

nRF52811

Product Specification

v1.0

Feature list

Features:

- **Bluetooth[®] 5.1**, IEEE 802.15.4-2006, 2.4 GHz transceiver
 - -97 dBm sensitivity in 1 Mbps **Bluetooth[®]** low energy mode
 - -104 dBm sensitivity in 125 kbps **Bluetooth[®]** low energy mode (long range)
 - -20 to +4 dBm TX power, configurable in 4 dB steps
 - On-air compatible with nRF52, nRF51, nRF24L, and nRF24AP Series
 - Supported data rates:
 - **Bluetooth[®] 5.1**: 2 Mbps, 1 Mbps, 500 kbps, and 125 kbps
 - IEEE 802.15.4-2006: 250 kbps
 - Proprietary 2.4 GHz: 2 Mbps, 1 Mbps
 - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using **Bluetooth[®]**.
 - Single-ended antenna output (on-chip balun)
 - 4.6 mA peak current in TX (0 dBm)
 - 4.6 mA peak current in RX
 - RSSI (1 dB resolution)
- **ARM[®] Cortex[®]-M4** 32-bit processor, 64 MHz
 - 144 EEMBC CoreMark[®] score running from flash memory
 - 34.4 μ A/MHz running CoreMark from flash memory
 - 32.8 μ A/MHz running CoreMark from RAM memory
 - Serial wire debug (SWD)
- Flexible power management
 - 1.7 V to 3.6 V supply voltage range
 - Fully automatic LDO and DC/DC regulator system
 - Fast wake-up using 64 MHz internal oscillator
 - 0.3 μ A at 3 V in System OFF mode, no RAM retention
 - 0.5 μ A at 3 V in System OFF mode with full 24 kB RAM retention
 - 1.5 μ A at 3 V in System ON mode, with full 24 kB RAM retention, wake on RTC
 - 1.4 μ A at 3 V in System ON mode, no RAM retention, wake on RTC
- 192 kB flash and 24 kB RAM
- Nordic SoftDevice ready
- Support for concurrent multi-protocol
- 12-bit, 200 ksps ADC - 8 configurable channels with programmable gain
- 64 level comparator
- Temperature sensor
- Up to 32 general purpose I/O pins
- 4-channel pulse width modulator (PWM) unit with EasyDMA
- Digital microphone interface (PDM)
- 3x 32-bit timer with counter mode
- 2x SPI master/slave with EasyDMA
- I2C compatible 2-wire master/slave
- UART (CTS/RTS) with EasyDMA
- Programmable peripheral interconnect (PPI)
- Quadrature decoder (QDEC)
- AES HW encryption with EasyDMA
- 2x real-time counter (RTC)
- Single crystal operation
- Package variants
 - QFN48 package, 6 x 6 mm
 - QFN32 package, 5 x 5 mm
 - WLCSP package, 2.482 x 2.464 mm

Applications:

- Computer peripherals and I/O devices
 - Mouse
 - Keyboard
 - Mobile HID
- CE remote controls
- Network processor
 - Wearables
 - Virtual reality headsets
- Health and medical
- Enterprise lighting
 - Industrial
 - Commercial
 - Retail
- Beacons
- Connectivity device in multi-chip solutions

1 Revision history

| Date | Version | Description |
|---------------|---------|---------------|
| February 2019 | 1.0 | First release |

2 About this document

This product specification is organized into chapters based on the modules and peripherals that are available in this IC.

The peripheral descriptions are divided into separate sections that include the following information:

- A detailed functional description of the peripheral
- Register configuration for the peripheral
- Electrical specification tables, containing performance data which apply for the operating conditions described in [Recommended operating conditions](#) on page 436.

2.1 Document naming and status

Nordic uses three distinct names for this document, which are reflecting the maturity and the status of the document and its content.

| Document name | Description |
|---|---|
| Objective Product Specification (OPS) | Applies to document versions up to 0.7. This product specification contains target specifications for product development. |
| Preliminary Product Specification (PPS) | Applies to document versions 0.7 and up to 1.0. This product specification contains preliminary data. Supplementary data may be published from Nordic Semiconductor ASA later. |
| Product Specification (PS) | Applies to document versions 1.0 and higher. This product specification contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |

Table 1: Defined document names

2.2 Peripheral naming and abbreviations

Every peripheral has a unique capitalized name or an abbreviation of its name, e.g. TIMER, used for identification and reference. This name is used in chapter headings and references, and it will appear in the ARM[®] Cortex[®] Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

The peripheral instance name, which is different from the peripheral name, is constructed using the peripheral name followed by a numbered postfix, starting with 0, for example, TIMER0. A postfix is normally only used if a peripheral can be instantiated more than once. The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

2.3 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

2.3.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value id in the **Value Id** column.

A blank space means that the field is reserved and read as undefined, and it also must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column. The **Value Id** may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, e.g. true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, e.g. [0..4], indicating all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value Id**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..'.

A feature marked **Deprecated** should not be used for new designs.

2.4 Registers

| Register | Offset | Description |
|----------|--------|---|
| DUMMY | 0x514 | Example of a register controlling a dummy feature |

Table 2: Register overview

2.4.1 DUMMY

3 Block diagram

This block diagram illustrates the overall system. Arrows with white heads indicate signals that share physical pins with other signals.

Figure 1: Block diagram

4 Core components

4.1 CPU

The ARM[®] Cortex[®]-M4 processor has a 32-bit instruction set (Thumb[®]-2 technology) that implements a superset of 16- and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing including:

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8 and 16-bit single instruction multiple data (SIMD) instructions

The ARM Cortex Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer for the ARM Cortex processor series is implemented and available for the M4 CPU.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the nested vectored interrupt controller (NVIC).

Executing code from flash will have a wait state penalty on the nRF52 Series. The section [Electrical specification](#) on page 15 shows CPU performance parameters including wait states in different modes, CPU current and efficiency, and processing power and efficiency based on the CoreMark[®] benchmark.

The ARM System Timer (SysTick) is present on the device. The SysTick's clock will only tick when the CPU is running or when the system is in debug interface mode.

4.1.1 Electrical specification

4.1.1.1 CPU performance

The CPU clock speed is 64 MHz. Current and efficiency data is taken when in System ON and the CPU is executing the CoreMark[®] benchmark. It includes power regulator and clock base currents. All other blocks are IDLE.

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------|--|------|------|------|------------------|
| W _{FLASH} | CPU wait states, running from flash | 0 | | 2 | |
| W _{RAM} | CPU wait states, running from RAM | | | 0 | |
| CM _{FLASH} | CoreMark ¹ , running from flash | | 144 | | CoreMark |
| CM _{FLASH/MHz} | CoreMark per MHz, running from flash | | 2.25 | | CoreMark/ MHz |
| CM _{FLASH/mA} | CoreMark per mA, running from flash, DCDC 3V | | 65 | | CoreMark/ mA |

4.1.2 CPU and support module configuration

The ARM[®] Cortex[®]-M4 processor has a number of CPU options and support modules implemented on the device.

¹ Using IAR v6.50.1.4452 with flags --endian=little --cpu=Cortex-M4 -e --fpu=VFPv4_sp --Ohs --no_size_constraints

| Option / Module | Description | Implemented |
|-----------------|---------------------------------------|---------------|
| Core options | | |
| NVIC | Nested vector interrupt controller | 30 vectors |
| PRIORITIES | Priority bits | 3 |
| WIC | Wakeup interrupt controller | NO |
| Endianness | Memory system endianness | Little endian |
| Bit-banding | Bit banded memory | NO |
| DWT | Data watchpoint and trace | NO |
| SysTick | System tick timer | YES |
| Modules | | |
| MPU | Memory protection unit | YES |
| FPU | Floating-point unit | NO |
| DAP | Debug access port | YES |
| ETM | Embedded trace macrocell | NO |
| ITM | Instrumentation trace macrocell | NO |
| TPIU | Trace port interface unit | NO |
| ETB | Embedded trace buffer | NO |
| FPB | Flash patch and breakpoint unit | YES |
| HTM | AMBA [®] AHB trace macrocell | NO |

4.2 Memory

The nRF52811 contains flash and RAM that can be used for code and data storage.

The amount of RAM and flash will vary depending on variant, see [Memory variants](#) on page 16.

| Device name | RAM | Flash | Comments |
|---------------|-------|--------|----------|
| nRF52811-QFAA | 24 kB | 192 kB | |
| nRF52811-QCAA | 24 kB | 192 kB | |
| nRF52811-CAAA | 24 kB | 192 kB | |

Table 3: Memory variants

The CPU and peripherals with EasyDMA can access memory via the AHB multilayer interconnect. The CPU is also able to access peripherals via the AHB multilayer interconnect, as illustrated in [Memory layout](#) on page 17.

Figure 2: Memory layout

See [AHB multilayer](#) on page 37 and [EasyDMA](#) on page 35 for more information about the AHB multilayer interconnect and the EasyDMA.

The same physical RAM is mapped to both the Data RAM region and the Code RAM region. It is up to the application to partition the RAM within these regions so that one does not corrupt the other.

4.2.1 RAM - Random access memory

The RAM interface is divided into multiple RAM AHB slaves.

Each RAM AHB slave is connected to two 4-kilobyte RAM sections, see Section 0 and Section 1 in [Memory layout](#) on page 17.

Each of the RAM sections have separate power control for System ON and System OFF mode operation, which is configured via RAM register (see the [POWER — Power supply](#) on page 48).

4.2.2 Flash - Non-volatile memory

The flash can be read an unlimited number of times by the CPU, but it has restrictions on the number of times it can be written and erased, and also on how it can be written.

Writing to flash is managed by the non-volatile memory controller (NVMC), see [NVMC — Non-volatile memory controller](#) on page 19.

The flash is divided into multiple 4 kB pages that can be accessed by the CPU via both the ICODE and DCODE buses as shown in, [Memory layout](#) on page 17. Each page is divided into 8 blocks.

4.2.3 Memory map

The complete memory map is shown in [Memory map](#) on page 18. As described in [Memory](#) on page 16, Code RAM and Data RAM are the same physical RAM.

Figure 3: Memory map

4.2.4 Instantiation

| ID | Base address | Peripheral | Instance | Description | |
|----|--------------|------------|----------|--|------------|
| 0 | 0x40000000 | BPROT | BPROT | Block protect | |

| 29 | 0x4001D000 | PDM | PDM | Pulse-density modulation (digital microphone interface) |
| 30 | 0x4001E000 | NVMC | NVMC | Non-volatile memory controller |
| 31 | 0x4001F000 | PPI | PPI | Programmable peripheral interconnect |
| N/A | 0x10000000 | FICR | FICR | Factory information configuration |
| N/A | 0x10001000 | UICR | UICR | User information configuration |

Table 4: Instantiation table

4.3 NVMC — Non-volatile memory controller

The non-volatile memory controller (NVMC) is used for writing and erasing of the internal flash memory and the UICR (user information configuration registers).

The `CONFIG` on page 21 is used to enable the NVMC for writing (`CONFIG.WEN`) and erasing (`CONFIG.EEN`). The user must make sure that writing and erasing are not enabled at the same time. Having both enabled at the same time may result in unpredictable behavior.

The CPU must be halted before initiating a NVMC operation from the debug system.

4.3.1 Writing to flash

When writing is enabled, full 32-bit words are written to word-aligned addresses in flash.

As illustrated in [Memory](#) on page 16, the flash is divided into multiple pages. The same 32-bit word in the flash can only be written n_{WRITE} number of times before a page erase must be performed.

The NVMC is only able to write 0 to bits in the flash that are erased (set to 1). It cannot rewrite a bit back to 1. Only full 32-bit words can be written to flash using the NVMC interface. To write less than 32 bits, write the data as a full 32-bit word and set all the bits that should remain unchanged in the word to 1. Note that the restriction on the number of writes (n_{WRITE}) still applies in this case.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a hard fault.

The time it takes to write a word to flash is specified by t_{WRITE} . The CPU is halted while the NVMC is writing to the flash.

4.3.2 Erasing a page in flash

When erase is enabled, the flash memory can be erased page by page using the `ERASEPAGE` on page 21.

After erasing a flash page, all bits in the page are set to 1. The time it takes to erase a page is specified by $t_{\text{ERASEPAGE}}$. The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the flash.

See [Partial erase of a page in flash](#) on page 20 for information on dividing the page erase time into shorter chunks.

4.3.3 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as flash. After UICR has been written, the new UICR configuration will take effect after a reset.

UICR can only be written n_{WRITE} number of times before an erase must be performed using [ERASEUICR](#) on page 23 or [ERASEALL](#) on page 22. The time it takes to write a word to UICR is specified by t_{WRITE} . The CPU is halted while the NVMC is writing to the UICR.

4.3.4 Erasing user information configuration registers (UICR)

When erase is enabled, UICR can be erased using the [ERASEUICR](#) on page 23.

After erasing UICR all bits in UICR are set to 1. The time it takes to erase UICR is specified by $t_{\text{ERASEPAGE}}$. The CPU is halted if the CPU executes code from the flash while the NVMC performs the erase operation.

4.3.5 Erase all

When erase is enabled, flash and UICR can be erased completely in one operation by using [ERASEALL](#) on page 22. This operation will not erase the factory information configuration registers (FICR).

The time it takes to perform an [ERASEALL](#) command is specified by t_{ERASEALL} . The CPU is halted if the CPU executes code from the flash while the NVMC performs the erase operation.

4.3.6 Partial erase of a page in flash

Partial erase is a feature in the NVMC to split a page erase time into shorter chunks, so this can be used to prevent longer CPU stalls in time-critical applications. Partial erase is only applicable to the code area in the flash and does not work with UICR.

When erase is enabled, the partial erase of a flash page can be started by writing to [ERASEPAGEPARTIAL](#) on page 23. The duration of a partial erase can be configured in [ERASEPAGEPARTIALCFG](#) on page 23. A flash page is erased when its erase time reaches $t_{\text{ERASEPAGE}}$. Use [ERASEPAGEPARTIAL](#) N number of times so that $N * \text{ERASEPAGEPARTIALCFG} \geq t_{\text{ERASEPAGE}}$, where $N * \text{ERASEPAGEPARTIALCFG}$ gives the cumulative (total) erase time. Every time the cumulative erase time reaches $t_{\text{ERASEPAGE}}$, it counts as one erase cycle.

After the erase is done, all bits in the page are set to '1'. The CPU is halted if the CPU executes code from the flash while the NVMC performs the partial erase operation.

The bits in the page are undefined if the flash page erase is incomplete, i.e. if a partial erase has started but the total erase time is less than $t_{\text{ERASEPAGE}}$.

4.3.7 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--------------------------------|---------------|
| 0x4001E000 | NVMC | NVMC | Non-volatile memory controller | |

Table 5: Instances

| Register | Offset | Description | |
|---------------------|--------|--|------------|
| READY | 0x400 | Ready flag | |
| CONFIG | 0x504 | Configuration register | |
| ERASEPAGE | 0x508 | Register for erasing a page in code area | |
| ERASEPCR1 | 0x508 | Register for erasing a page in code area. Equivalent to ERASEPAGE. | Deprecated |
| ERASEALL | 0x50C | Register for erasing all non-volatile user memory | |
| ERASEPCR0 | 0x510 | Register for erasing a page in code area. Equivalent to ERASEPAGE. | Deprecated |
| ERASEUICR | 0x514 | Register for erasing user information configuration registers | |
| ERASEPAGEPARTIAL | 0x518 | Register for partial erase of a page in code area | |
| ERASEPAGEPARTIALCFG | 0x51C | Register for partial erase configuration | |

Table 6: Register overview

4.3.7.1 READY

Address offset: 0x400

Ready flag

| Bit number | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|--|----------|-------|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| A | RW | ERASEUICR | | | Register starting erase of all user information configuration registers. Note that the erase must be enabled using CONFIG.WEN before the UICR can be erased. | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | NoOperation | 0 | No operation | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | Erase | 1 | Start erase of UICR | | | | | | | | | | | | | | | | | | | | | | | | | | |

4.3.7.8 ERASEPAGEPARTIAL

Address offset: 0x518

Register for partial erase of a page in code area

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|---|------------------|----------|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| ID | A | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset 0x00000000 | 0 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acce | Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | RW | ERASEPAGEPARTIAL | | | Register for starting partial erase of a page in code area | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | The value is the address to the page to be partially erased (address of the first word in page). Note that the erase must be enabled using CONFIG.WEN before every erase page partial and disabled using CONFIG.WEN after every erase page partial. Attempts to erase pages that are outside the code area may result in undesirable behaviour, e.g. the wrong page may be erased. | | | | | | | | | | | | | | | | | | | | | | | | | | |

4.3.7.9 ERASEPAGEPARTIALCFG

Address offset: 0x51C

Register for partial erase configuration

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|---|----------|----------|-------|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| ID | A A A A A A A | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset 0x0000000A | 0 1 0 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acce | Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | RW | DURATION | | | Duration of the partial erase in milliseconds | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | The user must ensure that the total erase time is long enough for a complete erase of the flash page. | | | | | | | | | | | | | | | | | | | | | | | | | | |

4.3.8 Electrical specification

4.3.8.1 Flash programming

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------------|--|-------|------|----------|---------|
| n_{WRITE} | Number of times a 32-bit word can be written before erase | | | 2 | |
| $n_{ENDURANCE}$ | Erase cycles per page | 10000 | | | |
| t_{WRITE} | Time to write one 32-bit word | | | 41^2 | μs |
| $t_{ERASEPAGE}$ | Time to erase one page | | | 85^2 | ms |
| $t_{ERASEALL}$ | Time to erase all flash | | | 169^2 | ms |
| $t_{ERASEPAGEPARTIAL,acc}$ | Accuracy of the partial page erase duration. Total execution time for one partial page erase is defined as $ERASEPAGEPARTIALCFG * t_{ERASEPAGEPARTIAL,acc}$ | | | 1.05^2 | |

4.4 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

4.4.1 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-----------------------------------|---------------|
| 0x10000000 | FICR | FICR | Factory information configuration | |

4.5.1.4 PSELRESET[n] (n=0..1)

Address offset: $0x200 + (n \times 0x4)$

Mapping of the nRESET function (see POWER chapter for details)

All PSELRESET registers have to contain the same value for a pin mapping to be valid. If values are not the same, there will be no nRESET function exposed on a GPIO. As a result, the device will always start independently of the levels present on any of the GPIOs.

4.6 EasyDMA

EasyDMA is a module implemented by some peripherals to gain direct access to Data RAM.

EasyDMA is an AHB bus master similar to CPU and is connected to the AHB multilayer interconnect for direct access to Data RAM. EasyDMA is not able to access flash.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, for reading and writing of data between the peripheral and RAM. This concept is illustrated in [EasyDMA example](#) on page 35.

Figure 4: EasyDMA example

An EasyDMA channel is implemented in the following way, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels - one for reading called READER, and one for writing called WRITER. When the peripheral is started, it is assumed that the peripheral will:

- Read 5 bytes from the readerBuffer located in RAM at address 0x20000000.
- Process the data.
- Write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005.

The memory layout of these buffers is illustrated in [EasyDMA memory layout](#) on page 36.

| | | | | |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] | |

Figure 5: EasyDMA memory layout

The WRITER.MAXCNT register should not be specified larger than the actual size of the buffer (writerBuffer). Otherwise, the channel would overflow the writerBuffer.

Once an EasyDMA transfer is completed, the AMOUNT register can be read by the CPU to see how many bytes were transferred. For example, CPU can read MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

Note that the PTR register of a READER or WRITER must point to a valid memory region before use. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 16 for more information about the different memory regions and EasyDMA connectivity.

4.6.1 EasyDMA error handling

Some errors may occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur. An EasyDMA channel is an AHB master. Depending on the peripheral, the peripheral may either stall and wait for access to be granted, or lose data.

4.6.2 EasyDMA array list

EasyDMA is able to operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA Array List can be implemented by using the data structure `ArrayList_type` as illustrated in the code example below using a `READER` EasyDMA channel as an example:

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure only includes a buffer with size equal to the size of `READER.MAXCNT` register. EasyDMA uses the `READER.MAXCNT` register to determine when the buffer is full.

Figure 6: EasyDMA array list

4.7 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to the slave devices using an interconnection matrix. The bus masters are assigned priorities. Priorities are used to resolve access when two (or more) bus masters request access to the same slave device. The following applies:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted the access first.
- Bus masters with lower priority are stalled until the higher priority master has completed its transaction.
- If the higher priority master pauses at any point during its transaction, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- Bus masters that have the same priority are mutually exclusive, thus cannot be used concurrently.

Below is a list of bus masters in the system and their priorities.

| Bus master name | Description |
|-----------------|--------------------------------------|
| CPU | |
| SPIM0/SPIS0 | Same priority and mutually exclusive |
| RADIO | |
| CCM/ECB/AAR | Same priority and mutually exclusive |
| SAADC | |
| UARTE0 | |
| TWIM0/TWIS0 | Same priority and mutually exclusive |
| PDM | |
| PWM | |

Table 11: AHB bus masters (listed in priority order, highest to lowest)

Defined bus masters are the CPU and the peripherals with implemented EasyDMA, and the available slaves are RAM AHB slaves. How the bus masters and slaves are connected using the interconnection matrix is illustrated in [Memory](#) on page 16.

4.8 Debug

Debug system offers a flexible and powerful mechanism for non-intrusive debugging.

Figure 7: Overview

The main features of the debug system are:

- Two-pin serial wire debug (SWD) interface
- Flash patch and breakpoint (FPB) unit supports:

- Two literal comparators
- Six instruction comparators

4.8.1 DAP - Debug access port

An external debugger can access the device via the DAP.

The debug access port (DAP) implements a standard ARM[®] CoreSight[™] serial wire debug port (SW-DP), which implements the serial wire debug protocol (SWD). SWD is a two-pin serial interface, see SWDCLK and SWDIO in [Overview](#) on page 38.

In addition to the default access port in CPU (AHB-AP), the DAP includes a custom control access port (CTRL-AP). The CTRL-AP is described in more detail in [CTRL-AP - Control access port](#) on page 39.

Note:

- The SWDIO line has an internal pull-up resistor.
- The SWDCLK line has an internal pull-down resistor.

4.8.2 CTRL-AP - Control access port

The control access port (CTRL-AP) is a custom access port that enables control of the device when other access ports in the DAP are disabled by the access port protection.

Access port protection blocks the debugger from read and write access to all CPU registers and memory-mapped addresses. See the UICR register [APPROTECT](#) on page 35 for more information on enabling access port protection.

Control access port has the following features:

- Soft reset, see [Reset](#) on page 52 for more information
- Disabling of access port protection, which is the reason why CTRL-AP allows control of the device even when all other access ports in the DAP are disabled by the access port protection

Access port protection is disabled by issuing an ERASEALL command via CTRL-AP. This command will erase the flash, UICR, and RAM.

4.8.2.1 Registers

| Register | Offset | Description |
|-----------------|--------|--|
| RESET | 0x000 | Soft reset triggered through CTRL-AP |
| ERASEALL | 0x004 | Erase all |
| ERASEALLSTATUS | 0x008 | Status register for the ERASEALL operation |
| APPROTECTSTATUS | 0x00C | Status register for access port protection |
| IDR | 0x0FC | CTRL-AP identification register, IDR |

Table 12: Register overview

4.8.2.2 Electrical specification

4.8.2.2.1 Control access port

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------|---|-------|------|------|------------|
| R_{pull} | Internal SWDIO and SWDCLK pull up/down resistance | | 13 | | k Ω |
| f_{SWDCLK} | SWDCLK frequency | 0.125 | | 8 | MHz |

4.8.3 Debug interface mode

Before an external debugger can access either CPU's access port (AHB-AP) or the control access port (CTRL-AP), the debugger must first request the device to power up via CxxxPWRUPREQ in the SWJ-DP.

If the device is in System OFF when power is requested via CxxxPWRUPREQ, the system will wake up and the DIF flag in [RESETREAS](#) on page 57 will be set. The device is in the debug interface mode as long as the debugger is requesting power via CxxxPWRUPREQ. Once the debugger stops requesting power via CxxxPWRUPREQ, the device is back in normal mode. Some peripherals behave differently in Debug Interface mode compared to normal mode. These differences are described in more detail in the chapters of the peripherals that are affected.

When a debug session is over, the external debugger must make sure to put the device back into normal mode since the overall power consumption is higher in debug interface mode than in normal mode.

For details on how to use the debug capabilities, read the debug documentation of your IDE.

4.8.4 Real-time debug

The nRF52811 supports real-time debugging.

Real-time debugging allows interrupts to execute to completion in real time when breakpoints are set in thread mode or lower priority interrupts. This enables developers to set breakpoints and single-step through the code without the risk of real-time event-driven threads running at higher priority failing. For example, this enables the device to continue to service the high-priority interrupts of an external controller or sensor without failure or loss of state synchronization while the developer steps through code in a low-priority thread.

5 Power and clock management

5.1 Power management unit (PMU)

Power and clock management in nRF52811 is designed to automatically ensure maximum power efficiency.

The core of the power and clock management system is the power management unit (PMU) illustrated in [Power management unit](#) on page 42.

Figure 8: Power management unit

The PMU automatically detects which power and clock resources are required by the different components in the system at any given time. It will then start/stop and choose operation modes in supply regulators and clock sources, without user interaction, to achieve the lowest power consumption possible.

5.2 Current consumption

As the system is being constantly tuned by the [Power management unit \(PMU\)](#) on page 42, estimating the current consumption of an application can be challenging if the designer is not able to perform measurements directly on the hardware. To facilitate the estimation process, a set of current consumption scenarios are provided to show the typical current drawn from the VDD supply.

Each scenario specifies a set of operations and conditions applying to the given scenario. [Current consumption scenarios, common conditions](#) on page 43 shows a set of common conditions used in all scenarios, unless otherwise stated in the description of a given scenario. All scenarios are listed in [Electrical specification](#) on page 43.

| Condition | Value |
|-----------------------------|--|
| VDD | 3 V |
| Temperature | 25°C |
| CPU | WFI (wait for interrupt)/WFE (wait for event) sleep |
| Peripherals | All idle |
| Clock | Not running |
| Regulator | LDO |
| RAM | Full 24 kB retention |
| Compiler ³ | GCC v4.9.3 20150529 (arm-none-eabi-gcc). Compiler flags: -O0 -falign-functions=16 -fno-strict-aliasing -mcpu=cortex-m4 -mfloat-abi=soft -msoft-float -mthumb. |
| 32 MHz crystal ⁴ | SMD 2520, 32 MHz, 10 pF +/- 10 ppm |

Table 13: Current consumption scenarios, common conditions

5.2.1 Electrical specification

5.2.1.1 CPU running

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------|---|------|------|------|-------|
| I _{CPU0} | CPU running CoreMark @64 MHz from flash, Clock = HFXO, Regulator = DCDC | | 2.2 | | mA |
| I _{CPU1} | CPU running CoreMark @64 MHz from flash, Clock = HFXO | | 4.2 | | mA |
| I _{CPU2} | CPU running CoreMark @64 MHz from RAM, Clock = HFXO, Regulator = DCDC | | 2.1 | | mA |
| I _{CPU3} | CPU running CoreMark @64 MHz from RAM, Clock = HFXO | | 4 | | mA |
| I _{CPU4} | CPU running CoreMark @64 MHz from flash, Clock = HFINT, Regulator = DCDC | | 2 | | mA |

³ Applying only when CPU is running

⁴ Applying only when HFXO is running

5.2.1.2 Radio transmitting/receiving

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------|---|------|------|------|-------|
| $I_{\text{RADIO_TX0}}$ | Radio transmitting @ 4 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC | | 8 | | mA |
| $I_{\text{RADIO_TX1}}$ | Radio transmitting @ 0 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC | | 5.8 | | mA |
| $I_{\text{RADIO_TX2}}$ | Radio transmitting @ -40 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC | | 3.4 | | mA |
| $I_{\text{RADIO_RX0}}$ | Radio receiving @ 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC | | 6.1 | | mA |
| $I_{\text{RADIO_TX3}}$ | Radio transmitting @ 0 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO | | 10.5 | | mA |
| $I_{\text{RADIO_TX4}}$ | Radio transmitting @ -40 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO | | 5.1 | | mA |
| $I_{\text{RADIO_RX1}}$ | Radio receiving @ 1 Mbps Bluetooth low energy mode, Clock = HFXO | | 10.8 | | mA |

Figure 9: Radio transmitting @ 4 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC (typical values)

Figure 10: Radio transmitting @ 0 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC (typical values)

5.2.1.3 Sleep

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------------------|---|------|------|------|-------|
| I _{ON_RAMOFF_EVENT} | System ON, No RAM retention, Wake on any event | | 0.6 | | μA |
| I _{ON_RAMON_EVENT} | System ON, Full 24 kB RAM retention, Wake on any event | | 0.8 | | μA |
| I _{ON_RAMON_POF} | System ON, Full 24 kB RAM retention, Wake on any event, Power fail comparator enabled | | 0.8 | | μA |
| I _{ON_RAMON_GPIOTE} | System ON, Full 24 kB RAM retention, Wake on GPIOTE input (Event mode) | | 3.3 | | μA |
| I _{ON_RAMON_GPIOTEPORT} | System ON, Full 24 kB RAM retention, Wake on GPIOTE PORT event | | 0.8 | | μA |
| I _{ON_RAMON_RTC} | System ON, Full 24 kB RAM retention, Wake on RTC (running from LFRC clock) | | 1.5 | | μA |
| I _{ON_RAMOFF_RTC} | System ON, No RAM retention, Wake on RTC (running from LFRC clock) | | 1.4 | | μA |
| I _{ON_RAMON_RTC_LFXO} | System ON, Full 24 kB RAM retention, Wake on RTC (running from LFXO clock) | | 1.1 | | μA |
| I _{ON_RAMOFF_RTC_LFXO} | System ON, No RAM retention, Wake on RTC (running from LFXO clock) | | 1.0 | | μA |
| I _{OFF_RAMOFF_RESET} | System OFF, No RAM retention, Wake on reset | | 0.3 | | μA |
| I _{OFF_RAMON_RESET} | System OFF, Full 24 kB RAM retention, Wake on reset | | 0.5 | | μA |

Figure 11: System OFF, No RAM retention, Wake on reset (typical values)

Figure 12: System ON, Full 24 kB RAM retention, Wake on any event (typical values)

5.2.1.4 Compounded

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------------|--|------|------|------|-------|
| I _{S0} | CPU running CoreMark from flash, Radio transmitting @ 0 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC | | 7.4 | | mA |
| I _{S1} | CPU running CoreMark from flash, Radio receiving @ 1 Mbps Bluetooth low energy mode, Clock = HFXO, Regulator = DCDC | | 7.6 | | mA |
| I _{S2} | CPU running CoreMark from flash, Radio transmitting @ 0 dBm output power, 1 Mbps Bluetooth low energy mode, Clock = HFXO | | 13.8 | | mA |
| I _{S3} | CPU running CoreMark from flash, Radio receiving @ 1 Mbps Bluetooth low energy mode, Clock = HFXO | | 14.2 | | mA |

5.2.1.5 TIMER running

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------|--|------|------|------|-------|
| I _{TIMER0} | One TIMER instance running @ 1 MHz, Clock = HFINT | | 432 | | μA |
| I _{TIMER1} | Two TIMER instances running @ 1 MHz, Clock = HFINT | | 432 | | μA |
| I _{TIMER2} | One TIMER instance running @ 1 MHz, Clock = HFXO | | 730 | | μA |
| I _{TIMER3} | One TIMER instance running @ 16 MHz, Clock = HFINT | | 495 | | μA |
| I _{TIMER4} | One TIMER instance running @ 16 MHz, Clock = HFXO | | 792 | | μA |

5.2.1.6 RNG active

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------|-------------|------|------|------|-------|
| I _{RNG0} | RNG running | | 539 | | μA |

5.2.1.7 TEMP active

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------------|--------------|------|------|------|-------|
| I _{TEMP0} | TEMP started | | 998 | | μA |

5.2.1.8 SAADC active

| Symbol | Description | Min. | Typ. | Max. | Units |
|------------------------|--|------|------|------|-------|
| I _{SAADC,RUN} | SAADC sampling @ 16 ksps, Acquisition time = 20 μs, Clock = HFXO, Regulator = DCDC | | 1.1 | | mA |

5.2.1.9 COMP active

| Symbol | Description | Min. | Typ. | Max. | Units |
|------------------------|-------------------------------|------|------|------|-------|
| I _{COMP,LP} | COMP enabled, low power mode | | 17.2 | | μA |
| I _{COMP,NORM} | COMP enabled, normal mode | | 21 | | μA |
| I _{COMP,HS} | COMP enabled, high-speed mode | | 28.7 | | μA |

5.2.1.10 WDT active

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------------------|-------------|------|------|------|-------|
| I _{WDT,STARTED} | WDT started | | 1.3 | | μA |

5.3 POWER — Power supply

This device has the following power supply features:

- On-chip LDO and DC/DC regulators
- Global System ON/OFF modes with individual RAM section power control
- Analog or digital pin wakeup from System OFF
- Supervisor HW to manage power on reset, brownout, and power fail
- Auto-controlled refresh modes for LDO and DC/DC regulators to maximize efficiency
- Automatic switching between LDO and DC/DC regulator based on load to maximize efficiency

Note: Two additional external passive components are required to use the DC/DC regulator.

5.3.1 Regulators

The following internal power regulator alternatives are supported:

- Internal LDO regulator
- Internal DC/DC regulator

The LDO is the default regulator.

The DC/DC regulator can be used as an alternative to the LDO regulator and is enabled through the [DCDCEN](#) on page 59 register. Using the DC/DC regulator will reduce current consumption compared to when using the LDO regulator, but the DC/DC regulator requires an external LC filter to be connected, as shown in [DC/DC regulator setup](#) on page 49.

Figure 13: LDO regulator setup

Figure 14: DC/DC regulator setup

5.3.2 System OFF mode

System OFF is the deepest power saving mode the system can enter. In this mode, the system's core functionality is powered down and all ongoing tasks are terminated.

The device can be put into System OFF mode using the register [SYSTEMOFF](#) on page 57. When in System OFF mode, the device can be woken up through one of the following signals:

1. The DETECT signal, optionally generated by the GPIO peripheral
2. A reset

When the system wakes up from System OFF mode, it gets reset. For more details, see [Reset behavior](#) on page 53.

One or more RAM sections can be retained in System OFF mode, depending on the settings in the `RAM[n].POWER` registers.

`RAM[n].POWER` are retained registers, see [Reset behavior](#). Note that these registers are usually overwritten by the startup code provided with the nRF application examples.

Before entering System OFF mode, the user must make sure that all on-going EasyDMA transactions have been completed. This is usually accomplished by making sure that the EasyDMA enabled peripheral is not active when entering System OFF.

5.3.2.1 Emulated System OFF mode

If the device is in debug interface mode, System OFF will be emulated to secure that all required resources needed for debugging are available during System OFF.

See [Debug](#) on page 38 for more information. Required resources needed for debugging include the following key components: [Debug](#) on page 38, [CLOCK — Clock control](#) on page 61, [POWER — Power supply](#) on page 48, [NVMC — Non-volatile memory controller](#) on page 19, CPU, Flash, and RAM. Since the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF, to prevent the CPU from executing code that normally should not be executed.

5.3.3 System ON mode

System ON is the default state after power-on reset. In System ON, all functional blocks such as the CPU or peripherals can be in IDLE or RUN mode, depending on the configuration set by the software and the state of the application executing.

Register [RESETREAS](#) on page 57 provides information about the source causing the wakeup or reset.

The system can switch the appropriate internal power sources on and off, depending on how much power is needed at any given time. The power requirement of a peripheral is directly related to its activity level, and the activity level of a peripheral is usually raised and lowered when specific tasks are triggered or events are generated.

5.3.3.1 Sub power modes

In System ON mode, when both the CPU and all the peripherals are in IDLE mode, the system can reside in one of the two sub power modes.

