

## FEATURES

Next generation of the [AD822](#)

Wide bandwidth: 8 MHz typical

High slew rate: +23 V/μs/–18 V/μs typical

Low input bias current: ±10 pA maximum at T<sub>A</sub> = 25°C

Low offset voltage

A grade: ±0.8 mV maximum at T<sub>A</sub> = 25°C

B grade: ±0.35 mV maximum at T<sub>A</sub> = 25°C

Low offset voltage drift

A grade: ±2 μV/°C typical, ±15 μV/°C maximum

B grade: ±2 μV/°C typical, ±5 μV/°C maximum

Input voltage range includes Pin V–

Rail-to-rail output

Input electromagnetic interference (EMI) filters

90 dB typical at f = 1000 MHz and f = 2400 MHz

Industry-standard package and pinouts

## APPLICATIONS

High output impedance sensor interfaces

Photodiode sensor interfaces

Transimpedance amplifiers

ADC drivers

Precision filters and signal conditioning

## GENERAL DESCRIPTION

The [ADA4622-2](#) is the next generation of the [AD822](#) single-supply, rail-to-rail output (RRO), precision junction field effect transistors (JFET) input op amp. The [ADA4622-2](#) includes many improvements that make it desirable as an upgrade without compromising the flexibility and ease of use that makes the [AD822](#) useful for a wide variety of applications.

The input voltage range includes the negative supply and the output swings rail-to-rail. Input EMI filters are added to increase the signal robustness in the face of closely located switching noise sources.

The speed in terms of bandwidth and slew rate is increased along with a strong output drive to improve settling time performance and enable the device to drive the inputs of modern single-ended, successive approximation register (SAR) analog-to-digital converters (ADCs).

## PIN CONFIGURATION

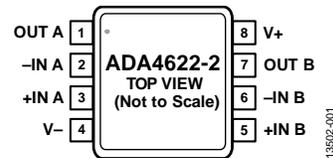

Figure 1. 8-Lead MSOP (RM Suffix) Pin Configuration (See the Pin Configurations and Function Descriptions Section for Additional Pin Configurations)

Voltage noise is reduced; broadband noise is reduced by 25% and 1/f is reduced by half while keeping the supply current the same as the [AD822](#). DC precision in the [ADA4622-2](#) improved from the [AD822](#) with half the offset and a maximum thermal drift specification added to the [ADA4622-2](#). The common-mode rejection ratio (CMRR) is improved from the [AD822](#) to make the [ADA4622-2](#) more suitable when used in noninverting gain and difference amplifier configurations.

The [ADA4622-2](#) is specified for operation over the extended industrial temperature range of –40°C to +125°C and operates from 5 V to 30 V with specifications at +5 V, ±5 V, and ±15 V. The [ADA4622-2](#) is available in 8-lead SOIC, 8-lead MSOP, and 8-lead LFCSP packages.

## ABSOLUTE MAXIMUM RATINGS

Table 4.

Parameter	Rating
Supply Voltage	36 V
Input Voltage	(V <sub>-</sub> ) - 0.3 V to (V <sub>+</sub> ) + 0.2 V
Differential Input Voltage	36 V
Storage Temperature Range	-65°C to +150°C
Operating Temperature Range	-40°C to +125°C
Junction Temperature Range	-65°C to +150°C
Lead Temperature, Soldering (10 sec)	300°C
ESD Rating, Human Body Model (HBM)	4 kV

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Close attention to PCB thermal design is required.

Table 5. Thermal Resistance<sup>1</sup>

Package Type	$\theta_{JA}$	Unit

2-Layer JEDEC Board with 2 × 2 Vias	55	°C/W

<sup>1</sup> Thermal impedance simulated values are based on a JEDEC thermal test board. See JEDEC JESD51.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

