DESCRIPTION

The DS1005 5-Tap Silicon Delay Line provides five equally spaced taps with delays ranging from 12 ns to 250 ns, with an accuracy of ± 2 ns or $\pm 3\%$, whichever is greater. This device is offered in a standard 14-pin DIP, making it compatible with existing delay line products. Space-saving 8-pin DIPs and 16-pin SOICs are also available. Both enhanced performance and superior reliability over hybrid technology is achieved by the combination of a 100% silicon delay line and industry standard DIP and SOIC packaging. In order to maintain complete pin compatibility, DIP packages are available with hybrid lead configurations. The DS1005 reproduces the input logic level at each tap after the fixed delay specified by the dash number in Table 1. The device is designed with both leading and trailing edge accuracy. Each tap is capable of driving up to ten 74LS loads. Dallas Semiconductor can customize standard products to meet special needs. For special requests and rapid delivery, call (972) 371-4348.

NOTES:

1. All voltages are referenced to ground.
2. Measured with outputs open.
3. $V_{CC} = 5V @ 25^{\circ}C$. Delays accurate on both rising and falling edges within ± 2 ns or $\pm 3\%$, whichever is greater.
4. See Test Conditions.
5. The combination of temperature variations from $25^{\circ}C$ to $0^{\circ}C$ or $25^{\circ}C$ to $70^{\circ}C$ and voltage variations from $5.0V$ to $4.75V$ or $5.0V$ to $5.25V$ may produce an additional input-to-tap delay shift of ± 1.5 ns or $\pm 4\%$, whichever is greater.
6. All tap delays tend to vary unidirectionally with temperature or voltage. For example, if TAP 1 slows down, all other taps will also slow down; TAP 3 can never be faster than TAP 2.
7. Pulse width and duty cycle specifications may be exceeded; however, accuracy will be application-sensitive (decoupling, layout, etc.).

TERMINOLOGY

Period: The time elapsed between the leading edge of the first pulse and the leading edge of the following pulse.

t_{WI} (Pulse Width): The elapsed time on the pulse between the 1.5V point on the leading edge and the 1.5V point on the trailing edge, or the 1.5V point on the trailing edge and the 1.5V point on the leading edge.

t_{RISE} (Input Rise Time): The elapsed time between the 20% and the 80% point on the leading edge of the input pulse.

t_{FALL} (Input Fall Time): The elapsed time between the 80% and the 20% point on the trailing edge of the input pulse.

t_{PLH} (Time Delay, Rising): The elapsed time between the 1.5V point on the leading edge of the input pulse and the 1.5V point on the leading edge of any tap output pulse.

t_{PHL} (Time Delay, Falling): The elapsed time between the 1.5V point on the trailing edge of the input pulse and the 1.5V point on the trailing edge of any tap output pulse.

TEST SETUP DESCRIPTION

Figure 3 illustrates the hardware configuration used for measuring the timing parameters on the DS1005. The input waveform is produced by a precision pulse generator under software control. Time delays are measured by a time interval counter (20 ps resolution) connected between the input and each tap. Each tap is selected and connected to the counter by a VHF switch control unit. All measurements are fully automated, with each instrument controlled by a central computer over an IEEE 488 bus.