The sub power modes are:

- Constant Latency
- Low-power

In Constant Latency mode, the CPU wakeup latency and the PPI task response are constant and kept at a minimum. This is secured by forcing a set of basic resources to be turned on while in sleep. Having a constant and predictable latency is at the cost of having increased power consumption. The Constant Latency mode is selected by triggering the CONSTLAT task.

In Low-power mode, the automatic power management system described in [System ON mode](#) on page 50 ensures that the most efficient supply option is chosen to save most power. Having the lowest power possible is at the cost of having a varying CPU wakeup latency and PPI task response. The Low-power mode is selected by triggering the LOWPWR task.

When the system enters System ON mode, it is by default in Low-power sub power mode.

5.3.4 Power supply supervisor

The power supply supervisor initializes the system at power-on and provides an early warning of impending power failure.

In addition, the power supply supervisor puts the system in a reset state if the supply voltage is too low for safe operation (brownout). The power supply supervisor is illustrated in [Power supply supervisor](#) on page 51.

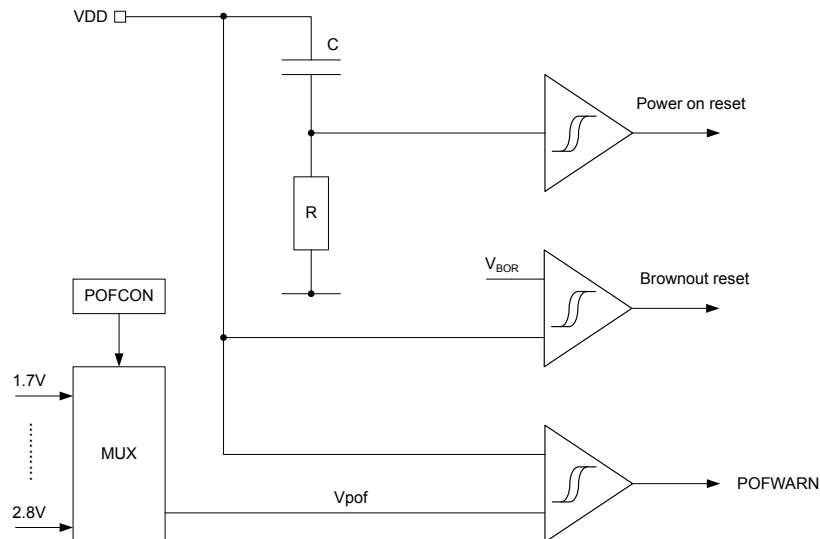

Figure 15: Power supply supervisor

5.3.4.1 Power-fail comparator

The power-fail comparator (POF) can provide the CPU with an early warning of impending power failure. It will not reset the system, but give the CPU time to prepare for an orderly power-down.

The comparator features a hysteresis of V_{HYST} , as illustrated in [Power-fail comparator \(BOR = Brownout reset\)](#) on page 51. The threshold V_{POF} is set in register [POFCON](#) on page 58. If the POF is enabled and the supply voltage falls below V_{POF} , the POFWARN event will be generated. This event will also be generated if the supply voltage is already below V_{POF} at the time the POF is enabled, or if V_{POF} is re-configured to a level above the supply voltage.

If power-fail warning is enabled and the supply voltage is below V_{POF} the power-fail comparator will prevent the NVMC from performing write operations to the NVM. See [NVMC — Non-volatile memory controller](#) on page 19 for more information about the NVMC.

Figure 16: Power-fail comparator (BOR = Brownout reset)

To save power, the power-fail comparator is not active in System OFF or in System ON when HFCLK is not running.

5.3.5 RAM power control

The RAM power control registers are used for configuring the following:

- The RAM sections to be retained during System OFF
- The RAM sections to be retained and accessible during System ON

In System OFF, retention of a RAM section is configured in the RETENTION field of the corresponding RAM[n] register.

In System ON, retention and accessibility for a RAM section is configured in the RETENTION and POWER fields of the corresponding RAM[n] register.

The following table summarizes the behavior of these registers.

| Configuration | RAM section status | | | |
|---------------|--------------------|------------------------|------------|----------|
| | RAM[n].POWER.POWER | RAM[n].POWER.RETENTION | Accessible | Retained |
| System on/off | | | | |
| Off | x | Off | No | No |
| Off | x | On | No | Yes |
| On | Off | Off | No | No |
| On | Off ¹ | On | No | Yes |
| On | On | x | Yes | Yes |

Table 14: RAM section configuration. x = don't care.

The advantage of not retaining RAM contents is that the overall current consumption is reduced.

See chapter [Memory](#) on page 16 for more information on RAM sections.

5.3.6 Reset

There are multiple sources that may trigger a reset.

After a reset has occurred, register [RESETREAS](#) can be read to determine which source generated the reset.

5.3.6.1 Power-on reset

The power-on reset generator initializes the system at power-on.

The system is held in reset state until the supply has reached the minimum operating voltage and the internal voltage regulators have started.

A step increase in supply voltage of 300 mV or more, with rise time of 300 ms or less, within the valid supply range, may result in a system reset.

5.3.6.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Pin reset is configured via the PSELRESET[n] registers.

Note: Pin reset is not available on all pins.

5.3.6.3 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

¹ Not useful setting. RAM section power off gives negligible reduction in current consumption when retention is on.

The debug access port (DAP) is not reset following a wake up from System OFF mode if the device is in Debug Interface mode. See chapter [Debug](#) on page 38 for more information.

5.3.6.4 Soft reset

A soft reset is generated when the SYSRESETREQ bit of the Application Interrupt and Reset Control Register (AIRCR register) in the ARM® core is set.

Refer to [ARM documentation](#) for more details.

A soft reset can also be generated via the [RESET](#) on page 39 register in the CTRL-AP.

5.3.6.5 Watchdog reset

A Watchdog reset is generated when the watchdog times out.

See chapter [WDT — Watchdog timer](#) on page 410 for more information.

5.3.6.6 Brown-out reset

The brown-out reset generator puts the system in reset state if the supply voltage drops below the brownout reset (BOR) threshold.

Refer to section [Power fail comparator](#) on page 61 for more information.

5.3.7 Retained registers

A retained register is a register that will retain its value in System OFF mode and through a reset, depending on reset source. See individual peripheral chapters for information of which registers are retained for the various peripherals.

5.3.8 Reset behavior

| Reset source | Reset target | | | | | | | | |
|-----------------------------------|--------------|-------------|------|--------------------|--------|----------------|-----|--------------------|-----------|
| | CPU | Peripherals | GPIO | Debug ^a | SWJ-DP | RAM | WDT | Retained registers | RESETREAS |
| CPU lockup ⁵ | x | x | x | | | | | | |
| Soft reset | x | x | x | | | | | | |
| Wakeup from System OFF mode reset | x | x | | x ⁶ | | x ⁷ | | | |
| Watchdog reset ⁸ | x | x | x | x | | x | x | x | |
| Pin reset | x | x | x | x | | x | x | x | |
| Brownout reset | x | x | x | x | x | x | x | x | x |
| Power on reset | x | x | x | x | x | x | x | x | x |

Note: The RAM is never reset, but depending on reset source, RAM content may be corrupted.

^a All debug components excluding SWJ-DP. See [Debug](#) on page 38 chapter for more information about the different debug components in the system.

⁵ Reset from CPU lockup is disabled if the device is in debug interface mode. CPU lockup is not possible in System OFF.

⁶ The Debug components will not be reset if the device is in debug interface mode.

⁷ RAM is not reset on wakeup from OFF mode, but depending on settings in the RAM register parts, or the whole RAM, may not be retained after the device has entered System OFF mode.

⁸ Watchdog reset is not available in System OFF.

5.3.9 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---------------|--|
| 0x40000000 | POWER | POWER | Power control | For 24 kB RAM variant, only RAM[0].x to RAM[2].x registers are in use. |

Table 15: Instances

| Register | Offset | Description |
|-------------------|--------|---|
| TASKS_CONSTLAT | 0x078 | Enable Constant Latency mode |
| TASKS_LOWPWR | 0x07C | Enable Low-power mode (variable latency) |
| EVENTS_POFWARN | 0x108 | Power failure warning |
| EVENTS_SLEEPENTER | 0x114 | CPU entered WFI/WFE sleep |
| EVENTS_SLEEPEXIT | 0x118 | CPU exited WFI/WFE sleep |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| RESETREAS | 0x400 | Reset reason |
| SYSTEMOFF | 0x500 | System OFF register |
| POFCON | 0x510 | Power failure comparator configuration |
| GPREGRET | 0x51C | General purpose retention register |
| GPREGRET2 | 0x520 | General purpose retention register |
| DCDCEN | 0x578 | DC/DC enable register |
| RAM[0].POWER | 0x900 | RAM0 power control register. The RAM size will vary depending on product variant, and the RAM0 register will only be present if the corresponding RAM AHB slave is present on the device. |
| RAM[0].POWERSET | 0x904 | RAM0 power control set register |
| RAM[0].POWERCLR | 0x908 | RAM0 power control clear register |
| RAM[1].POWER | 0x910 | RAM1 power control register. The RAM size will vary depending on product variant, and the RAM1 register will only be present if the corresponding RAM AHB slave is present on the device. |

5.3.9.8 RESETRAS

Address offset: 0x400

Reset reason

Unless cleared, the RESETRAS register will be cumulative. A field is cleared by writing '1' to it. If none of the reset sources are flagged, this indicates that the chip was reset from the on-chip reset generator, which will indicate a power-on-reset or a brownout reset.

5.3.10 Electrical specification

5.3.10.1 Device startup times

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------|--|------|--------------------------------------|------|-------|
| t _{POR} | Time in Power on Reset after VDD reaches 1.7 V for all supply voltages and temperatures. Dependent on supply rise time. ⁹ | | | | |
| t _{POR,10us} | VDD rise time 10us | | 1 | | ms |
| t _{POR,10ms} | VDD rise time 10ms | | 9 | | ms |
| t _{POR,60ms} | VDD rise time 60ms | | 23 | | ms |
| t _{PINR} | If a GPIO pin is configured as reset, the maximum time taken to pull up the pin and release reset after power on reset. Dependent on the pin capacitive load (C) ¹⁰ : t=5RC, R = 13kOhm | | | | |
| t _{PINR,500nF} | C = 500nF | | | 32.5 | ms |
| t _{PINR,10uF} | C = 10uF | | | 650 | ms |
| t _{R2ON} | Time from reset to ON (CPU execute) | | | | |
| t _{R2ON,NOTCONF} | If reset pin not configured | | t _{POR} | | ms |
| t _{R2ON,CONF} | If reset pin configured | | t _{POR} + t _{PINR} | | ms |

⁹ A step increase in supply voltage of 300 mV or more, with rise time of 300 ms or less, within the valid supply range, may result in a system reset.

¹⁰ To decrease maximum time a device could hold in reset, a strong external pullup resistor can be used.

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------|--|------|--------|------|-------|
| t _{OFF2ON} | Time from OFF to CPU execute | | 16.5 | | μs |
| t _{IDLE2CPU} | Time from IDLE to CPU execute | | 3.0 | | μs |
| t _{EVTSET,CL1} | Time from HW event to PPI event in Constant Latency System ON mode | | 0.0625 | | μs |
| t _{EVTSET,CL0} | Time from HW event to PPI event in Low Power System ON mode | | 0.0625 | | μs |

5.3.10.2 Power fail comparator

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------|---|------|------|------|-------|
| V _{POF} | Nominal power level warning thresholds (falling supply voltage). Levels are configurable between Min. and Max. in 100mV increments. | 1.7 | | 2.8 | V |
| V _{POFTOL} | Threshold voltage tolerance | | ±1 | ±5 | % |
| V _{POFHYST} | Threshold voltage hysteresis | | 50 | | mV |
| V _{BOR,OFF} | Brown out reset voltage range SYSTEM OFF mode | 1.2 | | 1.7 | V |
| V _{BOR,ON} | Brown out reset voltage range SYSTEM ON mode | 1.48 | | 1.7 | V |

5.4 CLOCK — Clock control

The clock control system can source the system clocks from a range of internal or external high and low frequency oscillators and distribute them to modules based upon a module's individual requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

Listed here are the main features for CLOCK:

- 64 MHz on-chip oscillator
- 64 MHz crystal oscillator, using external 32 MHz crystal
- 32.768 kHz +/-500 ppm RC oscillator
- 32.768 kHz crystal oscillator, using external 32.768 kHz crystal
- 32.768 kHz oscillator synthesized from 64 MHz oscillator
- Firmware (FW) override control of oscillator activity for low latency start up
- Automatic oscillator and clock control, and distribution for ultra-low power

Figure 17: Clock control

5.4.1 HFCLK clock controller

The HFCLK clock controller provides the following clocks to the system.

- HCLK64M: 64 MHz CPU clock
- PCLK1M: 1 MHz peripheral clock
- PCLK16M: 16 MHz peripheral clock
- PCLK32M: 32 MHz peripheral clock

The HFCLK controller supports the following high frequency clock (HFCLK) sources:

- 64 MHz internal oscillator (HFINT)
- 64 MHz crystal oscillator (HF XO)

For illustration, see [Clock control](#) on page 62.

When the system requests one or more clocks from the HFCLK controller, the HFCLK controller will automatically provide them. If the system does not request any clocks provided by the HFCLK controller, the controller will enter a power saving mode.

These clocks are only available when the system is in ON mode. When the system enters ON mode, the internal oscillator (HFINT) clock source will automatically start to be able to provide the required HFCLK clock(s) for the system.

The HFINT will be used when HFCLK is requested and HF XO has not been started. The HF XO is started by triggering the HFCLKSTART task and stopped using the HFCLKSTOP task. A HFCLKSTARTED event will be generated when the HF XO has started and its frequency is stable.

The HF XO must be running to use the RADIO or the calibration mechanism associated with the 32.768 kHz RC oscillator.

5.4.1.1 64 MHz crystal oscillator (HF XO)

The 64 MHz crystal oscillator (HF XO) is controlled by a 32 MHz external crystal

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet.

[Circuit diagram of the 64 MHz crystal oscillator](#) on page 63 shows how the 32 MHz crystal is connected to the 64 MHz crystal oscillator.

Figure 18: Circuit diagram of the 64 MHz crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. For more information, see [Reference circuitry](#) on page 425. C_{pcb1} and C_{pcb2} are stray capacitances on the PCB. C_{pin} is the pin input capacitance on the XC1 and XC2 pins. See [table 64 MHz crystal oscillator \(HF XO\)](#) on page 72. The load capacitors C1 and C2 should have the same value.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in [table 64 MHz crystal oscillator \(HF XO\)](#) on page 72. It is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance will reduce both start up time and current consumption.

5.4.2 LFCLK clock controller

The system supports several low frequency clock sources.

As illustrated in [Clock control](#) on page 62, the system supports the following low frequency clock sources:

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

The LFCLK clock is started by first selecting the preferred clock source in register [LFCLKSRC](#) on page 71 and then triggering the LFCLKSTART task. If the LFXO is selected as the clock source, the LFCLK will initially start running from the 32.768 kHz LFRC while the LFXO is starting up and automatically switch to using the LFXO once this oscillator is running. The LFCLKSTARTED event will be generated when the LFXO has been started.

The LFCLK clock is stopped by triggering the LFCLKSTOP task.

It is not allowed to write to register [LFCLKSRC](#) on page 71 when the LFCLK is running.

A LFCLKSTOP task will stop the LFCLK oscillator. However, the LFCLKSTOP task can only be triggered after the STATE field in register [LFCLKSTAT](#) on page 71 indicates a 'LFCLK running' state.

The LFCLK clock controller and all of the LFCLK clock sources are always switched off when in OFF mode.

5.4.2.1 32.768 kHz RC oscillator (LFRC)

The default source of the low frequency clock (LFCLK) is the 32.768 kHz RC oscillator (LFRC).

The LFRC frequency will be affected by variation in temperature. The LFRC oscillator can be calibrated to improve accuracy by using the HFCLK as a reference oscillator during calibration. See [Table 32.768 kHz RC oscillator \(LFRC\)](#) on page 73 for details on the default and calibrated accuracy of the LFRC oscillator.

The LFRC oscillator does not require additional external components.

5.4.2.2 Calibrating the 32.768 kHz RC oscillator

After the 32.768 kHz RC oscillator is started and running, it can be calibrated by triggering the CAL task. In this case, the HFCLK will be temporarily switched on and used as a reference.

A DONE event will be generated when calibration has finished. The calibration mechanism will only work as long as HFCLK is generated from the HFCLK crystal oscillator, it is therefore necessary to explicitly start this crystal oscillator before calibration can be started, see HFCLKSTART task.

It is not allowed to stop the LFRC during an ongoing calibration.

5.4.2.3 Calibration timer

The calibration timer can be used to time the calibration interval of the 32.768 kHz RC oscillator.

The calibration timer is started by triggering the CTSTART task and stopped by triggering the CTSTOP task. The calibration timer will always start counting down from the value specified in CTIV and generate a CTTO timeout event when it reaches 0. The Calibration timer will stop by itself when it reaches 0.

Figure 19: Calibration timer

Due to limitations in the calibration timer, only one task related to calibration, that is, CAL, CTSTART and CTSTOP, can be triggered for every period of LFCLK.

5.4.2.4 32.768 kHz crystal oscillator (LFXO)

For higher LFCLK accuracy the low frequency crystal oscillator (LFXO) must be used.

The following external clock sources are supported:

- Low swing clock signal applied to the *XL1* pin. The *XL2* pin shall then be grounded.
- Rail-to-rail clock signal applied to the *XL1* pin. The *XL2* pin shall then be grounded or left unconnected.

The [LFCLKSRC](#) on page 71 register controls the clock source, and its allowed swing. The truth table for various situations is as follows:

| SRC | EXTERNAL | BYPASS | Comment |
|-----|----------|--------|--|
| 0 | 0 | 0 | Normal operation, RC is source |
| 0 | 0 | 1 | DO NOT USE |
| 0 | 1 | X | DO NOT USE |
| 1 | 0 | 0 | Normal XTAL operation |
| 1 | 1 | 0 | Apply external low swing signal to XL1, ground XL2 |
| 1 | 1 | 1 | Apply external full swing signal to XL1, leave XL2 grounded or unconnected |
| 1 | 0 | 1 | DO NOT USE |
| 2 | 0 | 0 | Normal operation, synth is source |
| 2 | 0 | 1 | DO NOT USE |
| 2 | 1 | X | DO NOT USE |

Table 17: LFCLKSRC configuration depending on clock source

To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet. [Circuit diagram of the 32.768 kHz crystal oscillator](#) on page 65 shows the LFXO circuitry.

Figure 20: Circuit diagram of the 32.768 kHz crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. C_{pcb1} and C_{pcb2} are stray capacitances on the PCB. C_{pin} is the pin input capacitance on the XC1 and XC2 pins (see [32.768 kHz crystal oscillator \(LFXO\)](#) on page 73). The load capacitors C1 and C2 should have the same value.

For more information, see [Reference circuitry](#) on page 425.

5.4.2.5 32.768 kHz synthesized from HFCLK (LFSYNT)

LFCLK can also be synthesized from the HFCLK clock source. The accuracy of LFCLK will then be the accuracy of the HFCLK.

Using the LFSYNT clock avoids the requirement for a 32.768 kHz crystal, but increases average power consumption as the HFCLK will need to be requested in the system.

5.4.3 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000 | CLOCK | CLOCK | Clock control | |

Table 18: Instances

| Register | Offset | Description | |
|---------------------|--------|---|----------|
| TASKS_HFCLKSTART | 0x000 | Start HFCLK crystal oscillator | |
| TASKS_HFCLKSTOP | 0x004 | Stop HFCLK crystal oscillator | |
| TASKS_LFCLKSTART | 0x008 | Start LFCLK source | |
| TASKS_LFCLKSTOP | 0x00C | Stop LFCLK source | |
| TASKS_CAL | 0x010 | Start calibration of LFRC oscillator | |

5.4.4 Electrical specification

5.4.4.1 64 MHz internal oscillator (HFINT)

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------------|--------------------------|------|-------|------|-------|
| f_{NOM_HFINT} | Nominal output frequency | | 64 | | MHz |
| f_{TOL_HFINT} | Frequency tolerance | | <±1.5 | <±8 | % |
| t_{START_HFINT} | Startup time | | 3 | | us |

5.4.4.2 64 MHz crystal oscillator (HF XO)

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------------------|--|------|------|------|-------|
| $f_{NOM_HF XO}$ | Nominal output frequency | | 64 | | MHz |
| $f_{XTAL_HF XO}$ | External crystal frequency | | 32 | | MHz |
| $f_{TOL_HF XO}$ | Frequency tolerance requirement for 2.4 GHz proprietary radio applications | | | ±60 | ppm |
| $f_{TOL_HF XO_BLE}$ | Frequency tolerance requirement, Bluetooth low energy applications | | | ±40 | ppm |
| $C_L_HF XO$ | Load capacitance | | | 12 | pF |
| $C_0_HF XO$ | Shunt capacitance | | | 7 | pF |

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------|--|------|------|------|-------|
| R _{S_HFXO_7PF} | Equivalent series resistance C0 = 7 pF | | | 60 | ohm |
| R _{S_HFXO_5PF} | Equivalent series resistance C0 = 5 pF | | | 60 | ohm |
| R _{S_HFXO_3PF} | Equivalent series resistance C0 = 3 pF | | | 100 | ohm |
| P _{D_HFXO} | Drive level | | | 100 | uW |
| C _{PIN_HFXO} | Input capacitance XC1 and XC2 | | 4 | | pF |
| t _{START_HFXO} | Startup time | | 0.36 | | ms |

5.4.4.3 32.768 kHz RC oscillator (LFRC)

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------|--|------|--------|------|-------|
| f _{NOM_LFRC} | Nominal frequency | | 32.768 | | kHz |
| f _{TOL_LFRC} | Frequency tolerance | | | ±2 | % |
| f _{TOL_CAL_LFRC} | Frequency tolerance for LFRC after calibration ¹¹ | | | ±500 | ppm |
| t _{START_LFRC} | Startup time for 32.768 kHz RC oscillator | | 600 | | us |

5.4.4.4 32.768 kHz crystal oscillator (LFXO)

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------------|--|------|--------|------|-------|
| f _{NOM_LFXO} | Crystal frequency | | 32.768 | | kHz |
| f _{TOL_LFXO_BLE} | Frequency tolerance requirement for BLE stack | | | ±250 | ppm |
| f _{TOL_LFXO_ANT} | Frequency tolerance requirement for ANT stack | | | ±50 | ppm |
| C _{L_LFXO} | Load capacitance | | | 12.5 | pF |
| C _{D_LFXO} | Shunt capacitance | | | 2 | pF |
| R _{S_LFXO} | Equivalent series resistance | | | 100 | kohm |
| P _{D_LFXO} | Drive level | | | 0.5 | uW |
| C _{pin} | Input capacitance on XL1 and XL2 pads | | 4 | | pF |
| t _{START_LFXO} | Startup time for 32.768 kHz crystal oscillator | | 0.25 | | s |
| V _{AMP_IN_XO_LOW} | Peak to peak amplitude for external low swing clock. Input signal must not swing outside supply rails. | 200 | | 1000 | mV |

5.4.4.5 32.768 kHz synthesized from HFCLK (LFSYNT)

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------|--|------|--------|------|-------|
| f _{NOM_LFSYNT} | Nominal frequency | | 32.768 | | kHz |
| f _{TOL_LFSYNT} | Frequency tolerance in addition to HFCLK tolerance ¹² | | 8 | | ppm |
| t _{START_LFSYNT} | Startup time for synthesized 32.768 kHz | | 100 | | us |

¹¹ Constant temperature within ±0.5 °C and calibration performed at least every 8 seconds, defined as 3 sigma

¹² Frequency tolerance will be derived from the HFCLK source clock plus the LFSYNT tolerance

6 Peripherals

6.1 Peripheral interface

Peripherals are controlled by the CPU by writing to configuration registers and task registers. Peripheral events are indicated to the CPU by event registers and interrupts if they are configured for a given event.

Figure 21: Tasks, events, shortcuts, and interrupts

6.1.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Instantiation](#) on page 18 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Some peripherals share some registers or other common resources.
- Operation is mutually exclusive. Only one of the peripherals can be used at a time.
- Switching from one peripheral to another must follow a specific pattern (disable the first, then enable the second peripheral).

6.1.2 Peripherals with shared ID

In general (with the exception of ID 0), peripherals sharing an ID and base address may not be used simultaneously. The user can only enable one peripheral at the time on this specific ID.

When switching between two peripherals sharing an ID, the user should do the following to prevent unwanted behavior:

- Disable the previously used peripheral.
- Remove any programmable peripheral interconnect (PPI) connections set up for the peripheral that is being disabled.
- Clear all bits in the INTEN register, i.e. `INTENCLR = 0xFFFFFFFF`.
- Explicitly configure the peripheral that you are about to enable and do not rely on configuration values that may be inherited from the peripheral that was disabled.
- Enable the now configured peripheral.

See which peripherals are sharing ID in [Instantiation](#) on page 18.

6.1.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified in the relevant chapter, the peripheral registers (in particular the PSEL registers) must be configured before enabling the peripheral.

Note that the peripheral must be enabled before tasks and events can be used.

6.1.4 Bit set and clear

Registers with multiple single-bit bit fields may implement the set-and-clear pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

The SET register is used to set individual bits in the main register while the CLR register is used to clear individual bits in the main register. Writing 1 to a bit in SET or CLR register will set or clear the same bit in the main register respectively. Writing 0 to a bit in SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

Note: The main register may not be visible and hence not directly accessible in all cases.

6.1.5 Tasks

Tasks are used to trigger actions in a peripheral, for example to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes 1 to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See [Tasks, events, shortcuts, and interrupts](#) on page 74.

6.1.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example a state change in a peripheral. A peripheral may generate multiple events with each event having a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated. See [Tasks, events, shortcuts, and interrupts](#) on page 74. An event register is only cleared when firmware writes 0 to it.

Events can be generated by the peripheral even when the event register is set to 1.

6.1.7 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using a shortcut is the equivalent to making the same connection outside the peripheral and through the PPI. However, the propagation delay through the shortcut is usually shorter than the propagation delay through the PPI.

Shortcuts are predefined, which means their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

6.1.8 Interrupts

All peripherals support interrupts. Interrupts are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC).

Using the INTEN, INTENSET and INTENCLR registers, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers, and the INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is shown in [Tasks, events, shortcuts, and interrupts](#) on page 74.

Interrupt clearing

Clearing an interrupt by writing 0 to an event register, or disabling an interrupt using the INTENCLR register, can take up to four CPU clock cycles to take effect. This means that an interrupt may reoccur immediately, even if a new event has not come, if the program exits an interrupt handler after the interrupt is cleared or disabled but before four clock cycles have passed.

Note: To avoid an interrupt reoccurring before a new event has come, the program should perform a read from one of the peripheral registers. For example, the event register that has been cleared, or the INTENCLR register that has been used to disable the interrupt. This will cause a one to three-cycle delay and ensure the interrupt is cleared before exiting the interrupt handler.

Care should be taken to ensure the compiler does not remove the read operation as an optimization. If the program can guarantee a four-cycle delay after event being cleared or interrupt disabled in any other way, then a read of a register is not required.

6.2 AAR — Accelerated address resolver

Accelerated address resolver is a cryptographic support function for implementing the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0*. Resolvable Private Address generation should be achieved using ECB and is not supported by AAR.

The procedure allows two devices that share a secret key to generate and resolve a hash based on their device address. The AAR block enables real-time address resolution on incoming packets when configured as described in this chapter. This allows real-time packet filtering (whitelisting) using a list of known shared keys (Identity Resolving Keys (IRK) in *Bluetooth*).

6.2.1 EasyDMA

The AAR implements EasyDMA for reading and writing to the RAM. The EasyDMA will have finished accessing the RAM when the END, RESOLVED, and NOTRESOLVED events are generated.

If the [IRKPTR](#) on page 82, [ADDRPTR](#) on page 82, and the [SCRATCHPTR](#) on page 82 is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

6.2.2 Resolving a resolvable address

As per *Bluetooth* specification, a private resolvable address is composed of six bytes.

Figure 22: Resolvable address

To resolve an address the register [ADDRPTR](#) on page 82 must point to the start of the packet. The resolver is started by triggering the START task. A RESOLVED event is generated when the AAR manages to resolve the address using one of the Identity Resolving Keys (IRK) found in the IRK data structure. The AAR will use the IRK specified in the register IRK0 to IRK15 starting from IRK0. The register [NIRK](#) on page 81 specifies how many IRKs should be used. The AAR module will generate a NOTRESOLVED event if it is not able to resolve the address using the specified list of IRKs.

The AAR will go through the list of available IRKs in the IRK data structure and for each IRK try to resolve the address according to the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0* [Vol 3] chapter 10.8.2.3. The time it takes to resolve an address varies due to the location in the list of the resolvable address. The resolution time will also be affected by RAM accesses performed by other peripherals and the CPU. See the [Electrical specifications](#) for more information about resolution time.

The AAR only compares the received address to those programmed in the module without checking the address type.

The AAR will stop as soon as it has managed to resolve the address, or after trying to resolve the address using [NIRK](#) number of IRKs from the IRK data structure. The AAR will generate an END event after it has stopped.

Figure 23: Address resolution with packet preloaded into RAM

6.2.3 Use case example for chaining RADIO packet reception with address resolution using AAR

The AAR may be started as soon as the 6 bytes required by the AAR have been received by the RADIO and stored in RAM. The ADDRPTR pointer must point to the start of packet.

Figure 24: Address resolution with packet loaded into RAM by the RADIO

6.2.4 IRK data structure

The IRK data structure is located in RAM at the memory location specified by the IRKPTR register.

| Property | Address offset | Description |
|----------|----------------|---------------------------|
| IRK0 | 0 | IRK number 0 (16 - byte) |
| IRK1 | 16 | IRK number 1 (16 - byte) |
| .. | .. | .. |
| IRK15 | 240 | IRK number 15 (16 - byte) |

Table 20: IRK data structure overview

6.2.5 Registers

| Base address | Peripheral | Instance | Description | Configuration |

6.2.6.1 AAR Electrical Specification

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------|---|------|------|------|---------|
| t_{AAR} | Address resolution time per IRK. Total time for several IRKs is given as $(1 \mu s + n * t_{AAR})$, where n is the number of IRKs. (Given priority to the actual destination RAM block). | .. | .. | .. | μs |
| $t_{AAR,8}$ | Time for address resolution of 8 IRKs. (Given priority to the actual destination RAM block). | | 48 | | μs |

6.3 BPROT — Block protection

The mechanism for protecting non-volatile memory can be used to prevent erroneous application code from erasing or writing to protected blocks.

Non-volatile memory can be protected from erases and writes depending on the settings in the CONFIG registers. One bit in a CONFIG register represents one protected block of 4 kB. There are multiple CONFIG registers to cover the whole range of the flash. [Protected regions of program memory](#) on page 83 illustrates how the CONFIG bits map to the program memory space.

Important: If an erase or write to a protected block is detected, the CPU will hard fault. If an ERASEALL operation is attempted from the CPU while any block is protected, it will be blocked and the CPU will hard fault.

On reset, all the protection bits are cleared. To ensure safe operation, the first task after reset must be to set the protection bits. The only way of clearing protection bits is by resetting the device from any reset source.

The protection mechanism is turned off when in debug mode (when a debugger is connected) and the DISABLEINDEBUG register is set to disabled.

Figure 25: Protected regions of program memory

6.4 CCM — AES CCM mode encryption

Cipher block chaining - message authentication code (CCM) mode is an authenticated encryption algorithm designed to provide both authentication and confidentiality during data transfer. CCM combines counter mode encryption and CBC-MAC authentication. The CCM terminology "Message authentication code (MAC)" is called the "Message integrity check (MIC)" in *Bluetooth* terminology and also in this document.

The CCM block generates an encrypted keystream that is applied to input data using the XOR operation and generates the 4 byte MIC field in one operation. The CCM and radio can be configured to work synchronously. The CCM will encrypt in time for transmission and decrypt after receiving bytes into memory from the radio. All operations can complete within the packet RX or TX time. CCM on this device is implemented according to *Bluetooth* requirements and the algorithm as defined in IETF [RFC3610](#), and depends on the AES-128 block cipher. A description of the CCM algorithm can also be found in [NIST Special Publication 800-38C](#). The *Bluetooth* specification describes the configuration of counter mode blocks and encryption blocks to implement compliant encryption for BLE.

The CCM block uses EasyDMA to load key, counter mode blocks (including the nonce required), and to read/write plain text and cipher text.

The AES CCM supports three operations: key-stream generation, packet encryption, and packet decryption. All these operations are done in compliance with the *Bluetooth* specification.¹³

Figure 26: Key-stream generation followed by encryption or decryption. The shortcut is optional.

6.4.1 Key-stream generation

A new key-stream needs to be generated before a new packet encryption or packet decryption operation can be started.

A key-stream is generated by triggering the KSGEN task and an ENDKSGEN event will be generated when the key-stream has been generated.

Key-stream generation, packet encryption, and packet decryption operations utilize the configuration specified in the data structure pointed to by [CNFPTR](#) on page 95. It is necessary to configure this pointer and its underlying data structure, and the [MODE](#) on page 94 register before the KSGEN task is triggered.

¹³ *Bluetooth* AES CCM 128 bit block encryption, see *Bluetooth* Core specification Version 4.0.

The key-stream will be stored in the AES CCM's temporary memory area, specified by the [SCRATCHPTR](#) on page 95, where it will be used in subsequent encryption and decryption operations.

For default length packets (MODE.LENGTH = Default) the size of the generated key-stream is 27 bytes. When using extended length packets (MODE.LENGTH = Extended) the [MAXPACKETSIZE](#) on page 96 register specifies the length of the key-stream to be generated. The length of the generated key-stream must be greater or equal to the length of the subsequent packet payload to be encrypted or decrypted. The maximum length of the key-stream in extended mode is 251 bytes, which means that the maximum packet payload size is 251.

If a shortcut is used between ENDKSGEN event and CRYPT task, the [INPTR](#) on page 95 pointer and the [OUTPTR](#) on page 95 pointers must also be configured before the KSGEN task is triggered.

6.4.2 Encryption

During packet encryption, the AES CCM will read the unencrypted packet located in RAM at the address specified in the INPTR pointer, encrypt the packet and append a four byte long Message Integrity Check (MIC) field to the packet.

Encryption is started by triggering the CRYPT task with the [MODE](#) on page 94 register set to ENCRYPTION. An ENDCRYPT event will be generated when packet encryption is completed

The AES CCM will also modify the length field of the packet to adjust for the appended MIC field, that is, add four bytes to the length, and store the resulting packet back into RAM at the address specified in the [OUTPTR](#) on page 95 pointer, see [Encryption](#) on page 86.

Empty packets (length field is set to 0) will not be encrypted but instead moved unmodified through the AES CCM.

The CCM supports different widths of the LENGTH field in the data structure for encrypted packets. This is configured in the [MODE](#) on page 94 register.

Figure 27: Encryption

6.4.3 Decryption

During packet decryption, the AES CCM will read the encrypted packet located in RAM at the address specified in the INPTR pointer, decrypt the packet, authenticate the packet's MIC field and generate the appropriate MIC status.

Decryption is started by triggering the CRYPT task with the [MODE](#) on page 94 register set to DECRYPTION. An ENDCRYPT event will be generated when packet decryption is completed

The AES CCM will also modify the length field of the packet to adjust for the MIC field, that is, subtract four bytes from the length, and then store the decrypted packet into RAM at the address pointed to by the OUTPTR pointer, see [Decryption](#) on page 87.

The CCM is only able to decrypt packet payloads that are at least 5 bytes long, that is, 1 byte or more encrypted payload (EPL) and 4 bytes of MIC. The CCM will therefore generate a MIC error for packets where the length field is set to 1, 2, 3 or 4.

Empty packets (length field is set to 0) will not be decrypted but instead moved unmodified through the AES CCM, these packets will always pass the MIC check.