### THEORY OF OPERATION

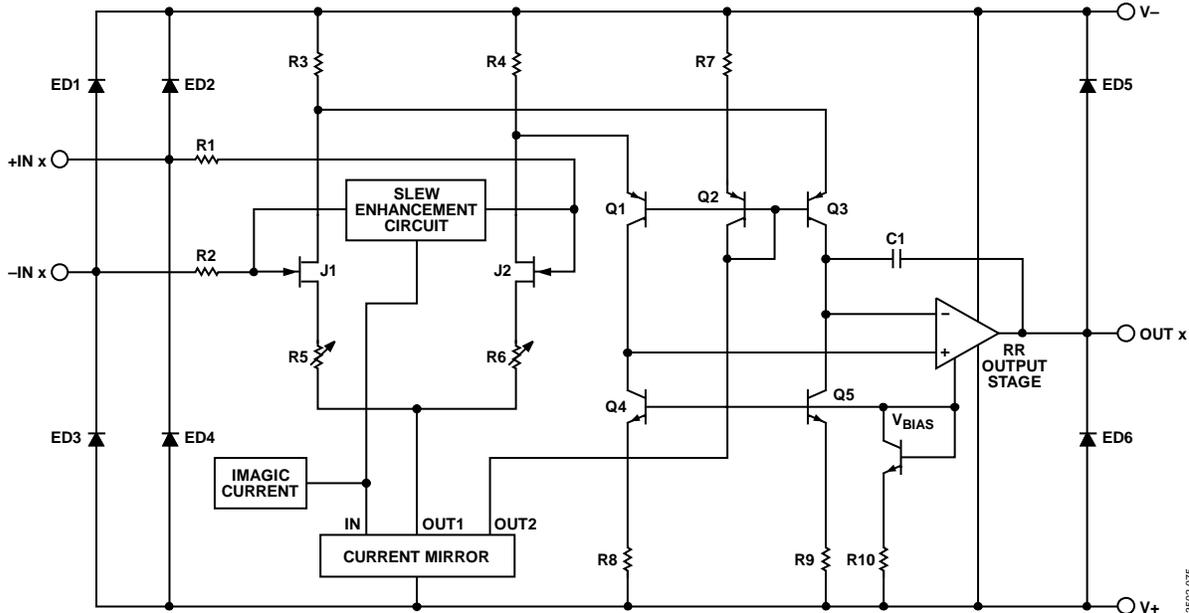

Figure 74. Simplified Circuit Diagram

### INPUT CHARACTERISTICS

The ADA4622-2 input stage consists of N-channel, JFETs that provide low offset, low noise, and high impedance. The minimum input common-mode voltage extends from  $-0.2\text{ mV}$  below  $V-$  to  $1\text{ V}$  less than  $V+$ . Driving the input closer to the positive rail causes loss of amplifier bandwidth and increased common-mode voltage error. Figure 75 shows the rounding of the output due to the loss of bandwidth. The input and output are superimposed.

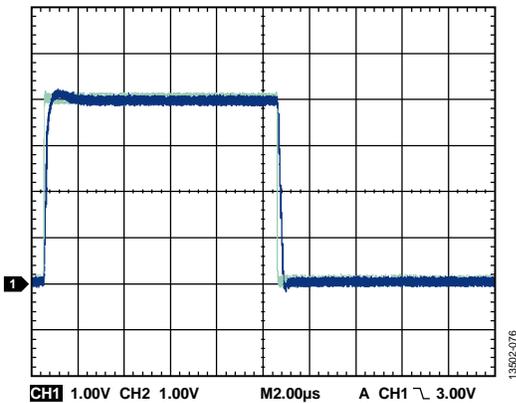

Figure 75. Bandwidth Limiting due to Headroom Requirements

The ADA4622-2 does not exhibit phase reversal for input voltages up to  $V+$ . For input voltages greater than  $V+$ , a  $10\text{ k}\Omega$  resistor in series with the noninverting input prevents phase reversal at the expense of higher noise (see Figure 76).

