1-2, callout 21]

The Ethernet PHY status LEDs are mounted to be visible through the metal bracket on the left edge of the KC705 board when it is installed into a PCIe slot in a PC chassis. The six PHY status LEDs are located above the RJ45 Ethernet jack as shown in the figure below.

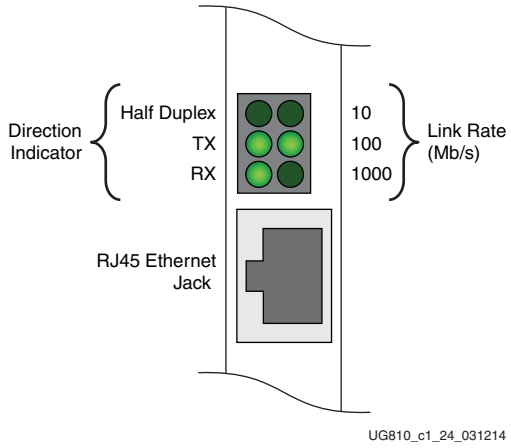

Figure 1-23: **Ethernet PHY Status LEDs**

The following table lists the Ethernet PHY status LEDs.

Table 1-26: **Ethernet PHY Status LEDs**

Reference Designator	Signal Name	Color	Description
DS11	PHY_LED_RX	GREEN	Ethernet PHY RX
DS11	PHY_LED_LINK1000	GREEN	Ethernet Link Speed is 1000 Mb/s
DS12	PHY_LED_TX	GREEN	Ethernet PHY TX
DS12	PHY_LED_LINK100	GREEN	Ethernet Link Speed is 100 Mb/s
DS13	PHY_LED_DUPLEX	GREEN	Ethernet Link is Half-duplex
DS13	PHY_LED_LINK10	GREEN	Ethernet Link Speed is 10 Mb/s

User I/O

[Figure 1-2, callout 22 - 26]

The KC705 board provides the following user and general purpose I/O capabilities:

- Eight user LEDs (callout 22)
  - GPIO_LED_[7-0]: DS27, DS26, DS25, DS3, DS10, DS1, DS4
- Five user pushbuttons and reset switch (callout 23)

- GPIO_SW_[NESWC]: SW2, SW3, SW4, SW6, SW5
- CPU_RESET: SW7

- 4-position user DIP Switch (callout 24)
  - GPIO_DIP_SW[3:0]: SW11
- User Rotary Switch (callout 25, hidden beneath the LCD)
  - ROTARY_PUSH, ROTARY_INCA, ROTARY_INCB: SW8
- User SMA (callout 26)
  - USER_SMA_GPIO_P, USER_SMA_GPIO_N: J13, J14
- 2 line x 16 character LCD Character Display (callout 19)
  - If the display is unmounted, connector J31 pins are available as 7 independent 5V GPIOs

User GPIO LEDs

[Figure 1-2, callout 34]

The following figure shows the user LED circuits.

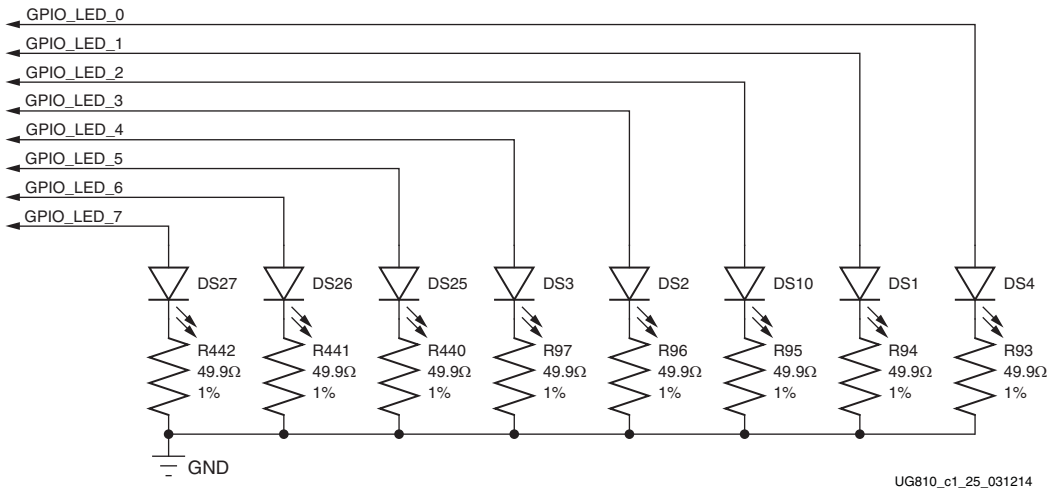

Figure 1-24: **User LEDs**

User Pushbuttons

[Figure 1-2, callout 23]

The figure below shows the user pushbutton switch circuits.

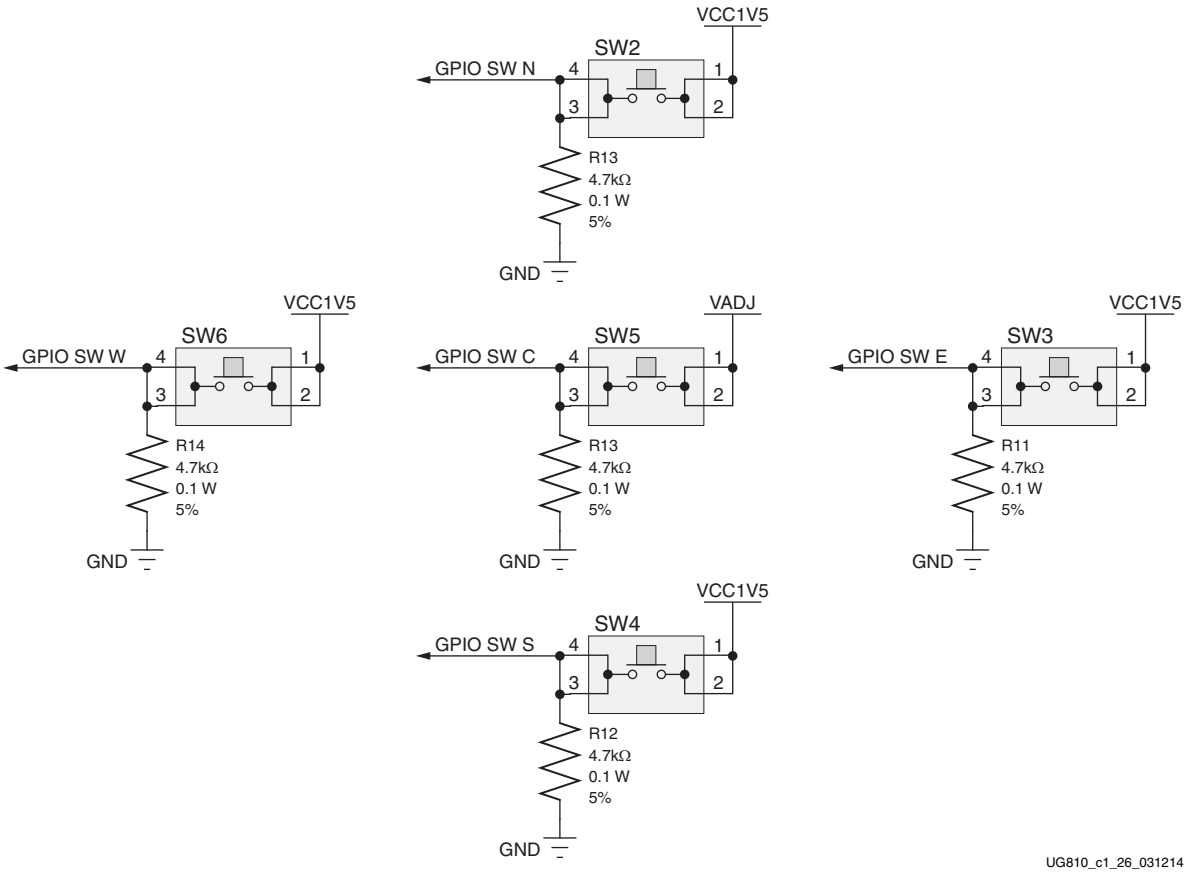

Figure 1-25: **User Pushbuttons**

CPU Reset Pushbutton

[Figure 1-2, callout 37]

The figure below shows the CPU reset pushbutton circuit.