The CCM supports different widths of the LENGTH field in the data structure for decrypted packets. This is configured in the **MODE** on page 94 register.

Figure 28: Decryption

6.4.4 AES CCM and RADIO concurrent operation

The CCM module is able to encrypt/decrypt data synchronously to data being transmitted or received on the radio.

In order for the CCM module to run synchronously with the radio, the data rate setting in the **MODE** on page 94 register needs to match the radio data rate. The settings in this register apply whenever either the KSGEN or CRYPT tasks are triggered.

The data rate setting of the **MODE** on page 94 register can also be overridden on-the-fly during an ongoing encrypt/decrypt operation by the contents of the **RATEOVERRIDE** on page 96 register. The data rate setting in this register applies whenever the RATEOVERRIDE task is triggered. This feature can be useful in cases where the radio data rate is changed during an ongoing packet transaction.

6.4.5 Encrypting packets on-the-fly in radio transmit mode

When the AES CCM is encrypting a packet on-the-fly at the same time as the radio is transmitting it, the radio must read the encrypted packet from the same memory location as the AES CCM is writing to.

The **OUTPTR** on page 95 pointer in the AES CCM must therefore point to the same memory location as the **PACKETPTR** pointer in the radio, see [Configuration of on-the-fly encryption](#) on page 87.

Figure 29: Configuration of on-the-fly encryption

In order to match the RADIO's timing, the KSGEN task must be triggered early enough to allow the key-stream generation to complete before the encryption of the packet shall start.

For short packets (**MODE.LENGTH** = Default) the KSGEN task must be triggered no later than when the **START** task in the RADIO is triggered. In addition the shortcut between the **ENDKSGEN** event and the **CRYPT** task must be enabled. This use-case is illustrated in [On-the-fly encryption of short packets \(MODE.LENGTH = Default\) using a PPI connection](#) on page 88 using a PPI connection between the **READY** event in the RADIO and the **KSGEN** task in the AES CCM.

For long packets (**MODE.LENGTH** = Extended) the key-stream generation will need to be started even earlier, for example at the time when the **TXEN** task in the RADIO is triggered.

Important: Refer to [Timing specification](#) on page 97 for information about the time needed for generating a key-stream.

Figure 30: On-the-fly encryption of short packets (MODE.LENGTH = Default) using a PPI connection

6.4.6 Decrypting packets on-the-fly in radio receive mode

When the AES CCM is decrypting a packet on-the-fly at the same time as the RADIO is receiving it, the AES CCM must read the encrypted packet from the same memory location as the RADIO is writing to.

The [INPTR](#) on page 95 pointer in the AES CCM must therefore point to the same memory location as the [PACKETPTR](#) pointer in the RADIO, see [Configuration of on-the-fly decryption](#) on page 88.

Figure 31: Configuration of on-the-fly decryption

In order to match the RADIO's timing, the KSGEN task must be triggered early enough to allow the key-stream generation to complete before the decryption of the packet shall start.

For short packets (MODE.LENGTH = Default) the KSGEN task must be triggered no later than when the START task in the RADIO is triggered. In addition, the CRYPT task must be triggered no earlier than when the ADDRESS event is generated by the RADIO.

If the CRYPT task is triggered exactly at the same time as the ADDRESS event is generated by the RADIO, the AES CCM will guarantee that the decryption is completed no later than when the END event in the RADIO is generated.

This use-case is illustrated in [On-the-fly decryption of short packets \(MODE.LENGTH = Default\) using a PPI connection](#) on page 89 using a PPI connection between the ADDRESS event in the RADIO and the CRYPT task in the AES CCM. The KSGEN task is triggered from the READY event in the RADIO through a PPI connection.

For long packets (MODE.LENGTH = Extended) the key-stream generation will need to be started even earlier, for example at the time when the RXEN task in the RADIO is triggered.

Important: Refer to [Timing specification](#) on page 97 for information about the time needed for generating a key-stream.

Figure 32: On-the-fly decryption of short packets (MODE.LENGTH = Default) using a PPI connection

6.4.7 CCM data structure

The CCM data structure is located in Data RAM at the memory location specified by the CNFPTR pointer register.

| Property | Address offset | Description |
|----------|----------------|--|
| KEY | 0 | 16 byte AES key |
| PKTCTR | 16 | Octet0 (LSO) of packet counter |
| | 17 | Octet1 of packet counter |
| | 18 | Octet2 of packet counter |
| | 19 | Octet3 of packet counter |
| | 20 | Bit 6 – Bit 0: Octet4 (7 most significant bits of packet counter, with Bit 6 being the most significant bit) Bit7: Ignored |
| | 21 | Ignored |
| | 22 | Ignored |
| | 23 | Ignored |
| | 24 | Bit 0: Direction bit Bit 7 – Bit 1: Zero padded |
| IV | 25 | 8 byte initialization vector (IV) Octet0 (LSO) of IV, Octet1 of IV, ... , Octet7 (MSO) of IV |

Table 25: CCM data structure overview

The NONCE vector (as specified by the *Bluetooth* Core Specification) will be generated by hardware based on the information specified in the CCM data structure from [CCM data structure overview](#) on page 89 .

| Property | Address offset | Description |
|----------|----------------|--|
| HEADER | 0 | Packet Header |
| LENGTH | 1 | Number of bytes in unencrypted payload |
| RFU | 2 | Reserved Future Use |
| PAYLOAD | 3 | Unencrypted payload |

Table 26: Data structure for unencrypted packet

| Property | Address offset | Description |
|----------|--------------------|--|
| HEADER | 0 | Packet Header |
| LENGTH | 1 | Number of bytes in encrypted payload including length of MIC Important: LENGTH will be 0 for empty packets since the MIC is not added to empty packets |
| RFU | 2 | Reserved Future Use |
| PAYLOAD | 3 | Encrypted payload |
| MIC | 3 + payload length | ENCRYPT: 4 bytes encrypted MIC Important: MIC is not added to empty packets |

Table 27: Data structure for encrypted packet

6.4.8 EasyDMA and ERROR event

The CCM implements an EasyDMA mechanism for reading and writing to the RAM.

In cases where the CPU and other EasyDMA enabled peripherals are accessing the same RAM block at the same time, a high level of bus collisions may cause too slow operation for correct on the fly encryption. In this case the ERROR event will be generated.

The EasyDMA will have finished accessing the RAM when the ENDKSGEN and ENDCRYPT events are generated.

If the CNFPTR, SCRATCHPTR, INPTR and the OUTPTR are not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

6.4.9 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-------------------------|---------------|
| 0x4000F000 | CCM | CCM | AES CCM mode encryption | |

Table 28: Instances

| Register | Offset | Description | |
|--------------------|--------|---|------------|
| TASKS_KSGEN | 0x000 | Start generation of key-stream. This operation will stop by itself when completed. | |
| TASKS_CRYPT | 0x004 | Start encryption/decryption. This operation will stop by itself when completed. | |
| TASKS_STOP | 0x008 | Stop encryption/decryption | |
| TASKS_RATEOVERRIDE | 0x00C | Override DATARATE setting in MODE register with the contents of the RATEOVERRIDE register for any ongoing encryption/decryption | |
| EVENTS_ENDKSGEN | 0x100 | Key-stream generation complete | |
| EVENTS_ENDCRYPT | 0x104 | Encrypt/decrypt complete | |
| EVENTS_ERROR | 0x108 | CCM error event | Deprecated |
| SHORTS | 0x200 | Shortcuts between local events and tasks | |
| INTENSET | 0x304 | Enable interrupt | |
| INTENCLR | 0x308 | Disable interrupt | |
| MICSTATUS | 0x400 | MIC check result | |
| ENABLE | 0x500 | Enable | |
| MODE | 0x504 | Operation mode | |
| CNFPTR | 0x508 | Pointer to data structure holding AES key and NONCE vector | |
| INPTR | 0x50C | Input pointer | |
| OUTPTR | 0x510 | Output pointer | |
| SCRATCHPTR | 0x514 | Pointer to data area used for temporary storage | |

| Register | Offset | Description |
|---------------|--------|---|
| MAXPACKETSIZE | 0x518 | Length of key-stream generated when MODE.LENGTH = Extended. |
| RATEOVERRIDE | 0x51C | Data rate override setting. |

Table 29: Register overview

6.4.9.1 TASKS_KSGEN

Address offset: 0x000

Start generation of key-stream. This operation will stop by itself when completed.

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|------------------|---|------|------|------|---------------|
| t_{gen} | Time needed for key-stream generation (given priority access to destination RAM block). | .. | .. | .. | μs |

6.5 COMP — Comparator

The comparator (COMP) compares an input voltage (VIN+) against a second input voltage (VIN-). VIN+ can be derived either from an analog input pin (AIN0-AIN6) or VDD/2. VIN- can be derived from multiple sources depending on the operation mode of the comparator.

Main features of the comparator are:

- Input range from 0 V to VDD
- Single-ended mode
 - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode
 - Configurable hysteresis
- Reference inputs (VREF):
 - VDD
 - External reference from AIN0 to AIN7 (between 0 V and VDD)
 - Internal references 1.2 V, 1.8 V and 2.4 V
- Three speed/power consumption modes: low-power, normal and high-speed
- Event generation on output changes
 - UP event on VIN- > VIN+
 - DOWN event on VIN- < VIN+
 - CROSS event on VIN+ and VIN- crossing
 - READY event on core and internal reference (if used) ready

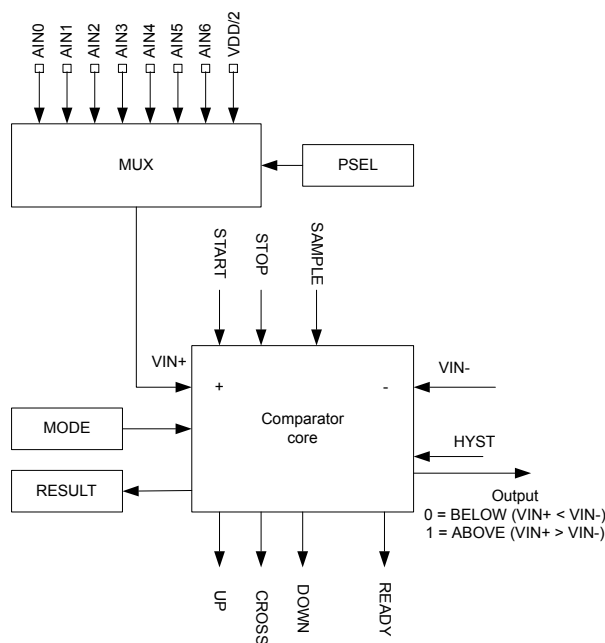

Figure 33: Comparator overview

Once enabled (using the [ENABLE](#) register), the comparator is started by triggering the START task and stopped by triggering the STOP task. After a start-up time of $t_{\text{COMP,START}}$, the comparator will generate a READY event to indicate that it is ready for use and that its output is correct. When the COMP module is started, events will be generated every time VIN+ crosses VIN-.

Operation modes

The comparator can be configured to operate in two main operation modes, differential mode and single-ended mode. See the [MODE](#) register for more information. In both operation modes, the comparator can operate in different speed and power consumption modes (low-power, normal and high-speed). High-speed mode will consume more power compared to low-power mode, and low-power mode will result in slower response time compared to high-speed mode.

Use the [PSEL](#) register to select any of the AIN0-AIN6 pins (or VDD/2) as VIN+ input, regardless of the operation mode selected for the comparator. The source of VIN- depends on which operation mode is used:

- Differential mode: Derived directly from AIN0 to AIN7
- Single-ended mode: Derived from VREF. VREF can be derived from VDD, AIN0-AIN7 or internal 1.2 V, 1.8 V and 2.4 V references.

The selected analog pins will be acquired by the comparator once it is enabled.

An optional hysteresis on VIN+ and VIN- can be enabled when the module is used in differential mode through the [HYST](#) register. In single-ended mode, VUP and VDOWN thresholds can be set to implement a hysteresis using the reference ladder (see [Comparator in single-ended mode](#) on page 100). This hysteresis is in the order of magnitude of 30 mV, and shall prevent noise on the signal to create unwanted events. See [Hysteresis example where VIN+ starts below VUP](#) on page 101 for illustration of the effect of an active hysteresis on a noisy input signal.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

The immediate value of the comparator can be sampled to [RESULT](#) register by triggering the SAMPLE task.

6.5.1 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

Before enabling the comparator via the **ENABLE** register, the following registers must be configured for the differential mode:

- **PSEL**
- **MODE**
- **EXTREFSEL**

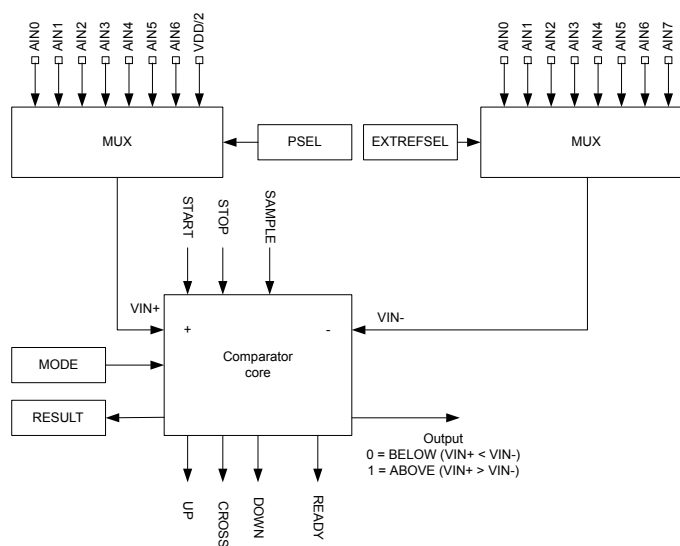

Figure 34: Comparator in differential mode

Restriction: Depending on the device, not all the analog inputs may be available for each MUX. See definitions for **PSEL** and **EXTREFSEL** for more information about which analog pins are available on a particular device.

When **HYST** register is turned on while in this mode, the output of the comparator (and associated events) will change from ABOVE to BELOW whenever VIN+ becomes lower than VIN- - ($V_{DIFFHYST} / 2$). It will also change from BELOW to ABOVE whenever VIN+ becomes higher than VIN- + ($V_{DIFFHYST} / 2$). This behavior is illustrated in [Hysteresis enabled in differential mode](#) on page 99.

Figure 35: Hysteresis enabled in differential mode

6.5.2 Single-ended mode

In single-ended mode, VIN- is derived from the reference ladder.

Before enabling the comparator via the **ENABLE** register, the following registers must be configured for the single-ended mode:

- **PSEL**
- **MODE**
- **REFSEL**
- **EXTREFSEL**
- **TH**

The reference ladder uses the reference voltage (VREF) to derive two new voltage references, VUP and VDOWN. VUP and VDOWN are configured using THUP and THDOWN respectively in the **TH** register. VREF can be derived from any of the available reference sources, configured using the **EXTREFSEL** and **REFSEL** registers as illustrated in [Comparator in single-ended mode](#) on page 100. When AREF is selected in the **REFSEL** register, the **EXTREFSEL** register is used to select one of the AIN0-AIN7 analog input pins as reference input. The selected analog pins will be acquired by the comparator once it is enabled.

Figure 36: Comparator in single-ended mode

Restriction: Depending on the device, not all the analog inputs may be available for each MUX. See definitions for **PSEL** and **EXTREFSEL** for more information about which analog pins are available on a particular device.

When the comparator core detects that $VIN+ > VIN-$, i.e. ABOVE as per the **RESULT** register, $VIN-$ will switch to VDOWN. When $VIN+$ falls below $VIN-$ again, $VIN-$ will be switched back to VUP. By specifying VUP larger than VDOWN, a hysteresis can be generated as illustrated in [Hysteresis example where \$VIN+\$ starts below VUP](#) on page 101 and [Hysteresis example where \$VIN+\$ starts above VUP](#) on page 101.

Writing to **HYST** has no effect in single-ended mode, and the content of this register is ignored.

Figure 37: Hysteresis example where $VIN+$ starts below VUP

Figure 38: Hysteresis example where $VIN+$ starts above VUP

6.5.3 Registers

| Base address | Peripheral | Instance | Description | Configuration |

| V _{INPUTOFFSET} | Input offset | -10 | | 10 | mV |
| t _{COMP,START} | Startup time for the comparator core | | 3 | | μS |

6.6 ECB — AES electronic codebook mode encryption

The AES electronic codebook mode encryption (ECB) can be used for a range of cryptographic functions like hash generation, digital signatures, and keystream generation for data encryption/decryption. The ECB encryption block supports 128 bit AES encryption (encryption only, not decryption).

AES ECB operates with EasyDMA access to system Data RAM for in-place operations on cleartext and ciphertext during encryption. ECB uses the same AES core as the CCM and AAR blocks and is an asynchronous operation which may not complete if the AES core is busy.

AES ECB features:

- 128 bit AES encryption
- Supports standard AES ECB block encryption
- Memory pointer support
- DMA data transfer

AES ECB performs a 128 bit AES block encrypt. At the STARTECB task, data and key is loaded into the algorithm by EasyDMA. When output data has been written back to memory, the ENDECB event is triggered.

AES ECB can be stopped by triggering the STOPECB task.

6.6.1 Shared resources

The ECB, CCM, and AAR share the same AES module. The ECB will always have lowest priority and if there is a sharing conflict during encryption, the ECB operation will be aborted and an ERRORECB event will be generated.

6.6.2 EasyDMA

The ECB implements an EasyDMA mechanism for reading and writing to the Data RAM. This DMA cannot access the program memory or any other parts of the memory area except RAM.

If the ECBDATAPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

The EasyDMA will have finished accessing the Data RAM when the ENDECB or ERRORECB is generated.

6.6.3 ECB data structure

Input to the block encrypt and output from the block encrypt are stored in the same data structure. ECBDATAPTR should point to this data structure before STARTECB is initiated.

| Property | Address offset | Description |
|------------|----------------|-------------------------------------|
| KEY | 0 | 16 byte AES key |
| CLEARTTEXT | 16 | 16 byte AES cleartext input block |
| CIPHERTEXT | 32 | 16 byte AES ciphertext output block |

6.6.5.1 ECB Electrical Specification

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------|---|------|------|------|---------|
| t_{ECB} | Run time per 16 byte block in all modes | | 6 | | μ s |

6.7 EGU — Event generator unit

The Event generator unit (EGU) provides support for inter-layer signaling. This means support for atomic triggering of both CPU execution and hardware tasks from both firmware (by CPU) and hardware (by PPI). This feature can, for instance, be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's ISR execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Enables SW triggering of interrupts
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

Each instance of The EGU implements a set of tasks which can individually be triggered to generate the corresponding event, i.e., the corresponding event for `TASKS_TRIGGER[n]` is `EVENTS_TRIGGERED[n]`.

Refer to [Instances](#) on page 113 for a list of the various EGU instances

6.7.1 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|------------------------|---------------|
| 0x40014000 | EGU | EGU0 | Event generator unit 0 | |
| 0x40015000 | EGU | EGU1 | Event generator unit 1 | |

Table 35: Instances

| Register | Offset | Description |
|----------------------|--------|--|
| TASKS_TRIGGER[0] | 0x000 | Trigger 0 for triggering the corresponding TRIGGERED[0] event |
| TASKS_TRIGGER[1] | 0x004 | Trigger 1 for triggering the corresponding TRIGGERED[1] event |
| TASKS_TRIGGER[2] | 0x008 | Trigger 2 for triggering the corresponding TRIGGERED[2] event |
| TASKS_TRIGGER[3] | 0x00C | Trigger 3 for triggering the corresponding TRIGGERED[3] event |

6.7.2 Electrical specification

6.7.2.1 EGU Electrical Specification

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------|---|------|------|------|--------|
| $t_{\text{EGU,EVT}}$ | Latency between setting an EGU event flag and the system setting an interrupt | | 1 | | cycles |

6.8 GPIO — General purpose input/output

The general purpose input/output pins (GPIOs) are grouped as one or more ports with each port having up to 32 GPIOs.

The number of ports and GPIOs per port might vary with product variant and package. Refer to [Registers](#) on page 117 and [Pin assignments](#) on page 416 for more information about the number of GPIOs that are supported.

GPIO has the following user-configurable features:

- Up to 32 GPIO pins per GPIO port
- Configurable output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins
- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through PPI and GPIOTE channels
- All pins can be individually mapped to interface blocks for layout flexibility
- GPIO state changes captured on SENSE signal can be stored by LATCH register

The GPIO port peripheral implements up to 32 pins, PIN_0 through PIN_{31} . Each of these pins can be individually configured in the $\text{PIN_CNF}[n]$ registers ($n=0..31$).

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect
- Analog input (for selected pins)

The PIN_CNF registers are retained registers. See [POWER — Power supply](#) on page 48 chapter for more information about retained registers.

6.8.1 Pin configuration

Pins can be individually configured, through the SENSE field in the PIN_CNF[n] register, to detect either a high level or a low level on their input.

When the correct level is detected on any such configured pin, the sense mechanism will set the DETECT signal high. Each pin has a separate DETECT signal. Default behavior, defined by the DETECTMODE register, is that the DETECT signals from all pins in the GPIO port are combined into one common DETECT signal that is routed throughout the system, which then can be utilized by other peripherals. This mechanism is functional in both System ON mode and System OFF mode. See [GPIO port and the GPIO pin details](#) on page 116.

Figure 39: GPIO port and the GPIO pin details

[GPIO port and the GPIO pin details](#) on page 116 illustrates the GPIO port containing 32 individual pins, where PIN0 is illustrated in more detail as a reference. All signals on the left side in the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

Make sure that a pin is in a level that cannot trigger the sense mechanism before enabling it. The DETECT signal will go high immediately if the SENSE condition configured in the PIN_CNF registers is met when the sense mechanism is enabled. This will trigger a PORT event if the DETECT signal was low before enabling the sense mechanism. See [GPIO — GPIO tasks and events](#) on page 123.

See the following peripherals for more information about how the DETECT signal is used:

- POWER: uses the DETECT signal to exit from System OFF mode.
- GPIOTE: uses the DETECT signal to generate the PORT event.

When a pin's PINx.DETECT signal goes high, a flag will be set in the LATCH register. For example, when the PIN0.DETECT signal goes high, bit 0 in the LATCH register will be set to '1'. If the CPU performs a clear operation on a bit in the LATCH register when the associated PINx.DETECT signal is high, the bit in the LATCH register will not be cleared. The LATCH register will only be cleared if the CPU explicitly clears it by writing a '1' to the bit that shall be cleared, i.e. the LATCH register will not be affected by a PINx.DETECT signal being set low.

The LDETECT signal will be set high when one or more bits in the LATCH register are '1'. The LDETECT signal will be set low when all bits in the LATCH register are successfully cleared to '0'.

If one or more bits in the LATCH register are '1' after the CPU has performed a clear operation on the LATCH registers, a rising edge will be generated on the LDETECT signal. This is illustrated in [DETECT signal behavior](#) on page 117.

Important: The CPU can read the LATCH register at any time to check if a SENSE condition has been met on one or more of the the GPIO pins, even if that condition is no longer met at the time the CPU queries the LATCH register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register it is possible to change from default behavior to DETECT signal being derived directly from the LDETECT signal instead. See [GPIO port and the GPIO pin details](#) on page 116. [DETECT signal behavior](#) on page 117 illustrates the DETECT signal behavior for these two alternatives.

Figure 40: DETECT signal behavior

The input buffer of a GPIO pin can be disconnected from the pin to enable power savings when the pin is not used as an input, see [GPIO port and the GPIO pin details](#) on page 116. Inputs must be connected to get a valid input value in the IN register, and for the sense mechanism to get access to the pin.

Other peripherals in the system can connect to GPIO pins and override their output value and configuration, or read their analog or digital input value. See [GPIO port and the GPIO pin details](#) on page 116.

Selected pins also support analog input signals, see ANAIN in [GPIO port and the GPIO pin details](#) on page 116. The assignment of the analog pins can be found in [Pin assignments](#) on page 416.

Important: When a pin is configured as digital input, care has been taken to minimize increased current consumption when the input voltage is between V_{IL} and V_{IH} . However, it is a good practice to ensure that the external circuitry does not drive that pin to levels between V_{IL} and V_{IH} for a long period of time.

6.8.2 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|----------------------------------|---------------|
| 0x50000000 | GPIO | P0 | General purpose input and output | |

| C_{PAD} | Pad capacitance | | 3 | | pF |

6.9 GPIOTE — GPIO tasks and events

The GPIOTE tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Low power detection of pin state changes is possible when in System ON or System OFF.

| Instance | Number of GPIOTE channels |
|----------|---------------------------|
| GPIOTE | 8 |

Table 39: GPIOTE properties

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear
- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

6.9.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The tasks (SET[n], CLR[n] and OUT[n]) can be used for writing to individual pins, and the events (IN[n]) can be generated from changes occurring at the inputs of individual pins.

The SET task will set the pin selected in CONFIG[n].PSEL to high.

The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in CONFIG[n].POLARITY, and can either set the pin high, set it low, or toggle it.

¹ Rise and fall times based on simulations

The tasks and events are configured using the CONFIG[n] registers. Every set of SET, CLR and OUT[n] tasks and IN[n] events has one CONFIG[n] register associated with it.

As long as a SET[n], CLR[n] and OUT[n] task or an IN[n] event is configured to control a pin *n*, the pin's output value will only be updated by the GPIOTE module. The pin's output value as specified in the GPIO will therefore be ignored as long as the pin is controlled by GPIOTE. Attempting to write a pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, see MODE field in CONFIG[n] register, the associated pin will get the output and configuration values specified in the GPIO module.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the precedence of the tasks will be as described in [Task priorities](#) on page 124.

| Priority | Task |
|----------|------|
| 1 | OUT |
| 2 | CLR |
| 3 | SET |

Table 40: Task priorities

When setting the CONFIG[n] registers, MODE=Disabled does not have the same effect as MODE=Task and POLARITY=None. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, according to the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the OUTINIT field of CONFIG[n].

6.9.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 115 for more information about the DETECT signal.

Putting the system into System ON IDLE while DETECT is high will not cause DETECT to wake the system up again. Make sure to clear all DETECT sources before entering sleep. If the LATCH register is used as a source, if any bit in LATCH is still high after clearing all or part of the register (for instance due to one of the PINx.DETECT signal still high), a new rising edge will be generated on DETECT, see [Pin configuration](#) on page 116.

Trying to put the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature is always enabled although the peripheral itself appears to be IDLE, that is, no clocks or other power intensive infrastructure have to be requested to keep this feature enabled. This feature can therefore be used to wake up the CPU from a WFI or WFE type sleep in System ON with all peripherals and the CPU idle, that is, lowest power consumption in System ON mode.

In order to prevent spurious interrupts from the PORT event while configuring the sources, the user shall first disable interrupts on the PORT event (through INTENCLR.PORT), then configure the sources (PIN_CNF[n].SENSE), clear any potential event that could have occurred during configuration (write '0' to EVENTS_PORT), and finally enable interrupts (through INTENSET.PORT).

6.9.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the CONFIG.PSEL field.

When Event mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an input, overriding the DIR setting in GPIO. Similarly, when Task mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an output overriding the DIR setting and OUT value in GPIO. When Disabled is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will use its configuration from the PIN[n].CNF registers in GPIO.

Only one GPIOTE channel can be assigned to one physical pin. Failing to do so may result in unpredictable behavior.

6.9.4 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-----------------------|---------------|
| 0x40006000 | GPIOTE | GPIOTE | GPIO tasks and events | |

Table 41: Instances

| Register | Offset | Description |
|--------------|--------|---|
| TASKS_OUT[0] | 0x000 | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is configured in CONFIG[0].POLARITY. |
| TASKS_OUT[1] | 0x004 | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is configured in CONFIG[1].POLARITY. |
| TASKS_OUT[2] | 0x008 | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is configured in CONFIG[2].POLARITY. |
| TASKS_OUT[3] | 0x00C | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is configured in CONFIG[3].POLARITY. |
| TASKS_OUT[4] | 0x010 | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is configured in CONFIG[4].POLARITY. |
| TASKS_OUT[5] | 0x014 | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is configured in CONFIG[5].POLARITY. |

6.9.5 Electrical specification

6.10 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock and supports single-channel or dual-channel (Left and Right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a Left/Right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters

The PDM module illustrated in [PDM module](#) on page 129 is interfacing up to two digital microphones with the PDM interface. It implements EasyDMA, which relieves real-time requirements associated with controlling the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce PCM samples. The PDM module allows continuous audio streaming.

Figure 41: PDM module

6.10.1 Master clock generator

The `FREQ` field in the master clock's `PDMCLKCTRL` register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the `HFCLK` source chosen. It is recommended (but not mandatory) to use the `Xtal` as `HFCLK` source.

6.10.2 Module operation

By default, bits from the left PDM microphone are sampled on `PDM_CLK` falling edge, bits for the right are sampled on the rising edge of `PDM_CLK`, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, and filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping Left and Right, so that Left will be sampled on rising edge, and Right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM.

Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono).

To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module are finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behaviour.

6.10.3 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low), its output is 2×16 -bit PCM samples at a sample rate 64 times lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by $G_{\text{PDM,default}}$. The gain is controlled by the GAINL and GAINR registers.

As an example, if the goal is to achieve 2500 RMS output samples (16 bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, the user will have to sum the PDM module's default gain ($G_{\text{PDM,default}}$) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain), and adjust GAINL and GAINR by this amount. Assuming that only the PDM module influences the gain, GAINL and GAINR must be set to $-G_{\text{PDM,default}}$ dB to achieve the requirement.

With $G_{\text{PDM,default}}=3.2$ dB, and as GAINL and GAINR are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

$$\text{GAINL} = \text{GAINR} = (\text{DefaultGain} - (2 * 3))$$

Remember to check that the resulting values programmed into GAINL and GAINR fall within MinGain and MaxGain.

6.10.4 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in SAMPLE.PTR register. If the destination address set in SAMPLE.PTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

DMA supports Stereo (Left+Right 16-bit samples) and Mono (Left only) data transfer, depending on setting in the OPERATION field in the MODE register. The samples are stored little endian.

| MODE.OPERATION | Bits per sample | Result stored per RAM word | Physical RAM allocated (32 bit words) | Result boundary indexes in RAM | Note |
|----------------|-----------------|----------------------------|---------------------------------------|--------------------------------|---------|
| Stereo | 32 (2x16) | L+R | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | R0=[31:16]; L0=[15:0] | Default |
| Mono | 16 | 2xL | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | L1=[31:16]; L0=[15:0] | |

Table 43: DMA sample storage

The destination buffer in RAM consists of one block, the size of which is set in SAMPLE.MAXCNT register. Format is number of 16-bit samples. The physical RAM allocated is always:

```
(RAM allocation, in bytes) = SAMPLE.MAXCNT * 2;
```

(but the mapping of the samples depends on MODE.OPERATION.

If OPERATION=Stereo, RAM will contain a succession of Left and Right samples.

If OPERATION=Mono, RAM will contain a succession of mono samples.

For a given value of SAMPLE.MAXCNT, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

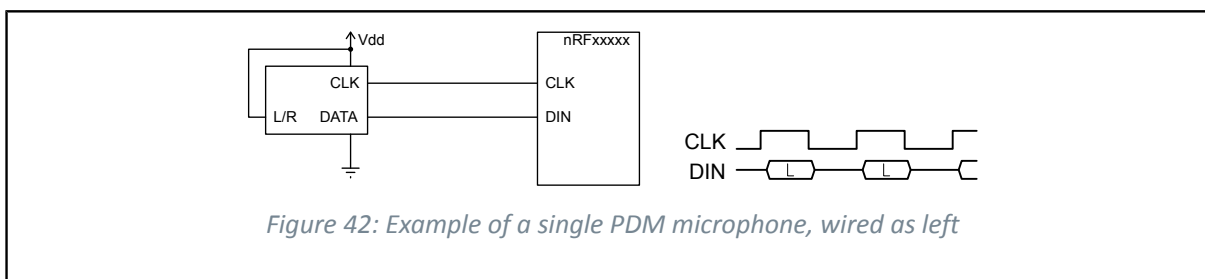

The PDM acquisition can be started by the START task, after the SAMPLE.PTR and SAMPLE.MAXCNT registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the STARTED event is received, the firmware can write the next SAMPLE.PTR value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an END event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by SAMPLE.PTR, and sends a new STARTED event, so that the firmware can update SAMPLE.PTR to the next buffer address.

6.10.5 Hardware example

Connect the microphone clock to CLK, and data to DIN.

Note that in a single-microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data. If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

6.10.6 Pin configuration

The CLK and DIN signals associated to the PDM module are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to Disconnected, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power supply](#) on page 48 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register.

To ensure correct behaviour in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 132 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behaviour.

| PDM signal | PDM pin | Direction | Output value | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK | As specified in PSEL.CLK | Output | 0 | |
| DIN | As specified in PSEL.DIN | Input | Not applicable | |

Table 44: GPIO configuration before enabling peripheral

6.10.7 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---|---------------|
| 0x4001D000 | PDM | PDM | Pulse-density modulation (digital microphone interface) | |

Table 45: Instances

| Register | Offset | Description |
|----------------|--------|---|
| TASKS_START | 0x000 | Starts continuous PDM transfer |
| TASKS_STOP | 0x004 | Stops PDM transfer |
| EVENTS_STARTED | 0x100 | PDM transfer has started |
| EVENTS_STOPPED | 0x104 | PDM transfer has finished |
| EVENTS_END | 0x108 | The PDM has written the last sample specified by SAMPLE.MAXCNT (or the last sample after a STOP task has been received) to Data RAM |
| INTEN | 0x300 | Enable or disable interrupt |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ENABLE | 0x500 | PDM module enable register |
| PDMCLKCTRL | 0x504 | PDM clock generator control |
| MODE | 0x508 | Defines the routing of the connected PDM microphones' signals |
| GAINL | 0x518 | Left output gain adjustment |
| GAINR | 0x51C | Right output gain adjustment |
| PSEL.CLK | 0x540 | Pin number configuration for PDM CLK signal |
| PSEL.DIN | 0x544 | Pin number configuration for PDM DIN signal |
| SAMPLE.PTR | 0x560 | RAM address pointer to write samples to with EasyDMA |
| SAMPLE.MAXCNT | 0x564 | Number of samples to allocate memory for in EasyDMA mode |

Table 46: Register overview

6.10.7.1 TASKS_START

Address offset: 0x000

Starts continuous PDM transfer

6.10.7.12 GAINL

Address offset: 0x518

Left output gain adjustment

Figure 45: PDM timing diagram

6.11 PPI — Programmable peripheral interconnect

The programmable peripheral interconnect (PPI) enables peripherals to interact autonomously with each other using tasks and events independent of the CPU. The PPI allows precise synchronization between peripherals when real-time application constraints exist and eliminates the need for CPU activity to implement behavior which can be predefined using PPI.

Figure 46: PPI block diagram

The PPI system has, in addition to the fully programmable peripheral interconnections, a set of channels where the event end point (EEP) and task end points (TEP) are fixed in hardware. These fixed channels can be individually enabled, disabled, or added to PPI channel groups (see CHG[n] registers), in the same way as ordinary PPI channels.

| Instance | Channel | Number of channels |
|-------------|---------|--------------------|
| PPI | 0-19 | 20 |
| PPI (fixed) | 20-31 | 12 |

Table 47: Configurable and fixed PPI channels

The PPI provides a mechanism to automatically trigger a task in one peripheral as a result of an event occurring in another peripheral. A task is connected to an event through a PPI channel. The PPI channel is composed of three end point registers, one EEP and two TEPs. A peripheral task is connected to a TEP using the address of the task register associated with the task. Similarly, a peripheral event is connected to an EEP using the address of the event register associated with the event.

On each PPI channel, the signals are synchronized to the 16 MHz clock, to avoid any internal violation of setup and hold timings. As a consequence, events that are synchronous to the 16 MHz clock will be delayed by one clock period, while other asynchronous events will be delayed by up to one 16 MHz clock period.