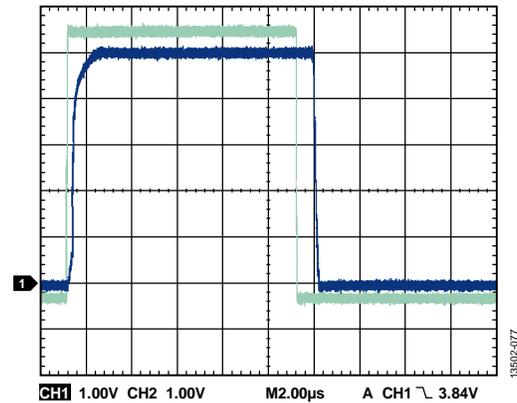

Figure 76. No Phase Reversal

Because the input stage uses N-channel JFETs, the input current during normal operation is negative. However, the input bias current changes direction as the input voltage approaches  $V+$  due to internal junctions becoming forward biased (see Figure 77).

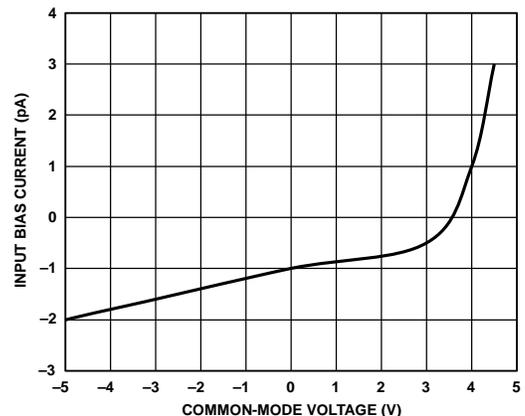

Figure 77. Input Bias Current vs. Common-Mode Voltage with  $\pm 5\text{ V}$  Supply

The ADA4622-2 is designed for 12 nV/ $\sqrt{\text{Hz}}$  wideband input voltage noise density and maintains low noise performance at low frequencies (see Figure 78). This noise performance, along with the low input current as well as low current noise, means that the ADA4622-2 contributes negligible noise for applications with a source resistance greater than 10 k $\Omega$  and at signal bandwidths greater than 1 kHz.

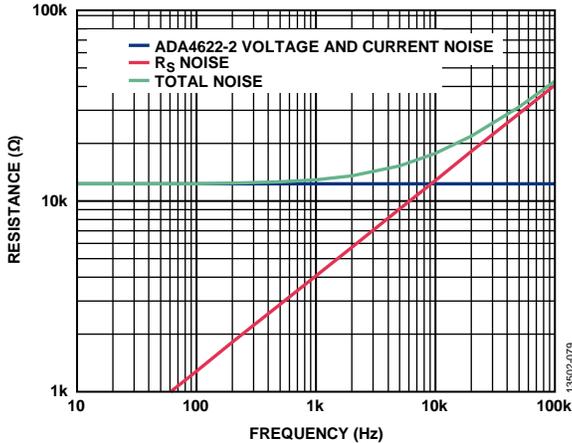

Figure 78. Total Noise vs. Source Resistance

**Input Overvoltage Protection**

The ADA4622-2 has internal protective circuitry that allows voltages as high as 0.3 V beyond the supplies applied at the input of either terminal without causing damage. Use a current limiting resistor in series with the input of the ADA4622-2 if the input voltage exceeds 0.3 V beyond the amplifier supply rails. If the overvoltage condition persists for more than a few seconds, the amplifier can be damaged.

For higher input voltages, determine the resistor value by

$$\frac{V_{IN} - V_{SY}}{R_s} \leq 10 \text{ mA}$$

where:

$V_{IN}$  is the input voltage.

$V_{SY}$  is the voltage of either the V+ pin or the V- pin.

$R_s$  is the series resistor.

With a very low input bias current of  $\pm 1.5$  nA maximum up to 125°C, higher resistor values can be used in series with the inputs without introducing large offset errors. A 1 k $\Omega$  series resistor allows the ADA4622-2 to withstand 10 V of continuous overvoltage and increases the noise by a negligible amount. A 5 k $\Omega$  resistor protects the inputs from voltages as high as 25 V beyond the supplies and adds less than 10  $\mu\text{V}$  to the amplifier offset voltage.

**EMI Rejection Ratio**

Figure 79 shows the electromagnetic interference rejection ratio (EMIRR) vs. frequency for the ADA4622-2.