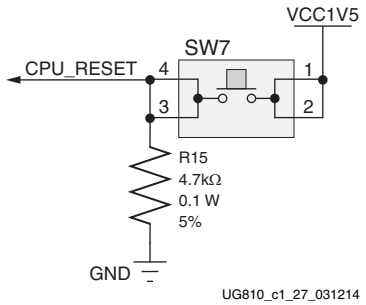

Figure 1-26: **CPU Reset Pushbutton**

GPIO DIP Switch

[Figure 1-2, callout 24]

The following figure shows the GPIO DIP Switch circuit.

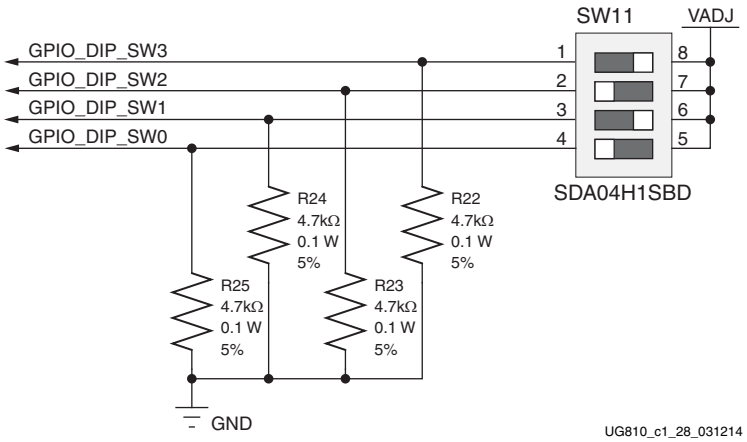

Figure 1-27: **GPIO DIP Switch**

Rotary Switch

The figure below shows the rotary switch SW8.

[Figure 1-2, callout 25]

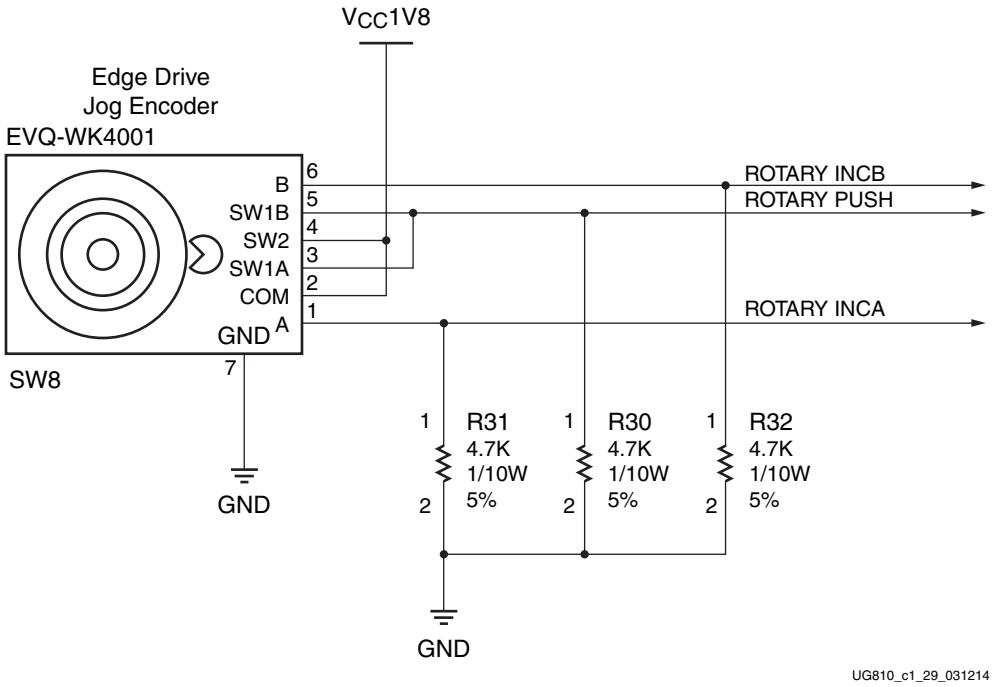

Figure 1-28: **Rotary Switch SW8**

GPIO SMA Connectors

The figure below shows the GPIO SMAs J13 and J14.

[Figure 1-2, callout 26]

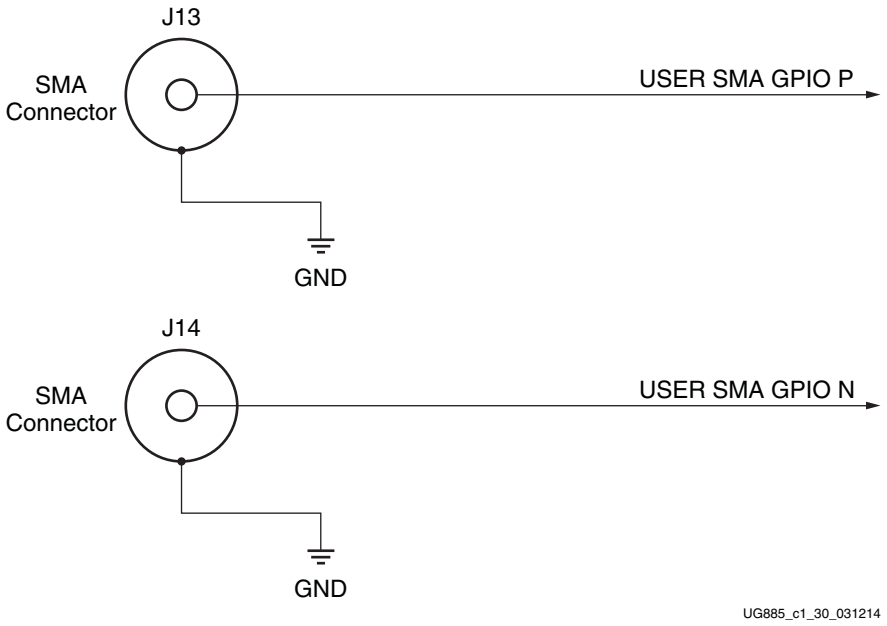

Figure 1-29: **GPIO SMAs J13 and J14**

The following table lists the GPIO Connections to FPGA U1.

Table 1-27: **GPIO Connections to FPGA U1**

U1 FPGA Pin	Schematic Net Name	I/O Standard	GPIO Pin
Indicator LEDs (Active-High)			
AB8	GPIO_LED_0	LVCMOS15	DS4.2
AA8	GPIO_LED_1	LVCMOS15	DS1.2
AC9	GPIO_LED_2	LVCMOS15	DS10.2

Switches

[Figure 1-2, callout 27 - 28]

The KC705 evaluation board includes a power and a configuration switch:

- Power on/off slide switch SW15 (callout 27)
- FPGA_PROG_B SW14, active-Low (callout 28)

Power On/Off Slide Switch SW15

[Figure 1-2, callout 27]

The KC705 board power switch is SW15. Sliding the switch actuator from the Off to On position applies 12V power from J49, a 6-pin mini-fit connector. Green LED DS22 illuminates when the KC705 board power is on. See Power Management for details on the onboard power system.

CAUTION! *Do NOT plug a PC ATX power supply 6-pin connector into J49 on the KC705 board The ATX 6-pin connector has a different pinout than J49. Connecting an ATX 6-pin connector into J49 will damage the KC705 board and void the board warranty.*

The following figure shows the power connector J49, power switch SW15 and indicator LED DS22.

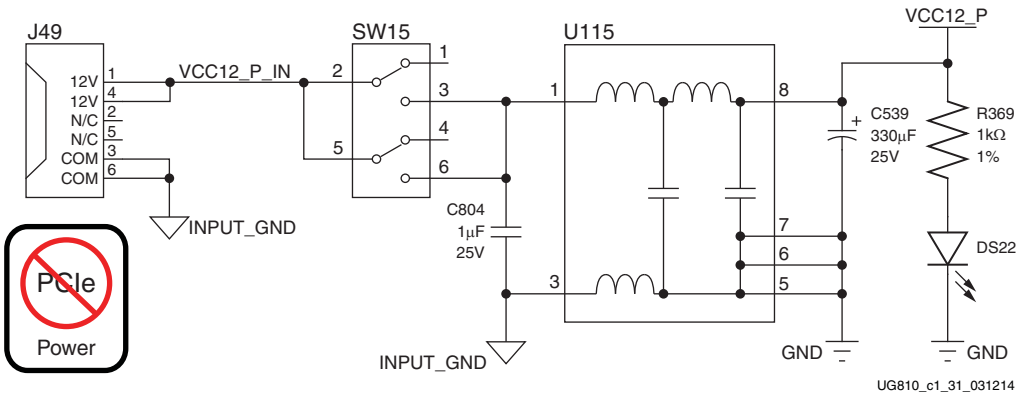

Figure 1-30: **Power On/Off Switch SW15**

The KC705 Evaluation Kit provides the adapter cable shown in Figure 1-31 for powering the KC705 board from the ATX power supply 4-pin peripheral connector. The Xilinx part number for this cable is 2600304, and is equivalent to Sourcegate Technologies part number AZCBL-WH-1109-RA4. For information on ordering this cable, see [Ref 21].