Note that shortcuts (as defined in the SHORTS register in each peripheral) are not affected by this 16 MHz synchronization, and are therefore not delayed.

Each TEP implements a fork mechanism that enables a second task to be triggered at the same time as the task specified in the TEP is triggered. This second task is configured in the task end point register in the FORK registers groups, e.g. FORK.TEP[0] is associated with PPI channel CH[0].

There are two ways of enabling and disabling PPI channels:

- Enable or disable PPI channels individually using the CHEN, CHENSET, and CHENCLR registers.
- Enable or disable PPI channels in PPI channel groups through the groups' ENABLE and DISABLE tasks. Prior to these tasks being triggered, the PPI channel group must be configured to define which PPI channels belong to which groups.

Note that when a channel belongs to two groups m and n, and the tasks CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), the CHG[m].EN on that channel has priority.

PPI tasks (for example, CHG[0].EN) can be triggered through the PPI like any other task, which means they can be hooked to a PPI channel as a TEP. One event can trigger multiple tasks by using multiple channels and one task can be triggered by multiple events in the same way.

6.11.1 Pre-programmed channels

Some of the PPI channels are pre-programmed. These channels cannot be configured by the CPU, but can be added to groups and enabled and disabled like the general purpose PPI channels. The FORK TEP for these channels are still programmable and can be used by the application.

For a list of pre-programmed PPI channels, see the table below.

| Channel | EEP | TEP |
|---------|---------------------------|--------------------------|
| 20 | TIMER0->EVENTS_COMPARE[0] | RADIO->TASKS_TXEN |
| 21 | TIMER0->EVENTS_COMPARE[0] | RADIO->TASKS_RXEN |
| 22 | TIMER0->EVENTS_COMPARE[1] | RADIO->TASKS_DISABLE |
| 23 | RADIO->EVENTS_BCMATCH | AAR->TASKS_START |
| 24 | RADIO->EVENTS_READY | CCM->TASKS_KSGEN |
| 25 | RADIO->EVENTS_ADDRESS | CCM->TASKS_CRYPT |
| 26 | RADIO->EVENTS_ADDRESS | TIMER0->TASKS_CAPTURE[1] |
| 27 | RADIO->EVENTS_END | TIMER0->TASKS_CAPTURE[2] |
| 28 | RTC0->EVENTS_COMPARE[0] | RADIO->TASKS_TXEN |
| 29 | RTC0->EVENTS_COMPARE[0] | RADIO->TASKS_RXEN |
| 30 | RTC0->EVENTS_COMPARE[0] | TIMER0->TASKS_CLEAR |
| 31 | RTC0->EVENTS_COMPARE[0] | TIMER0->TASKS_START |

6.12 PWM — Pulse width modulation

The pulse with modulation (PWM) module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

The following are the main features of a PWM module:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency possibly on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 47: PWM module

6.12.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by a value read from RAM (see figure [Decoder memory access modes](#) on page 149). Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 149 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM_MODE_Up), with three PWM channels with the same frequency but different duty cycle:

Figure 48: PWM counter in up mode example - FallingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to FallingEdge. Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t) (pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

$$\text{PWM period: } T_{\text{PWM(Up)}} = T_{\text{PWM_CLK}} * \text{COUNTERTOP}$$

Step width/Resolution: $T_{steps} = T_{PWM_CLK}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM_MODE_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

Figure 49: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{PWM(Up\ And\ Down)} = T_{PWM_CLK} * 2 * COUNTERTOP$$

Step width/Resolution: $T_{steps} = T_{PWM_CLK} * 2$

6.12.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in RAM and update the internal compare registers of the wave counter, based on the mode of operation.

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|---|----------|-------------|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Id | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | B | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A | A |
| Reset 0x00000000 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Id | RW | Field | Value Id | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | RW | COMPARE | | | Duty cycle setting - value loaded to internal compare register | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| B | RW | POLARITY | | | Edge polarity of GPIO. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | RisingEdge | 0 | First edge within the PWM period is rising | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | FallingEdge | 1 | First edge within the PWM period is falling | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

The DECODER register controls how the RAM content is interpreted and loaded into the internal compare registers. The LOAD field controls if the RAM values are loaded to all compare channels, or to update a group or all channels with individual values. The following figure illustrates how parameters stored in RAM are organized and routed to various compare channels in different modes:

Figure 50: Decoder memory access modes

A special mode of operation is available when DECODER.LOAD is set to WaveForm. In this mode, up to three PWM channels can be enabled - OUT[0] to OUT[2]. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load

the COUNTERTOP register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register SEQ[n].REFRESH=N (one per sequence n=0 or 1) will instruct a new RAM stored pulse width value on every (N+1)th PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers SEQ[n].REFRESH and SEQ[n].ENDDelay are ignored when DECODER.MODE=NextStep. The next value is loaded upon every received NEXTSTEP task.

SEQ[n].PTR is the pointer used to fetch COMPARE values from RAM. If the SEQ[n].PTR is not pointing to a RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions. After the SEQ[n].PTR is set to the desired RAM location, the SEQ[n].CNT register must be set to number of 16-bit half words in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the SEQSTART[n] task is triggered, the task will load the first value from RAM and then start the PWM generation. A SEQSTARTED[n] event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When LOOP.CNT=0, sequence n=0 or 1 is played back once. After the last value in the sequence has been loaded and started executing, a SEQEND[n] event is generated. The PWM generation will then continue with the last loaded value. The following figure illustrates an example of such simple playback:

Figure 51: Simple sequence example

Figure depicts the source code used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of currently running PWM period, and the pins go into their idle state as defined in GPIO OUT register. PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The table below indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

| Register | Taken into account by hardware | Recommended (safe) update |
|-----------------|---|---|
| SEQ[n].PTR | When sending the SEQSTART[n] task | After having received the SEQSTARTED[n] event |
| SEQ[n].CNT | When sending the SEQSTART[n] task | After having received the SEQSTARTED[n] event |
| SEQ[0].ENDDelay | When sending the SEQSTART[0] task Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [0] through a SEQSTART[0] task When no more value from sequence [0] gets loaded from RAM (indicated by the SEQEND[0] event) At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated) |
| SEQ[1].ENDDelay | When sending the SEQSTART[1] task Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [1] through a SEQSTART[1] task When no more value from sequence [1] gets loaded from RAM (indicated by the SEQEND[1] event) At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated) |
| SEQ[0].REFRESH | When sending the SEQSTART[0] task Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [0] through a SEQSTART[0] task At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated) |
| SEQ[1].REFRESH | When sending the SEQSTART[1] task Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [1] through a SEQSTART[1] task At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated) |
| COUNTERTOP | In DECODER.LOAD=WaveForm: this register is ignored. In all other LOAD modes: at the end of current PWM period (indicated by the PWMPERIODEND event) | Before starting PWM generation through a SEQSTART[n] task After a STOP task has been triggered, and the STOPPED event has been received. |
| MODE | Immediately | Before starting PWM generation through a SEQSTART[n] task After a STOP task has been triggered, and the STOPPED event has been received. |
| DECODER | Immediately | Before starting PWM generation through a SEQSTART[n] task After a STOP task has been triggered, and the STOPPED event has been received. |
| PRESCALER | Immediately | Before starting PWM generation through a SEQSTART[n] task After a STOP task has been triggered, and the STOPPED event has been received. |
| LOOP | Immediately | Before starting PWM generation through a SEQSTART[n] task After a STOP task has been triggered, and the STOPPED event has been received. |
| PSEL.OUT[n] | Immediately | Before enabling the PWM instance through the ENABLE register |

Table 51: When to safely update PWM registers

Note: SEQ[n].REFRESH and SEQ[n].ENDDelay are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

A more complex example, where LOOP.CNT>0, is shown in the following figure:

Figure 52: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].CNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDDELAY=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDDELAY=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR  = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT  = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

Figure 53: Single shot ($LOOP.CNT=0$)

Note: The single-shot example also applies to SEQ[1]. Only SEQ[0] is represented for simplicity.

Figure 54: Complex sequence ($LOOP.CNT > 0$) starting with SEQ[0]

Figure 55: Complex sequence ($LOOP.CNT > 0$) starting with SEQ[1]

Note: If a sequence is in use in a simple or complex sequence, it must have a length of $SEQ[n].CNT > 0$.

6.12.3 Limitations

Previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

6.12.4 Pin configuration

The OUT[n] ($n=0..3$) signals associated with each PWM channel are mapped to physical pins according to the configuration of PSEL.OUT[n] registers. If PSEL.OUT[n].CONNECT is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The PSEL.OUT[n] registers and their configurations are used as long as the PWM module is enabled and the PWM generation active (wave counter started). They are retained only as long as the device is in System ON mode (see section [POWER](#) for more information about power modes).

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

| PWM signal | PWM pin | Direction | Output value | Comment |
|------------|---|-----------|--------------|---|
| OUT[n] | As specified in PSEL.OUT[n] ($n=0..3$) | Output | 0 | Idle state defined in GPIO OUT register |

Table 52: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module, to ensure that the pins used by the PWM module are driven correctly. If PWM generation is stopped by triggering a STOP task, the PWM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected pins (I/Os) for as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

6.12.5 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-------------------------------|---------------|
| 0x4001C000 | PWM | PWM0 | Pulse-width modulation unit 0 | |

Table 53: Instances

| Register | Offset | Description |
|----------------------|--------|--|
| TASKS_STOP | 0x004 | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback |
| TASKS_SEQSTART[0] | 0x008 | Loads the first PWM value on all enabled channels from sequence 0, and starts playing that sequence at the rate defined in SEQ[0]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_SEQSTART[1] | 0x00C | Loads the first PWM value on all enabled channels from sequence 1, and starts playing that sequence at the rate defined in SEQ[1]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_NEXTSTEP | 0x010 | Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running. |
| EVENTS_STOPPED | 0x104 | Response to STOP task, emitted when PWM pulses are no longer generated |
| EVENTS_SEQSTARTED[0] | 0x108 | First PWM period started on sequence 0 |
| EVENTS_SEQSTARTED[1] | 0x10C | First PWM period started on sequence 1 |
| EVENTS_SEQEND[0] | 0x110 | Emitted at end of every sequence 0, when last value from RAM has been applied to wave counter |
| EVENTS_SEQEND[1] | 0x114 | Emitted at end of every sequence 1, when last value from RAM has been applied to wave counter |
| EVENTS_PWMPERIODEND | 0x118 | Emitted at the end of each PWM period |
| EVENTS_LOOPSDONE | 0x11C | Concatenated sequences have been played the amount of times defined in LOOP.CNT |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTEN | 0x300 | Enable or disable interrupt |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ENABLE | 0x500 | PWM module enable register |
| MODE | 0x504 | Selects operating mode of the wave counter |
| COUNTERTOP | 0x508 | Value up to which the pulse generator counter counts |
| PRESCALER | 0x50C | Configuration for PWM_CLK |
| DECODER | 0x510 | Configuration of the decoder |
| LOOP | 0x514 | Number of playbacks of a loop |
| SEQ[0].PTR | 0x520 | Beginning address in RAM of this sequence |
| SEQ[0].CNT | 0x524 | Number of values (duty cycles) in this sequence |
| SEQ[0].REFRESH | 0x528 | Number of additional PWM periods between samples loaded into compare register |
| SEQ[0].ENDELAY | 0x52C | Time added after the sequence |
| SEQ[1].PTR | 0x540 | Beginning address in RAM of this sequence |
| SEQ[1].CNT | 0x544 | Number of values (duty cycles) in this sequence |
| SEQ[1].REFRESH | 0x548 | Number of additional PWM periods between samples loaded into compare register |
| SEQ[1].ENDELAY | 0x54C | Time added after the sequence |

| Register | Offset | Description |
|-------------|--------|-------------------------------------|
| PSEL.OUT[0] | 0x560 | Output pin select for PWM channel 0 |
| PSEL.OUT[1] | 0x564 | Output pin select for PWM channel 1 |
| PSEL.OUT[2] | 0x568 | Output pin select for PWM channel 2 |
| PSEL.OUT[3] | 0x56C | Output pin select for PWM channel 3 |

Table 54: Register overview

6.12.5.1 TASKS_STOP

Address offset: 0x004

Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|---|------------|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|
| ID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | A |
| Reset | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acces Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | W | TASKS_STOP | | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | Trigger | 1 | Trigger task | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.12.5.2 TASKS_SEQSTART[n] (n=0..1)

Address offset: 0x008 + (n × 0x4)

Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running.

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.13 QDEC — Quadrature decoder

The Quadrature decoder (QDEC) provides buffered decoding of quadrature-encoded sensor signals. It is suitable for mechanical and optical sensors.

The sample period and accumulation are configurable to match application requirements. The QDEC provides the following:

- Decoding of digital waveform from off-chip quadrature encoder.
- Sample accumulation eliminating hard real-time requirements to be enforced on application.
- Optional input de-bounce filters.
- Optional LED output signal for optical encoders.

Figure 56: Quadrature decoder configuration

6.13.1 Sampling and decoding

The QDEC decodes the output from an incremental motion encoder by sampling the QDEC phase input pins (A and B).

The off-chip quadrature encoder is an incremental motion encoder outputting two waveforms, phase A and phase B. The two output waveforms are always 90 degrees out of phase, meaning that one always changes level before the other. The direction of movement is indicated by which of these two waveforms that changes level first. Invalid transitions may occur, that is when the two waveforms switch simultaneously. This may occur if the wheel rotates too fast relative to the sample rate set for the decoder.

The QDEC decodes the output from the off-chip encoder by sampling the QDEC phase input pins (A and B) at a fixed rate as specified in the SAMPLEPER register.

If the SAMPLEPER value needs to be changed, the QDEC shall be stopped using the STOP task. SAMPLEPER can be then changed upon receiving the STOPPED event, and QDEC can be restarted using the START task. Failing to do so may result in unpredictable behaviour.

It is good practice to change other registers (LEDPOL, REPORTPER, DBFEN and LEDPRE) only when the QDEC is stopped.

When started, the decoder continuously samples the two input waveforms and decodes these by comparing the current sample pair (n) with the previous sample pair (n-1).

The decoding of the sample pairs is described in the table below.

| Previous sample pair(n-1) | | Current samples pair(n) | | SAMPLE register | ACC operation | ACCDBL operation | Description |
|---------------------------|---|-------------------------|---|-----------------|---------------|------------------|--------------------------------|
| A | B | A | B | | | | |
| 0 | 0 | 0 | 0 | 0 | No change | No change | No movement |
| 0 | 0 | 0 | 1 | 1 | Increment | No change | Movement in positive direction |
| 0 | 0 | 1 | 0 | -1 | Decrement | No change | Movement in negative direction |
| 0 | 0 | 1 | 1 | 2 | No change | Increment | Error: Double transition |
| 0 | 1 | 0 | 0 | -1 | Decrement | No change | Movement in negative direction |
| 0 | 1 | 0 | 1 | 0 | No change | No change | No movement |
| 0 | 1 | 1 | 0 | 2 | No change | Increment | Error: Double transition |
| 0 | 1 | 1 | 1 | 1 | Increment | No change | Movement in positive direction |
| 1 | 0 | 0 | 0 | 1 | Increment | No change | Movement in positive direction |
| 1 | 0 | 0 | 1 | 2 | No change | Increment | Error: Double transition |
| 1 | 0 | 1 | 0 | 0 | No change | No change | No movement |
| 1 | 0 | 1 | 1 | -1 | Decrement | No change | Movement in negative direction |
| 1 | 1 | 0 | 0 | 2 | No change | Increment | Error: Double transition |
| 1 | 1 | 0 | 1 | -1 | Decrement | No change | Movement in negative direction |
| 1 | 1 | 1 | 0 | 1 | Increment | No change | Movement in positive direction |
| 1 | 1 | 1 | 1 | 0 | No change | No change | No movement |

Table 55: Sampled value encoding

6.13.2 LED output

The LED output follows the sample period, and the LED is switched on a given period before sampling and switched off immediately after the inputs are sampled. The period the LED is switched on before sampling is given in the LEDPRE register.

The LED output pin polarity is specified in the LEDPOL register.

For using off-chip mechanical encoders not requiring a LED, the LED output can be disabled by writing value 'Disconnected' to the CONNECT field of the PSEL.LED register. In this case the QDEC will not acquire access to a LED output pin and the pin can be used for other purposes by the CPU.

6.13.3 Debounce filters

Each of the two-phase inputs have digital debounce filters.

When enabled through the DBFEN register, the filter inputs are sampled at a fixed 1 MHz frequency during the entire sample period (which is specified in the SAMPLEPER register), and the filters require all of the samples within this sample period to equal before the input signal is accepted and transferred to the output of the filter.

As a result, only input signal with a steady state longer than twice the period specified in SAMPLEPER are guaranteed to pass through the filter, and any signal with a steady state shorter than SAMPLEPER will always be suppressed by the filter. (This is assumed that the frequency during the debounce period never exceeds 500 kHz (as required by the Nyquist theorem when using a 1 MHz sample frequency).

The LED will always be ON when the debounce filters are enabled, as the inputs in this case will be sampled continuously.

Note that when the debounce filters are enabled, displacements reported by the QDEC peripheral are delayed by one SAMPLEPER period.

6.13.4 Accumulators

The quadrature decoder contains two accumulator registers, ACC and ACCDBL, that accumulate respectively valid motion sample values and the number of detected invalid samples (double transitions).

The ACC register will accumulate all valid values (1/-1) written to the SAMPLE register. This can be useful for preventing hard real-time requirements from being enforced on the application. When using the ACC register the application does not need to read every single sample from the SAMPLE register, but can instead fetch the ACC register whenever it fits the application. The ACC register will always hold the relative movement of the external mechanical device since the previous clearing of the ACC register. Sample values indicating a double transition (2) will not be accumulated in the ACC register.

An ACCOF event will be generated if the ACC receives a SAMPLE value that would cause the register to overflow or underflow. Any SAMPLE value that would cause an ACC overflow or underflow will be discarded, but any samples not causing the ACC to overflow or underflow will still be accepted.

The accumulator ACCDBL accumulates the number of detected double transitions since the previous clearing of the ACCDBL register.

The ACC and ACCDBL registers can be cleared by the READCLRACC and subsequently read using the ACCREAD and ACCDBLREAD registers.

The ACC register can be separately cleared by the RDCLRACC and subsequently read using the ACCREAD registers.

The ACCDBL register can be separately cleared by the RDCLRDBL and subsequently read using the ACCDBLREAD registers.

The REPORTPER register allows automating the capture of several samples before it can send out a REPORTRDY event in case a non-null displacement has been captured and accumulated, and a DBLRDY event in case one or more double-displacements have been captured and accumulated. The REPORTPER field in this register selects after how many samples the accumulators contents are evaluated to send (or not) REPORTRDY and DBLRDY events.

Using the RDCLRACC task (manually sent upon receiving the event, or using the DBLRDY_RDCLRACC shortcut), ACCREAD can then be read.

In case at least one double transition has been captured and accumulated, a DBLRDY event is sent. Using the RDCLRDBL task (manually sent upon receiving the event, or using the DBLRDY_RDCLRDBL shortcut), ACCDBLREAD can then be read.

6.13.5 Output/input pins

The QDEC uses a three-pin interface to the off-chip quadrature encoder.

These pins will be acquired when the QDEC is enabled in the ENABLE register. The pins acquired by the QDEC cannot be written by the CPU, but they can still be read by the CPU.

The pin numbers to be used for the QDEC are selected using the PSEL.n registers.

6.13.6 Pin configuration

The Phase A, Phase B, and LED signals are mapped to physical pins according to the configuration specified in the PSEL.A, PSEL.B, and PSEL.LED registers respectively.

If the CONNECT field value 'Disconnected' is specified in any of these registers, the associated signal will not be connected to any physical pin. The PSEL.A, PSEL.B, and PSEL.LED registers and their configurations are only used as long as the QDEC is enabled, and retained only as long as the device is in ON mode.

When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register.

To secure correct behavior in the QDEC, the pins used by the QDEC must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 169 before enabling the QDEC. This configuration must be retained in the GPIO for the selected IOs as long as the QDEC is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| QDEC signal | QDEC pin | Direction | Output value | Comment |
|-------------|--------------------------|-----------|----------------|---------|
| Phase A | As specified in PSEL.A | Input | Not applicable | |
| Phase B | As specified in PSEL.B | Input | Not applicable | |
| LED | As specified in PSEL.LED | Input | Not applicable | |

Table 56: GPIO configuration before enabling peripheral

6.13.7 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--------------------|---------------|
| 0x40012000 | QDEC | QDEC | Quadrature decoder | |

Table 57: Instances

| Register | Offset | Description |
|------------------|--------|---|
| TASKS_START | 0x000 | Task starting the quadrature decoder |
| TASKS_STOP | 0x004 | Task stopping the quadrature decoder |
| TASKS_READLRACC | 0x008 | Read and clear ACC and ACCDBL |
| TASKS_RDCLRACC | 0x00C | Read and clear ACC |
| TASKS_RDCLRDBL | 0x010 | Read and clear ACCDBL |
| EVENTS_SAMPLERDY | 0x100 | Event being generated for every new sample value written to the SAMPLE register |
| EVENTS_REPORTRDY | 0x104 | Non-null report ready |
| EVENTS_ACCOF | 0x108 | ACC or ACCDBL register overflow |
| EVENTS_DBLRDY | 0x10C | Double displacement(s) detected |
| EVENTS_STOPPED | 0x110 | QDEC has been stopped |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ENABLE | 0x500 | Enable the quadrature decoder |
| LEDPOL | 0x504 | LED output pin polarity |
| SAMPLEPER | 0x508 | Sample period |
| SAMPLE | 0x50C | Motion sample value |
| REPORTPER | 0x510 | Number of samples to be taken before REPORTRDY and DBLRDY events can be generated |
| ACC | 0x514 | Register accumulating the valid transitions |
| ACCREAD | 0x518 | Snapshot of the ACC register, updated by the READLRACC or RDCLRACC task |
| PSEL.LED | 0x51C | Pin select for LED signal |
| PSEL.A | 0x520 | Pin select for A signal |
| PSEL.B | 0x524 | Pin select for B signal |
| DBFEN | 0x528 | Enable input debounce filters |
| LEDPRE | 0x540 | Time period the LED is switched ON prior to sampling |
| ACCDBL | 0x544 | Register accumulating the number of detected double transitions |

| Register | Offset | Description |
|------------|--------|--|
| ACCDBLREAD | 0x548 | Snapshot of the ACCDBL, updated by the READCLRACC or RDCLRDBL task |

Table 58: Register overview

6.13.7.1 TASKS_START

Address offset: 0x000

Task starting the quadrature decoder

When started, the SAMPLE register will be continuously updated at the rate given in the SAMPLEPER register.

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.14 RADIO — 2.4 GHz radio

The 2.4 GHz radio transceiver is compatible with multiple radio standards such as 1 Mbps, 2 Mbps and long range *Bluetooth*[®] low energy. IEEE 802.15.4 250 kbps mode is fully supported as well as Nordic's proprietary 1 Mbps and 2 Mbps modes of operation.

Listed here are main features for the RADIO:

- Multidomain 2.4 GHz radio transceiver
 - 1 Mbps, 2 Mbps, and long range (125 kbps and 500 kbps mode) *Bluetooth*[®] low energy modes
 - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using *Bluetooth*[®] low energy
 - 250 kbps IEEE 802.15.4 mode
 - 1 Mbps and 2 Mbps Nordic proprietary modes
- Best in class link budget and low power operation
- Efficient data interface with EasyDMA support
- Automatic address filtering and pattern matching

EasyDMA, in combination with an automated packet assembler, packet disassembler, automated CRC generator and CRC checker, makes it easy to configure and use the RADIO. See the following figure for details.

Figure 57: RADIO block diagram

The RADIO includes a device address match unit and an interframe spacing control unit that can be utilized to simplify address whitelisting and interframe spacing respectively in *Bluetooth*[®] low energy and similar applications.

The RADIO also includes a received signal strength indicator (RSSI) and a bit counter. The bit counter generates events when a preconfigured number of bits are sent or received by the RADIO.

6.14.1 Packet configuration

A RADIO packet contains the following fields: PREAMBLE, ADDRESS, S0, LENGTH, S1, PAYLOAD, and CRC.

The content of a RADIO packet is illustrated in the figure below. The RADIO sends the fields in the packet according to the order illustrated in the following figure, starting on the left.

Figure 58: On-air packet layout

Not shown in the figure is the static payload add-on (the length of which is defined in `PCNF1.STATLEN`, and which is 0 bytes in a standard BLE packet). The static payload add-on is sent between PAYLOAD and CRC fields. The RADIO sends the different fields in the packet in the order they are illustrated above, from left to right. The preamble will be sent with least significant bit first on air.

PREAMBLE is sent with least significant bit first on air. The size of the PREAMBLE depends on the mode selected in the `MODE` register:

- The PREAMBLE is one byte for `MODE = Ble_1Mbit` as well as all Nordic proprietary operating modes (`MODE = Nrf_1Mbit` and `MODE = Nrf_2Mbit`), and `PCNF0.PLEN` has to be set accordingly. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAA. Otherwise the PREAMBLE will be set to 0x55.
- For `MODE = Ble_2Mbit`, the PREAMBLE must be set to 2 byte through `PCNF0.PLEN`. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAAAA. Otherwise the PREAMBLE will be set to 0x5555.
- For `MODE = Ble_LR125Kbit` and `MODE = Ble_LR500Kbit`, the PREAMBLE is 10 repetitions of 0x3C.
- For `MODE = leee802154_250Kbit`, the PREAMBLE is 4 bytes and set to all zeros.

Radio packets are stored in memory inside instances of a RADIO packet data structure as illustrated below. The PREAMBLE, ADDRESS, CI, TERM1, TERM2, and CRC fields are omitted in this data structure. Fields S0, LENGTH, and S1 are optional.

Figure 59: In-RAM representation of RADIO packet

The byte ordering on air is always least significant byte first for the ADDRESS and PAYLOAD fields, and most significant byte first for the CRC field. The ADDRESS fields are always transmitted and received least significant bit first. The CRC field is always transmitted and received most significant bit first. The bit-endian, i.e. the order in which the bits are sent and received, of the S0, LENGTH, S1, and PAYLOAD fields can be configured via `PCNF1.ENDIAN`.

The sizes of the S0, LENGTH and S1 fields can be individually configured via `SOLEN`, `LFLEN`, and `S1LEN` in `PCNF0` respectively. If any of these fields are configured to be less than 8 bits, the least significant bits of the fields are used.

If S0, LENGTH, or S1 are specified with zero length, their fields will be omitted in memory. Otherwise each field will be represented as a separate byte, regardless of the number of bits in their on-air counterpart.

Independent of the configuration of `PCNF1.MAXLEN`, the combined length of `S0`, `LENGTH`, `S1`, and `PAYLOAD` cannot exceed 258 bytes.

6.14.2 Address configuration

The on-air radio `ADDRESS` field is composed of two parts, the base address field and the address prefix field.

The size of the base address field is configurable via `PCNF1.BALEN`. The base address is truncated from the least significant byte if the `PCNF1.BALEN` is less than 4. See [Definition of logical addresses](#) on page 182.

| Logical address | Base address | Prefix byte |
|-----------------|--------------|-------------|
| 0 | BASE0 | PREFIX0.AP0 |
| 1 | BASE1 | PREFIX0.AP1 |
| 2 | BASE1 | PREFIX0.AP2 |
| 3 | BASE1 | PREFIX0.AP3 |
| 4 | BASE1 | PREFIX1.AP4 |
| 5 | BASE1 | PREFIX1.AP5 |
| 6 | BASE1 | PREFIX1.AP6 |
| 7 | BASE1 | PREFIX1.AP7 |

Table 59: Definition of logical addresses

The on-air addresses are defined in the `BASE0/BASE1` and `PREFIX0/PREFIX1` registers. It is only when writing these registers that the user must relate to the actual on-air addresses. For other radio address registers, such as the `TXADDRESS`, `RXADDRESSES`, and `RXMATCH` registers, logical radio addresses ranging from 0 to 7 are being used. The relationship between the on-air radio addresses and the logical addresses is described in [Definition of logical addresses](#) on page 182.

6.14.3 Data whitening

The RADIO is able to do packet whitening and de-whitening, enabled in `PCNF1.WHITEEN`. When enabled, whitening and de-whitening will be handled by the RADIO automatically as packets are sent and received.

The whitening word is generated using polynomial $g(D) = D^7 + D^4 + 1$, which then is XORed with the data packet that is to be whitened, or de-whitened. See the figure below.

Figure 60: Data whitening and de-whitening

Whitening and de-whitening will be performed over the whole packet (except for the preamble and the address field).

The linear feedback shift register in the figure above is initialized via register `DATAWHITEIV` on page 228.

6.14.4 CRC

The CRC generator in the RADIO calculates the CRC over the whole packet excluding the preamble. If desirable, the address field can be excluded from the CRC calculation as well.

See [CRC CNF](#) register for more information.

The CRC polynomial is configurable as illustrated in the following figure, where bit 0 in the [CRCPOLY](#) register corresponds to X^0 and bit 1 corresponds to X^1 etc. See [CRCPOLY](#) on page 227 for more information.

Figure 61: CRC generation of an n bit CRC

The figure shows that the CRC is calculated by feeding the packet serially through the CRC generator. Before the packet is clocked through the CRC generator, the CRC generator's latches b_0 through b_n will be initialized with a predefined value specified in the [CRCINIT](#) register. After the whole packet has been clocked through the CRC generator, b_0 through b_n will hold the resulting CRC. This value will be used by the RADIO during both transmission and reception. Latches b_0 through b_n are not available to be read by the CPU at any time. However, a received CRC can be read by the CPU via the [RXCRC](#) register.

The length (n) of the CRC is configurable, see [CRC CNF](#) for more information.

Once the entire packet, including the CRC, has been received and no errors were detected, the RADIO generates a [CRCOK](#) event. If CRC errors were detected, a [CRCERROR](#) event is generated.

The status of the CRC check can be read from the [CRCSTATUS](#) register after a packet has been received.

6.14.5 Radio states

Tasks and events are used to control the operating state of the RADIO.

The RADIO can enter the states described the table below.

| State | Description |
|-----------|--|
| DISABLED | No operations are going on inside the RADIO and the power consumption is at a minimum |
| RXRU | The RADIO is ramping up and preparing for reception |
| RXIDLE | The RADIO is ready for reception to start |
| RX | Reception has been started and the addresses enabled in the RXADDRESSES register are being monitored |
| TXRU | The RADIO is ramping up and preparing for transmission |
| TXIDLE | The RADIO is ready for transmission to start |
| TX | The RADIO is transmitting a packet |
| RXDISABLE | The RADIO is disabling the receiver |
| TXDISABLE | The RADIO is disabling the transmitter |

Table 60: RADIO state diagram

A state diagram showing an overview of the RADIO is shown in the following figure.

Figure 62: Radio states

This figure shows how the tasks and events relate to the RADIO's operation. The RADIO does not prevent a task from being triggered from the wrong state. If a task is triggered from the wrong state, for example if the **RXEN** task is triggered from the **RXDISABLE** state, this may lead to incorrect behavior. The **PAYLOAD** event is always generated even if the payload is zero.

The END to START shortcut should not be used with Ble_LR125Kbit, Ble_LR500Kbit, and leee802154_250Kbit modes. Rather the **PHYEND** to **START** shortcut.

6.14.6 Transmit sequence

Before the RADIO is able to transmit a packet, it must first ramp-up in TX mode. See **TXRU** in [Radio states](#) on page 184 and [Transmit sequence](#) on page 185. A **TXRU** ramp-up sequence is initiated when the **TXEN** task is triggered. After the RADIO has successfully ramped up it will generate the **READY** event indicating that a packet transmission can be initiated. A packet transmission is initiated by triggering the **START** task. The **START** task can first be triggered after the RADIO has entered into the **TXIDLE** state.

The following figure illustrates a single packet transmission where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between **READY** and **START**, and between **END** and **DISABLE**. As illustrated in [Transmit sequence](#) on page 185 the RADIO will by default transmit '1's between **READY** and **START**, and between **END** and **DISABLED**. What is transmitted can be programmed through the DTX field in the **MODECNF0** register.

Figure 63: Transmit sequence

The following figure shows a slightly modified version of the transmit sequence where the RADIO is configured to use shortcuts between **READY** and **START**, and between **END** and **DISABLE**, which means that no delay is introduced.

Figure 64: Transmit sequence using shortcuts to avoid delays

The RADIO is able to send multiple packets one after the other without having to disable and re-enable the RADIO between packets, as illustrated in the following figure.

Figure 65: Transmission of multiple packets

6.14.7 Receive sequence

Before the RADIO is able to receive a packet, it must first ramp up in RX mode, see RXRU in [Radio states](#) on page 184 and [Receive sequence](#) on page 186.

An RXRU ramp up sequence is initiated when the [RXEN](#) task is triggered. After the RADIO has successfully ramped up it will generate the [READY](#) event indicating that a packet reception can be initiated. A packet reception is initiated by triggering the [START](#) task. As illustrated in [Radio states](#) on page 184, the [START](#) task can first be triggered after the RADIO has entered into the RXIDLE state.

The following figure shows a single packet reception where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between [READY](#) and [START](#), and between [END](#) and [DISABLE](#). The RADIO will be listening and possibly receiving undefined data, represented with an 'X', from [START](#) and until a packet with valid preamble (P) is received.

Figure 66: Receive sequence

The following figure shows a slightly modified version of the receive sequence, where the RADIO is configured to use shortcuts between [READY](#) and [START](#), and between [END](#) and [DISABLE](#), which means that no delay is introduced.

Figure 67: Receive sequence using shortcuts to avoid delays

The RADIO is able to receive consecutive packets without having to disable and re-enable the RADIO between packets, as illustrated in the figure below.

Figure 68: Reception of multiple packets

6.14.8 Received signal strength indicator (RSSI)

The RADIO implements a mechanism for measuring the power in the received signal. This feature is called received signal strength indicator (RSSI).

The RSSI is measured continuously and the value filtered using a single-pole IIR filter. After a signal level change, the RSSI will settle after approximately $RSSI_{SETTLE}$.

Sampling of the received signal strength is started by using the `RSSISTART` task. The sample can be read from the `RSSISAMPLE` register.

The sample period of the RSSI is defined by $RSSI_{PERIOD}$. The `RSSISAMPLE` will hold the pre-filtered received signal strength after this sample period.

For the RSSI sample to be valid, the RADIO has to be enabled in receive mode (`RXEN` task) and the reception has to be started (`READY` event followed by `START` task).

6.14.9 Interframe spacing (IFS)

Interframe spacing (IFS) is defined as the time, in microseconds, between two consecutive packets, starting from when the end of the last bit of the previous packet is received, to the beginning of the first bit of the subsequent packet that is transmitted. The RADIO is able to enforce this interval, as specified in the `TIFS` register, as long as the `TIFS` is not specified to be shorter than the RADIO's turnaround time, i.e. the time needed to switch off the receiver, and then switch the transmitter back on. The `TIFS` register can be written any time before the last bit on air is received.

This timing is illustrated in the figure below.

Figure 69: IFS timing detail

The TIFS duration starts after the last bit on air (just before the **END** event), and elapses with first bit being transmitted on air (just after **READY** event).

TIFS is only enforced if the shortcuts **END-to-DISABLE** and **DISABLED-to-TXEN** or **END-to-DISABLE** and **DISABLED-to-RXEM** are enabled. TIFS is qualified for use when **MODE** is either **Ble_1Mbit**, **Ble_2Mbit**, **Ble_LR125Kbit**, **Ble_LR500Kbit**, or **leee802154_250Kbit**, using the default ramp-up mode. **SHORTS** and **TIFS** are not double-buffered, and can be updated at any point in time before the last bit on air is received. The **MODE** register is double-buffered and sampled at the **TXEN** or **RXEN** task.

6.14.10 Device address match

The device address match feature is tailored for address whitelisting in *Bluetooth*[®] low energy and similar implementations.

This feature enables on-the-fly device address matching while receiving a packet on air. This feature only works in receive mode and when the RADIO is configured for little endian, see **PCNF1.ENDIAN**.