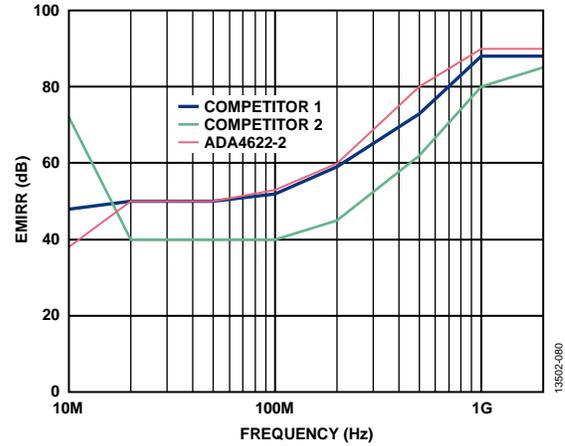

Figure 79. EMI Rejection Ratio (EMIRR) vs. Frequency

**OUTPUT CHARACTERISTICS**

The ADA4622-2 unique bipolar rail-to-rail output stage swings within 10 mV of the supplies with no external resistive load.

The ADA4622-2 approximate output saturation resistance is 24  $\Omega$ , sourcing or sinking. Use the output impedance to estimate the output saturation voltage when driving heavier loads. As an example, when driving 5 mA, the saturation voltage from either rail is roughly 120 mV.

If the ADA4622-2 output drives hard against the output saturation voltage, it recovers within 1.2  $\mu\text{s}$  of the input, returning to the linear operating region of the amplifier (see Figure 51 and Figure 54).

**Capacitive Load Drive Capability**

Direct capacitive loads interact with the effective output impedance of the ADA4622-2 to form an additional pole in the amplifier feedback loop, which causes excessive peaking on the pulse response or loss of stability. The worst case condition is when the device uses a single 5 V supply in a unity-gain configuration. Figure 80 shows the pulse response of the ADA4622-2 driving 500 pF directly.

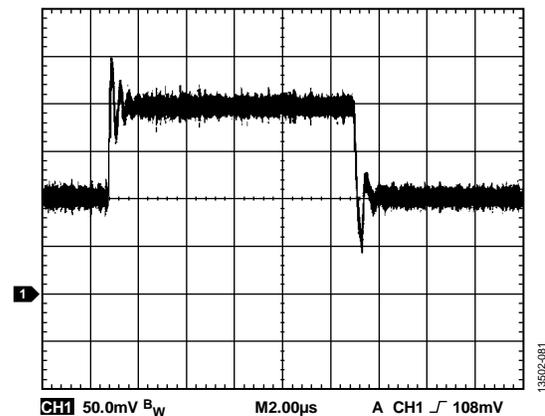

Figure 80. Pulse Response with 500 pF Load Capacitance

# APPLICATIONS INFORMATION

## RECOMMENDED POWER SOLUTION

The ADA4622-2 can be operated from ±2.5 V to ±15 volt dual supply or 5 V to 30 V single supply. The ADP7118 and ADP7182 are recommended to generate the clean positive and negative rails for the ADA4622-2. Both low dropout regulators (LDOs) are available in fixed output voltage or adjustable output voltage versions. To generate the input voltages for the LDOs, the ADP5070 dc-to-dc switching regulator is recommended. Figure 81 shows the recommended power solution configuration for the ADA4622-2.

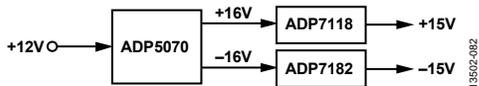

Figure 81. Power Solution Configuration for the ADA4622-2

Table 8. Recommended Power Management Devices

Product	Description
ADP5070	DC-to-DC switching regulator with independent positive and negative outputs
ADP7118	20 V, 200 mA, low noise, CMOS LDO regulator
ADP7182	-28 V, -200 mA, low noise, linear regulator

## MAXIMUM POWER DISSIPATION

The maximum power the ADA4622-2 can safely dissipate is limited by the associated rise in junction temperature. For plastic packages, the maximum safe junction temperature is 150°C. If this maximum temperature is exceeded, reduce the die temperature to restore proper circuit operation. Leaving the device in the overheated condition for an extended period can result in device burnout. To ensure proper operation, it is important to observe the Absolute Maximum Ratings and Thermal Resistance specifications.