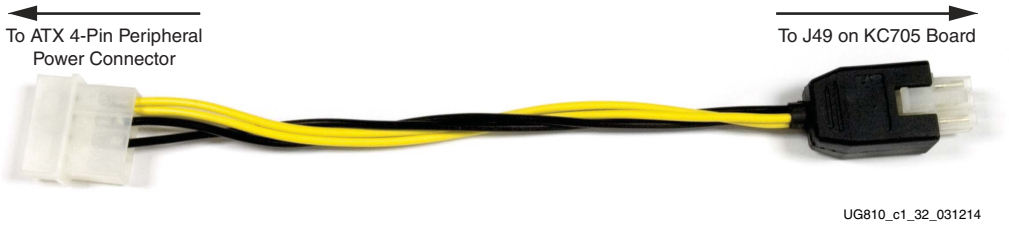

Figure 1-31: **ATX Power Supply Adapter Cable**

FPGA_PROG_B Pushbutton SW14 (Active-Low)

[Figure 1-2, callout 28]

Switch SW14 grounds the FPGA PROG_B pin when pressed. This action initiates an FPGA reconfiguration. The FPGA_PROG_B signal is connected to FPGA U1 pin K10.

See *7 Series FPGAs Configuration User Guide* (UG470) [Ref 3] for further details on configuring the 7 series FPGAs.

The following figure shows SW14.

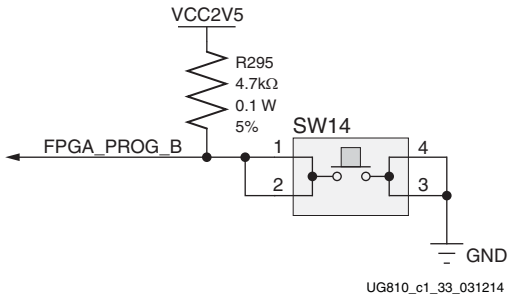

Figure 1-32: **FPGA_PROG_B Pushbutton SW14**

Configuration Mode and Upper Linear Flash Address Switch (SW13)

[Figure 1-2, callout 29]

FPGA Configuration Mode: DIP switch SW13 positions 3, 4, and 5 control which configuration mode is used at power-up or when the PROG pushbutton is pressed.

Linear BPI Flash Memory Upper Addresses: DIP switch SW13 positions 1 and 2 control the setting of address bits FLASH_A25 and FLASH_A24. The mode signals FPGA_M2, _M1 and _M0 are connected to FPGA U1 pins AB1, AB2 and AB5 respectively. The BPI flash memory U58 address signals FLASH_A24 AND FLASH_A25 are connected to FPGA U1 pins M23 and M22 respectively. Configuration mode is used at power-up or when the PROG pushbutton is pressed.

The following figure shows the SW13 circuit.

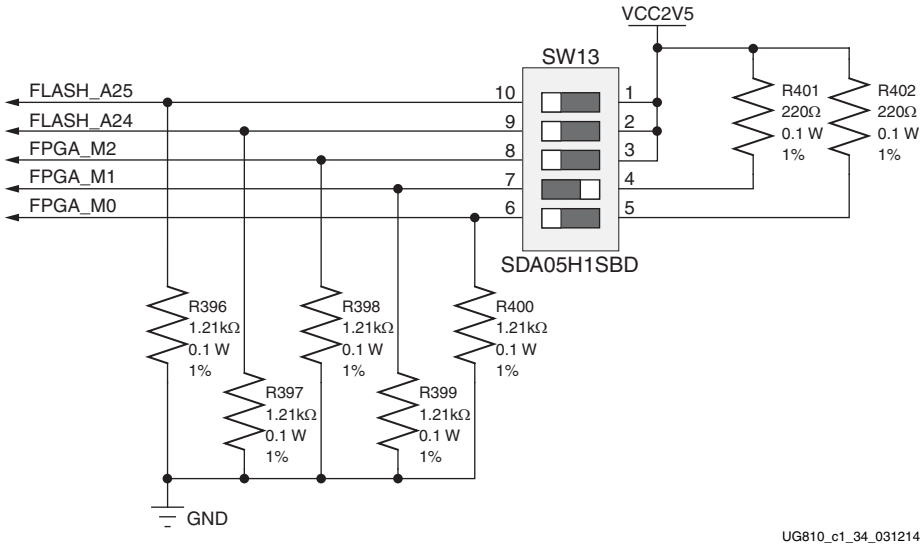

Figure 1-33: **Configuration Mode and Upper Linear Flash Address Switch**

FPGA Mezzanine Card Interface

[Figure 1-2, callout 30 - 31]

The KC705 evaluation board for the Kintex-7 FPGA supports the VITA 57.1 FPGA Mezzanine Card (FMC) specification by providing subset implementations of a high pin count (HPC) connector at J22 and a low pin count (LPC) connector at J2. Both connectors use the same 10 x 40 form factor, except the HPC version is fully populated with 400 pins and the LPC version is partially populated with 160 pins. Both connectors are keyed so that a the mezzanine card faces away from the KC705 board when connected.

Signaling Speed Ratings:

- Single-ended: 9 GHz (18 Gb/s)
- Differential Optimal Vertical: 9 GHz (18 Gb/s)
- Differential Optimal Horizontal: 16 GHz (32 Gb/s)
- High Density Vertical: 7 GHz (15 Gb/s)

The Samtec connector system is rated for signaling speeds up to 9 GHz (18 Gb/s) based on a -3 dB insertion loss point within a two-level signaling environment.

Connector Type:

- Samtec SEAF Series, 1.27 mm (0.050 in) pitch. Mates with SEAM series connector

For more information about SEAF series connectors, see [Ref 20].

HPC Connector J22

[Figure 1-2, callout 30]

The 400-pin HPC connector defined by the FMC specification (Figure B-1) provides connectivity for up to:

- 160 single-ended or 80 differential user-defined signals
- 10 GTX transceivers
- 2 GTX clocks
- 4 differential clocks
- 159 ground and 15 power connections

The connections between the HPC connector at J22 and FPGA U1 (Table 1-28) implement a subset of this connectivity:

- 58 differential user defined pairs

- 34 LA pairs (LA00-LA33)
- 24 HA pairs (HA00-HA23)

- 4 GTX transceivers
- 2 GTX clocks
- 2 differential clocks
- 159 ground and 15 power connections

The HPC signals are distributed across GTX Quads 116, 117, and 118. Each of these Quads have their VCCO voltage connected to VADJ.

Note: The KC705 board VADJ voltage for the J22 and J2 connectors is determined by the FMC VADJ power sequencing logic described in Power Management.

LPC Connector J2

[Figure 1-2, callout 31]

The 160-pin LPC connector defined by the FMC specification (Figure B-2) provides connectivity for up to:

- 68 single-ended or 34 differential user-defined signals
- 1 GTX transceiver
- 1 GTX clock
- 2 differential clocks
- 61 ground and 10 power connections

The connections between the LPC connector at J2 and FPGA U1 (Table 1-29) implement a subset of this connectivity:

- 34 differential user defined pairs
  - 34 LA pairs (LA00-LA33)
- 1 GTX transceiver
- 1 GTX clock

- 2 differential clocks
- 61 ground and 9 power connections

Power Management

[Figure 1-2, callout 32]

The KC705 board uses power regulators and PMBus compliant digital PWM system controllers from Texas Instruments to supply core and auxiliary voltages. The Texas Instruments Fusion Digital Power graphical user interface (GUI) is used to monitor the current and temperature levels of the board power modules. If any module temperature approaches 85°C, forced air cooling must be provided to keep the module temperature within rated limits.

The PCB layout and power system have been designed to meet the recommended criteria described in *7 Series FPGAs PCB Design and Pin Planning Guide* (UG483) [Ref 22].

The KC705 board power distribution diagram is shown in Figure 1-34.