The device address match unit assumes that the first 48 bits of the payload are the device address and that bit number 6 in **S0** is the TxAdd bit. See the *Bluetooth*[®] Core Specification for more information about device addresses, TxAdd, and whitelisting.

The RADIO is able to listen for eight different device addresses at the same time. These addresses are specified in a DAB/DAP register pair, one pair per address, in addition to a TxAdd bit configured in the DACNF register. The DAB register specifies the 32 least significant bits of the device address, while the DAP register specifies the 16 most significant bits of the device address.

Each of the device addresses can be individually included or excluded from the matching mechanism. This is configured in the **DACNF** register.

6.14.11 Bit counter

The RADIO implements a simple counter that can be configured to generate an event after a specific number of bits have been transmitted or received.

By using shortcuts, this counter can be started from different events generated by the RADIO and count relative to these.

The bit counter is started by triggering the **BCSTART** task, and stopped by triggering the **BCSTOP** task. A **BCMATCH** event will be generated when the bit counter has counted the number of bits specified in the

BCC register. The bit counter will continue to count bits until the **DISABLED** event is generated or until the **BCSTOP** task is triggered. The CPU can therefore, after a **BCMATCH** event, reconfigure the **BCC** value for new **BCMATCH** events within the same packet.

The bit counter can only be started after the RADIO has received the **ADDRESS** event.

The bit counter will stop and reset on either the **BCSTOP**, **STOP**, or **DISABLE** task, or the **END** event.

The figure below illustrates how the bit counter can be used to generate a **BCMATCH** event in the beginning of the packet payload, and again generate a second **BCMATCH** event after sending 2 bytes (16 bits) of the payload.

Figure 70: Bit counter example

6.14.12 Direction finding

The RADIO implements the Angle-of-Arrival (AoA) and Angle-of-Departure (AoD) Bluetooth Low Energy feature, which can be used to determine the direction of a peer device. The feature is available for the BLE 1 Mbps and BLE 2 Mbps modes.

When using this feature, the transmitter sends a packet with a continuous tone extension (CTE) appended to the packet, after the CRC. During the CTE, the receiver can take IQ samples of the incoming signal.

An antenna array is employed at the transmitter (AoD) or at the receiver (AoA). The AoD transmitter, or AoA receiver, switches between the antennas, in order to collect IQ samples from the different antenna pairs. The IQ samples can be used to calculate the relative path lengths between the antenna pairs, which can be used to estimate the direction of the transmitter.

6.14.12.1 CTE format

The CTE is from 16 μ s to 160 μ s and consists of an unwhitened sequence of 1's, equivalent to a continuous tone nominally offset from the carrier by +250 kHz for the 1 Mbps PHY and +500 kHz for the 2 Mbps BLE PHYs. The format of the CTE, when switching and/or sampling, is shown below.

Figure 71: Constant tone extension (CTE) structure

Antenna switching is performed during switch slots and the guard period. The AoA/AoD feature requires that one IQ sample is taken for each microsecond within the reference period, and once for each sample

slot. Oversampling is possible by changing the sample spacing as described in [IQ sampling](#) on page 193. The switch slot and sample slot durations are either 1 or 2 μs , but must be equal. The format of the CTE and switching and sampling procedures may be configured prior to, or during, packet transmission and reception. Alternatively, during packet reception, these operations can be configured by reading specific fields of the packet contents.

6.14.12.2 Mode

Depending on the [DFEMODE](#), the device performs the following procedures:

| | DFEMODE | | | |
|---|---------|----|-----|----|
| | AOA | | AOD | |
| | TX | RX | TX | RX |
| AoA/AoD Procedure | | | | |
| Generating and transmitting CTE | x | | x | |
| Receiving, interpreting, and sampling CTE | | x | | x |
| Antenna switching | | x | x | |

Table 61: AoA/AoD Procedures performed as a function of DFEMODE and TX/RX mode

6.14.12.3 Inline configuration

When inline configuration is enabled during RX, further configuration of the AoA/AoD procedures is performed based on the values of the CP bit and the CTEInfo octet within the packet. This is enabled by setting [CTEINLINECONF.CTEINLINCTRLLEN](#). The CTEInfo octet is present only if the CP bit is set. The position of the CP bit and CTEInfo octet depends on whether the packet has a *Data Channel PDU* ([CTEINLINECONF.CTEINFOINS1=InS1](#)), or an *Advertising Channel PDU* ([CTEINLINECONF.CTEINFOINS1=NotInS1](#)).

Data channel PDU

For Data Channel PDUs, [PCNF0.SOLEN](#) must be 1 byte, and [PCNF0.LFLEN](#) must be 8 bits. To determine if S1 is present, the registers [CTEINLINECONF.S0MASK](#) and [CTEINLINECONF.S0CONF](#) forms a bitwise mask-and-test for the S0 field. If the bitwise AND between S0 and S0MASK equals S0CONF, then S1 is determined to be present. When present, the value of [PCNF0.S1LEN](#) will be ignored, as this is decided by the CP bit in the the following figure.

Figure 72: Data channel PDU header

When encrypting and decrypting BLE packets using the [CCM](#) peripheral, it is also required to set [PCNF0.S1INCL=1](#). The CCM mode must be configured to use an 8-bit length field. The value of the CP bit is included in the calculation of the MIC, while the S1 field is ignored by the CCM calculation.

Advertising channel PDU

For advertising channel PDUs, the CTEInfo Flag replaces the CP bit. The CTEInfo Flag is within the extended header flag field in some of the advertising PDUs that employ the common extended advertising payload format (i.e. [AUX_SYNC_IND](#), [AUX_CHAIN_IND](#)). The format of such packets is shown in the following figure.

Figure 73: Advertising channel PDU header

The [CTEINLINECONF.SOCONF](#) and [CTEINLINECONF.SOMASK](#) fields can be configured to accept only certain advertising PDU Types. If the extended header length is non-zero, the CTEInfo extended header flag is checked to determine whether CTEInfo is present. If a bit before the CTEInfo flag within the extended header flags is set, then the CTEInfo position is postponed 6 octets.

CTEInfo parsing

The CTEInfo field is shown in the following figure.

Figure 74: CTEInfo field

The CTETIME field defines the length of the CTE in 8 μs units. The valid upper bound of values can be adjusted using [CTEINLINECONF.CTETIMEVALIDRANGE](#), including allowing use of the RFU bit within this field. If the CTETIME field is an invalid value of either 0 or 1, the CTE is assumed to be the minimum valid length of 16 μs . The slot duration is determined by the CTEType field. In RX this determines whether the sample spacing as defined in [CTEINLINECONF.CTEINLINERXMODE1US](#) or [CTEINLINECONF.CTEINLINERXMODE2US](#) is used.

| CTEType | Description | TX switch spacing | RX sample spacing during reference period | Sample spacing RX during reference period |
|---------|----------------------------|-------------------|---|---|
| 0 | AoA, no switching | - | TSAMPLESPACING1 | TSAMPLESPACING2 |
| 1 | AoD, 1 μs slots | 2 μs | TSAMPLESPACING1 | CTEINLINERXMODE1US |
| 2 | AoD, 2 μs slots | 4 μs | TSAMPLESPACING1 | CTEINLINERXMODE2US |
| 3 | Reserved for future use | | | |

Table 62: Switching and sampling spacing based on CTEType

6.14.12.4 Manual configuration

If [CTEINLINECONF.CTEINLINECTRLN](#) is not set, then the packet is not parsed to determine the CTE parameters, and the antenna switching and sampling is controlled by other registers, see [Antenna switching](#) on page 192. The length of the CTE is given in 8 μs units by [DFCTRL1.NUMBEROF8US](#). The start of the antenna switching and/or sampling (denoted as an AoA/AoD procedure), can be configured to start at some trigger with an additional offset. Using [DFCTRL1.DFEINEXTENSION](#), the trigger can be configured to be the end of the CRC, or alternatively, the ADDRESS event. The additional offset for antenna switching is configured using [DFCTRL2.TSWITCHOFFSET](#). Similarly, the additional offset for antenna sampling is configured using [DFCTRL2.TSAMPLEOFFSET](#).

6.14.12.5 Receive- and transmit sequences

The addition of the CTE to the transmitted packet is illustrated in the following figure.

Figure 75: Transmit sequence with DFE

The presence of CTE within a received packet is signalled by the CTEPRESENT and CTEWARNING events illustrated in the figure below.

Figure 76: Receive sequence with DFE

6.14.12.6 Antenna switching

The RADIO can control up to 8 GPIO pins in order to control external antenna switches used in direction finding.

Pin configuration

The eight antenna selection signals are mapped to physical pins according to the pin numbers specified in the PSEL.DFEGPIO[n] registers. Only pins that have the PSEL.DFEGPIO[n].CONNECTED field set to *Connected* will be controlled by the RADIO. Pins that are *Disconnected* will be controlled by GPIO.

During transmission in AoD TX mode or reception in AoA RX mode, the RADIO automatically acquires the pins as needed. At times when the RADIO does not use the pin, the pin is released to its default state and controlled by the GPIO configuration. Thus, the pin must be configured using the GPIO peripheral.

| Pin acquired by RADIO | Direction | Value | Comment |
|-----------------------|-------------------|----------------------------|--|
| Yes | Output | Specified in SWITCHPATTERN | Pin acquired by RADIO, and in use for DFE. |
| No | Specified by GPIO | Specified by GPIO | DFE not in progress. Pin has not been acquired by RADIO, but is available for DFE use. |

Table 63: Pin configuration matrix for a connected and enabled pin [n]

Switch pattern configuration

The values of the GPIOs while switching during the CTE are configured by writing successively to the `SWITCHPATTERN` register. The first write to `SWITCHPATTERN` is the GPIO pattern applied from the call of `TASKS_TXEN` or `TASKS_RXEN` until the first antenna switch is triggered. The second write sets the pattern for the reference period and is applied at the start of the guard period. The following writes set the pattern for the remaining switch slots and are applied at the start of each switch slot. If writing beyond the total number of antenna slots, the pattern will wrap to `SWITCHPATTERN[2]` and start over again. During operation, when the end of the `SWITCHPATTERN` buffer is reached, the RADIO cycles back to `SWITCHPATTERN[2]`. At the end of the AoA/AoD procedure, `SWITCHPATTERN[0]` is applied to `DFECTRL1.TSWITCHSPACING` after the previous antenna switch. The `SWITCHPATTERN` buffer can be erased/cleared using `CLEARPATTERN`.

A minimum number of three patterns must be written to the `SWITCHPATTERN` register.

If `CTEINLINECONF.CTEINLINECTRLEN` is not set, then the antenna switch spacing is determined by `DFECTRL1.TSWITCHSPACING` (otherwise described by [Switching and sampling spacing based on CTEType](#) on page 191). `DFECTRL2.TSWITCHOFFSET` determines the position of the first switch compared to the configurable start of CTE (see `DFECTRL1.DFEINEXTENSION`).

6.14.12.7 IQ sampling

The RADIO uses DMA to write IQ samples recorded during the CTE to RAM. Alternatively, the magnitude and phase of the samples can be recorded using the `DFECTRL1.SAMPLETYPE` field. The samples are written to the location in RAM specified by `DFEPACKET.PTR`. The maximum number of samples to transfer are specified by `DFEPACKET.MAXCNT` and the number of samples transferred are given in `DFEPACKET.AMOUNT`. The IQ samples are recorded with respect to the RX carrier frequency. The format of the samples is provided in the following table.

| SAMPLETYPE | Field | Bits | Description |
|------------------|-----------|-------|--|
| 0: I_Q (default) | Q | 31:16 | 12 bits signed, sign extended to 16 bits |
| | I | 15:0 | |
| 1: MagPhase | reserved | 31:29 | Always zero |
| | magnitude | 28:16 | 13 bits unsigned. Equals $1.646756 \cdot \sqrt{I^2 + Q^2}$ |
| | phase | 15:0 | 9 bits signed, sign extended to 16 bits. Equals $64 \cdot \text{atan2}(Q, I)$ in the range $[-201, 201]$ |

Table 64: Format of samples

Oversampling is configured separately for the reference period and for the time after the reference period. During the reference period, the sample spacing is determined by `DFECTRL1.TSAMPLESPACINGREF`. `DFECTRL2.TSAMPLEOFFSET` determines the position of the first sample relative to the end of the last bit of the CRC.

For the time after the reference period, if `CTEINLINECONF.CTEINLINECTRLEN` is disabled, the sample spacing is set in `DFECTRL1.TSAMPLESPACING`. However, when `CTEINLINECONF.CTEINLINECTRLEN` is enabled, the sample spacing are determined by two different registers, depending on whether the device is in AoA or AoD RX-mode, as follows.

For AoD RX mode, the sample spacing after the reference period is determined by the CTEType in the packet, as listed in the table below.

| CTEType | Sample spacing |
|---------------------|---|
| AoD 1 μ s slots | <code>CTEINLINECONF.CTEINLINERXMODE1US</code> |
| AoD 2 μ s slots | <code>CTEINLINECONF.CTEINLINERXMODE2US</code> |
| Other | <code>DFECTRL1.TSAMPLESPACING</code> |

Table 65: Sample spacing when `CTEINLINECONF.CTEINLINECTRLEN` is set and the device is in AoD RX mode

For AoA RX mode, the sample spacing after the reference period is determined by `DFECTRL1.TSWITCHSPACING`, as listed in the table below.

| <code>DFECTRL1.TSWITCHSPACING</code> | Sample spacing |
|--------------------------------------|---|
| 2 μ s | <code>CTEINLINECONF.CTEINLINERXMODE1US</code> |
| 4 μ s | <code>CTEINLINECONF.CTEINLINERXMODE2US</code> |
| Other | <code>DFECTRL1.TSAMPLESPACING</code> |

Table 66: Sample spacing when `CTEINLINECONF.CTEINLINECTRLLEN` is set and the device is in AoA RX mode

For the reference- and switching periods, `DFECTRL1.TSAMPLESPACINGREF` and `DFECTRL1.TSAMPLESPACING` can be used to achieve oversampling.

6.14.13 IEEE 802.15.4 operation

With the `MODE=ieee802154_250kbit` the RADIO will comply with the IEEE 802.15.4-2006 standard implementing its 250 kbps, 2450 MHz, O-QPSK PHY.

The IEEE 802.15.4 standard differs from Nordic's proprietary and *Bluetooth*[®] low energy modes. Notable differences include modulation scheme, channel structure, packet structure, security, and medium access control.

The main features of the IEEE 802.15.4 mode are:

- Ultra-low power 250 kbps, 2450 MHz, IEEE 802.15.4-2006 compliant link
- Clear channel assessment
- Energy detection scan
- CRC generation

6.14.13.1 Packet structure

The IEEE 802.15.4 standard defines an on-the-air frame/packet that is different from what is used in BLE mode.

The following figure provides an overview of the physical frame structure and its timing.

Figure 77: IEEE 802.15.4 frame format (PPDU)

The standard uses the term *octet* for an 8-bit storage unit within the PPDU. For timing, the value *symbol* is used, and it has a duration of 16 μ s.

The total usable payload (PSDU) is 127 octets, but when CRC is in use, this is reduced to 125 octets of usable payload.

The preamble sequence consists of four octets that are all zero, and are used for synchronizing the RADIO's receiver. Following the preamble is the single octet *start of frame delimiter (SFD)*, with a fixed value of 0xA7. An alternate SFD can be programmed through the `SFD` register, providing an initial level of frame filtering for those who choose non-standard compliance. It is a valuable feature when operating in a congested or private network. The preamble sequence and the SFD are generated by the RADIO, and are not programmed by the user into the frame buffer.

Following the five octet *synchronization header (SHR)* is the single octet *phy header (PHR)*. The least significant seven bits of PHR denote the frame length of the following PSDU. The most significant bit is reserved and is set to zero for frames that are standard compliant. The RADIO reports all eight bits which can be used to carry additional information. The PHR is the first byte written to the frame data memory pointed to by [PACKETPTR](#). Frames with zero length are discarded, and the [FRAMESTART](#) event is not generated in this case.

The next N octets carry the data of the PHY packet, where N equals the value of the PHR. For an implementation also using the IEEE 802.15.4 MAC layer, the PHY data is a MAC frame of N-2 octets, since two octets occupy a CRC field.

As illustrated in the figure below, an IEEE 802.15.4 MAC layer frame always consists of

- A header:
 - The frame control field (FCF)
 - The sequence number
 - Addressing fields
- A payload
- The 16-bit frame control sequence (FCS)

Figure 78: IEEE 802.15.4 frame format (MPDU)

The two FCF octets contain information about the frame type, addressing, and other control flags. This field is decoded when using the assisted operating modes offered by the RADIO.

The sequence number is a single octet in size and is unique for a frame. It is used in the associated acknowledgement frame sent upon successful frame reception.

The addressing field can be zero (acknowledgement frame) or up to 20 octets in size. The field is used to direct packets to the correct recipient and denote its origin. IEEE 802.15.4 bases its addressing on networks being organized in PANs with 16-bit identifier and nodes having a 16-bit or 64-bit address. In the assisted receive mode, these parameters are analyzed for address matching and acknowledgement.

The MAC payload carries the data of the next higher layer, or in the case of a MAC command frame, information used by the MAC layer itself.

The two last octets contain the 16-bit ITU-T CRC. The FCS is calculated over the MAC header (MHR) and MAC payload (MSDU) parts of the frame. This field is calculated automatically when sending a frame, or indicated in the [CRCSTATUS](#) register when a frame is received. If configured, this feature is taken care of autonomously by the CRC module.

6.14.13.2 Operating frequencies

The IEEE 802.15.4 standard defines 16 channels, 11 - 26, of 5 MHz each, in the 2450 MHz frequency band.

To choose the correct channel center frequency, the **FREQUENCY** register must be programmed according to the table below.

| IEEE 802.15.4 channel | Center frequency (MHz) | FREQUENCY setting |
|-----------------------|------------------------|-------------------|
| Channel 11 | 2405 | 5 |
| Channel 12 | 2410 | 10 |
| Channel 13 | 2415 | 15 |
| Channel 14 | 2420 | 20 |
| Channel 15 | 2425 | 25 |
| Channel 16 | 2430 | 30 |
| Channel 17 | 2435 | 35 |
| Channel 18 | 2440 | 40 |
| Channel 19 | 2445 | 45 |
| Channel 20 | 2450 | 50 |
| Channel 21 | 2455 | 55 |
| Channel 22 | 2460 | 60 |
| Channel 23 | 2465 | 65 |
| Channel 24 | 2470 | 70 |
| Channel 25 | 2475 | 75 |
| Channel 26 | 2480 | 80 |

Table 67: IEEE 802.15.4 center frequency definition

6.14.13.3 Energy detection (ED)

As required by the IEEE 802.15.4 standard, it must be possible to sample the received signal power within the bandwidth of a channel, for the purpose of determining presence of activity.

To prevent the channel signal from being decoded, the shortcut between the **READY** event and the **START** task should be disabled before putting the RADIO in receive mode. The energy detection (ED) measurement time, where RSSI samples are averaged, is 8 symbol periods, corresponding to 128 μ s. The standard further specifies the measurement to be a number between 0 and 255, where 0 shall indicate received power less than 10 dB above the selected receiver sensitivity. The power range of the ED values must be at least a 40 dB linear mapping with accuracy of ± 6 dB. See section 6.9.7 *Receiver ED* in the IEEE 802.15.4 standard for further details.

The following example shows how to perform a single energy detection measurement and convert to IEEE 802.15.4 scale.

IEEE 802.15.4 ED measurement example

```
#define ED_RSSISCALE 4 // From electrical specifications
uint8_t sample_ed(void)
{
    int val;
    NRF_RADIO->TASKS_EDSTART = 1; // Start
    while (NRF_RADIO->EVENTS_EDEND != 1) {
        // CPU can sleep here or do something else
        // Use of interrupts are encouraged
    }
    val = NRF_RADIO->EDSAMPLE; // Read level
    return (uint8_t)(val > 63 ? 255 : val * ED_RSSISCALE); // Convert to IEEE
    802.15.4 scale
}
```

For scaling between hardware value and dBm, see equation [Conversion between hardware value and dBm](#) on page 198.

The `mlme-scan.req` primitive of the MAC layer uses the ED measurement to detect channels where there might be wireless activity. To assist this primitive, a tailored mode of operation is available where the ED measurement runs for a defined number of iterations keeping track of the maximum ED level. This is engaged by writing the `EDCNT` register to a value different from 0, where it will run the specified number of iterations and report the maximum energy measurement in the `EDSAMPLE` register. The scan is started with `EDSTART` task and its end indicated with the `EDEND` event. This significantly reduces the interrupt frequency and therefore power consumption. The following figure shows how the ED measurement will operate depending on the `EDCNT` register.

Figure 79: Energy detection measurement examples

The scan is stopped by writing the `EDSTOP` task. It will be followed by the `EDSTOPPED` event when the module has terminated.

6.14.13.4 Clear channel assessment (CCA)

IEEE 802.15.4 implements a listen-before-talk channel access method to avoid collisions when transmitting, known as *carrier sense multiple access with collision avoidance (CSMA-CA)*. The key part of this is measuring if the wireless medium is busy or not.

The following clear channel assesment modes are supported:

- **CCA Mode 1** (energy above threshold): The medium is reported busy upon detecting any energy above the ED threshold.
- **CCA Mode 2** (carrier sense only): The medium is reported busy upon detection of a signal compliant with the IEEE 802.15.4 standard with the same modulation and spreading characteristics.
- **CCA Mode 3** (carrier sense with energy above threshold): The medium is reported busy using a logical combination (AND/OR) between the results from CCA Mode 1 and CCA Mode 2.

The clear channel assessment should survey a period equal to 8 symbols or 128 μ s.

The RADIO must be in receive mode and be able to receive correct packets when performing the CCA. The shortcut between `READY` and `START` must be disabled if baseband processing is not to be performed while the measurement is running.

CCA Mode 1

CCA Mode 1 is enabled by first configuring the field `CCACTRL.CCAMODE=EdMode` and writing the `CCACTRL.CCAEDTHRES` field to a chosen value. Once the `CCASTART` task is written, the RADIO will perform a ED measurement for 8 symbols and compare the measured level with that found in the `CCACTRL.CCAEDTHRES` field. If the measured value is higher than or equal to this threshold, the `CCABUSY` event is generated. If the measured level is less than the threshold, the `CCAIDLE` event is generated.

CCA Mode 2

CCA Mode 2 is enabled by configuring `CCACTRL.CCAMODE=CarrierMode`. The RADIO will sample to see if a valid SFD is found during the 8 symbols. If a valid SFD is detected, the `CCABUSY` event is generated and the device should not send any data. The `CCABUSY` event is also generated if the scan was performed during an ongoing frame reception. In the case where the measurement period completes with no SFD detection, the `CCAIDLE` event is generated. With `CCACTRL.CCACORRCNT` not being zero, the algorithm will look at the correlator output in addition to the SFD detection signal. If a SFD is reported during the scan period, it will terminate immediately indicating busy medium. Similarly, if the number of peaks above `CCACTRL.CCACORRTHRES` crosses the `CCACTRL.CCACORRCNT`, the `CCACTRL.CCABUSY` event is generated. If less than `CCACORRCOUNT` crossings are found and no SFD is reported, the `CCAIDLE` event will be generated and the device can send data.

CCA Mode 3

CCA Mode 3 is enabled by configuring `CCACTRL.CCAMODE=CarrierAndEdMode` or `CCACTRL.CCAMODE=CarrierOrEdMode`, performing the required logical combination of the result from CCA Mode 1 and 2. The `CCABUSY` or `CCAIDLE` events are generated by ANDing or ORing the *energy above threshold* and *carrier detection* scans.

Shortcuts

An ongoing CCA can always be stopped by issuing the `CCASTOP` task. This will trigger the associated `CCASTOPPED` event.

For CCA mode automation, a number of shortcuts are available.

- To automatically switch between RX (when performing the CCA) and to TX where the packet is sent, the shortcut between `CCAIDLE` and `TXEN`, in conjunction with the short between `CCAIDLE` and `STOP` must be used.
- To automatically disable the RADIO whenever the CCA reports a busy medium, the shortcut between `CCABUSY` and `DISABLE` can be used.
- To immediately start a CCA after ramping up into RX mode, the shortcut between `RXREADY` and `CCASTART` can be used.

Conversion

The conversion from a `CCAEDTHRES`, `CCA`, or `EDLEVEL` value to dBm can be done with the following equation, where `VALHARDWARE` is the hardware-reported values, being either `CCAEDTHRES`, `CCA` or `EDLEVEL`, and constants `ED_RSSISCALE` and `ED_RSSIOFFS` are from electrical specifications.

$$P_{RF}[\text{dBm}] = \text{ED_RSSIOFFS} + \text{ED_RSSISCALE} \times \text{VAL}_{\text{HARDWARE}}$$

Figure 80: Conversion between hardware value and dBm

6.14.13.5 Cyclic redundancy check (CRC)

IEEE 802.15.4 uses a 16-bit ITU-T cyclic redundancy check (CRC) calculated over the MAC header (MHR) and MAC service data unit (MSDU).

The standard defines the following generator polynomial:

$$G(x) = x^{16} + x^{12} + x^5 + 1$$

In receive mode the RADIO will trigger the CRC module when the first octet after the frame length (PHR) is received. The CRC will then update on each consecutive octet received. When a complete frame is received the **CRCSTATUS** register will be updated accordingly and the **CRCOK** or **CRCERROR** events generated. When the CRC module is enabled it will not write the two last octets (CRC) to the frame Data RAM. When transmitting, the CRC will be computed on the fly, starting with the first octet after PHR, and inserted as the two last octets in the frame. The EasyDMA will fetch frame length minus 2 octets from RAM and insert the CRC octets insitu.

Below is a code snippet for configuring the CRC module for correct operation when in IEEE 802.15.4 mode. The **CRC CNF** is written to 16-bit CRC and the **CRC POLY** is written to 0x11021. The start value used by IEEE 802.15.4 is zero and **CRC INIT** is configured to reflect this.

```
/* 16-bit CRC with ITU-T polynomial with 0 as start condition*/
NRF_RADIO->CRCCNF = ((RADIO_CRCCNF_SKIPADDR_Ieee802154 << RADIO_CRCCNF_SKIPADDR_Pos) |
                    (RADIO_CRCCNF_LEN_Two << RADIO_CRCCNF_LEN_Pos));
NRF_RADIO->CRCPOLY = 0x11021;
NRF_RADIO->CRCINIT = 0;
```

The ENDIANESS subregister must be set to little-endian since the FCS field is transmitted from left bit to right.

6.14.13.6 Transmit sequence

The transmission is started by first putting the RADIO in receive mode and triggering the **RXEN** task.

An outline of the IEEE 802.15.4 transmission is illustrated in the figure below.

Figure 81: IEEE 802.15.4 transmit sequence

The receiver will ramp up and enter the RXIDLE state where the **READY** event is generated. Upon receiving the ready event, the CCA is started by triggering the **CCASTART** task. The chosen mode of assessment (**CCACTRL.CCAMODE** register) will be performed and signal the **CCAIDLE** or **CCABUSY** event 128 μ s later. If the **CCABUSY** event is received, the RADIO will have to retry the CCA after a specific back-off period. This is outlined in the *IEEE 802.15.4 standard, Figure 69 in section 7.5.1.4 The CSMA-CA algorithm*.

If the **CCAIDLE** event is generated, a write to the **TXEN** task register enters the RADIO in TXRU state. The **READY** event will be generated when the RADIO is in TXIDLE state and ready to transmit. With the **PACKETPTR** pointing to the length (PHR) field of the frame, the **START** task can be written. The RADIO will send the four octet preamble sequence followed by the start of frame delimiter (**SFD** register). The first byte read from the Data RAM is the length field (PHR) followed by the transmission of the number of bytes indicated as the frame length. If the CRC module is configured it will run for PHR-2 octets. The last two octets will be substituted with the results from running the CRC. The necessary CRC parameters are sampled on the **START** task. The FCS field of the frame is little endian.

In addition to the already available shortcuts, one is provided between **READY** event and **CCASTART** task so that a CCA can automatically start when the receiver is ready. A second shortcut has been added between **CCAIDLE** event and the **TXEN** task, so that upon detecting a clear channel the RADIO can immediately enter transmit mode.

6.14.13.7 Receive sequence

The reception is started by first putting the RADIO in receive mode. After writing to the **RXEN** task, the RADIO will start ramping up and enter the **RXRU** state.

When the **READY** event is generated, the RADIO enters the **RXIDLE** mode. For the baseband processing to be enabled, the **START** task must be written. An outline of the IEEE 802.15.4 reception can be found in the figure below.

Figure 82: IEEE 802.15.4 receive sequence

When a valid SHR is received the RADIO will start storing future octets (starting with PHR) to the data memory pointed to by **PACKETPTR**. After the SFD octet is received the **FRAMESTART** event is generated. If the CRC module is enabled it will start updating with the second byte received (first byte in payload) and run for the full frame length. The two last bytes in the frame are not written to RAM when CRC is configured. However, if the result of the CRC after running the full frame is zero, the **CRCOK** event will be generated. The **END** event is generated when the last octet has been received and is available in data memory.

When a packet is received a link quality indicator (LQI) is also generated and appended immediately after the last received octet. When using an IEEE 802.15.4 compliant frame, this will be just after the MSDU since the FCS is not reported. In the case of a non-compliant frame it will be appended after the full frame. The LQI reported by hardware must be converted to IEEE 802.15.4 range by an 8-bit saturating multiplication by 4, as shown in [IEEE 802.15.4 ED measurement example](#) on page 196. The LQI is only valid for frames equal to or longer than three octets. When receiving a frame the RSSI (reported as negative dB) will be measured at three points during the reception. These three values will be sorted and the middle one selected (median 3) to be remapped within the LQI range. The following figure illustrates the LQI measurement and how the data is arranged in data memory.

Figure 83: IEEE 802.15.4 frame in data memory

A shortcut has been added between the **FRAMESTART** event and the **BCSTART** task. This can be used to trigger a **BCMATCH** event after N bits, such as when inspecting the MAC addressing fields.

6.14.13.8 Interframe spacing (IFS)

The IEEE 802.15.4 standard defines a specific time that is allotted for the MAC sublayer to process received data. Interframe spacing (IFS) is used to prevent that two frames are transmitted too close together. If the transmission is requesting an acknowledgement, the space before the second frame shall be at least one IFS period.

The IFS is determined to be one of the following:

- IFS equals `macMinSIFSPeriod` (12 symbols) if the MPDU is less than or equal to `aMaxSIFSFrameSize` (18 octets) octets
- IFS equals `macMinLIFSPeriod` (40 symbols) if the MPDU is larger than `aMaxSIFSFrameSize`

Using the efficient assisted modes in the RADIO, the **TIFS** will be programmed with the correct value based on the frame being transmitted. If the assisted modes are not being used the user must update the **TIFS** register manually. The figure below provides details on what IFS period is valid in both acknowledged and unacknowledged transmissions.

Figure 84: Interframe spacing examples

6.14.14 EasyDMA

The RADIO uses EasyDMA to read and write packets to RAM without CPU involvement.

As illustrated in [RADIO block diagram](#) on page 180, the RADIO's EasyDMA utilizes the same `PACKETPTR` for receiving and transmitting packets. This pointer should be reconfigured by the CPU each time before RADIO is started by the `START` task. The `PACKETPTR` register is double-buffered, meaning that it can be updated and prepared for the next transmission.

Important: If `PACKETPTR` is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

The `END` event indicates that the last bit has been processed by the RADIO. The `DISABLED` event is issued to acknowledge that a `DISABLE` task is done.

The structure of a packet is described in detail in [Packet configuration](#) on page 181. The data that is stored in Data RAM and transported by EasyDMA consists of the following fields:

- S0
- LENGTH
- S1
- PAYLOAD

In addition, a static add-on is sent immediately after the payload.

The size of each of the above fields in the frame is configurable (see [Packet configuration](#) on page 181), and the space occupied in RAM depends on these settings. The size of the field can be zero, as long as the resulting frame complies with the chosen RF protocol.

All fields are extended in size to align with a byte boundary in RAM. For instance, a 3-bit long field on air will occupy 1 byte in RAM while a 9-bit long field will be extended to 2 bytes.

The packet's elements can be configured as follows:

- `CI`, `TERM1`, and `TERM2` fields are only present in *Bluetooth*[®] low energy long range mode
- `S0` is configured through the `PCNF0.SOLEN` field
- `LENGTH` is configured through the `PCNF0.LFLEN` field
- `S1` is configured through the `PCNF0.S1LEN` field
- Payload size is configured through the value in RAM corresponding to the `LENGTH` field
- Static add-on size is configured through the `PCNF1.STATLEN` field

The `PCNF1.MAXLEN` field configures the maximum packet payload plus add-on size in number of bytes that can be transmitted or received by the RADIO. This feature can be used to ensure that the RADIO does not overwrite, or read beyond, the RAM assigned to the packet payload. This means that if the `LENGTH`

field of the packet payload exceeds `PCNF1.STATLEN`, and the `LENGTH` field in the packet specifies a packet larger than configured in `PCNF1.MAXLEN`, the payload will be truncated to the length specified in `PCNF1.MAXLEN`.

Note: The `PCNF1.MAXLEN` field includes the payload and the add-on, but excludes the size occupied by the `S0`, `LENGTH`, and `S1` fields. This has to be taken into account when allocating RAM.

If the payload and add-on length is specified larger than `PCNF1.MAXLEN`, the RADIO will still transmit or receive in the same way as before, except the payload is now truncated to `PCNF1.MAXLEN`. The packet's `LENGTH` field will not be altered when the payload is truncated. The RADIO will calculate CRC as if the packet length is equal to `PCNF1.MAXLEN`.

Note: If `PACKETPTR` is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

The `END` event indicates that the last bit has been processed by the RADIO. The `DISABLED` event is issued to acknowledge that an `DISABLE` task is done.

