1. Calculated with $T_j = +150$ °C and $T_{amb} = +25$ °C with relative R_{thja} depending on the package.
2. Human body model: A 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This happens for all couples of connected pin combinations while the other pins are left floating.
3. Machine model: A 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This happens for all couples of connected pin combinations while the other pins are left floating.
4. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This happens for all pins

4 Parameter definitions

4.1 Reference input voltage deviation overtemperature range

ΔV_{ref} is defined as the difference between the maximum and minimum values obtained over the full temperature range.

$$\Delta V_{ref} = V_{ref\ max.} - V_{ref\ min.}$$

Figure 23. Reference input voltage deviation overtemperature range

4.2 Temperature coefficient of reference input voltage

The temperature coefficient is defined as the slopes (positive and negative) of the voltage versus temperature limits within which the reference is guaranteed.

Figure 24. Temperature coefficient of reference input voltage

4.3 Dynamic impedance

The dynamic impedance is defined as $|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$