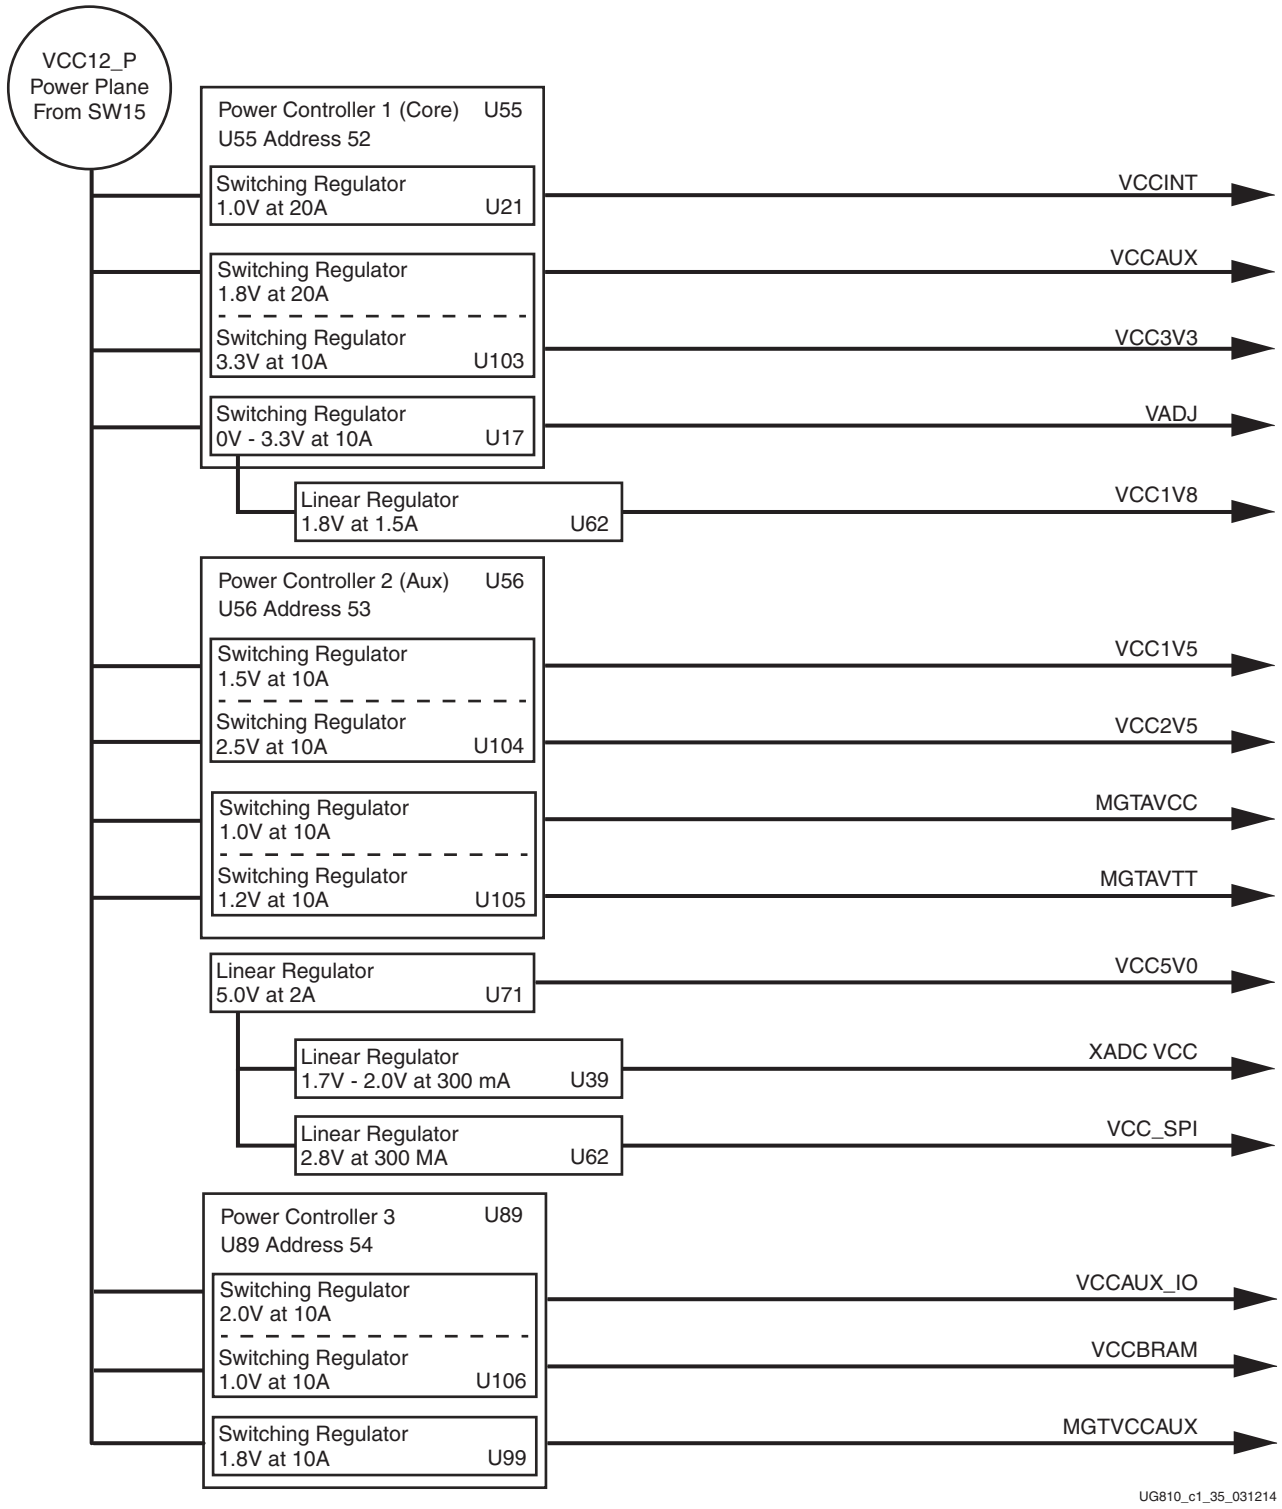

Figure 1-34: **KC705 Board Onboard Power Regulators**

The KC705 board core and auxiliary voltages are listed in Table 1-30.

Table 1-30: **Onboard Power System Devices**

Notes:
1. See Table 1-31.
2. See Table 1-32.
3. See Table 1-33.

FMC_VADJ Voltage Control

The FMC_VADJ rail is set to 2.5V. When the KC705 board is powered on, the state of the FMC_VADJ_ON_B signal wired to header J65 is sampled by the Texas Instruments UCD9248 controller U55. If a jumper is installed on J65, signal FMC_VADJ_ON_B is held low, and the TI controller U55 energizes the FMC_VADJ rail at power on.

Because the rail turn on decision is made at power on time based on the presence of the J65 jumper, removing the jumper at J65 after the board is powered up does not affect the 2.5V power delivered to the FMC_VADJ rail and it remains on.

A jumper installed at J65 is the default setting.

If a jumper is not installed on J65, signal FMC_VADJ_ON_B is High, and the KC705 board does not energize the FMC_VADJ 2.5V at power on. In this mode you can control when to turn on FMC_VADJ and to what voltage level (1.8V - 3.3V). With FMC_VADJ off, the FPGA still configures and has access to the TI controller PMBUS (on bank 32) along with the FMC_VADJ_ON_B signal (on bank 15 pin J27). The combination of these allows you to develop code to command the FMC_VADJ rail to be set to something other than the default setting of 2.5V. After the new FMC_VADJ voltage level has been programmed into TI controller U55, the FMC_VADJ_ON_B signal can be driven Low by the user logic and the FMC_VADJ rail comes up at the new FMC_VADJ voltage level. Installing a jumper at J65 after a KC705 board powers up in this mode turns on the FMC_VADJ rail.

For Texas Instruments fusion tools documentation describing PMBUS programming for the UCD9248 digital power controller, see [Ref 20].

Cooling Fan Control

Cooling fan RPM is controlled and monitored by user-created IP in the FPGA using the fan control circuit is shown in Figure 1-35.

FPGA U1 is cooled by a 12V DC fan connected to J61. $12V_{DC}$ is provided to the fan through J61 pin 2. The fan GND return is provided through J61 pin 1 and transistor Q17. Fan speed is controlled by a pulse-width-modulated signal from FPGA U1 pin L26 (on bank 15) driving the gate of Q17. The default unprogrammed FPGA fan operation mode is ON. The fan speed tachometer signal on J61 pin 3 can be monitored on FPGA U1 pin U22 (on bank 14).