6.14.15 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40001000 | RADIO | RADIO | 2.4 GHz radio | |

Table 68: Instances

| Register | Offset | Description |
|--------------------------------|--------|--|
| <code>TASKS_TXEN</code> | 0x000 | Enable RADIO in TX mode |
| <code>TASKS_RXEN</code> | 0x004 | Enable RADIO in RX mode |
| <code>TASKS_START</code> | 0x008 | Start RADIO |
| <code>TASKS_STOP</code> | 0x00C | Stop RADIO |
| <code>TASKS_DISABLE</code> | 0x010 | Disable RADIO |
| <code>TASKS_RSSISTART</code> | 0x014 | Start the RSSI and take one single sample of the receive signal strength |
| <code>TASKS_RSSISTOP</code> | 0x018 | Stop the RSSI measurement |
| <code>TASKS_BCSTART</code> | 0x01C | Start the bit counter |
| <code>TASKS_BCSTOP</code> | 0x020 | Stop the bit counter |
| <code>TASKS_EDSTART</code> | 0x024 | Start the energy detect measurement used in IEEE 802.15.4 mode |
| <code>TASKS_EDSTOP</code> | 0x028 | Stop the energy detect measurement |
| <code>TASKS_CCASTART</code> | 0x02C | Start the clear channel assessment used in IEEE 802.15.4 mode |
| <code>TASKS_CCASTOP</code> | 0x030 | Stop the clear channel assessment |
| <code>EVENTS_READY</code> | 0x100 | RADIO has ramped up and is ready to be started |
| <code>EVENTS_ADDRESS</code> | 0x104 | Address sent or received |
| <code>EVENTS_PAYLOAD</code> | 0x108 | Packet payload sent or received |
| <code>EVENTS_END</code> | 0x10C | Packet sent or received |
| <code>EVENTS_DISABLED</code> | 0x110 | RADIO has been disabled |
| <code>EVENTS_DEVMATCH</code> | 0x114 | A device address match occurred on the last received packet |
| <code>EVENTS_DEVMISS</code> | 0x118 | No device address match occurred on the last received packet |
| <code>EVENTS_RSSIEND</code> | 0x11C | Sampling of receive signal strength complete |
| <code>EVENTS_BCMATCH</code> | 0x128 | Bit counter reached bit count value |
| <code>EVENTS_CRCOK</code> | 0x130 | Packet received with CRC ok |
| <code>EVENTS_CRCERROR</code> | 0x134 | Packet received with CRC error |
| <code>EVENTS_FRAMESTART</code> | 0x138 | IEEE 802.15.4 length field received |

| Register | Offset | Description |
|-------------------|--------|---|
| EVENTS_EDEND | 0x13C | Sampling of energy detection complete. A new ED sample is ready for readout from the RADIO.EDSAMPLE register. |
| EVENTS_EDSTOPPED | 0x140 | The sampling of energy detection has stopped |
| EVENTS_CCAIDLE | 0x144 | Wireless medium in idle - clear to send |
| EVENTS_CCABUSY | 0x148 | Wireless medium busy - do not send |
| EVENTS_CCASTOPPED | 0x14C | The CCA has stopped |
| EVENTS_RATEBOOST | 0x150 | Ble_LR CI field received, receive mode is changed from Ble_LR125Kbit to Ble_LR500Kbit. |
| EVENTS_TXREADY | 0x154 | RADIO has ramped up and is ready to be started TX path |
| EVENTS_RXREADY | 0x158 | RADIO has ramped up and is ready to be started RX path |
| EVENTS_MHRMATCH | 0x15C | MAC header match found |
| EVENTS_PHYEND | 0x16C | Generated in Ble_LR125Kbit, Ble_LR500Kbit and leee802154_250Kbit modes when last bit is sent on air. |
| EVENTS_CTEPRESENT | 0x170 | CTE is present (early warning right after receiving CTEInfo byte) |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| CRCSTATUS | 0x400 | CRC status |
| RXMATCH | 0x408 | Received address |
| RXCRC | 0x40C | CRC field of previously received packet |
| DAI | 0x410 | Device address match index |
| PDUSTAT | 0x414 | Payload status |
| CTESTATUS | 0x44C | CTEInfo parsed from received packet |
| DFESTATUS | 0x458 | DFE status information |
| PACKETPTR | 0x504 | Packet pointer |
| FREQUENCY | 0x508 | Frequency |
| TXPOWER | 0x50C | Output power |
| MODE | 0x510 | Data rate and modulation |
| PCNF0 | 0x514 | Packet configuration register 0 |
| PCNF1 | 0x518 | Packet configuration register 1 |
| BASE0 | 0x51C | Base address 0 |
| BASE1 | 0x520 | Base address 1 |
| PREFIX0 | 0x524 | Prefixes bytes for logical addresses 0-3 |
| PREFIX1 | 0x528 | Prefixes bytes for logical addresses 4-7 |
| TXADDRESS | 0x52C | Transmit address select |
| RXADDRESSES | 0x530 | Receive address select |
| CRC CNF | 0x534 | CRC configuration |
| CRC POLY | 0x538 | CRC polynomial |
| CRC INIT | 0x53C | CRC initial value |
| TIFS | 0x544 | Interframe spacing in μ s |
| RSSISAMPLE | 0x548 | RSSI sample |
| STATE | 0x550 | Current radio state |
| DATAWHITEIV | 0x554 | Data whitening initial value |
| BCC | 0x560 | Bit counter compare |
| DAB[n] | 0x600 | Device address base segment n |
| DAP[n] | 0x620 | Device address prefix n |
| DACNF | 0x640 | Device address match configuration |
| MHRMATCHCONF | 0x644 | Search pattern configuration |
| MHRMATCHMAS | 0x648 | Pattern mask |
| MODECNF0 | 0x650 | Radio mode configuration register 0 |
| SFD | 0x660 | IEEE 802.15.4 start of frame delimiter |
| EDCNT | 0x664 | IEEE 802.15.4 energy detect loop count |
| EDSAMPLE | 0x668 | IEEE 802.15.4 energy detect level |
| CCACTRL | 0x66C | IEEE 802.15.4 clear channel assessment control |

| Register | Offset | Description |
|------------------|--------|---|
| DFEMODE | 0x900 | Whether to use Angle-of-Arrival (AOA) or Angle-of-Departure (AOD) |
| CTEINLINECONF | 0x904 | Configuration for CTE inline mode |
| DFECTR1 | 0x910 | Various configuration for Direction finding |
| DFECTR2 | 0x914 | Start offset for Direction finding |
| SWITCHPATTERN | 0x928 | GPIO patterns to be used for each antenna |
| CLEARPATTERN | 0x92C | Clear the GPIO pattern array for antenna control |
| PSEL.DFEGPIO[0] | 0x930 | Pin select for DFE pin 0 |
| PSEL.DFEGPIO[1] | 0x934 | Pin select for DFE pin 1 |
| PSEL.DFEGPIO[2] | 0x938 | Pin select for DFE pin 2 |
| PSEL.DFEGPIO[3] | 0x93C | Pin select for DFE pin 3 |
| PSEL.DFEGPIO[4] | 0x940 | Pin select for DFE pin 4 |
| PSEL.DFEGPIO[5] | 0x944 | Pin select for DFE pin 5 |
| PSEL.DFEGPIO[6] | 0x948 | Pin select for DFE pin 6 |
| PSEL.DFEGPIO[7] | 0x94C | Pin select for DFE pin 7 |
| DFEPACKET.PTR | 0x950 | Data pointer |
| DFEPACKET.MAXCNT | 0x954 | Maximum number of buffer words to transfer |
| DFEPACKET.AMOUNT | 0x958 | Number of samples transferred in the last transaction |
| POWER | 0xFFC | Peripheral power control |

Table 69: Register overview

6.14.15.1 TASKS_TXEN

Address offset: 0x000

Enable RADIO in TX mode

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| A | RW | PACKETPTR | | Packet pointer | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Packet address to be used for the next transmission or reception. When transmitting, the packet pointed to by this address will be transmitted and when receiving, the received packet will be written to this address. This address is a byte aligned RAM address.

Note: See the memory chapter for details about which memories are available for EasyDMA.

| ID | Acce Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | RW | MAXLEN | [0..255] | Maximum length of packet payload. If the packet payload is larger than MAXLEN, the radio will truncate the payload to MAXLEN. | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| B | RW | STATLEN | [0..255] | Static length in number of bytes The static length parameter is added to the total length of the payload when sending and receiving packets, e.g. if the static length is set to N the radio will receive or send N bytes more than what is defined in the LENGTH field of the packet. | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| C | RW | BALEN | [2..4] | Base address length in number of bytes The address field is composed of the base address and the one byte long address prefix, e.g. set BALEN=2 to get a total address of 3 bytes. | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| D | RW | ENDIAN | | On-air endianness of packet, this applies to the S0, LENGTH, S1, and the PAYLOAD fields. | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | Little | 0 | Least significant bit on air first | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| A | RW CRCPOLY | | | CRC polynomial | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | Each term in the CRC polynomial is mapped to a bit in this register which index corresponds to the term's exponent. The least significant term/bit is hardwired internally to 1, and bit number 0 of the register content is ignored by the hardware. The following example is for an 8 bit CRC polynomial: $x^8 + x^7 + x^3 + x^2 + 1 = 1\ 1000\ 1101$. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.14.15.81 SWITCHPATTERN

Address offset: 0x928

GPIO patterns to be used for each antenna

Maximum 8 GPIOs can be controlled. To secure correct signal levels on the pins, the pins must be configured in the GPIO peripheral as described in Pin configuration.

If, during switching, the total number of antenna slots is bigger than the number of written patterns, the RADIO loops back to the pattern used after the reference pattern.

A minimum number of 3 patterns must be written.

6.14.16 Electrical specification

6.14.16.1 General radio characteristics

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------------------|----------------------------------|------|------|------|-------------|
| f _{OP} | Operating frequencies | 2360 | | 2500 | MHz |
| f _{PLL,CH,SP} | PLL channel spacing | | 1 | | MHz |
| f _{DELTA,1M} | Frequency deviation @ 1 Mbps | | ±170 | | kHz |
| f _{DELTA,BLE,1M} | Frequency deviation @ BLE 1 Mbps | | ±250 | | kHz |
| f _{DELTA,2M} | Frequency deviation @ 2 Mbps | | ±320 | | kHz |
| f _{DELTA,BLE,2M} | Frequency deviation @ BLE 2 Mbps | | ±500 | | kHz |
| f _{skBPS} | On-the-air data rate | 125 | | 2000 | kbps |
| f _{chip, IEEE 802.15.4} | Chip rate in IEEE 802.15.4 mode | | 2000 | | kchip, s |

6.14.16.2 Radio current consumption (transmitter)

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------------|---|------|------|------|-------|
| I _{TX,PLUS4dBm,DCDC} | TX only run current (DC/DC, 3 V) P _{RF} = +4 dBm | | 7.0 | | mA |

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------------|--|------|------|------|-------|
| I _{TX,PLUS4dBm} | TX only run current P _{RF} = +4 dBm | | 15.4 | | mA |
| I _{TX,0dBm,DCDC} | TX only run current (DC/DC, 3 V) P _{RF} = 0 dBm | | 4.6 | | mA |
| I _{TX,0dBm} | TX only run current P _{RF} = 0 dBm | | 10.1 | | mA |
| I _{TX,MINUS4dBm,DCDC} | TX only run current DC/DC, 3 V P _{RF} = -4 dBm | | 3.6 | | mA |
| I _{TX,MINUS4dBm} | TX only run current P _{RF} = -4 dBm | | 7.8 | | mA |
| I _{TX,MINUS8dBm,DCDC} | TX only run current DC/DC, 3 V P _{RF} = -8 dBm | | 3.2 | | mA |
| I _{TX,MINUS8dBm} | TX only run current P _{RF} = -8 dBm | | 6.8 | | mA |
| I _{TX,MINUS12dBm,DCDC} | TX only run current DC/DC, 3 V P _{RF} = -12 dBm | | 2.9 | | mA |
| I _{TX,MINUS12dBm} | TX only run current P _{RF} = -12 dBm | | 6.2 | | mA |
| I _{TX,MINUS16dBm,DCDC} | TX only run current DC/DC, 3 V P _{RF} = -16 dBm | | 2.7 | | mA |
| I _{TX,MINUS16dBm} | TX only run current P _{RF} = -16 dBm | | 5.7 | | mA |
| I _{TX,MINUS20dBm,DCDC} | TX only run current DC/DC, 3 V P _{RF} = -20 dBm | | 2.5 | | mA |
| I _{TX,MINUS20dBm} | TX only run current P _{RF} = -20 dBm | | 5.4 | | mA |
| I _{TX,MINUS40dBm,DCDC} | TX only run current DC/DC, 3 V P _{RF} = -40 dBm | | 2.1 | | mA |
| I _{TX,MINUS40dBm} | TX only run current P _{RF} = -40 dBm | | 4.3 | | mA |
| I _{START,TX,DCDC} | TX start-up current DC/DC, 3 V, P _{RF} = 4 dBm | .. | .. | .. | mA |
| I _{START,TX} | TX start-up current, P _{RF} = 4 dBm | .. | .. | .. | mA |

6.14.16.3 Radio current consumption (Receiver)

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------------|--|------|------|------|-------|
| I _{RX,1M,DCDC} | RX only run current (DC/DC, 3 V) 1 Mbps/1 Mbps BLE | | 4.6 | | mA |
| I _{RX,1M} | RX only run current (LDO, 3 V) 1 Mbps/1 Mbps BLE | | 10.0 | | mA |
| I _{RX,2M,DCDC} | RX only run current (DC/DC, 3 V) 2 Mbps/2 Mbps BLE | | 5.2 | | mA |
| I _{RX,2M} | RX only run current (LDO, 3 V) 2 Mbps/2 Mbps BLE | | 11.2 | | mA |
| I _{START,RX,1M,DCDC} | RX start-up current (DC/DC, 3 V) 1 Mbps/1 Mbps BLE | | 3.5 | | mA |
| I _{START,RX,1M} | RX start-up current 1 Mbps/1 Mbps BLE | | 6.7 | | mA |

6.14.16.4 Transmitter specification

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------------------|--|------|------|------|-------|
| P _{RF} | Maximum output power | | 4.0 | | dBm |
| P _{RF,FC} | RF power control range | | 24 | | dB |
| P _{RF,CR} | RF power accuracy | | | ±4 | dB |
| P _{RF,1,1} | 1st Adjacent Channel Transmit Power 1 MHz (1 Mbps) | | -25 | | dBc |
| P _{RF,2,1} | 2nd Adjacent Channel Transmit Power 2 MHz (1 Mbps) | | -50 | | dBc |
| P _{RF,1,2} | 1st Adjacent Channel Transmit Power 2 MHz (2 Mbps) | | -25 | | dBc |
| P _{RF,2,2} | 2nd Adjacent Channel Transmit Power 4 MHz (2 Mbps) | | -50 | | dBc |
| E _{VM} | Error vector magnitude IEEE 802.15.4 | | 12 | | %rms |
| P _{harm2nd, IEEE 802.15.4} | 2nd harmonics in IEEE 802.15.4 mode | | -45 | | dBm |
| P _{harm3rd, IEEE 802.15.4} | 3rd harmonics in IEEE 802.15.4 | | | | dBm |

Figure 85: Output power, 1 Mbps Bluetooth low energy mode, at maximum TXPOWER setting (typical values)

Figure 86: Output power, 1 Mbps Bluetooth low energy mode, at 0 dBm TXPOWER setting (typical values)

6.14.16.5 Receiver operation

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------------|---|------|------|------|-------|
| P _{RX,MAX} | Maximum received signal strength at < 0.1% PER | | 0 | | dBm |
| P _{SENS,IT,1M} | Sensitivity, 1 Mbps nRF mode ideal transmitter ¹⁴ | | -94 | | dBm |
| P _{SENS,IT,2M} | Sensitivity, 2 Mbps nRF mode ideal transmitter ¹⁵ | | -91 | | dBm |
| P _{SENS,IT,SP,1M,BLE} | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≤ 37 bytes BER=1E-3 ¹⁶ | | -97 | | dBm |
| P _{SENS,IT,LP,1M,BLE} | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≥ 128 bytes BER=1E-4 ¹⁷ | | -96 | | dBm |
| P _{SENS,IT,SP,2M,BLE} | Sensitivity, 2 Mbps BLE ideal transmitter, packet length ≤ 37 bytes | | -94 | | dBm |
| P _{SENS,IT,BLE LE125k} | Sensitivity, 125 kbps BLE mode | | -104 | | dBm |
| P _{SENS,IT,BLE LE500k} | Sensitivity, 500 kbps BLE mode | | -100 | | dBm |
| P _{SENS,IEEE 802.15.4} | Sensitivity in IEEE 802.15.4 mode | | -101 | | dBm |

Figure 87: Sensitivity, 1 Mbps Bluetooth low energy mode, Regulator = LDO (typical values)

6.14.16.6 RX selectivity

RX selectivity with equal modulation on interfering signal¹⁸

¹⁴ Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1...7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

¹⁵ Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1..7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

¹⁶ As defined in the *Bluetooth Core Specification v4.0 Volume 6: Core System Package (Low Energy Controller Volume)*

¹⁷ Equivalent BER limit < 10E-04

¹⁸ Desired signal level at PIN = -67 dBm. One interferer is used, having equal modulation as the desired signal. The input power of the interferer where the sensitivity equals BER = 0.1% is presented

| Symbol | Description | Min. | Typ. | Max. | Units |

6.14.16.7 RX intermodulation

RX intermodulation¹⁹

¹⁹ Desired signal level at PIN = -64 dBm. Two interferers with equal input power are used. The interferer closest in frequency is not modulated, the other interferer is modulated equal with the desired signal. The input power of the interferers where the sensitivity equals BER = 0.1% is presented.

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------------------------|---|------|------|------|-------|
| P _{IMD,5TH,1M} | IMD performance, 1 Mbps, 5th offset channel, packet length ≤ 37 bytes | | -33 | | dBm |
| P _{IMD,5TH,1M,BLE} | IMD performance, BLE 1 Mbps, 5th offset channel, packet length ≤ 37 bytes | | -30 | | dBm |
| P _{IMD,5TH,2M} | IMD performance, 2 Mbps, 5th offset channel, packet length ≤ 37 bytes | | -33 | | dBm |
| P _{IMD,5TH,2M,BLE} | IMD performance, BLE 2 Mbps, 5th offset channel, packet length ≤ 37 bytes | | -31 | | dBm |

6.14.16.8 Radio timing

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------------------------------|--|------|------|------|-------|
| t _{TXEN,BLE,1M} | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE and 150 μs TIFS) | 140 | | 140 | μs |
| t _{TXEN,FAST,BLE,1M} | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up and 150 μs TIFS) | 40 | | 40 | μs |
| t _{TXDIS,BLE,1M} | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit | 6 | | 6 | μs |
| t _{RXEN,BLE,1M} | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE) | 140 | | 140 | μs |
| t _{RXEN,FAST,BLE,1M} | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up) | 40 | | 40 | μs |
| t _{RXDIS,BLE,1M} | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit | 0 | | 0 | μs |
| t _{TXDIS,BLE,2M} | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit | 4 | | 4 | μs |
| t _{RXDIS,BLE,2M} | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit | 0 | | 0 | μs |
| t _{TXEN,IEEE 802.15.4} | Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4) | 130 | | 130 | μs |
| t _{TXEN,FAST,IEEE 802.15.4} | Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 with fast ramp-up) | 40 | | 40 | μs |
| t _{TXDIS,IEEE 802.15.4} | When in TX, delay between DISABLE task and DISABLED event (IEEE 802.15.4) | 21 | | 21 | μs |
| t _{RXEN,IEEE 802.15.4} | Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4) | 130 | | 130 | μs |
| t _{RXEN,FAST,IEEE 802.15.4} | Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 with fast ramp-up) | 40 | | 40 | μs |
| t _{RXDIS,IEEE 802.15.4} | When in RX, delay between DISABLE task and DISABLED event (IEEE 802.15.4) | 0.5 | | 0.5 | μs |
| t _{RX-to-TX turnaround} | Maximum TX-to-RX or RX-to-TX turnaround time in IEEE 802.15.4 mode | | 40 | | μs |

6.14.16.9 Received signal strength indicator (RSSI) specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|----------------------------|--|------|------|------|-------|
| RSSI _{ACC} | RSSI accuracy valid range -90 to -20 dBm | | ±2 | | dB |
| RSSI _{RESOLUTION} | RSSI resolution | | 1 | | dB |
| RSSI _{PERIOD} | RSSI sampling time from RSSI_START task | | 0.25 | | μs |
| RSSI _{SETTLE} | RSSI settling time after signal level change | | 15 | | μs |

6.14.16.10 Jitter

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------------------------|---|------|------|------|-------|
| t _{DISABLEDJITTER} | Jitter on DISABLED event relative to END event when shortcut between END and DISABLE is enabled | | 0.25 | | μs |
| t _{READYJITTER} | Jitter on READY event relative to TXEN and RXEN task | | 0.25 | | μs |

6.14.16.11 IEEE 802.15.4 energy detection constants

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------|---|------|------|------|-------|
| ED_RSSISCALE | Scaling value when converting between hardware-reported value and dBm | 4 | 4 | 4 | |
| ED_RSSIOFFS | Offset value when converting between hardware-reported value and dBm | -92 | -92 | -92 | |

6.15 RNG — Random number generator

The Random number generator (RNG) generates true non-deterministic random numbers based on internal thermal noise that are suitable for cryptographic purposes. The RNG does not require a seed value.

Figure 88: Random number generator

The RNG is started by triggering the START task and stopped by triggering the STOP task. When started, new random numbers are generated continuously and written to the VALUE register when ready. A VALRDY event is generated for every new random number that is written to the VALUE register. This means that after a VALRDY event is generated the CPU has the time until the next VALRDY event to read out the random number from the VALUE register before it is overwritten by a new random number.

6.15.1 Bias correction

A bias correction algorithm is employed on the internal bit stream to remove any bias toward '1' or '0'. The bits are then queued into an eight-bit register for parallel readout from the VALUE register.

It is possible to enable bias correction in the CONFIG register. This will result in slower value generation, but will ensure a statistically uniform distribution of the random values.

6.15.2 Speed

The time needed to generate one random byte of data is unpredictable, and may vary from one byte to the next. This is especially true when bias correction is enabled.

6.15.3 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-------------------------|---------------|
| 0x4000D000 | RNG | RNG | Random number generator | |

Table 70: Instances

| Register | Offset | Description |
|---------------|--------|---|

6.15.4 Electrical specification

6.15.4.1 RNG Electrical Specification

| Symbol | Description | Min. | Typ. | Max. | Units |
|------------------------|--|------|------|------|---------------|
| $t_{\text{RNG,START}}$ | Time from setting the START task to generation begins. This is a one-time delay on START signal and does not apply between samples. | | 128 | | μs |
| $t_{\text{RNG,RAW}}$ | Run time per byte without bias correction. Uniform distribution of 0 and 1 is not guaranteed. | | 30 | | μs |
| $t_{\text{RNG,BC}}$ | Run time per byte with bias correction. Uniform distribution of 0 and 1 is guaranteed. Time to generate a byte cannot be guaranteed. | | 120 | | μs |

6.16 RTC — Real-time counter

The Real-time counter (RTC) module provides a generic, low power timer on the low-frequency clock source (LFCLK).

Figure 89: RTC block schematic

The RTC module features a 24-bit COUNTER, a 12-bit (1/X) prescaler, capture/compare registers, and a tick event generator for low power, tickless RTOS implementation.

6.16.1 Clock source

The RTC will run off the LFCLK.

The COUNTER resolution will therefore be 30.517 μ s. Depending on the source, the RTC is able to run while the HFCLK is OFF and PCLK16M is not available.

The software has to explicitly start LFCLK before using the RTC.

See [CLOCK — Clock control](#) on page 61 for more information about clock sources.

6.16.2 Resolution versus overflow and the PRESCALER

Counter increment frequency:

$$f_{\text{RTC}} [\text{kHz}] = 32.768 / (\text{PRESCALER} + 1)$$

The PRESCALER register is read/write when the RTC is stopped. The PRESCALER register is read-only once the RTC is STARTed. Writing to the PRESCALER register when the RTC is started has no effect.

The PRESCALER is restarted on START, CLEAR and TRIGOVRFLW, that is, the prescaler value is latched to an internal register (<<PRESC>>) on these tasks.

Examples:

1. Desired COUNTER frequency 100 Hz (10 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 100 \text{ Hz}) - 1 = 327$$

$$f_{\text{RTC}} = 99.9 \text{ Hz}$$

$$10009.576 \mu\text{s counter period}$$

2. Desired COUNTER frequency 8 Hz (125 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 8 \text{ Hz}) - 1 = 4095$$

$$f_{\text{RTC}} = 8 \text{ Hz}$$

125 ms counter period

| Prescaler | Counter resolution | Overflow |
|------------|--------------------|----------------|
| 0 | 30.517 μ s | 512 seconds |
| 2^8-1 | 7812.5 μ s | 131072 seconds |
| $2^{12}-1$ | 125 ms | 582.542 hours |

Table 72: RTC resolution versus overflow

6.16.3 COUNTER register

The COUNTER increments on LFCLK when the internal PRESCALER register (<<PRESC>>) is 0x00. <<PRESC>> is reloaded from the PRESCALER register. If enabled, the TICK event occurs on each increment of the COUNTER. The TICK event is disabled by default.

Figure 90: Timing diagram - COUNTER_PRESCALER_0

Figure 91: Timing diagram - COUNTER_PRESCALER_1

6.16.4 Overflow features

The TRIGOVFLW task sets the COUNTER value to 0xFFFFF0 to allow SW test of the overflow condition. OVRFLW occurs when COUNTER overflows from 0xFFFFF to 0.

Important: The OVRFLW event is disabled by default.

6.16.5 TICK event

The TICK event enables low power "tick-less" RTOS implementation as it optionally provides a regular interrupt source for a RTOS without the need to use the ARM[®] SysTick feature.

Using the RTC TICK event rather than the SysTick allows the CPU to be powered down while still keeping RTOS scheduling active.

Important: The TICK event is disabled by default.

6.16.6 Event control feature

To optimize RTC power consumption, events in the RTC can be individually disabled to prevent PCLK16M and HFCLK being requested when those events are triggered. This is managed using the EVTEN register.

For example, if the TICK event is not required for an application, this event should be disabled as it is frequently occurring and may increase power consumption if HFCLK otherwise could be powered down for long durations.

This means that the RTC implements a slightly different task and event system compared to the standard system described in [Peripheral interface](#) on page 74. The RTC task and event system is illustrated in [Tasks, events and interrupts in the RTC](#) on page 249.

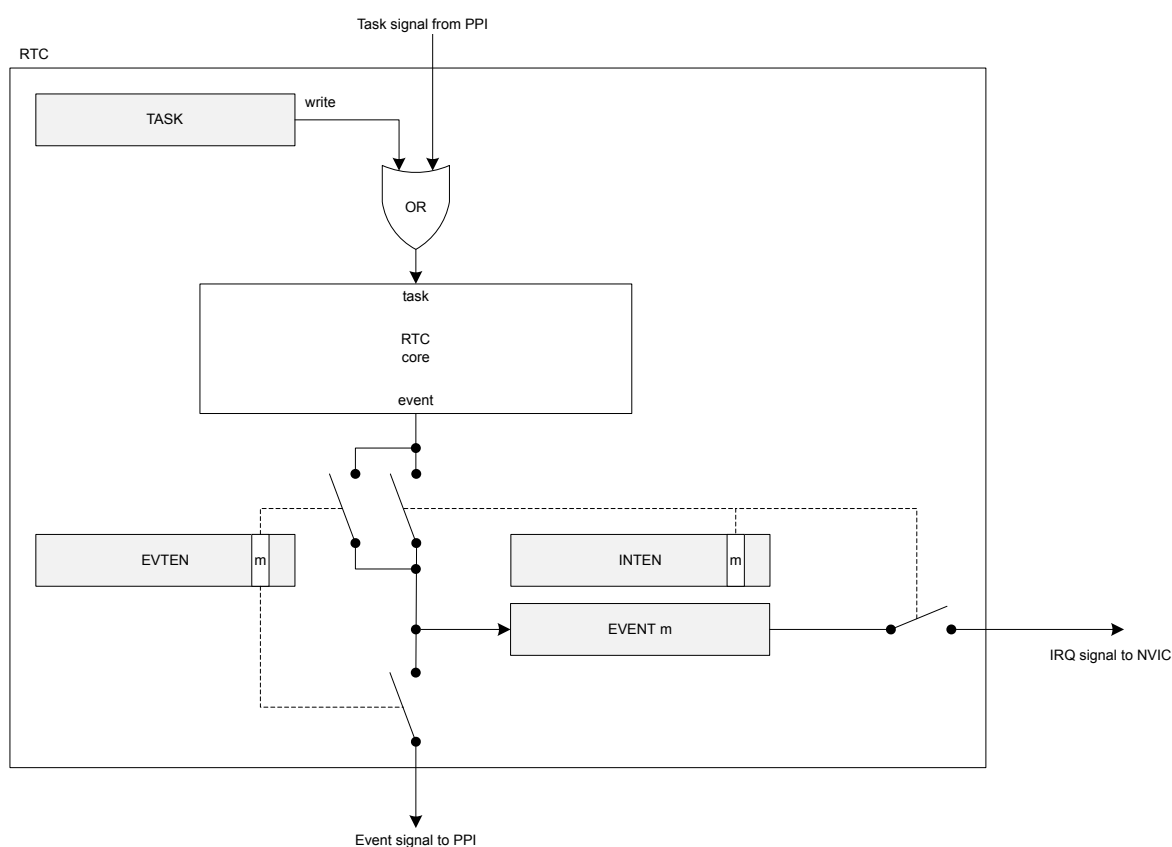

Figure 92: Tasks, events and interrupts in the RTC

6.16.7 Compare feature

There are a number of Compare registers.

For more information, see [Registers](#) on page 254.

When setting a compare register, the following behavior of the RTC compare event should be noted:

- If a CC register value is 0 when a CLEAR task is set, this will not trigger a COMPARE event.

Figure 93: Timing diagram - COMPARE_CLEAR

- If a CC register is N and the COUNTER value is N when the START task is set, this will not trigger a COMPARE event.

Figure 94: Timing diagram - COMPARE_START

- COMPARE occurs when a CC register is N and the COUNTER value transitions from N-1 to N.

Figure 95: Timing diagram - COMPARE

- If the COUNTER is N, writing N+2 to a CC register is guaranteed to trigger a COMPARE event at N+2.

Figure 96: Timing diagram - COMPARE_N+2

- If the COUNTER is N, writing N or N+1 to a CC register may not trigger a COMPARE event.

Figure 97: Timing diagram - COMPARE_N+1

- If the COUNTER is N and the current CC register value is N+1 or N+2 when a new CC value is written, a match may trigger on the previous CC value before the new value takes effect. If the current CC value greater than N+2 when the new value is written, there will be no event due to the old value.

Figure 98: Timing diagram - COMPARE_N-1

6.16.8 TASK and EVENT jitter/delay

Jitter or delay in the RTC is due to the peripheral clock being a low frequency clock (LFCLK) which is not synchronous to the faster PCLK16M.

Registers in the peripheral interface, part of the PCLK16M domain, have a set of mirrored registers in the LFCLK domain. For example, the COUNTER value accessible from the CPU is in the PCLK16M domain and is latched on read from an internal register called COUNTER in the LFCLK domain. COUNTER is the register which is actually modified each time the RTC ticks. These registers must be synchronised between clock domains (PCLK16M and LFCLK).

The following is a summary of the jitter introduced on tasks and events. Figures illustrating jitter follow.

| Task | Delay |
|---------------------------------|-------------------|
| CLEAR, STOP, START, TRIGOVRFLOW | +15 to 46 μ s |

Table 73: RTC jitter magnitudes on tasks

| Operation/Function | Jitter |
|----------------------------------|----------------|
| START to COUNTER increment | +/- 15 μ s |
| COMPARE to COMPARE ²⁰ | +/- 62.5 ns |

Table 74: RTC jitter magnitudes on events

1. CLEAR and STOP (and TRIGOVRFLOW; not shown) will be delayed as long as it takes for the peripheral to clock a falling edge and rising of the LFCLK. This is between 15.2585 μ s and 45.7755 μ s – rounded to 15 μ s and 46 μ s for the remainder of the section.

Figure 99: Timing diagram - DELAY_CLEAR

Figure 100: Timing diagram - DELAY_STOP

2. The START task will start the RTC. Assuming that the LFCLK was previously running and stable, the first increment of COUNTER (and instance of TICK event) will be typically after 30.5 μ s +/- 15 μ s. In some cases, in particular if the RTC is STARTed before the LFCLK is running, that timing can be up to ~250 μ s. The software should therefore wait for the first TICK if it has to make sure the RTC is running.

²⁰ Assumes RTC runs continuously between these events.

Note: 32.768 kHz clock jitter is additional to the numbers provided above.

Sending a TRIGOVFLW task sets the COUNTER to a value close to overflow. However, since the update of COUNTER relies on a stable LFCLK, sending this task while LFCLK is not running will start LFCLK, but the update will then be delayed by the same amount of time of up to $\sim 250 \mu\text{s}$. The figures show the smallest and largest delays to on the START task which appears as a $\pm 15 \mu\text{s}$ jitter on the first COUNTER increment.

Figure 101: Timing diagram - JITTER_START-

Figure 102: Timing diagram - JITTER_START+

6.16.9 Reading the COUNTER register

To read the COUNTER register, the internal $\ll\text{COUNTER}\gg$ value is sampled.

To ensure that the $\ll\text{COUNTER}\gg$ is safely sampled (considering an LFCLK transition may occur during a read), the CPU and core memory bus are halted for three cycles by lowering the core PREADY signal. The Read takes the CPU 2 cycles in addition resulting in the COUNTER register read taking a fixed five PCLK16M clock cycles.

Figure 103: Timing diagram - COUNTER_READ

6.16.10 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---------------------|---|
| 0x4000B000 | RTC | RTC0 | Real-time counter 0 | CC[0..2] implemented, CC[3] not implemented |
| 0x40011000 | RTC | RTC1 | Real-time counter 1 | CC[0..3] implemented |

Table 75: Instances

| Register | Offset | Description |
|-------------------|--------|---|
| TASKS_START | 0x000 | Start RTC COUNTER |

6.16.11 Electrical specification

6.17 SAADC — Successive approximation analog-to-digital converter

The ADC is a differential successive approximation register (SAR) analog-to-digital converter.

Listed here are the main features of SAADC:

- 8/10/12-bit resolution, 14-bit resolution with oversampling
- Up to eight input channels
 - One channel per single-ended input and two channels per differential input
 - Scan mode can be configured with both single-ended channels and differential channels.
- Full scale input range (0 to VDD)
- Sampling triggered via a task from software or a PPI channel for full flexibility on sample frequency source from low power 32.768kHz RTC or more accurate 1/16MHz Timers
- One-shot conversion mode to sample a single channel
- Scan mode to sample a series of channels in sequence. Sample delay between channels is $t_{ack} + t_{conv}$ which may vary between channels according to user configuration of t_{ack} .
- Support for direct sample transfer to RAM using EasyDMA
- Interrupts on single sample and full buffer events
- Samples stored as 16-bit 2's complement values for differential and single-ended sampling
- Continuous sampling without the need of an external timer
- Internal resistor string
- Limit checking on the fly

6.17.1 Shared resources

The ADC can coexist with COMP and other peripherals using one of AIN0–AIN7, provided these are assigned to different pins.

It is not recommended to select the same analog input pin for both modules.

6.17.2 Overview

The ADC supports up to eight external analog input channels, depending on package variant. It can be operated in a one-shot mode with sampling under software control, or a continuous conversion mode with a programmable sampling rate.

The analog inputs can be configured as eight single-ended inputs, four differential inputs or a combination of these. Each channel can be configured to select AIN0 to AIN7 pins, or the VDD pin. Channels can be

sampled individually in one-shot or continuous sampling modes, or, using scan mode, multiple channels can be sampled in sequence. Channels can also be oversampled to improve noise performance.

Figure 104: Simplified ADC block diagram

Internally, the ADC is always a differential analog-to-digital converter, but by default it is configured with single-ended input in the MODE field of the CH[n].CONFIG register. In single-ended mode, the negative input will be shorted to ground internally.

The assumption in single-ended mode is that the internal ground of the ADC is the same as the external ground that the measured voltage is referred to. The ADC is thus sensitive to ground bounce on the PCB in single-ended mode. If this is a concern we recommend using differential measurement.

6.17.3 Digital output

The output result of the ADC depends on the settings in the CH[n].CONFIG and RESOLUTION registers as follows:

$$\text{RESULT} = [V(P) - V(N)] * \text{GAIN}/\text{REFERENCE} * 2^{(\text{RESOLUTION} - m)}$$

where

V(P)

is the voltage at input P

V(N)

is the voltage at input N

GAIN

is the selected gain setting

REFERENCE

is the selected reference voltage

and $m=0$ if CONFIG.MODE=SE, or $m=1$ if CONFIG.MODE=Diff.

The result generated by the ADC will deviate from the expected due DC errors like offset, gain, differential non-linearity (DNL), and integral non-linearity (INL). See [Electrical specification](#) for details on these parameters. The result can also vary due to AC errors like non-linearities in the GAIN block, settling errors

due to high source impedance and sampling jitter. For battery measurement the DC errors are most noticeable.

The ADC has a wide selection of gains controlled in the GAIN field of the CH[n].CONFIG register. If CH[n].CONFIG.REFSEL=0, the input range of the ADC core is nominally ± 0.6 V differential and the input must be scaled accordingly.

The ADC has a temperature dependent offset. If the ADC is to operate over a large temperature range, we recommend running CALIBRATEOFFSET at regular intervals, a CALIBRATEDONE event will be fired when the calibration is complete

6.17.4 Analog inputs and channels

Up to eight analog input channels, CH[n](n=0..7), can be configured.

See [Shared resources](#) on page 259 for shared input with comparators.