## SECOND-ORDER LOW-PASS FILTER

Figure 82 shows the ADA4622-2 configured as a second-order, Butterworth, low-pass filter. With the values as shown, the corner frequency equals 200 kHz. Component selection is shown in the following equations:

$$R1 = R2 = \text{User Selected (Typical Values: 10 k}\Omega \text{ to 100 k}\Omega)$$

$$C1 = \frac{1.414}{2\pi f_{CUTOFF} \times R1}$$

$$C2 = \frac{0.707}{2\pi f_{CUTOFF} \times R1}$$

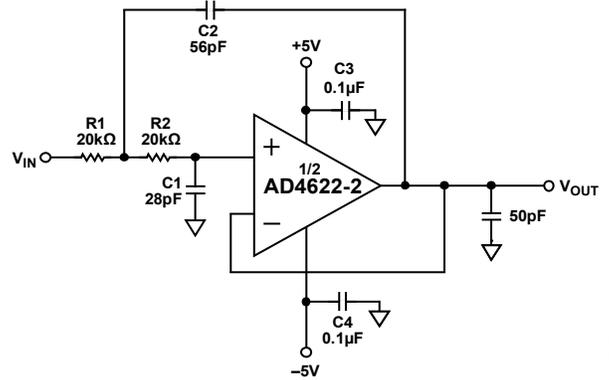

Figure 82. Second-Order, Butterworth, Low-Pass Filter

A plot of the filter is shown in Figure 83; greater than 35 dB of high frequency rejection is achieved.

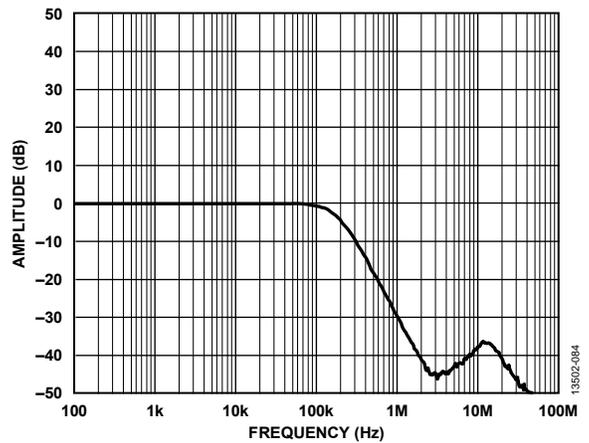

Figure 83. Frequency Response of the Filter

## WIDEBAND PHOTODIODE PREAMPLIFIER

The ADA4622-2 is an excellent choice for photodiode preamplifier application. The low input bias current minimizes the dc error at the preamplifier output. In addition, the high gain bandwidth product and low input capacitance maximizes the signal bandwidth of the photodiode preamplifier. Figure 84 shows the ADA4622-2 as a current to voltage (I to V) converter with an electrical model of a photodiode.

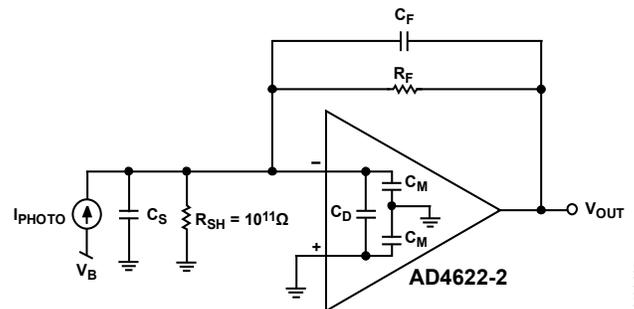

Figure 84. Wideband Photodiode Preamplifier

The transimpedance gain of the photodiode preamplifier is described by the following basic transfer function:

$$V_{OUT} = \frac{I_{PHOTO} \times R_F}{1 + sC_F R_F}$$

where

$I_{PHOTO}$  is the output current of the photodiode.