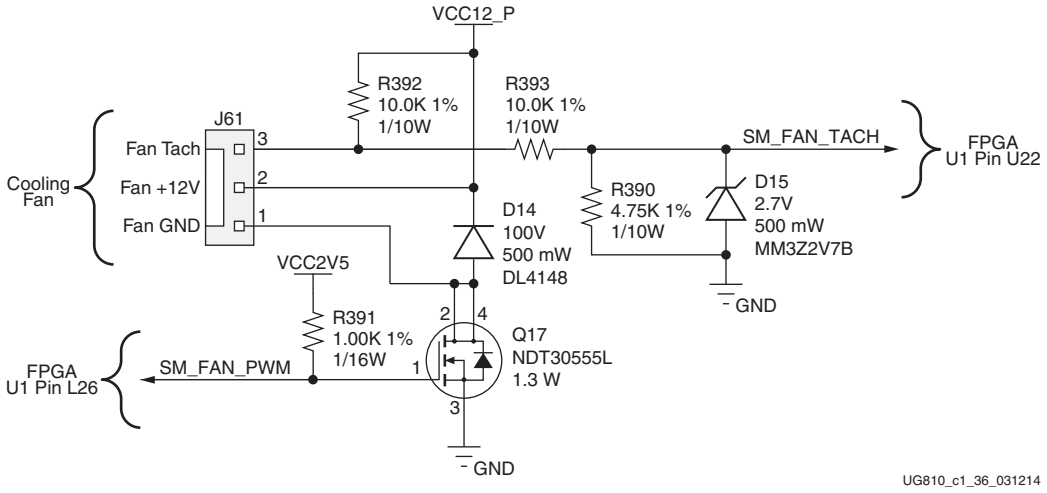

Figure 1-35: **FPGA Cooling Fan Circuit**

Monitoring Voltage and Current

Voltage and current monitoring and control are available for selected power rails through the Texas Instruments Fusion Digital Power GUI. The three onboard TI power controllers (U55 at address 52, U56 at address 53, and U89 at address 54) are wired to the same PMBus. The PMBus connector, J39, is provided for use with the TI USB Interface Adapter PMBus pod (TI part number EVM USB-TO-GPIO), which can be ordered from the TI website [Ref 24], and the associated TI Fusion Digital Power Designer GUI (downloadable from the Texas Instrument website [Ref 25]). This is the simplest and most convenient way to monitor the voltage and current values for the power rail listed in Table 1-31, Table 1-32, and Table 1-33.

In each of these the three tables (one per controller), the Power Good (PG) On Threshold is the set-point at or below which the particular rail is deemed "good". The PG Off Threshold is the set-point at or below which the particular rail is no longer deemed "good". The controller internally ORs these PG conditions together and drives an output PG pin High only if all active rail PG states are "good". The On and Off Delay and rise and fall times are relative to when the board power on-off slide switch SW15 is turned on and off.

The following table defines the voltage and current values for each power rail controlled by the UCD9248 PMBus controller at Address 52 (U55).

Table 1-31: **Power Rail Specifications for UCD9248 PMBus controller at Address 52**

Rail Number	Rail Name	Schematic Rail Name	Nominal V_{OUT} (V)	PG On Threshold (V)	PG Off Threshold (V)	On Delay (ms)	Rise Time (ms)	Off Delay (ms)	Fall Time (ms)	Shutdown Threshold[1]		
										V_{OUT} Over Fault (V)	I_{OUT} Over Fault (A)	Temp Over Fault (°C)
1	Rail #1	VCCINT_FPGA	1	0.9	0.85	0	5	10	1	1.15	20	90
2	Rail #2	VCCAUX	1.8	1.62	1.53	0	5	5	1	2.07	10.41	90
3	Rail #3	VCC3V3	3.3	2.97	2.805	0	5	4	1	3.795	10.41	90
4	Rail #4	VADJ	2.5	2.25	2.125	0	5	3	1	2.875	10.41	90

Notes:

1. The values defined in these columns are the voltage, current, and temperature thresholds that cause the regulator to shut down if the value is exceeded.

The following table defines the voltage and current values for each power rail controlled by the UCD9248 PMBus controller at Address 53 (U56).

Table 1-32: **Power Rail Specifications for UCD9248 PMBus controller at Address 53**

Rail Number	Rail Name	Schematic Rail Name	Nominal V_{OUT} (V)	PG On Threshold (V)	PG Off Threshold (V)	On Delay (ms)	Rise Time (ms)	Off Delay (ms)	Fall Time (ms)	Shutdown Threshold[1]		
										V_{OUT} Over Fault (V)	I_{OUT} Over Fault (A)	Temp Over Fault (°C)
1	Rail #1	VCC2V5_FPGA	2.5	2.25	2.125	0	5	1	1	2.875	10.41	90
2	Rail #2	VCC1V5	1.5	1.35	1.275	0	5	0	1	1.725	10.41	90
3	Rail #3	MGTAVCC	1	0.9	0.85	0	5	7	1	1.45	10.41	90

Table 1-32: **Power Rail Specifications for UCD9248 PMBus controller at Address 53 *(Cont'd)***

Rail Number	Rail Name	Schematic Rail Name	Nominal V_{OUT} (V)	PG On Threshold (V)	PG Off Threshold (V)	On Delay (ms)	Rise Time (ms)	Off Delay (ms)	Fall Time (ms)	Shutdown Threshold[1]		
										V_{OUT} Over Fault (V)	I_{OUT} Over Fault (A)	Temp Over Fault (°C)
4	Rail #4	MGTAVTT	1.2	1.08	1.02	0	5	8	1	1.38	10.41	90

Notes:

1. The values defined in these columns are the voltage, current, and temperature thresholds that cause the regulator to shut down if the value is exceeded.

The following table defines the voltage and current values for each power rail controlled by the UCD9248 PMBus controller at Address 54 (U89).

Table 1-33: **Power Rail Specifications for UCD9248 PMBus controller at Address 54**

Rail Number	Rail Name	Schematic Rail Name	Nominal V_{OUT} (V)	PG On Threshold (V)	PG Off Threshold (V)	On Delay (ms)	Rise Time (ms)	Off Delay (ms)	Fall Time (ms)	Shutdown Threshold[1]		
										V_{OUT} Over Fault (V)	I_{OUT} Over Fault (A)	Temp Over Fault (°C)
1	Rail #1	VCCAUX_IO	2	1.8	1.7	0	5	2	1		10.41	90
2	Rail #2	VCC_BRAM	1	0.9	0.85	0	5	9	1		10.41	90
3	Rail #3	MGTVCCAUX	1.8	1.62	1.53	0	5	6	1		10.41	90

Notes:

1. The values defined in these columns are the voltage, current, and temperature thresholds that cause the regulator to shut down if the value is exceeded.

For more information about the UCD9248PFC, PTD08A010W, PTD08A020W, PTD08D021W, LMZ12002, TL1962ADC, and TPS51200DR power system components, see [Ref 20].

XADC Header

[Figure 1-2, callout 33]

7 series FPGAs provide an analog-to-digital converter (XADC) block. The XADC block includes a dual 12-bit, 1 MSPS analog-to-digital converter (ADC) and on-chip sensors.

See *7 Series FPGAs XADC Dual 12-Bit 1MSPS Analog-to-Digital Converter User Guide* (UG480) [Ref 26] for details on the capabilities of the analog front end.

The following figure shows the KC705 board XADC support features.