Any one of the available channels can be enabled for the ADC to operate in one-shot mode. If more than one CH[n] is configured, the ADC enters scan mode.

An analog input is selected as a positive converter input if CH[n].PSELP is set, setting CH[n].PSELP also enables the particular channel.

An analog input is selected as a negative converter input if CH[n].PSELN is set. The CH[n].PSELN register will have no effect unless differential mode is enabled, see MODE field in CH[n].CONFIG register.

If more than one of the CH[n].PSELP registers is set, the device enters scan mode. Input selections in scan mode are controlled by the CH[n].PSELP and CH[n].PSELN registers, where CH[n].PSELN is only used if the particular scan channel is specified as differential, see MODE field in CH[n].CONFIG register.

Important: Channels selected for COMP cannot be used at the same time for ADC sampling, though channels not selected for use by these blocks can be used by the ADC.

| Channel input | Source | Connectivity |
|---------------|-------------|--------------|
| CH[n].PSELP | AIN0...AIN7 | Yes(any) |
| CH[n].PSELN | VDD | Yes |
| CH[n].PSELN | AIN0...AIN7 | Yes(any) |
| CH[n].PSELN | VDD | Yes |

Table 77: Legal connectivity CH[n] vs. analog input

6.17.5 Operation modes

The ADC input configuration supports one-shot mode, continuous mode and scan mode.

Scan mode and oversampling cannot be combined.

6.17.5.1 One-shot mode

One-shot operation is configured by enabling only one of the available channels defined by CH[n].PSELP, CH[n].PSELN, and CH[n].CONFIG registers.

Upon a SAMPLE task, the ADC starts to sample the input voltage. The CH[n].CONFIG.TACQ controls the acquisition time.

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event has the same meaning as DONE when no oversampling takes place. Note that both events may occur before the actual value has been transferred into RAM by EasyDMA. For more information, see [EasyDMA](#) on page 263.

6.17.5.2 Continuous mode

Continuous sampling can be achieved by using the internal timer in the ADC, or triggering the SAMPLE task from one of the general purpose timers through the PPI.

Care shall be taken to ensure that the sample rate fulfils the following criteria, depending on how many channels are active:

$$f_{\text{SAMPLE}} < 1 / [t_{\text{ACQ}} + t_{\text{conv}}]$$

The SAMPLERATE register can be used as a local timer instead of triggering individual SAMPLE tasks. When SAMPLERATE.MODE is set to Timers, it is sufficient to trigger SAMPLE task only once in order to start the SAADC and triggering the STOP task will stop sampling. The SAMPLERATE.CC field controls the sample rate.

The SAMPLERATE timer mode cannot be combined with SCAN mode, and only one channel can be enabled in this mode.

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event has the same meaning as DONE when no oversampling takes place. Note that both events may occur before the actual value has been transferred into RAM by EasyDMA.

6.17.5.3 Oversampling

An accumulator in the ADC can be used to average noise on the analog input. In general, oversampling improves the signal-to-noise ratio (SNR). Oversampling, however, does not improve the integral non-linearity (INL), or differential non-linearity (DNL).

Oversampling and scan should not be combined, since oversampling and scan will average over input channels.

The accumulator is controlled in the OVERSAMPLE register. The SAMPLE task must be set $2^{\text{OVERSAMPLE}}$ number of times before the result is written to RAM. This can be achieved by:

- Configuring a fixed sampling rate using the local timer or a general purpose timer and PPI to trigger a SAMPLE task
- Triggering SAMPLE $2^{\text{OVERSAMPLE}}$ times from software
- Enabling BURST mode

CH[n].CONFIG.BURST can be enabled to avoid setting SAMPLE task $2^{\text{OVERSAMPLE}}$ times. With BURST = 1 the ADC will sample the input $2^{\text{OVERSAMPLE}}$ times as fast as it can (actual timing: $<(t_{\text{ACQ}}+t_{\text{CONV}}) \times 2^{\text{OVERSAMPLE}}>$). Thus, for the user it will just appear like the conversion took a bit longer time, but other than that, it is similar to one-shot mode. Scan mode can be combined with BURST=1, if burst is enabled on all channels.

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event signals that enough conversions have taken place for an oversampled result to get transferred into RAM. Note that both events may occur before the actual value has been transferred into RAM by EasyDMA.

6.17.5.4 Scan mode

A channel is considered enabled if CH[n].PSEL is set. If more than one channel, CH[n], is enabled, the ADC enters scan mode.

In scan mode, one SAMPLE task will trigger one conversion per enabled channel. The time it takes to sample all channels is:

$$\text{Total time} < \text{Sum}(\text{CH}[x].t_{\text{ACQ}}+t_{\text{CONV}}), x=0..\text{enabled channels}$$

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event signals has the same meaning as DONE when no oversampling takes place. Note that both events may occur before the actual values have been transferred into RAM by EasyDMA.

[Example of RAM placement \(even RESULT.MAXCNT\), channels 1, 2 and 5 enabled](#) on page 263 provides an example of results placement in Data RAM, with an even RESULT.MAXCNT. In this example, channels 1, 2 and 5 are enabled, all others are disabled.

| | | | | |
|---------------------------------------|------------------------------|----|------------------------------|---|

| RESULT.PTR + 8 | CH[5] 2 nd result | | CH[2] 2 nd result | |
| | (...) | | | |
| RESULT.PTR + 2*(RESULT.MAXCNT - 1) | | | CH[5] last result | |

Figure 106: Example of RAM placement (odd RESULT.MAXCNT), channels 1, 2 and 5 enabled

6.17.6 EasyDMA

After configuring RESULT.PTR and RESULT.MAXCNT, the ADC resources are started by triggering the START task. The ADC is using EasyDMA to store results in a Result buffer in RAM.

The Result buffer is located at the address specified in the RESULT.PTR register. The RESULT.PTR register is double-buffered and it can be updated and prepared for the next START task immediately after the STARTED event is generated. The size of the Result buffer is specified in the RESULT.MAXCNT register and the ADC will generate an END event when it has filled up the Result buffer, see [ADC](#) on page 264. Results are stored in little-endian byte order in Data RAM. Every sample will be sign extended to 16 bit before stored in the Result buffer.

The ADC is stopped by triggering the STOP task. The STOP task will terminate an ongoing sampling. The ADC will generate a STOPPED event when it has stopped. If the ADC is already stopped when the STOP task is triggered, the STOPPED event will still be generated.

Figure 107: ADC

If the RESULT.PTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

The EasyDMA will have finished accessing the RAM when the END or STOPPED event has been generated.

The RESULT.AMOUNT register can be read following an END event or a STOPPED event to see how many results have been transferred to the Result buffer in RAM since the START task was triggered.

In scan mode, SAMPLE tasks can be triggered once the START task is triggered. The END event is generated when the number of samples transferred to memory reaches the value specified by RESULT.MAXCNT. After an END event, the START task needs to be triggered again before new samples can be taken. Also make sure that the size of the Result buffer is large enough to have space for minimum one result from each of the enabled channels, by specifying RESULT.MAXCNT >= number of channels enabled. For more information about the scan mode, see [Scan mode](#) on page 262.

6.17.7 Resistor ladder

The ADC has an internal resistor string for positive and negative input.

See [Resistor ladder for positive input \(negative input is equivalent, using RESN instead of RESP\)](#) on page 265. The resistors are controlled in the CH[n].CONFIG.RESP and CH[n].CONFIG.RESN registers.

Figure 108: Resistor ladder for positive input (negative input is equivalent, using RESN instead of RESP)

6.17.8 Reference

The ADC can use two different references, controlled in the REFSEL field of the CH[n].CONFIG register.

These are:

- Internal reference
- VDD as reference

The internal reference results in an input range of ± 0.6 V on the ADC core. VDD as reference results in an input range of $\pm VDD/4$ on the ADC core. The gain block can be used to change the effective input range of the ADC.

$$\text{Input range} = (+- 0.6 \text{ V or } +-VDD/4) / \text{Gain}$$

For example, choosing VDD as reference, single ended input (grounded negative input), and a gain of 1/4 the input range will be:

$$\text{Input range} = (VDD/4) / (1/4) = VDD$$

With internal reference, single ended input (grounded negative input), and a gain of 1/6 the input range will be:

$$\text{Input range} = (0.6 \text{ V}) / (1/6) = 3.6 \text{ V}$$

The AIN0-AIN7 inputs cannot exceed VDD, or be lower than VSS.

6.17.9 Acquisition time

To sample the input voltage, the ADC connects a capacitor to the input.

For illustration, see [Simplified ADC sample network](#) on page 266. The acquisition time indicates how long the capacitor is connected, see TACQ field in CH[n].CONFIG register. The required acquisition time depends on the source (R_{source}) resistance. For high source resistance the acquisition time should be increased, see [Acquisition time](#) on page 266.

Figure 109: Simplified ADC sample network

| TACQ [μ s] | Maximum source resistance [kOhm] |
|-----------------|----------------------------------|
| 3 | 10 |
| 5 | 40 |
| 10 | 100 |
| 15 | 200 |
| 20 | 400 |
| 40 | 800 |

Table 78: Acquisition time

6.17.10 Limits event monitoring

A channel can be event monitored by configuring limit register CH[n].LIMIT.

If the conversion result is higher than the defined high limit, or lower than the defined low limit, the appropriate event will get fired.

Figure 110: Example of limits monitoring on channel 'n'

Note that when setting the limits, CH[n].LIMIT.HIGH shall always be higher than or equal to CH[n].LIMIT.LOW . In other words, an event can be fired only when the input signal has been sampled outside of the defined limits. It is not possible to fire an event when the input signal is inside a defined range by swapping high and low limits.

The comparison to limits always takes place, there is no need to enable it. If comparison is not required on a channel, the software shall simply ignore the related events. In that situation, the value of the limits registers is irrelevant, so it does not matter if CH[n].LIMIT.LOW is lower than CH[n].LIMIT.HIGH or not.

6.17.11 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-----------------------------|---------------|

6.17.12 Electrical specification

6.17.12.1 SAADC Electrical Specification

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------------------|--|-------|------|------|--------------------|
| DNL ₁₀ | Differential non-linearity, 10-bit resolution | -0.95 | <1 | | LSB _{10b} |
| INL ₁₀ | Integral non-linearity, 10-bit resolution | | 1 | | LSB _{10b} |
| V _{OS} | Differential offset error (calibrated), 10-bit resolution ^a | | +2 | | LSB _{10b} |
| DNL ₁₂ | Differential non-linearity, 12-bit resolution | -0.95 | 1.3 | | LSB _{12b} |
| INL ₁₂ | Integral non-linearity, 12-bit resolution | | 4.7 | | LSB _{12b} |
| C _{EG} | Gain error temperature coefficient | | 0.02 | | %/°C |
| f _{SAMPLE} | Maximum sampling rate | | | 200 | kHz |
| t _{ACQ,10k} | Acquisition time (configurable), source Resistance <= 10kOhm | | 3 | | μs |
| t _{ACQ,40k} | Acquisition time (configurable), source Resistance <= 40kOhm | | 5 | | μs |
| t _{ACQ,100k} | Acquisition time (configurable), source Resistance <= 100kOhm | | 10 | | μs |
| t _{ACQ,200k} | Acquisition time (configurable), source Resistance <= 200kOhm | | 15 | | μs |

^a Digital output code at zero volt differential input.

| Symbol | Description | Min. | Typ. | Max. | Units |
|-----------------------|--|------|------|------|-------|
| t _{ACQ,400k} | Acquisition time (configurable), source Resistance <= 400kOhm | | 20 | | μs |
| t _{ACQ,800k} | Acquisition time (configurable), source Resistance <= 800kOhm | | 40 | | μs |
| t _{CONV} | Conversion time | | <2 | | μs |
| E _{G1/6} | Error ^b for Gain = 1/6 | -3 | | 3 | % |
| E _{G1/4} | Error ^b for Gain = 1/4 | -3 | | 3 | % |
| E _{G1/2} | Error ^b for Gain = 1/2 | -3 | | 4 | % |
| E _{G1} | Error ^b for Gain = 1 | -3 | | 4 | % |
| C _{SAMPLE} | Sample and hold capacitance at maximum gain ²¹ | | 2.5 | | pF |
| R _{INPUT} | Input resistance | | >1 | | MΩ |
| E _{NOB} | Effective number of bits, differential mode, 12-bit resolution, 1/1 gain, 3 μs acquisition time, crystal HFCLK, 200 ksp/s | | 9 | | Bit |
| S _{NDR} | Peak signal to noise and distortion ratio, differential mode, 12-bit resolution, 1/1 gain, 3 μs acquisition time, crystal HFCLK, 200 ksp/s | | 56 | | dB |
| S _{FDR} | Spurious free dynamic range, differential mode, 12-bit resolution, 1/1 gain, 3 μs acquisition time, crystal HFCLK, 200 ksp/s | | 70 | | dBc |
| R _{LADDER} | Ladder resistance | | 160 | | kΩ |

6.17.13 Performance factors

Clock jitter, affecting sample timing accuracy, and circuit noise can affect ADC performance.

Jitter can be between START tasks or from START task to acquisition. START timer accuracy and startup times of regulators and references will contribute to variability. Sources of circuit noise may include CPU activity and the DC/DC regulator. Best ADC performance is achieved using START timing based on the TIMER module, HFXO clock source, and Constant Latency mode.

6.18 SPI — Serial peripheral interface master

The SPI master provides a simple CPU interface which includes a TXD register for sending data and an RXD register for receiving data. This section is added for legacy support for now.

^b Does not include temperature drift

²¹ Maximum gain corresponds to highest capacitance.

Figure 111: SPI master

RXD-1 and TXD+1 illustrate the double buffered version of RXD and TXD respectively.

6.18.1 Functional description

The TXD and RXD registers are double-buffered to enable some degree of uninterrupted data flow in and out of the SPI master.

The SPI master does not implement support for chip select directly. Therefore, the CPU must use available GPIOs to select the correct slave and control this independently of the SPI master. The SPI master supports SPI modes 0 through 3.

| Mode | Clock polarity | Clock phase |
|-----------|----------------|-----------------|
| | CPOL | CPHA |
| SPI_MODE0 | 0 (Leading) | 0 (Active high) |
| SPI_MODE1 | 0 (Leading) | 1 (Active low) |
| SPI_MODE2 | 1 (Trailing) | 0 (Active high) |
| SPI_MODE3 | 1 (Trailing) | 1 (Active low) |

Table 81: SPI modes

6.18.1.1 SPI master mode pin configuration

The different signals SCK, MOSI, and MISO associated with the SPI master are mapped to physical pins.

This mapping is according to the configuration specified in the PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated SPI master signal is not connected to any physical pin. The PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI master is disabled.

To secure correct behavior in the SPI, the pins used by the SPI must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 284 prior to enabling the SPI. The SCK must always be connected to a pin, and that pin's input buffer must always be connected for the SPI to work. This configuration must be retained in the GPIO for the selected IOs as long as the SPI is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time, failing to do so may result in unpredictable behavior.

| SPI master signal | SPI master pin | Direction | Output value |
|-------------------|---------------------------|-----------|---------------------|
| SCK | As specified in PSEL.SCK | Output | Same as CONFIG.CPOL |
| MOSI | As specified in PSEL.MOSI | Output | 0 |
| MISO | As specified in PSEL.MISO | Input | Not applicable |

Table 82: GPIO configuration

6.18.1.2 Shared resources

The SPI shares registers and other resources with other peripherals that have the same ID as the SPI. Therefore, the user must disable all peripherals that have the same ID as the SPI before the SPI can be configured and used.

Disabling a peripheral that has the same ID as the SPI will not reset any of the registers that are shared with the SPI. It is therefore important to configure all relevant SPI registers explicitly to secure that it operates correctly.

See the Instantiation table in [Instantiation](#) on page 18 for details on peripherals and their IDs.

6.18.1.3 SPI master transaction sequence

An SPI master transaction is started by writing the first byte, which is to be transmitted by the SPI master, to the TXD register.

Since the transmitter is double buffered, the second byte can be written to the TXD register immediately after the first one. The SPI master will then send these bytes in the order they are written to the TXD register.

The SPI master is a synchronous interface, and for every byte that is sent, a different byte will be received at the same time; this is illustrated in [SPI master transaction](#) on page 285. Bytes that are received will be moved to the RXD register where the CPU can extract them by reading the register. The RXD register is double buffered in the same way as the TXD register, and a second byte can therefore be received at the same time as the first byte is being extracted from RXD by the CPU. The SPI master will generate a READY event every time a new byte is moved to the RXD register. The double buffered byte will be moved from RXD-1 to RXD as soon as the first byte is extracted from RXD. The SPI master will stop when there are no more bytes to send in TXD and TXD+1.

Figure 112: SPI master transaction

The READY event of the third byte transaction is delayed until B is extracted from RXD in occurrence number 3 on the horizontal lifeline. The reason for this is that the third event is generated first when C is moved from RXD-1 to RXD after B is read.

The SPI master will move the incoming byte to the RXD register after a short delay following the SCK clock period of the last bit in the byte. This also means that the READY event will be delayed accordingly, see [SPI master transaction](#) on page 285. Therefore, it is important that you always clear the READY event, even if the RXD register and the data that is being received is not used.

Figure 113: SPI master transaction

6.18.2 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--------------|---------------|
| 0x40003000 | SPI | SPI1 | SPI master 1 | Deprecated |
| 0x40004000 | SPI | SPI0 | SPI master 0 | Deprecated |

Table 83: Instances

| Register | Offset | Description |

6.18.3 Electrical specification

6.18.3.1 SPI master interface electrical specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|------------------------|--|------|------|----------|---------------|
| f_{SPI} | Bit rates for SPI ²² | | | g^{23} | Mbps |
| $t_{\text{SPI,START}}$ | Time from writing TXD register to transmission started | | 1 | | μs |

6.18.3.2 Serial Peripheral Interface (SPI) Master timing specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------------------|--|------|------|----------------------|-------|
| $t_{\text{SPI,CCLK}}$ | SCK period | 125 | | | ns |
| $t_{\text{SPI,RSCK,LD}}$ | SCK rise time, standard drive ^a | | | $t_{\text{RF,25pF}}$ | |

²² High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

²³ The actual maximum data rate depends on the slave's CLK to MISO and MOSI setup and hold timings.

^a At 25pF load, including GPIO capacitance, see GPIO spec.

| Symbol | Description | Min. | Typ. | Max. | Units |
|--------------------------|--|-----------------------|------|------------------------------|-------|
| $t_{\text{SPI,RSCK,HD}}$ | SCK rise time, high drive ^a | | | $t_{\text{HRF},25\text{pF}}$ | |
| $t_{\text{SPI,FSCK,LD}}$ | SCK fall time, standard drive ^a | | | $t_{\text{RF},25\text{pF}}$ | |
| $t_{\text{SPI,FSCK,HD}}$ | SCK fall time, high drive ^a | | | $t_{\text{HRF},25\text{pF}}$ | |
| $t_{\text{SPI,WHSCk}}$ | SCK high time ^a | $(t_{\text{CSCK}}/2)$ | | | |
| | | $-t_{\text{RSCK}}$ | | | |
| $t_{\text{SPI,WLSCk}}$ | SCK low time ^a | $(t_{\text{CSCK}}/2)$ | | | |
| | | $-t_{\text{FSCK}}$ | | | |
| $t_{\text{SPI,SUMI}}$ | MISO to CLK edge setup time | 19 | | | ns |
| $t_{\text{SPI,HMI}}$ | CLK edge to MISO hold time | 18 | | | ns |
| $t_{\text{SPI,VMO}}$ | CLK edge to MOSI valid | | | 59 | ns |
| $t_{\text{SPI,HMO}}$ | MOSI hold time after CLK edge | 20 | | | ns |

Figure 114: SPI master timing diagram

6.19 SPIM — Serial peripheral interface master with EasyDMA

The SPI master can communicate with multiple slaves using individual chip select signals for each of the slave devices attached to a bus.

Listed here are the main features for the SPIM

- SPI mode 0-3
- EasyDMA direct transfer to/from RAM for both SPI Slave and SPI Master
- Individual selection of IO pin for each SPI signal

Figure 115: SPIM — SPI master with EasyDMA

The SPIM does not implement support for chip select directly. Therefore, the CPU must use available GPIOs to select the correct slave and control this independently of the SPI master. The SPIM supports SPI modes 0 through 3. The CONFIG register allows setting CPOL and CPHA appropriately.

| Mode | Clock polarity | Clock phase |
|-----------|-----------------|--------------|
| | CPOL | CPHA |
| SPI_MODE0 | 0 (Active High) | 0 (Leading) |
| SPI_MODE1 | 0 (Active High) | 1 (Trailing) |
| SPI_MODE2 | 1 (Active Low) | 0 (Leading) |
| SPI_MODE3 | 1 (Active Low) | 1 (Trailing) |

Table 85: SPI modes

6.19.1 SPI master transaction sequence

An SPI master transaction consists of a sequence started by the START task followed by a number of events, and finally the STOP task.

An SPI master transaction is started by triggering the START task. The ENDTX event will be generated when the transmitter has transmitted all bytes in the TXD buffer as specified in the TXD.MAXCNT register. The ENDRX event will be generated when the receiver has filled the RXD buffer, i.e. received the last possible byte as specified in the RXD.MAXCNT register.

Following a START task, the SPI master will generate an END event when both ENDRX and ENDTX have been generated.

The SPI master is stopped by triggering the STOP task. A STOPPED event is generated when the SPI master has stopped.

If the ENDRX event has not already been generated when the SPI master has come to a stop, the SPI master will generate the ENDRX event explicitly even though the RX buffer is not full.

If the ENDTX event has not already been generated when the SPI master has come to a stop, the SPI master will generate the ENDTX event explicitly even though all bytes in the TXD buffer, as specified in the TXD.MAXCNT register, have not been transmitted.

The SPI master is a synchronous interface, and for every byte that is sent, a different byte will be received at the same time; this is illustrated in [SPI master transaction](#) on page 292.

Figure 116: SPI master transaction

6.19.2 Master mode pin configuration

The SCK, MOSI, and MISO signals associated with the SPI master are mapped to physical pins according to the configuration specified in the PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively.

The PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCK, PSEL.MOSI and PSEL.MISO must only be configured when the SPI master is disabled.

To secure correct behavior in the SPI, the pins used by the SPI must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 292 prior to enabling the SPI. This configuration must be retained in the GPIO for the selected IOs as long as the SPI is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI master signal | SPI master pin | Direction | Output value |
|-------------------|---------------------------|-----------|---------------------|
| SCK | As specified in PSEL.SCK | Output | Same as CONFIG.CPOL |
| MOSI | As specified in PSEL.MOSI | Output | 0 |
| MISO | As specified in PSEL.MISO | Input | Not applicable |

Table 86: GPIO configuration

6.19.3 EasyDMA

The SPIM implements EasyDMA for accessing RAM without CPU involvement.

The SPIM peripheral implements the following EasyDMA channels:

| Channel | Type | Register Cluster |
|---------|--------|------------------|
| TXD | READER | TXD |
| RXD | WRITER | RXD |

Table 87: SPIM EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 35.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next transmission immediately after having received the STARTED event.

The SPI master will automatically stop transmitting after TXD.MAXCNT bytes have been transmitted and RXD.MAXCNT bytes have been received. If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register. If TXD.MAXCNT is larger than RXD.MAXCNT, the superfluous received bytes will be discarded.

The ENDRX/ENDTX event indicate that EasyDMA has finished accessing respectively the RX/TX buffer in RAM. The END event gets generated when both RX and TX are finished accessing the buffers in RAM.

In the case of bus congestion as described in , data loss may occur.

6.19.4 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

6.19.5 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--------------|---------------|
| 0x40003000 | SPIM | SPIM1 | SPI master 1 | |
| 0x40004000 | SPIM | SPIM0 | SPI master 0 | |

Table 88: Instances

| Register | Offset | Description |
|----------------|--------|--|
| TASKS_START | 0x010 | Start SPI transaction |
| TASKS_STOP | 0x014 | Stop SPI transaction |
| TASKS_SUSPEND | 0x01C | Suspend SPI transaction |
| TASKS_RESUME | 0x020 | Resume SPI transaction |
| EVENTS_STOPPED | 0x104 | SPI transaction has stopped |
| EVENTS_ENDRX | 0x110 | End of RXD buffer reached |
| EVENTS_END | 0x118 | End of RXD buffer and TXD buffer reached |
| EVENTS_ENDTX | 0x120 | End of TXD buffer reached |
| EVENTS_STARTED | 0x14C | Transaction started |
| SHORTS | 0x200 | Shortcuts between local events and tasks |

| Register | Offset | Description |
|------------|--------|---|
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ENABLE | 0x500 | Enable SPIM |
| PSEL.SCK | 0x508 | Pin select for SCK |
| PSEL.MOSI | 0x50C | Pin select for MOSI signal |
| PSEL.MISO | 0x510 | Pin select for MISO signal |
| FREQUENCY | 0x524 | SPI frequency. Accuracy depends on the HFCLK source selected. |
| RXD.PTR | 0x534 | Data pointer |
| RXD.MAXCNT | 0x538 | Maximum number of bytes in receive buffer |
| RXD.AMOUNT | 0x53C | Number of bytes transferred in the last transaction |
| RXD.LIST | 0x540 | EasyDMA list type |
| TXD.PTR | 0x544 | Data pointer |
| TXD.MAXCNT | 0x548 | Maximum number of bytes in transmit buffer |
| TXD.AMOUNT | 0x54C | Number of bytes transferred in the last transaction |
| TXD.LIST | 0x550 | EasyDMA list type |
| CONFIG | 0x554 | Configuration register |
| ORC | 0x5C0 | Over-read character. Character clocked out in case and over-read of the TXD buffer. |

6.19.6 Electrical specification

6.19.6.1 SPIM master interface electrical specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|-------------------------|--|------|------|-----------------|-------|
| f_{SPIM} | Bit rates for SPIM ²⁴ | | | g ²⁵ | Mbps |
| $t_{\text{SPIM,START}}$ | Time from START task to transmission started | .. | .. | .. | µs |

6.19.6.2 Serial Peripheral Interface Master (SPIM) timing specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------|--|---|------|------------------------------|-------|
| $t_{\text{SPIM,CCLK}}$ | SCK period | .. | .. | .. | ns |
| $t_{\text{SPIM,RSCK,LD}}$ | SCK rise time, standard drive ^a | | | $t_{\text{RF},25\text{pF}}$ | |
| $t_{\text{SPIM,RSCK,HD}}$ | SCK rise time, high drive ^a | | | $t_{\text{HRF},25\text{pF}}$ | |
| $t_{\text{SPIM,FSCK,LD}}$ | SCK fall time, standard drive ^a | | | $t_{\text{RF},25\text{pF}}$ | |
| $t_{\text{SPIM,FSCK,HD}}$ | SCK fall time, high drive ^a | | | $t_{\text{HRF},25\text{pF}}$ | |
| $t_{\text{SPIM,WHCK}}$ | SCK high time ^a | $(0.5 * t_{\text{CCLK}}$ $- t_{\text{RSCK}}$ | | | |
| $t_{\text{SPIM,WLCK}}$ | SCK low time ^a | $(0.5 * t_{\text{CCLK}}$ $- t_{\text{FSCK}}$ | | | |
| $t_{\text{SPIM,SUMI}}$ | MISO to CLK edge setup time | 19 | | | ns |
| $t_{\text{SPIM,HMI}}$ | CLK edge to MISO hold time | 18 | | | ns |
| $t_{\text{SPIM,VMO}}$ | CLK edge to MOSI valid | | | 59 | ns |
| $t_{\text{SPIM,HMO}}$ | MOSI hold time after CLK edge | 20 | | | ns |

²⁴ High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

²⁵ The actual maximum data rate depends on the slave's CLK to MISO and MOSI setup and hold timings.

^a At 25pF load, including GPIO pin capacitance, see GPIO spec.

Figure 117: SPIM timing diagram

6.20 SPIS — Serial peripheral interface slave with EasyDMA

SPI slave (SPIS) is implemented with EasyDMA support for ultra low power serial communication from an external SPI master. EasyDMA in conjunction with hardware-based semaphore mechanisms removes all real-time requirements associated with controlling the SPI slave from a low priority CPU execution context.

Figure 118: SPI slave

The SPIS supports SPI modes 0 through 3. The CONFIG register allows setting CPOL and CPHA appropriately.

| Mode | Clock polarity | Clock phase |
|-----------|-----------------|-------------------|
| | CPOL | CPHA |
| SPI_MODE0 | 0 (Active High) | 0 (Trailing Edge) |
| SPI_MODE1 | 0 (Active High) | 1 (Leading Edge) |
| SPI_MODE2 | 1 (Active Low) | 0 (Trailing Edge) |
| SPI_MODE3 | 1 (Active Low) | 1 (Leading Edge) |

Table 90: SPI modes

6.20.1 Shared resources

The SPI slave shares registers and other resources with other peripherals that have the same ID as the SPI slave. Therefore, you must disable all peripherals that have the same ID as the SPI slave before the SPI slave can be configured and used.

Disabling a peripheral that has the same ID as the SPI slave will not reset any of the registers that are shared with the SPI slave. It is important to configure all relevant SPI slave registers explicitly to secure that it operates correctly.

The Instantiation table in [Instantiation](#) on page 18 shows which peripherals have the same ID as the SPI slave.

6.20.2 EasyDMA

The SPIS implements EasyDMA for accessing RAM without CPU involvement.

The SPIS peripheral implements the following EasyDMA channels:

| Channel | Type | Register Cluster |
|---------|--------|------------------|
| TXD | READER | TXD |
| RXD | WRITER | RXD |

Table 91: SPIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 35.

If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register.

The END event indicates that EasyDMA has finished accessing the buffer in RAM.

6.20.3 SPI slave operation

SPI slave uses two memory pointers, RXD.PTR and TXD.PTR, that point to the RXD buffer (receive buffer) and TXD buffer (transmit buffer) respectively. Since these buffers are located in RAM, which can be accessed by both the SPI slave and the CPU, a hardware based semaphore mechanism is implemented to enable safe sharing.

See [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 306.

Before the CPU can safely update the RXD.PTR and TXD.PTR pointers it must first acquire the SPI semaphore. The CPU can acquire the semaphore by triggering the ACQUIRE task and then receiving the ACQUIRED event. When the CPU has updated the RXD.PTR and TXD.PTR pointers the CPU must release the semaphore before the SPI slave will be able to acquire it. The CPU releases the semaphore by triggering the RELEASE task. This is illustrated in [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 306. Triggering the RELEASE task when the semaphore is not granted to the CPU will have no effect.

The semaphore mechanism does not, at any time, prevent the CPU from performing read or write access to the RXD.PTR register, the TXD.PTR registers, or the RAM that these pointers are pointing to. The semaphore is only telling when these can be updated by the CPU so that safe sharing is achieved.

The semaphore is by default assigned to the CPU after the SPI slave is enabled. No ACQUIRED event will be generated for this initial semaphore handover. An ACQUIRED event will be generated immediately if the ACQUIRE task is triggered while the semaphore is assigned to the CPU.

The SPI slave will try to acquire the semaphore when CSN goes low. If the SPI slave does not manage to acquire the semaphore at this point, the transaction will be ignored. This means that all incoming data on MOSI will be discarded, and the DEF (default) character will be clocked out on the MISO line throughout the whole transaction. This will also be the case even if the semaphore is released by the CPU during the transaction. In case of a race condition where the CPU and the SPI slave try to acquire the semaphore at the same time, as illustrated in lifeline item 2 in [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 306, the semaphore will be granted to the CPU.

If the SPI slave acquires the semaphore, the transaction will be granted. The incoming data on MOSI will be stored in the RXD buffer and the data in the TXD buffer will be clocked out on MISO.

When a granted transaction is completed and CSN goes high, the SPI slave will automatically release the semaphore and generate the END event.

As long as the semaphore is available the SPI slave can be granted multiple transactions one after the other. If the CPU is not able to reconfigure the TXD.PTR and RXD.PTR between granted transactions, the same TX data will be clocked out and the RX buffers will be overwritten. To prevent this from happening, the END_ACQUIRE shortcut can be used. With this shortcut enabled the semaphore will be handed over to the CPU automatically after the granted transaction has completed, giving the CPU the ability to update the TXPTR and RXPTR between every granted transaction.

If the CPU tries to acquire the semaphore while it is assigned to the SPI slave, an immediate handover will not be granted. However, the semaphore will be handed over to the CPU as soon as the SPI slave has released the semaphore after the granted transaction is completed. If the END_ACQUIRE shortcut is enabled and the CPU has triggered the ACQUIRE task during a granted transaction, only one ACQUIRE request will be served following the END event.

The MAXRX register specifies the maximum number of bytes the SPI slave can receive in one granted transaction. If the SPI slave receives more than MAXRX number of bytes, an OVERFLOW will be indicated in the STATUS register and the incoming bytes will be discarded.

The MAXTX parameter specifies the maximum number of bytes the SPI slave can transmit in one granted transaction. If the SPI slave is forced to transmit more than MAXTX number of bytes, an OVERREAD will be indicated in the STATUS register and the ORC character will be clocked out.

The RXD.AMOUNT and TXD.AMOUNT registers are updated when a granted transaction is completed. The TXD.AMOUNT register indicates how many bytes were read from the TX buffer in the last transaction, that is, ORC (over-read) characters are not included in this number. Similarly, the RXD.AMOUNT register indicates how many bytes were written into the RX buffer in the last transaction.

The ENDRX event is generated when the RX buffer has been filled.

Figure 119: SPI transaction when shortcut between END and ACQUIRE is enabled

6.20.4 Pin configuration

The CSN, SCK, MOSI, and MISO signals associated with the SPI slave are mapped to physical pins according to the configuration specified in the PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If the CONNECT field of any of these registers is set to Disconnected, the associated SPI slave signal will not be connected to any physical pins.

The PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI slave is enabled, and retained only as long as the device is in System ON mode, see [POWER — Power supply](#) on page 48 chapter for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNFG[n] register. PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI slave is disabled.

To secure correct behavior in the SPI slave, the pins used by the SPI slave must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 307 before enabling the SPI slave. This is to secure that the pins used by the SPI slave are driven correctly if the SPI slave itself is temporarily disabled, or if the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the SPI slave is to be recognized by an external SPI master.

The MISO line is set in high impedance as long as the SPI slave is not selected with CSN.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI signal | SPI pin | Direction | Output value | Comment |
|------------|---------------------------|-----------|----------------|--|
| CSN | As specified in PSEL.CSN | Input | Not applicable | |
| SCK | As specified in PSEL.SCK | Input | Not applicable | |
| MOSI | As specified in PSEL.MOSI | Input | Not applicable | |
| MISO | As specified in PSEL.MISO | Input | Not applicable | Emulates that the SPI slave is not selected. |

|---------------------|-----------------------------------|------------------|------|------|-------|
| $t_{SPIS,CSCKIN}$ | SCK input period | .. | .. | .. | ns |
| $t_{SPIS,RFSCCKIN}$ | SCK input rise/fall time | | | 30 | ns |
| $t_{SPIS,WHSCCKIN}$ | SCK input high time | 30 | | | ns |
| $t_{SPIS,WLSCCKIN}$ | SCK input low time | 30 | | | ns |
| $t_{SPIS,SUCSN}$ | CSN to CLK setup time | .. | .. | .. | ns |
| $t_{SPIS,HCSN}$ | CLK to CSN hold time | 2000 | | | ns |
| $t_{SPIS,ASA}$ | CSN to MISO driven | .. | .. | .. | ns |
| $t_{SPIS,ASO}$ | CSN to MISO valid ^a | | | 1000 | ns |
| $t_{SPIS,DISSO}$ | CSN to MISO disabled ^a | | | 68 | ns |
| $t_{SPIS,CWH}$ | CSN inactive time | 300 | | | ns |
| $t_{SPIS,VSO}$ | CLK edge to MISO valid | | | 19 | ns |
| $t_{SPIS,HSD}$ | MISO hold time after CLK edge | 18 ²⁸ | | | ns |
| $t_{SPIS,SUSI}$ | MOSI to CLK edge setup time | 59 | | | ns |
| $t_{SPIS,HSI}$ | CLK edge to MOSI hold time | 20 | | | ns |

²⁶ High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

²⁷ The actual maximum data rate depends on the master's CLK to MISO and MOSI setup and hold timings.