The parallel combination of  $R_F$  and  $C_F$  sets the signal bandwidth (see the I to V gain curve in Figure 86).

$s$  refers to the s-plane.

Note that  $R_F$  must be set so the maximum attainable output voltage corresponds to the maximum diode output current,  $I_{PHOTO}$ , which allows use of the full output swing. The attainable signal bandwidth with this photodiode preamplifier is a function of  $R_F$ , the gain bandwidth product ( $f_{GBP}$ ) of the amplifier, and the total capacitance at the amplifier summing junction, including  $C_S$  and the amplifier input capacitance,  $C_D$  and  $C_M$ .  $R_F$  and the total capacitance produce a pole with loop frequency ( $f_p$ ).

$$f_p = \frac{1}{2\pi R_F C_S}$$

With the additional pole from the amplifier open-loop response, the two-pole system results in peaking and instability due to an insufficient phase margin (see Figure 85).

Adding  $C_F$  creates a zero in the loop transmission that compensates for the effect of the input pole. This stabilizes the photodiode preamplifier design because of the increased phase margin. Adding  $C_F$  also sets the signal bandwidth (see Figure 86). The signal bandwidth and the zero frequency are determined by

$$f_z = \frac{1}{2\pi R_F C_F}$$

where  $f_z$  is the zero frequency.

Setting the zero at the  $f_x$  frequency maximizes the signal bandwidth with a 45° phase margin. Because  $f_x$  is the geometric mean of  $f_p$  and  $f_{GBP}$ , it can be calculated by

$$f_x = \sqrt{f_p \times f_{GBP}}$$

Combining these equations, the value of  $C_F$  that produces  $f_x$  is defined by

$$C_F = \sqrt{\frac{C_S}{2\pi \times R_F \times f_{GBP}}}$$

The frequency response in this case shows about 2 dB of peaking and 15% overshoot. Doubling  $C_F$  and halving the bandwidth results in a flat frequency response with about 5% transient overshoot.

The dominant sources of output noise in the wideband photodiode preamplifier design are the input voltage noise of the amplifier,  $V_{NOISE}$ , and the resistor noise due to  $R_F$ . The gray curve in Figure 86 shows the noise gain over frequencies for the photodiode preamplifier. Calculate the noise bandwidth at the  $f_N$  frequency by

$$f_N = \frac{f_{GBP}}{(C_S + C_F)/C_F}$$

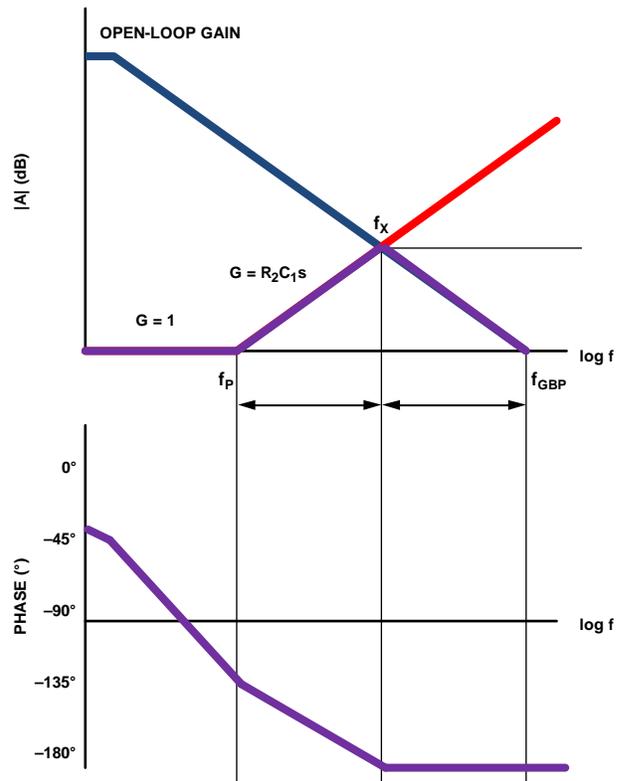

Figure 85. Gain and Phase Plot of the Transimpedance Amplifier Design, Without Compensation