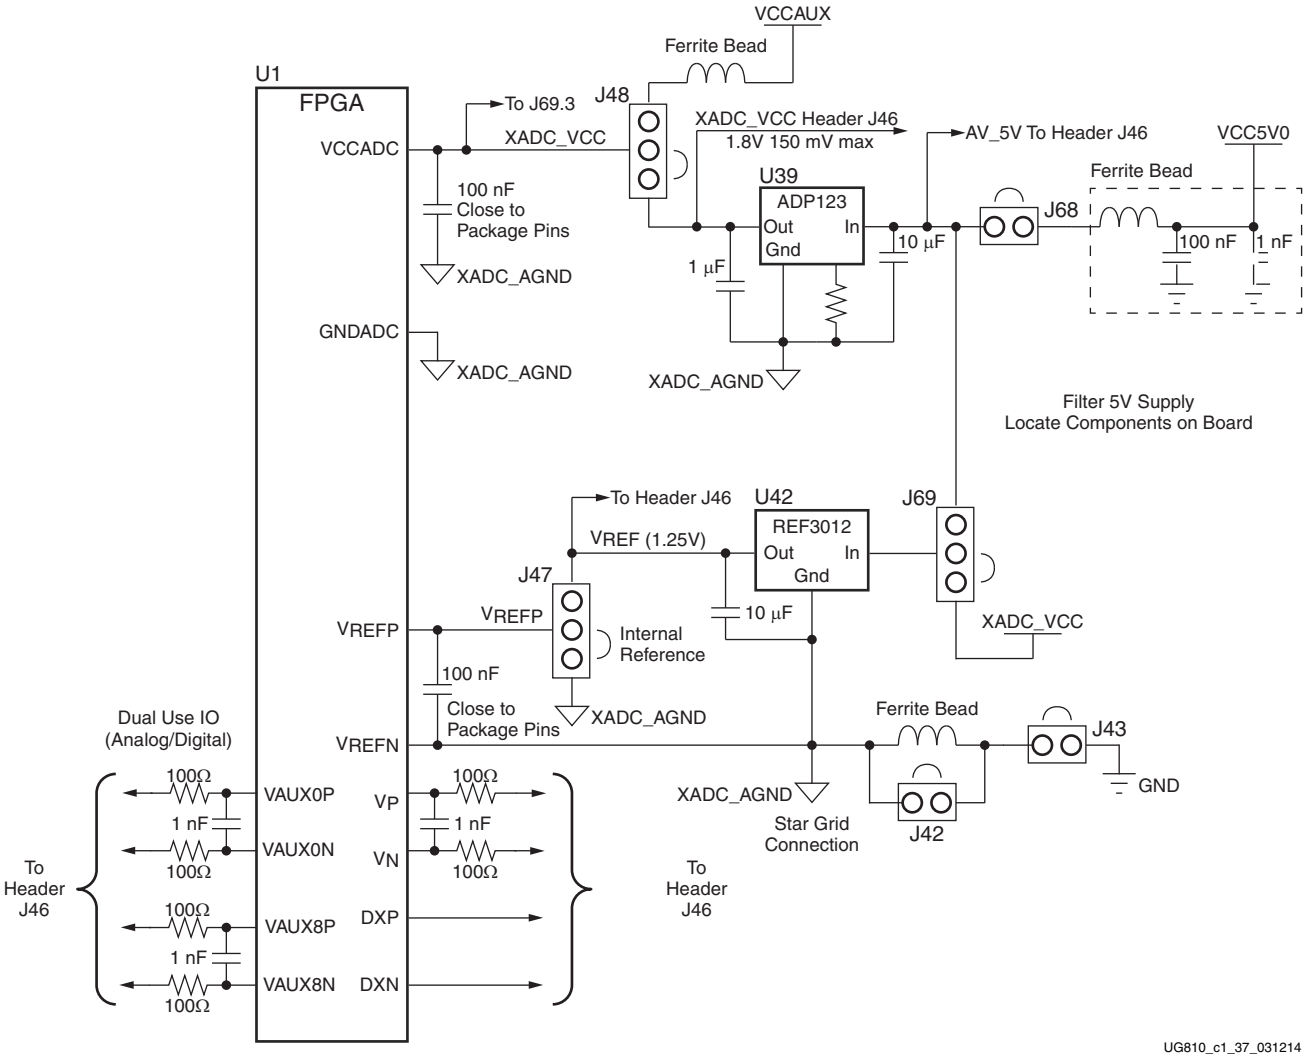

Figure 1-36: **Header XADC_VREF Voltage Source Options**

The KC705 board supports both the internal FPGA sensor measurements and the external measurement capabilities of the XADC. Internal measurements of the die temperature,

VCCINT, VCCAUX, and VCCBRAM are available. The KC705 board VCCINT and VCCBRAM are provided by a common 1.0 V supply.

Jumper J47 can be used to select either an external differential voltage reference (XADC_VREF) or on-chip voltage reference (jumper J47 2–3) for the analog-to-digital converter.

For external measurements an XADC header (J46) is provided. This header can be used to provide analog inputs to the FPGA dedicated VP/VN channel, and to the VAUXP[0]/VAUXN[0], VAUXP[8]/VAUXN[8] auxiliary analog input channels. Simultaneous sampling of Channel 0 and Channel 8 is supported.

A user-provided analog signal multiplexer card can be used to sample additional external analog inputs using the 4 GPIO pins available on the XADC header as multiplexer address lines. The following figure shows the XADC header connections.

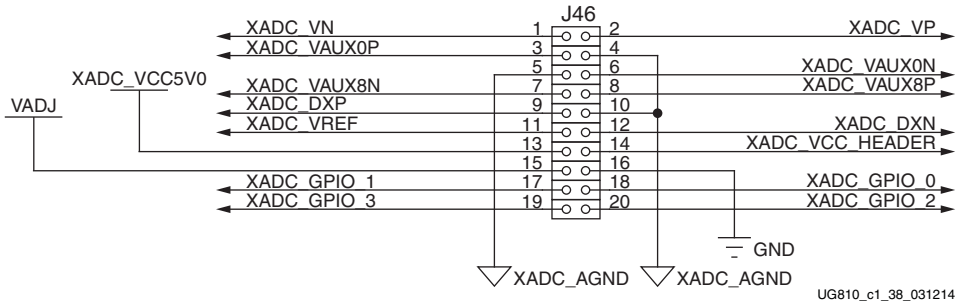

Figure 1-37: **XADC Header (J46)**

The following table describes the XADC header J46 pin functions.

Table 1-34: **XADC Header J46 Pinout**

Net Name	J46 Pin Number	Description
VN, VP	1, 2	Dedicated analog input channel for the XADC.
XADC_VAUX0P, N	3, 6	Auxiliary analog input channel 0. Also supports use as I/O inputs when anti alias capacitor is not present.
XADC_VAUX8N, P	7, 8	Auxiliary analog input channel 8. Also supports use as I/O inputs when anti alias capacitor is not present.
DXP, DXN	9, 12	Access to thermal diode.
XADC_AGND	4, 5, 10	Analog ground reference.
XADC_VREF	11	1.25V reference from the board.
XADC_VCC5V0	13	Filtered 5V supply from board.
XADC_VCC_HEADER	14	Analog 1.8V supply for XADC.
VADJ	15	VCCO supply for bank which is the source of DIO pins.

Table 1-34: **XADC Header J46 Pinout *(Cont'd)***

Net Name	J46 Pin Number	Description
GND	16	Digital Ground (board) Reference
XADC_GPIO_3, 2, 1, 0	19, 20, 17, 18	Digital I/O. These pins should come from the same bank. These I/Os should not be shared with other functions because they are required to support 3-state operation.

Configuration Options

The FPGA on the KC705 board can be configured by the following methods:

- Master BPI (uses the Linear BPI flash memory)
- Master SPI (uses the Quad SPI flash memory)
- JTAG (uses the USB-to-JTAG Bridge or Download cable). See USB JTAG Module for more information

See *7 Series FPGAs Configuration User Guide* (UG470) [Ref 3] for details on configuration modes.

The method used to configure the FPGA is controlled by the mode pin (M2, M1, M0) settings selected through DIP switch SW13.

The following table lists the supported mode switch settings.

Table 1-35: **Mode Switch SW13 Settings**

Configuration Mode	Mode Pins (M[2:0])	Bus Width	CCLK Direction
Master SPI	001	x1, x2, x4	Output
Master BPI	010	x8, x16	Output
JTAG	101	x1	Not Applicable

The following figure shows mode switch SW13.

