

MAX707, MAX708

μP Supervisory Circuits

The MAX707/708 are cost-effective system supervisor circuits designed to monitor V_{CC} in digital systems and provide a reset signal to the host processor when necessary. No external components are required.

The reset output is driven active within 20 μsec of V_{CC} falling through the reset voltage threshold. Reset is maintained with 200 mS of delay time after V_{CC} rise above the reset threshold. The MAX707/708 have a low quiescent current of 12 μA at $V_{CC} = 3.3$ V, an active-high RESET and active-low $\overline{\text{RESET}}$ with a push-pull output. The output is guaranteed valid down to $V_{CC} = 1.0$ V. The MAX707/708 have a Manual Reset $\overline{\text{MR}}$ input and a +1.25 V threshold detector for power-fail input PFI. These devices are available in a Micro8 and SOIC-8 package.

Features

- Precision Supply-Voltage Monitor
MAX707: 4.63 V Reset Threshold Voltage
MAX708: Standard Reset Threshold Voltages (Typical):
4.38 V, 3.08 V, 2.93 V, 2.63 V
- Reset Threshold Available from 1.6 V to 4.9 V with 100 mV Increments (Factory Option)
- 200 mS (Typ) Reset Timeout Delay
- 12 μA ($V_{CC} = 3.3$ V) Quiescent Current
- Active_High and Active_Low Reset Output
- Guaranteed RESET_L and RESET Output Valid to $V_{CC} = 1.0$ V
- Voltage Monitor for Power-Fail or Low-Battery Warning
- 8 Pin SOIC or Micro8 Package
- Pb-Free Packages are Available

Applications

- Computers
- Embedded System
- Battery Powered Equipment
- Critical μP Power Supply Monitor

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 8 of this data sheet.

MAX707, MAX708

Figure 1. Representative Block Diagram

MAXIMUM RATINGS (Note 1)

| Rating | Symbol | Value | Unit |
|------------------------------------|-----------------|--------------------------|---------------|
| Supply Voltage | V_{CC} | 6.0 | V |
| Output Voltage | V_{out} | -0.3 to $(V_{CC} + 0.3)$ | V |
| Output Current (All Outputs) | I_{out} | 20 | mA |
| Input Current (V_{CC} and GND) | I_{in} | 20 | mA |
| Thermal Resistance Junction-to-Air | $R_{\theta JA}$ | 248 187 | $^{\circ}C/W$ |
| | | Micro8 SOIC-8 | |
| Operating Ambient Temperature | T_A | -40 to +85 | $^{\circ}C$ |
| Storage Temperature Range | T_{stg} | -40 to +125 | $^{\circ}C$ |
| LatchUp Performance | $I_{LATCHUP}$ | 300 280 | mA |
| | | Positive Negative | |

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

- This device series contains ESD protection and exceeds the following tests:
Human Body Model 2000 V per MIL-STD-883, Method 3015.
Machine Model Method 200 V.
- The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}} \quad \text{with } T_{J(max)} = 150^{\circ}C$$

MAX707, MAX708

ELECTRICAL CHARACTERISTICS ($V_{CC} = 1.0 \text{ V to } 5.5 \text{ V}$, $T_A = -40^\circ\text{C to } +85^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = 25^\circ\text{C}$, $V_{CC} = 3.3 \text{ V}$.)

MAX707, MAX708

PIN DESCRIPTION (Pin No. with parentheses is for Micro8 package.)

| Pin No. | Symbol | Description |
|---------|--------------------|---|
| 1 (3) | \overline{MR} | Manual Reset Input. \overline{MR} can be driven from TTL/CMOS logic or from a manual Reset switch. This input, when floating, is internally pulled up to V_{CC} with 50 k Ω resistor. |
| 2 (4) | V_{CC} | Supply Voltage: C = 100 nF is recommended as a bypass capacitor between V_{CC} and GND. |
| 3 (5) | GND | Ground Reference |
| 4 (6) | PFI | Power Fail Voltage Monitor Input. When PFI is less than 1.25 V, \overline{PFO} goes low. Connect PFI to GND or V_{CC} when not used. |
| 5 (7) | \overline{PFO} | Power Fail Monitor Output. When PFI is less than 1.25 V, it goes low and sinks current. Otherwise, it remains high. |
| 6 (8) | NC | Non-connective Pin |
| 7 (1) | \overline{RESET} | Active Low \overline{RESET} can be triggered by V_{CC} below the threshold level or by a low signal on \overline{MR} . It remains low for 200 ms (typ.) after V_{CC} rises above the reset threshold. |
| 8 (2) | RESET | Active high RESET output the inverse of \overline{RESET} one. |