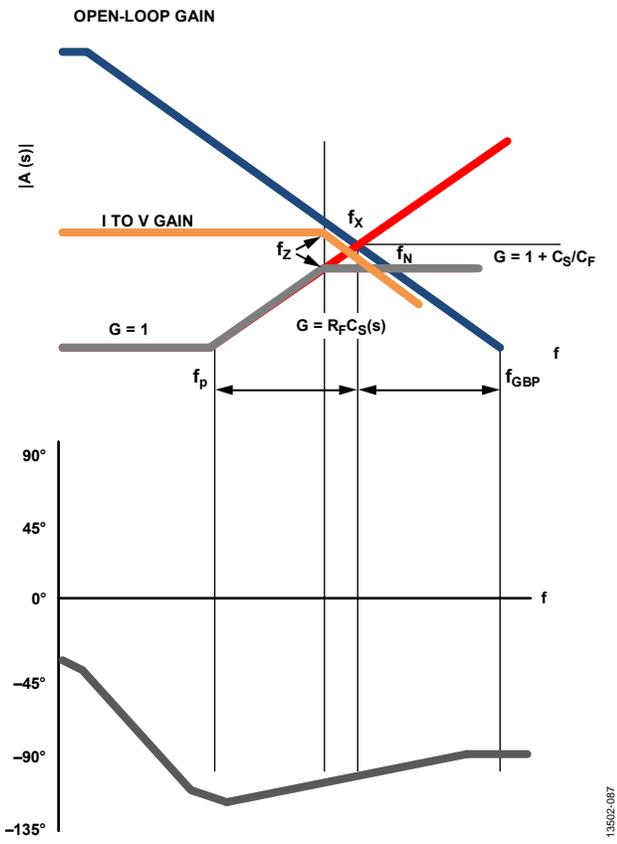

Figure 86. Gain and Phase Plot of the Transimpedance Amplifier Design with Compensation

Figure 87 shows the ADA4622-2 configured as a transimpedance photodiode amplifier. The amplifier is used in conjunction with a photodiode detector with an input capacitance of 5 pF. Figure 88 shows the transimpedance response of the ADA4622-2 when I<sub>PHOTO</sub> is 1 μA p-p. The amplifier has a bandwidth of 2 MHz when it is maximized for a 45° phase margin with C<sub>F</sub> = 2 pF. Note that with the PCB parasitics added to C<sub>F</sub>, the peaking is only 0.5 dB and the bandwidth is slightly reduced.

Increasing C<sub>F</sub> to 3 pF completely eliminates the peaking. However, increasing C<sub>F</sub> to 3 pF reduces the bandwidth to 1 MHz.

Table 9 shows the noise sources and total output noise for the photodiode preamplifier, where the preamplifier is configured to have a 45° phase margin for maximum bandwidth and f<sub>Z</sub> = f<sub>X</sub> = f<sub>N</sub> in this case.