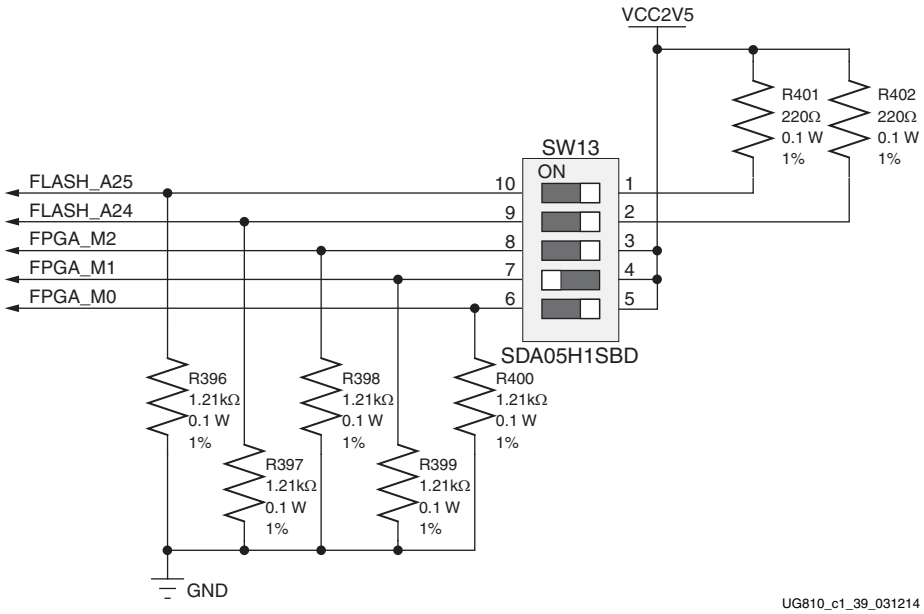

Figure 1-38: **Mode Switch**

The mode pins settings on SW13 determine if the Linear BPI or the Quad SPI flash memory is used for configuring the FPGA. DIP switch SW13 also provides the upper two address bits for the Linear BPI flash memory and can be used to select one of multiple stored configuration bitstreams. Figure 1-39 shows the connectivity between the onboard nonvolatile flash devices used for configuration and the FPGA.

To obtain the fastest configuration speed an external 66 MHz oscillator is wired to the EMCCLK pin of the FPGA. This allows users to create bitstreams that configure the FPGA over the 16-bit datapath from the Linear BPI flash memory at a maximum synchronous read rate of 33 MHz. The bitstream stored in the flash memory must be generated with a BitGen option to divide the EMCCLK by two.

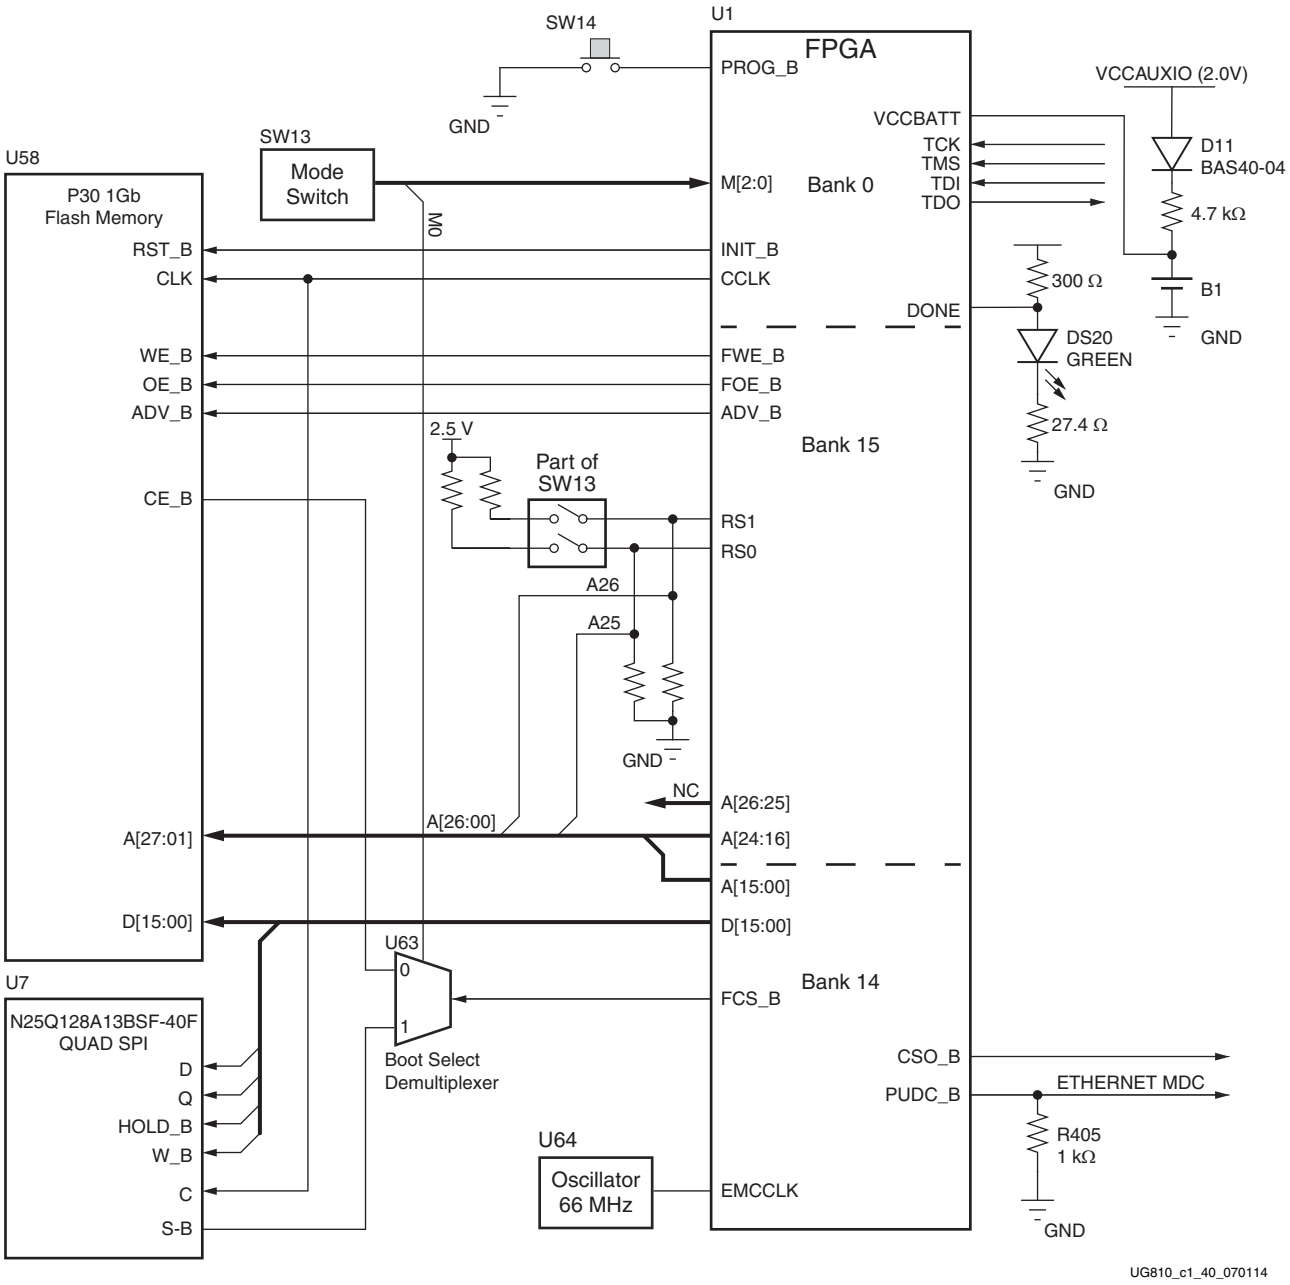

Figure 1-39: **KC705 Board Configuration Circuit**

Default Switch and Jumper Settings

DIP Switch SW11 User GPIO

See Figure 1-2 Item 24 for location of SW11. Default settings are shown in Figure A-1 and details are listed in Table A-1.

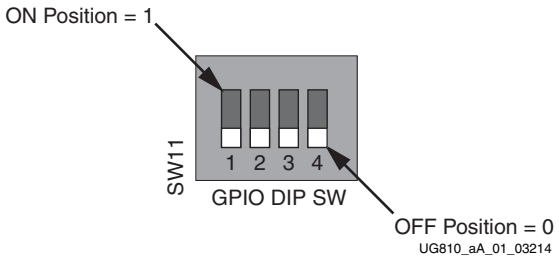

Figure A-1: **SW11 Default Settings**

Table A-1: **SW11 Default Switch Settings**

Position	Function	Default
1	GPIO_DIP_SW3	Off
2	GPIO_DIP_SW2	Off
3	GPIO_DIP_SW1	Off
4	GPIO_DIP_SW0	Off

DIP Switch SW13 Mode and Flash Memory Address Settings

See Figure 1-2 Item 29 for location of SW13. Default settings are shown in Figure A-2 and details are listed in Table A-2.