MAX707, MAX708

APPLICATIONS INFORMATION

Microprocessor Reset

To generate a processor reset, the manual Reset input allows different reset sources. A pushbutton switch can be

one of these. It is effectively debounced by the 1.0 μs minimum reset pulse width. As $\overline{\text{MR}}$ is TTL/CMOS logic compatible, it can be driven by an external logic line.

Figure 12. RESET and MR Timing

VCC Transient Rejection

The MAX707/708 provides accurate V_{CC} monitoring and reset timing during power-up, power-down, and brownout/sag conditions, and rejects negative glitches on the power supply line. Figure 13 shows the maximum transient duration vs. maximum negative excursion

(overdrive) for glitch rejection. For a given overdrive, the point of the curve is the maximum width of the glitch allowed before the device generates a reset signal. Transient immunity can be improved by adding a capacitor (100 nF for example) in close proximity to the V_{CC} pin of the MAX707/708.

Figure 13. Maximum Transient Duration vs. Overdrive for Glitch Rejection at 25°C

RESET Signal Integrity During Power-Down

The MAX707/708 $\overline{\text{RESET}}$ output is valid until V_{CC} falls below 1.0 V. Then, the output becomes an open circuit and no longer sinks current. This means CMOS logic inputs of the μP will be floating at an undetermined voltage. Most digital systems are completely shutdown well above this voltage. However, in the case $\overline{\text{RESET}}$ must be maintained valid to $V_{CC} = 0\text{ V}$, a pull down resistor must be connected from $\overline{\text{RESET}}$ to ground to discharge stray capacitances and hold the output low (Figure 14). This resistor value, though not critical, should be chosen large enough not to load $\overline{\text{RESET}}$ and small enough to pull it to ground. $R = 100\text{ k}\Omega$ will be suitable for most applications.

Figure 14. Ensuring $\overline{\text{RESET}}$ Valid to $V_{CC} = 0\text{ V}$

Interfacing with μPs with Bidirectional I/O Pins

Some μPs have bidirectional reset pins. If, for example, the $\overline{\text{RESET}}$ output is driven high and the μP wants to put it low, indeterminate logic level may result. This can be avoided by adding a 4.7 k Ω resistor in series with the output of the MAX707/708 (Figure 15). If there are other components in the system that require a reset signal, they should be buffered so as not to load the reset line.

components are required to follow the reset I/O of the μP , the buffer should be connected as shown with the solid line.

Figure 15. Interfacing to Bidirectional Reset I/O

Monitoring Additional Supply Levels

When connecting a voltage divider to PFI and adjusting it properly, you can monitor a voltage different than the unregulated DC one. As shown in Figure 16, to increase noise immunity, hysteresis may be added to the power-fail comparator just by a resistor between $\overline{\text{PFO}}$ and PFI. Not to unbalance the potential divider network, R3 should be 10 times the sum of the two resistors R1 and R2. If required, a capacitor between PFI and GND will reduce the sensitivity of the circuit to high-frequency noise on the line being monitored. The $\overline{\text{PFO}}$ output may be connected to $\overline{\text{MR}}$ input to generate a low level on the $\overline{\text{RESET}}$ when V_{CC_1} drops out of tolerance. Thus a $\overline{\text{RESET}}$ is generated when one of the two voltages is below its threshold level.

$$V_L = 1.25 + R1 \times \left(\frac{1.25}{R2} + \frac{1.25 - V_{CC_2}}{R3} \right)$$

$$V_H = 1.25 \times \left(1 + R1 \times \left(\frac{R2 + R3}{R2 \times R3} \right) \right)$$

$$V_{HYS} = V_H - V_L = \frac{R1 \times V_{CC_2}}{R3}$$

Figure 16. Monitoring Additional Supply Levels

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