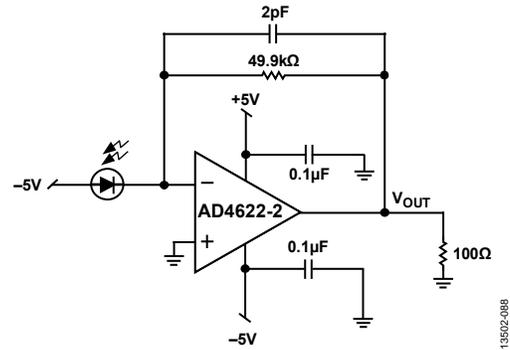

Figure 87. Photodiode Preamplifier

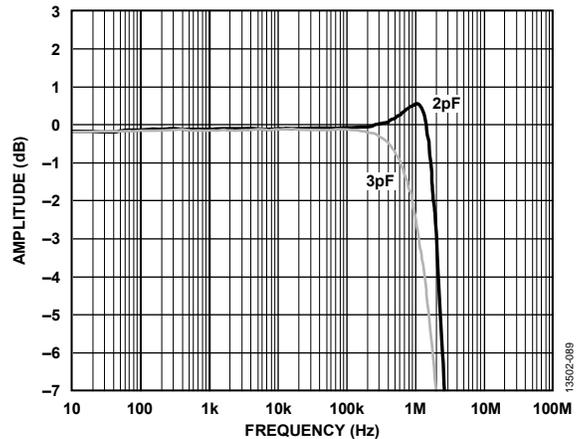

Figure 88. Photodiode Preamplifier Frequency Response

Table 9. RMS Noise Contributions of the Photodiode Preamplifier

Contributor	Expression	RMS Noise (μV) <sup>1</sup>
R <sub>F</sub>	$\sqrt{4kT \times R_F \times f_N \times \frac{\pi}{2}}$	50.8
V <sub>NOISE</sub>	$V_{NOISE} \times \sqrt{\frac{(C_S + C_M + C_F + C_D)}{C_F}} \times \sqrt{\frac{\pi}{2} \times f_N}$	131.6
Root Sum Square (RSS) Total	$\sqrt{R_F^2 \times V_{NOISE}^2}$	141

<sup>1</sup> RMS noise with R<sub>F</sub> = 50 kΩ, C<sub>S</sub> = 5 pF, C<sub>F</sub> = 2 pF, C<sub>M</sub> = 3.7 pF, and C<sub>D</sub> = 0.4 pF.

**PEAK DETECTOR**

A peak detector captures the peak value of a signal and produces an output equal to it. By taking advantage of the dc precision and super low input bias current of the JFET input amplifiers, such as the ADA4622-2, a highly accurate peak detector can be built, as shown in Figure 89.

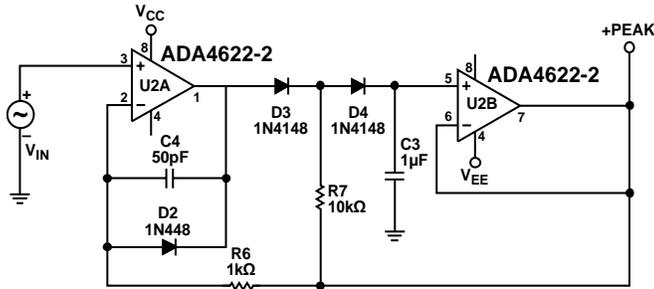

Figure 89. Positive Peak Detector

13802-090

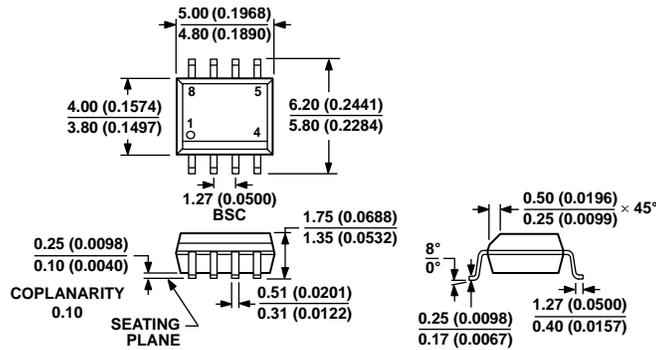

In this application, D3 and D4 act as unidirectional current switches that open when the output is kept constant in hold mode.

To detect a positive peak, U2A drives C3 through D3 and drives D4 until C3 is charged to a voltage equal to the input peak value.

Feedback from the output of the U2B (positive peak) through R6 limits the output voltage of U2A. After detecting the peak, the output of U2A swings low but is clamped by D2. D3 reverses bias and the common node of D3, D4, and R7 is held to a voltage equal to positive peak by R7. The voltage across D4 is 0 V; therefore, the leakage is small. The bias current of U2B is also small. With almost no leakage, C3 has a long hold time.

The ADA4622-2, shown in Figure 89, is a perfect fit for building a peak detector because U2A requires dc precision and high output current during fast peaks and U2B requires low input bias current ( $I_B$ ) to minimize capacitance discharge between peaks. A low leakage and low dielectric absorption capacitor, such as polystyrene or polypropylene, is required for C3. Reversing the diode directions causes the circuit to detect negative peaks.

<sup>1</sup> Z = RoHS Compliant Part.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