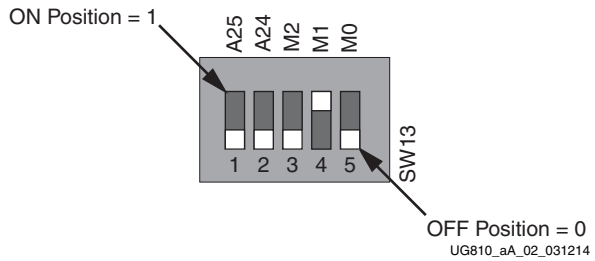

Figure A-2: **SW13 Default Settings**

The default mode setting M[2:0] = `010` selects Master BPI configuration at board power-on.

Table A-2: **SW13 Default Switch Settings**

Position	Function		Default
1	FLASH_A25	A25	Off
2	FLASH_A24	A24	Off
3	FPGA_M2	M2	Off
4	FPGA_M1	M1	On
5	FPGA_M0	M0	Off

Figure B-2: **FMC LPC Connector Pinout**

Appendix C

Xilinx Design Constraints

The KC705 board Xilinx® design constraints (XDC) file template provides for designs targeting the KC705 board. Net names in the constraints correlate with net names on the latest KC705 board schematic. You must identify the appropriate pins and replace the net names with net names in the user RTL. See *Vivado Design Suite User Guide: Using Constraints* (UG903) [Ref 27] for more information.

The FMC connectors J2 and J22 are connected to 2.5V V_{CCO} banks. Because each FMC card implements customer-specific circuitry, the FMC bank I/O standards must be uniquely defined by each customer.

Note: See the Kintex-7 KC705 Evaluation Kit product page Documentation tab for the latest versions of the FPGA pins constraints files (XDC files).

Board Setup

Installing KC705 Board in a PC Chassis

Installation of the KC705 board inside a computer chassis is required when developing or testing PCI Express functionality.

When the KC705 board is used inside a computer chassis (plugged in to the PCIe® slot), power is provided from the ATX power supply 4-pin peripheral connector through the ATX adapter cable shown in Figure D-1 to J18 on the KC705 board. The Xilinx part number for this cable is 2600304 and is equivalent to Sourcegate Technologies part number AZCBL-WH-1109-RA4. For information on ordering this cable, see [Ref 21].

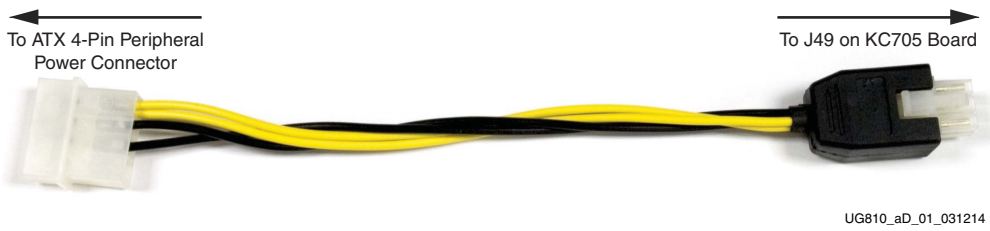

Figure D-1: **ATX Power Supply Adapter Cable**

To install the KC705 board in a PC chassis:

1. On the KC705 board, remove the six screws retaining the six rubber feet with their standoffs, and the PCIe bracket. Reinstall the PCIe bracket using two of the previously removed screws.
2. Power down the host computer and remove the power cord from the PC.
3. Open the PC chassis following the instructions provided with the PC.
4. Select a vacant PCIe expansion slot and remove the expansion cover (at the back of the chassis) by removing the screws on the top and bottom of the cover.
5. Plug the KC705 board into the PCIe connector at this slot.
6. Install the top mounting bracket screw into the PC expansion cover retainer bracket to secure the KC705 board in its slot.

   Note: The KC705 board is taller than standard PCIe cards. Ensure that the height of the card is free of obstructions.

7. Connect the ATX power supply to the KC705 board using the ATX power supply adapter cable as shown in Figure D-1:
   a. Plug the 6-pin 2 x 3 Molex connector on the adapter cable into J49 on the KC705 board.
   b. Plug the 4-pin 1 x 4 peripheral power connector from the ATX power supply into the 4-pin adapter cable connector.
8. Slide the KC705 board power switch SW12 to the ON position. The PC can now be powered on.

Board Specifications

Dimensions

Height 5.5 in (14.0 cm)

Length 10.5 in (26.7 cm)

Note: The KC705 board height exceeds the standard 4.376 in (11.15 cm) height of a PCI Express card.

Environmental

Temperature

Operating: 0°C to +45°C

Storage: –25°C to +60°C

Humidity

10% to 90% non-condensing

Operating Voltage

+12 V_{DC}

XILINX

Appendix F

Regulatory and Compliance Information

Overview

This product is designed and tested to conform to the European Union directives and standards described in this section.

See the Kintex-7 FPGA KC705 Evaluation Kit Xilinx Answer (AR#45934) concerning the CE requirements for the PC Test Environment.

Declaration of Conformity

The Kintex-7 FPGA KC705 Declaration of Conformity is here.

CE Directives

2006/95/EC, *Low Voltage Directive (LVD)*

2004/108/EC, *Electromagnetic Compatibility (EMC) Directive*

CE Standards

EN standards are maintained by the European Committee for Electrotechnical Standardization (CENELEC). IEC standards are maintained by the International Electrotechnical Commission (IEC).

Electromagnetic Compatibility

EN 55022:2010, *Information Technology Equipment Radio Disturbance Characteristics – Limits and Methods of Measurement*

EN 55024:2010, *Information Technology Equipment Immunity Characteristics – Limits and Methods of Measurement*

This is a Class A product and can cause radio interference. In a domestic environment, the user might be required to take adequate corrective measures.

Safety

IEC 60950-1:2005, *Information technology equipment – Safety, Part 1: General requirements*

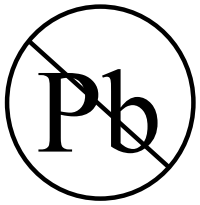
EN 60950-1:2006, *Information technology equipment – Safety, Part 1: General requirements*

Markings

In August of 2005, the European Union (EU) implemented the EU WEEE Directive 2002/96/EC and later the WEEE Recast Directive 2012/19/EU requiring Producers of electronic and electrical equipment (EEE) to manage and finance the collection, reuse, recycling and to appropriately treat WEEE that the Producer places on the EU market after August 13, 2005. The goal of this directive is to minimize the volume of electrical and electronic waste disposal and to encourage re-use and recycling at the end of life.

Xilinx has met its national obligations to the EU WEEE Directive by registering in those countries to which Xilinx is an importer. Xilinx has also elected to join WEEE Compliance Schemes in some countries to help manage customer returns at end-of-life.

If you have purchased Xilinx-branded electrical or electronic products in the EU and are intending to discard these products at the end of their useful life, please do not dispose of them with your other household or municipal waste. Xilinx has labeled its branded electronic products with the WEEE Symbol to alert our customers that products bearing this label should not be disposed of in a landfill or with municipal or household waste in the EU.



This product complies with Directive 2002/95/EC on the restriction of hazardous substances (RoHS) in electrical and electronic equipment.

This product complies with CE Directives 2006/95/EC, *Low Voltage Directive (LVD)* and 2004/108/EC, *Electromagnetic Compatibility (EMC) Directive*.

Additional Resources and Legal Notices

Xilinx Resources

For support resources such as Answers, Documentation, Downloads, and Forums, see Xilinx Support.

Solution Centers

See the Xilinx Solution Centers for support on devices, software tools, and intellectual property at all stages of the design cycle. Topics include design assistance, advisories, and troubleshooting tips.

Documentation Navigator and Design Hubs

Xilinx® Documentation Navigator provides access to Xilinx documents, videos, and support resources, which you can filter and search to find information. To open the Xilinx Documentation Navigator (DocNav):

- From the Vivado® IDE, select **Help > Documentation and Tutorials**.
- On Windows, select **Start > All Programs > Xilinx Design Tools > DocNav**.
- At the Linux command prompt, enter `docnav`.

Xilinx Design Hubs provide links to documentation organized by design tasks and other topics, which you can use to learn key concepts and address frequently asked questions. To access the Design Hubs:

- In the Xilinx Documentation Navigator, click the **Design Hubs View** tab.
- On the Xilinx website, see the Design Hubs page.

Note: For more information on Documentation Navigator, see the Documentation Navigator page on the Xilinx website.

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