^a At 25pF load, including GPIO capacitance, see GPIO spec.

²⁸ This is to ensure compatibility to SPI masters sampling MISO on the same edge as MOSI is output

Figure 120: SPIS timing diagram

Figure 121: Common SPIM and SPIS timing diagram

6.21 SWI — Software interrupts

A set of interrupts have been reserved for use as software interrupts.

6.21.1 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x40014000 | SWI | SWI0 | Software interrupt 0 | |
| 0x40015000 | SWI | SWI1 | Software interrupt 1 | |
| 0x40016000 | SWI | SWI2 | Software interrupt 2 | |
| 0x40017000 | SWI | SWI3 | Software interrupt 3 | |
| 0x40018000 | SWI | SWI4 | Software interrupt 4 | |
| 0x40019000 | SWI | SWI5 | Software interrupt 5 | |

Table 95: Instances

6.22 TEMP — Temperature sensor

The temperature sensor measures die temperature over the temperature range of the device. Linearity compensation can be implemented if required by the application.

Listed here are the main features for TEMP:

- Temperature range is greater than or equal to operating temperature of the device
- Resolution is 0.25 degrees

TEMP is started by triggering the START task.

When the temperature measurement is completed, a DATARDY event will be generated and the result of the measurement can be read from the TEMP register.

To achieve the measurement accuracy stated in the electrical specification, the crystal oscillator must be selected as the HFCLK source, see [CLOCK — Clock control](#) on page 61 for more information.

When the temperature measurement is completed, TEMP analog electronics power down to save power.

TEMP only supports one-shot operation, meaning that every TEMP measurement has to be explicitly started using the START task.

6.22.1 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--------------------|---------------|
| 0x4000C000 | TEMP | TEMP | Temperature sensor | |

Table 96: Instances

| Register | Offset | Description |
|----------------|--------|--|
| TASKS_START | 0x000 | Start temperature measurement |
| TASKS_STOP | 0x004 | Stop temperature measurement |
| EVENTS_DATARDY | 0x100 | Temperature measurement complete, data ready |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| TEMP | 0x508 | Temperature in °C (0.25° steps) |
| A0 | 0x520 | Slope of 1st piece wise linear function |

| Register | Offset | Description |
|----------|--------|---|
| A1 | 0x524 | Slope of 2nd piece wise linear function |
| A2 | 0x528 | Slope of 3rd piece wise linear function |
| A3 | 0x52C | Slope of 4th piece wise linear function |
| A4 | 0x530 | Slope of 5th piece wise linear function |
| A5 | 0x534 | Slope of 6th piece wise linear function |
| B0 | 0x540 | y-intercept of 1st piece wise linear function |
| B1 | 0x544 | y-intercept of 2nd piece wise linear function |
| B2 | 0x548 | y-intercept of 3rd piece wise linear function |
| B3 | 0x54C | y-intercept of 4th piece wise linear function |
| B4 | 0x550 | y-intercept of 5th piece wise linear function |
| B5 | 0x554 | y-intercept of 6th piece wise linear function |
| T0 | 0x560 | End point of 1st piece wise linear function |
| T1 | 0x564 | End point of 2nd piece wise linear function |
| T2 | 0x568 | End point of 3rd piece wise linear function |
| T3 | 0x56C | End point of 4th piece wise linear function |
| T4 | 0x570 | End point of 5th piece wise linear function |

Table 97: Register overview

6.22.1.1 TASKS_START

Address offset: 0x000

Start temperature measurement

6.23 TWI — I²C compatible two-wire interface

The TWI master is compatible with I²C operating at 100 kHz and 400 kHz.

Figure 122: TWI master's main features

6.23.1 Functional description

This TWI master is not compatible with CBUS. The TWI transmitter and receiver are single buffered.

See, [TWI master's main features](#) on page 327.

A TWI setup comprising one master and three slaves is illustrated in [A typical TWI setup comprising one master and three slaves](#) on page 327. This TWI master is only able to operate as the only master on the TWI bus.

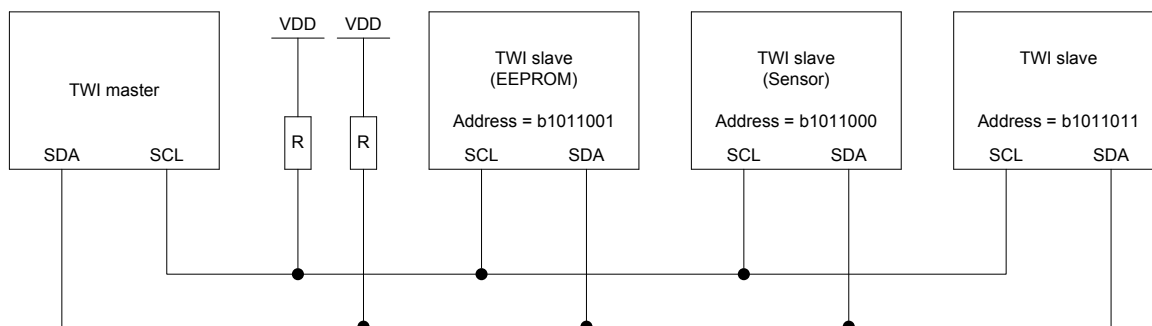

Figure 123: A typical TWI setup comprising one master and three slaves

This TWI master supports clock stretching performed by the slaves. The TWI master is started by triggering the STARTTX or STARTRX tasks, and stopped by triggering the STOP task.

If a NACK is clocked in from the slave, the TWI master will generate an ERROR event.

6.23.2 Master mode pin configuration

The different signals SCL and SDA associated with the TWI master are mapped to physical pins according to the configuration specified in the PSEL.SCL and PSEL.SDA registers respectively.

If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated TWI signal is not connected to any physical pin. The PSEL.SCL and PSEL.SDA registers and their configurations are only used

as long as the TWI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCL and PSEL.SDA must only be configured when the TWI is disabled.

To secure correct signal levels on the pins used by the TWI master when the system is in OFF mode, and when the TWI master is disabled, these pins must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 328.

Only one peripheral can be assigned to drive a particular GPIO pin at a time, failing to do so may result in unpredictable behavior.

| TWI master signal | TWI master pin | Direction | Drive strength | Output value |
|-------------------|--------------------------|-----------|----------------|----------------|
| SCL | As specified in PSEL.SCL | Input | S0D1 | Not applicable |
| SDA | As specified in PSEL.SDA | Input | S0D1 | Not applicable |

Table 98: GPIO configuration

6.23.3 Shared resources

The TWI shares registers and other resources with other peripherals that have the same ID as the TWI.

Therefore, you must disable all peripherals that have the same ID as the TWI before the TWI can be configured and used. Disabling a peripheral that has the same ID as the TWI will not reset any of the registers that are shared with the TWI. It is therefore important to configure all relevant TWI registers explicitly to secure that it operates correctly.

The Instantiation table in [Instantiation](#) on page 18 shows which peripherals have the same ID as the TWI.

6.23.4 Master write sequence

A TWI master write sequence is started by triggering the STARTTX task. After the STARTTX task has been triggered, the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1).

The address must match the address of the slave device that the master wants to write to. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) generated by the slave.

After receiving the ACK bit, the TWI master will clock out the data bytes that are written to the TXD register. Each byte clocked out from the master will be followed by an ACK/NACK bit clocked in from the slave. A TXDSENT event will be generated each time the TWI master has clocked out a TXD byte, and the associated ACK/NACK bit has been clocked in from the slave.

The TWI master transmitter is single buffered, and a second byte can only be written to the TXD register after the previous byte has been clocked out and the ACK/NACK bit clocked in, that is, after the TXDSENT event has been generated.

If the CPU is prevented from writing to TXD when the TWI master is ready to clock out a byte, the TWI master will stretch the clock until the CPU has written a byte to the TXD register.

A typical TWI master write sequence is illustrated in [The TWI master writing data to a slave](#) on page 329. Occurrence 3 in the figure illustrates delayed processing of the TXDSENT event associated with TXD byte 1. In this scenario the TWI master will stretch the clock to prevent writing erroneous data to the slave.

Figure 124: The TWI master writing data to a slave

The TWI master write sequence is stopped when the STOP task is triggered whereupon the TWI master will generate a stop condition on the TWI bus.

6.23.5 Master read sequence

A TWI master read sequence is started by triggering the STARTRX task. After the STARTRX task has been triggered the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE = 0, READ = 1).

The address must match the address of the slave device that the master wants to read from. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK = 1) generated by the slave.

After having sent the ACK bit the TWI slave will send data to the master using the clock generated by the master.

The TWI master will generate a RXDRDY event every time a new byte is received in the RXD register.

After receiving a byte, the TWI master will delay sending the ACK/NACK bit by stretching the clock until the CPU has extracted the received byte, that is, by reading the RXD register.

The TWI master read sequence is stopped by triggering the STOP task. This task must be triggered before the last byte is extracted from RXD to ensure that the TWI master sends a NACK back to the slave before generating the stop condition.

A typical TWI master read sequence is illustrated in [The TWI master reading data from a slave](#) on page 330. Occurrence 3 in this figure illustrates delayed processing of the RXDRDY event associated with RXD byte B. In this scenario the TWI master will stretch the clock to prevent the slave from overwriting the contents of the RXD register.

Figure 125: The TWI master reading data from a slave

6.23.6 Master repeated start sequence

A typical repeated start sequence is one in which the TWI master writes one byte to the slave followed by reading M bytes from the slave. Any combination and number of transmit and receive sequences can be combined in this fashion. Only one shortcut to STOP can be enabled at any given time.

The figure below illustrates a repeated start sequence where the TWI master writes one byte, followed by reading M bytes from the slave without performing a stop in-between.

Figure 126: A repeated start sequence, where the TWI master writes one byte, followed by reading M bytes from the slave without performing a stop in-between

To generate a repeated start after a read sequence, a second start task must be triggered instead of the STOP task, that is, STARTRX or STARTTX. This start task must be triggered before the last byte is extracted from RXD to ensure that the TWI master sends a NACK back to the slave before generating the repeated start condition.

6.23.7 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

6.23.8 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---------------------------|---------------|
| 0x40003000 | TWI | TWI0 | Two-wire interface master | Deprecated |

Table 99: Instances

| Register | Offset | Description |
|------------------|--------|--|
| TASKS_STARTRX | 0x000 | Start TWI receive sequence |
| TASKS_STARTTX | 0x008 | Start TWI transmit sequence |
| TASKS_STOP | 0x014 | Stop TWI transaction |
| TASKS_SUSPEND | 0x01C | Suspend TWI transaction |
| TASKS_RESUME | 0x020 | Resume TWI transaction |
| EVENTS_STOPPED | 0x104 | TWI stopped |
| EVENTS_RXDREADY | 0x108 | TWI RXD byte received |
| EVENTS_TXDSENT | 0x11C | TWI TXD byte sent |
| EVENTS_ERROR | 0x124 | TWI error |
| EVENTS_BB | 0x138 | TWI byte boundary, generated before each byte that is sent or received |
| EVENTS_SUSPENDED | 0x148 | TWI entered the suspended state |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ERRORSRC | 0x4C4 | Error source |
| ENABLE | 0x500 | Enable TWI |
| PSEL_SCL | 0x508 | Pin select for SCL |
| PSEL_SDA | 0x50C | Pin select for SDA |
| RXD | 0x518 | RXD register |
| TXD | 0x51C | TXD register |
| FREQUENCY | 0x524 | TWI frequency. Accuracy depends on the HFCLK source selected. |
| ADDRESS | 0x588 | Address used in the TWI transfer |

Table 100: Register overview

6.23.8.1 TASKS_STARTRX

Address offset: 0x000

Start TWI receive sequence

| Bit number | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

6.23.9 Electrical specification

6.23.9.1 TWI interface electrical specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|------------------------|--|------|------|------|---------------|
| $f_{\text{TWI,SCL}}$ | Bit rates for TWI ²⁹ | 100 | | 400 | kbps |
| $t_{\text{TWI,START}}$ | Time from STARTRX/STARTTX task to transmission started | | 1.5 | | μs |

²⁹ High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see GPIO chapter for more details.

6.23.9.2 Two Wire Interface (TWI) timing specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------|---|-------|------|------|-------|
| t_{TWI,SU_DAT} | Data setup time before positive edge on SCL – all modes | 300 | | | ns |
| t_{TWI,HD_DAT} | Data hold time after negative edge on SCL – all modes | 500 | | | ns |
| $t_{TWI,HD_STA,100kbps}$ | TWI master hold time for START and repeated START condition, 100 kbps | 10000 | | | ns |
| $t_{TWI,HD_STA,250kbps}$ | TWI master hold time for START and repeated START condition, 250kbps | 4000 | | | ns |
| $t_{TWI,HD_STA,400kbps}$ | TWI master hold time for START and repeated START condition, 400 kbps | 2500 | | | ns |
| $t_{TWI,SU_STO,100kbps}$ | TWI master setup time from SCL high to STOP condition, 100 kbps | 5000 | | | ns |
| $t_{TWI,SU_STO,250kbps}$ | TWI master setup time from SCL high to STOP condition, 250 kbps | 2000 | | | ns |
| $t_{TWI,SU_STO,400kbps}$ | TWI master setup time from SCL high to STOP condition, 400 kbps | 1250 | | | ns |
| $t_{TWI,BUF,100kbps}$ | TWI master bus free time between STOP and START conditions, 100 kbps | 5800 | | | ns |
| $t_{TWI,BUF,250kbps}$ | TWI master bus free time between STOP and START conditions, 250 kbps | 2700 | | | ns |
| $t_{TWI,BUF,400kbps}$ | TWI master bus free time between STOP and START conditions, 400 kbps | 2100 | | | ns |

Figure 127: TWI timing diagram, 1 byte transaction

6.24 TIMER — Timer/counter

The TIMER can operate in two modes: timer and counter.

Figure 128: Block schematic for timer/counter

The timer/counter runs on the high-frequency clock source (HFCLK) and includes a four-bit (1/2X) prescaler that can divide the timer input clock from the HFCLK controller. Clock source selection between PCLK16M and PCLK1M is automatic according to TIMER base frequency set by the prescaler. The TIMER base frequency is always given as 16 MHz divided by the prescaler value.

The PPI system allows a TIMER event to trigger a task of any other system peripheral of the device. The PPI system also enables the TIMER task/event features to generate periodic output and PWM signals to any GPIO. The number of input/outputs used at the same time is limited by the number of GPIOTE channels.

The TIMER can operate in two modes, Timer mode and Counter mode. In both modes, the TIMER is started by triggering the START task, and stopped by triggering the STOP task. After the timer is stopped the timer can resume timing/counting by triggering the START task again. When timing/counting is resumed, the timer will continue from the value it had prior to being stopped.

In Timer mode, the TIMER's internal Counter register is incremented by one for every tick of the timer frequency f_{TIMER} as illustrated in [Block schematic for timer/counter](#) on page 340. The timer frequency is derived from PCLK16M as shown below, using the values specified in the PRESCALER register:

$$f_{\text{TIMER}} = 16 \text{ MHz} / (2^{\text{PRESCALER}})$$

When $f_{\text{TIMER}} \leq 1 \text{ MHz}$ the TIMER will use PCLK1M instead of PCLK16M for reduced power consumption.

In counter mode, the TIMER's internal Counter register is incremented by one each time the COUNT task is triggered, that is, the timer frequency and the prescaler are not utilized in counter mode. Similarly, the COUNT task has no effect in Timer mode.

The TIMER's maximum value is configured by changing the bit-width of the timer in the [BITMODE](#) on page 345 register.

[PRESCALER](#) on page 345 and the [BITMODE](#) on page 345 must only be updated when the timer is stopped. If these registers are updated while the TIMER is started then this may result in unpredictable behavior.

When the timer is incremented beyond its maximum value the Counter register will overflow and the TIMER will automatically start over from zero.

The Counter register can be cleared, that is, its internal value set to zero explicitly, by triggering the CLEAR task.

The TIMER implements multiple capture/compare registers.

Independent of prescaler setting the accuracy of the TIMER is equivalent to one tick of the timer frequency f_{TIMER} as illustrated in [Block schematic for timer/counter](#) on page 340.

6.24.1 Capture

The TIMER implements one capture task for every available capture/compare register.

Every time the CAPTURE[n] task is triggered, the Counter value is copied to the CC[n] register.

6.24.2 Compare

The TIMER implements one COMPARE event for every available capture/compare register.

A COMPARE event is generated when the Counter is incremented and then becomes equal to the value specified in one of the capture compare registers. When the Counter value becomes equal to the value specified in a capture compare register CC[n], the corresponding compare event COMPARE[n] is generated.

BITMODE on page 345 specifies how many bits of the Counter register and the capture/compare register that are used when the comparison is performed. Other bits will be ignored.

6.24.3 Task delays

After the TIMER is started, the CLEAR task, COUNT task and the STOP task will guarantee to take effect within one clock cycle of the PCLK16M.

6.24.4 Task priority

If the START task and the STOP task are triggered at the same time, that is, within the same period of PCLK16M, the STOP task will be prioritized.

6.24.5 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-------------|---|
| 0x40008000 | TIMER | TIMER0 | Timer 0 | This timer instance has 4 CC registers (CC[0..3]) |
| 0x40009000 | TIMER | TIMER1 | Timer 1 | This timer instance has 4 CC registers (CC[0..3]) |
| 0x4000A000 | TIMER | TIMER2 | Timer 2 | This timer instance has 4 CC registers (CC[0..3]) |

6.25 TWIM — I²C compatible two-wire interface master with EasyDMA

TWI master with EasyDMA (TWIM) is a two-wire half-duplex master which can communicate with multiple slave devices connected to the same bus

Listed here are the main features for TWIM:

- I²C compatible
- Supported baud rates: 100, 250, 400 kbps
- Support for clock stretching (non I²C compliant)
- EasyDMA

The two-wire interface can communicate with a bi-directional wired-AND bus with two lines (SCL, SDA). The protocol makes it possible to interconnect up to 127 individually addressable devices. TWIM is not compatible with CBUS.

The GPIOs used for each two-wire interface line can be chosen from any GPIO on the device and are independently configurable. This enables great flexibility in device pinout and efficient use of board space and signal routing.

Figure 129: TWI master with EasyDMA

A typical TWI setup consists of one master and one or more slaves. For an example, see [A typical TWI setup comprising one master and three slaves](#) on page 347. This TWIM is only able to operate as a single master on the TWI bus. Multi-master bus configuration is not supported.

Figure 130: A typical TWI setup comprising one master and three slaves

This TWI master supports clock stretching performed by the slaves. Note that the SCK pulse following a stretched clock cycle may be shorter than specified by the I2C specification.

The TWI master is started by triggering the STARTTX or STARTRX tasks, and stopped by triggering the STOP task. The TWI master will generate a STOPPED event when it has stopped following a STOP task. The TWI master cannot get stopped while it is suspended, so the STOP task has to be issued after the TWI master has been resumed.

After the TWI master is started, the STARTTX task or the STARTRX task should not be triggered again before the TWI master has stopped, i.e. following a LASTRX, LASTTX or STOPPED event.

If a NACK is clocked in from the slave, the TWI master will generate an ERROR event.

6.25.1 EasyDMA

The TWIM implements EasyDMA for accessing RAM without CPU involvement.

The TWIM peripheral implements the following EasyDMA channels:

| Channel | Type | Register Cluster |
|---------|--------|------------------|
| TXD | READER | TXD |
| RXD | WRITER | RXD |

Table 103: TWIM EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 35.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next RX/TX transmission immediately after having received the RXSTARTED/TXSTARTED event.

The STOPPED event indicates that EasyDMA has finished accessing the buffer in RAM.

6.25.2 Master write sequence

A TWI master write sequence is started by triggering the STARTTX task. After the STARTTX task has been triggered, the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1).

The address must match the address of the slave device that the master wants to write to. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) generated by the slave.

After receiving the ACK bit, the TWI master will clock out the data bytes found in the transmit buffer located in RAM at the address specified in the TXD.PTR register. Each byte clocked out from the master will be followed by an ACK/NACK bit clocked in from the slave.

A typical TWI master write sequence is illustrated in [TWI master writing data to a slave](#) on page 348.

Occurrence 2 in the figure illustrates clock stretching performed by the TWI master following a SUSPEND task.

A SUSPENDED event indicates that the SUSPEND task has taken effect; this event can be used to synchronize the software.

Figure 131: TWI master writing data to a slave

The TWI master will generate a LASTTX event when it starts to transmit the last byte, this is illustrated in [TWI master writing data to a slave](#) on page 348

The TWI master is stopped by triggering the STOP task, this task should be triggered during the transmission of the last byte to secure that the TWI will stop as fast as possible after sending the last byte. It is safe to use the shortcut between LASTTX and STOP to accomplish this.

Note that the TWI master does not stop by itself when the whole RAM buffer has been sent, or when an error occurs. The STOP task must be issued, through the use of a local or PPI shortcut, or in software as part of the error handler.

The TWI master cannot get stopped while it is suspended, so the STOP task has to be issued after the TWI master has been resumed.

6.25.3 Master read sequence

A TWI master read sequence is started by triggering the STARTRX task. After the STARTRX task has been triggered the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE = 0, READ = 1). The address must match the address of the slave device that the master wants to read from. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK = 1) generated by the slave.

After having sent the ACK bit the TWI slave will send data to the master using the clock generated by the master.

Data received will be stored in RAM at the address specified in the RXD.PTR register. The TWI master will generate an ACK after all but the last byte received from the slave. The TWI master will generate a NACK after the last byte received to indicate that the read sequence shall stop.

A typical TWI master read sequence is illustrated in [The TWI master reading data from a slave](#) on page 350. Occurrence 2 in the figure illustrates clock stretching performed by the TWI master following a SUSPEND task.

A SUSPENDED event indicates that the SUSPEND task has taken effect; this event can be used to synchronize the software.

The TWI master will generate a LASTRX event when it is ready to receive the last byte, this is illustrated in [The TWI master reading data from a slave](#) on page 350. If RXD.MAXCNT > 1 the LASTRX event is generated after sending the ACK of the previously received byte. If RXD.MAXCNT = 1 the LASTRX event is generated after receiving the ACK following the address and READ bit.

The TWI master is stopped by triggering the STOP task, this task must be triggered before the NACK bit is supposed to be transmitted. The STOP task can be triggered at any time during the reception of the last byte. It is safe to use the shortcut between LASTRX and STOP to accomplish this.

Note that the TWI master does not stop by itself when the RAM buffer is full, or when an error occurs. The STOP task must be issued, through the use of a local or PPI shortcut, or in software as part of the error handler.

The TWI master cannot get stopped while it is suspended, so the STOP task has to be issued after the TWI master has been resumed.

Figure 132: The TWI master reading data from a slave

6.25.4 Master repeated start sequence

A typical repeated start sequence is one in which the TWI master writes two bytes to the slave followed by reading four bytes from the slave. This example uses shortcuts to perform the simplest type of repeated start sequence, i.e. one write followed by one read. The same approach can be used to perform a repeated start sequence where the sequence is read followed by write.

The figure [A repeated start sequence, where the TWI master writes two bytes followed by reading 4 bytes from the slave](#) on page 350 illustrates this:

Figure 133: A repeated start sequence, where the TWI master writes two bytes followed by reading 4 bytes from the slave

If a more complex repeated start sequence is needed and the TWI firmware drive is serviced in a low priority interrupt it may be necessary to use the SUSPEND task and SUSPENDED event to guarantee that the correct tasks are generated at the correct time. This is illustrated in [A double repeated start sequence using the SUSPEND task to secure safe operation in low priority interrupts](#) on page 351.

Figure 134: A double repeated start sequence using the *SUSPEND* task to secure safe operation in low priority interrupts

6.25.5 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

6.25.6 Master mode pin configuration

The SCL and SDA signals associated with the TWI master are mapped to physical pins according to the configuration specified in the PSEL.SCL and PSEL.SDA registers respectively.

The PSEL.SCL and PSEL.SDA registers and their configurations are only used as long as the TWI master is enabled, and retained only as long as the device is in ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register. PSEL.SCL, PSEL.SDA must only be configured when the TWI master is disabled.

To secure correct signal levels on the pins used by the TWI master when the system is in OFF mode, and when the TWI master is disabled, these pins must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 351.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| TWI master signal | TWI master pin | Direction | Output value | Drive strength |
|-------------------|--------------------------|-----------|----------------|----------------|
| SCL | As specified in PSEL.SCL | Input | Not applicable | S0D1 |
| SDA | As specified in PSEL.SDA | Input | Not applicable | S0D1 |

Table 104: GPIO configuration before enabling peripheral

6.25.7 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---------------------------|---------------|
| 0x40003000 | TWIM | TWIM0 | Two-wire interface master | |

Table 105: Instances

| Register | Offset | Description |
|------------------|--------|---|
| TASKS_STARTRX | 0x000 | Start TWI receive sequence |
| TASKS_STARTTX | 0x008 | Start TWI transmit sequence |
| TASKS_STOP | 0x014 | Stop TWI transaction. Must be issued while the TWI master is not suspended. |
| TASKS_SUSPEND | 0x01C | Suspend TWI transaction |
| TASKS_RESUME | 0x020 | Resume TWI transaction |
| EVENTS_STOPPED | 0x104 | TWI stopped |
| EVENTS_ERROR | 0x124 | TWI error |
| EVENTS_SUSPENDED | 0x148 | Last byte has been sent out after the SUSPEND task has been issued, TWI traffic is now suspended. |
| EVENTS_RXSTARTED | 0x14C | Receive sequence started |
| EVENTS_TXSTARTED | 0x150 | Transmit sequence started |
| EVENTS_LASTRX | 0x15C | Byte boundary, starting to receive the last byte |
| EVENTS_LASTTX | 0x160 | Byte boundary, starting to transmit the last byte |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTEN | 0x300 | Enable or disable interrupt |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ERRORSRC | 0x4C4 | Error source |
| ENABLE | 0x500 | Enable TWIM |
| PSEL.SCL | 0x508 | Pin select for SCL signal |
| PSEL.SDA | 0x50C | Pin select for SDA signal |
| FREQUENCY | 0x524 | TWI frequency. Accuracy depends on the HFCLK source selected. |
| RXD.PTR | 0x534 | Data pointer |
| RXD.MAXCNT | 0x538 | Maximum number of bytes in receive buffer |
| RXD.AMOUNT | 0x53C | Number of bytes transferred in the last transaction |
| RXD.LIST | 0x540 | EasyDMA list type |
| TXD.PTR | 0x544 | Data pointer |
| TXD.MAXCNT | 0x548 | Maximum number of bytes in transmit buffer |
| TXD.AMOUNT | 0x54C | Number of bytes transferred in the last transaction |
| TXD.LIST | 0x550 | EasyDMA list type |
| ADDRESS | 0x588 | Address used in the TWI transfer |

|------------------|--|------|------|------|---------|
| $f_{TWIM,SCL}$ | Bit rates for TWIM ³⁰ | 100 | | 400 | kbps |
| $t_{TWIM,START}$ | Time from STARTRX/STARTTX task to transmission started | .. | .. | .. | μ s |

6.25.8.2 Two Wire Interface Master (TWIM) timing specifications

| Symbol | Description | Min. | Typ. | Max. | Units |
|---------------------------|--|-------|------|------|-------|
| $t_{TWIM,SU,DAT}$ | Data setup time before positive edge on SCL – all modes | 300 | | | ns |
| $t_{TWIM,HD,DAT}$ | Data hold time after negative edge on SCL – all modes | 500 | | | ns |
| $t_{TWIM,HD,STA,100kbps}$ | TWIM master hold time for START and repeated START condition, 100 kbps | 10000 | | | ns |
| $t_{TWIM,HD,STA,250kbps}$ | TWIM master hold time for START and repeated START condition, 250kbps | 4000 | | | ns |
| $t_{TWIM,HD,STA,400kbps}$ | TWIM master hold time for START and repeated START condition, 400 kbps | 2500 | | | ns |
| $t_{TWIM,SU,STO,100kbps}$ | TWIM master setup time from SCL high to STOP condition, 100 kbps | 5000 | | | ns |
| $t_{TWIM,SU,STO,250kbps}$ | TWIM master setup time from SCL high to STOP condition, 250 kbps | 2000 | | | ns |
| $t_{TWIM,SU,STO,400kbps}$ | TWIM master setup time from SCL high to STOP condition, 400 kbps | 1250 | | | ns |
| $t_{TWIM,BUF,100kbps}$ | TWIM master bus free time between STOP and START conditions, 100 kbps | 5800 | | | ns |
| $t_{TWIM,BUF,250kbps}$ | TWIM master bus free time between STOP and START conditions, 250 kbps | 2700 | | | ns |
| $t_{TWIM,BUF,400kbps}$ | TWIM master bus free time between STOP and START conditions, 400 kbps | 2100 | | | ns |

³⁰ High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Figure 135: TWIM timing diagram, 1 byte transaction

6.25.9 Pullup resistor

Figure 136: Recommended TWIM pullup value vs. line capacitance

- The I2C specification allows a line capacitance of 400 pF at most.
- The value of internal pullup resistor (R_{PU}) for nRF52811 can be found in [GPIO — General purpose input/output](#) on page 115.

6.26 TWIS — I²C compatible two-wire interface slave with EasyDMA

TWI slave with EasyDMA (TWIS) is compatible with I²C operating at 100 kHz and 400 kHz. The TWI transmitter and receiver implement EasyDMA.

Figure 137: TWI slave with EasyDMA

A typical TWI setup consists of one master and one or more slaves. For an example, see [A typical TWI setup comprising one master and three slaves](#) on page 364. TWIS is only able to operate with a single master on the TWI bus.

Figure 138: A typical TWI setup comprising one master and three slaves

The TWI slave state machine is illustrated in [TWI slave state machine](#) on page 365 and [TWI slave state machine symbols](#) on page 365 is explaining the different symbols used in the state machine.

Figure 139: TWI slave state machine

| Symbol | Type | Description |
|------------------|--------------|---|
| ENABLE | Register | The TWI slave has been enabled via the <code>ENABLE</code> register |
| PREPARETX | Task | The <code>TASKS_PREPARETX</code> task has been triggered |
| STOP | Task | The <code>TASKS_STOP</code> task has been triggered |
| PREPARERX | Task | The <code>TASKS_PREPARERX</code> task has been triggered |
| STOPPED | Event | The <code>EVENTS_STOPPED</code> event was generated |
| RXSTARTED | Event | The <code>EVENTS_RXSTARTED</code> event was generated |
| TXSTARTED | Event | The <code>EVENTS_TXSTARTED</code> event was generated |
| TX prepared | Internal | Internal flag indicating that a <code>TASKS_PREPARETX</code> task has been triggered. This flag is not visible to the user. |
| RX prepared | Internal | Internal flag indicating that a <code>TASKS_PREPARERX</code> task has been triggered. This flag is not visible to the user. |
| Unprepare TX | Internal | Clears the internal 'TX prepared' flag until next <code>TASKS_PREPARETX</code> task. |
| Unprepare RX | Internal | Clears the internal 'RX prepared' flag until next <code>TASKS_PREPARERX</code> task. |
| Stop sequence | TWI protocol | A TWI stop sequence was detected |
| Restart sequence | TWI protocol | A TWI restart sequence was detected |

Table 107: TWI slave state machine symbols

The TWI slave supports clock stretching performed by the master.

The TWI slave operates in a low power mode while waiting for a TWI master to initiate a transfer. As long as the TWI slave is not addressed, it will remain in this low power mode.

To secure correct behaviour of the TWI slave, PSEL.SCL, PSEL.SDA, CONFIG and the ADDRESS[n] registers, must be configured prior to enabling the TWI slave through the ENABLE register. Similarly, changing these settings must be performed while the TWI slave is disabled. Failing to do so may result in unpredictable behaviour.

6.26.1 EasyDMA

The TWIS implements EasyDMA for accessing RAM without CPU involvement.

The TWIS peripheral implements the following EasyDMA channels:

| Channel | Type | Register Cluster |
|---------|--------|------------------|
| TXD | READER | TXD |
| RXD | WRITER | RXD |

Table 108: TWIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 35.

The STOPPED event indicates that EasyDMA has finished accessing the buffer in RAM.

6.26.2 TWI slave responding to a read command

Before the TWI slave can respond to a read command the TWI slave must be configured correctly and enabled via the ENABLE register. When enabled the TWI slave will be in its IDLE state where it will consume I_{IDLE} .

A read command is started when the TWI master generates a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE=0, READ=1). The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) response from the TWI slave.

The TWI slave is able to listen for up to two addresses at the same time. Which addresses to listen for is configured in the ADDRESS registers and the CONFIG register.

The TWI slave will only acknowledge (ACK) the read command if the address presented by the master matches one of the addresses the slave is configured to listen for. The TWI slave will generate a READ event when it acknowledges the read command.

The TWI slave is only able to detect a read command from the IDLE state.

The TWI slave will set an internal 'TX prepared' flag when the PREPARETX task is triggered.

When the read command is received the TWI slave will enter the TX state if the internal 'TX prepared' flag is set.

If the internal 'TX prepared' flag is not set when the read command is received, the TWI slave will stretch the master's clock until the PREPARETX task is triggered and the internal 'TX prepared' flag is set.

The TWI slave will generate the TXSTARTED event and clear the 'TX prepared' flag ('unprepare TX') when it enters the TX state. In this state the TWI slave will send the data bytes found in the transmit buffer to the master using the master's clock. The TWI slave will consume I_{TX} in this mode.

The TWI slave will go back to the IDLE state if the TWI slave receives a restart command when it is in the TX state.

The TWI slave is stopped when it receives the stop condition from the TWI master. A STOPPED event will be generated when the transaction has stopped. The TWI slave will clear the 'TX prepared' flag ('unprepare TX') and go back to the IDLE state when it has stopped.

The transmit buffer is located in RAM at the address specified in the TXD.PTR register. The TWI slave will only be able to send TXD.MAXCNT bytes from the transmit buffer for each transaction. If the TWI master forces the slave to send more than TXD.MAXCNT bytes, the slave will send the byte specified in the ORC register to the master instead. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers, see TXD.PTR etc., are latched when the TXSTARTED event is generated.

The TWI slave can be forced to stop by triggering the STOP task. A STOPPED event will be generated when the TWI slave has stopped. The TWI slave will clear the 'TX prepared' flag and go back to the IDLE state when it has stopped, see also [Terminating an ongoing TWI transaction](#) on page 369.

Each byte sent from the slave will be followed by an ACK/NACK bit sent from the master. The TWI master will generate a NACK following the last byte that it wants to receive to tell the slave to release the bus so that the TWI master can generate the stop condition. The TXD.AMOUNT register can be queried after a transaction to see how many bytes were sent.

A typical TWI slave read command response is illustrated in [The TWI slave responding to a read command](#) on page 367. Occurrence 2 in the figure illustrates clock stretching performed by the TWI slave following a SUSPEND task.

Figure 140: The TWI slave responding to a read command

6.26.3 TWI slave responding to a write command

Before the TWI slave can respond to a write command the TWI slave must be configured correctly and enabled via the ENABLE register. When enabled the TWI slave will be in its IDLE state where it will consume I_{IDLE} .

A write command is started when the TWI master generates a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1). The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) response from the slave.

The TWI slave is able to listen for up to two addresses at the same time. Which addresses to listen for is configured in the ADDRESS registers and the CONFIG register.

The TWI slave will only acknowledge (ACK) the write command if the address presented by the master matches one of the addresses the slave is configured to listen for. The TWI slave will generate a WRITE event if it acknowledges the write command.

The TWI slave is only able to detect a write command from the IDLE state.

The TWI slave will set an internal 'RX prepared' flag when the PREPARERX task is triggered.

When the write command is received the TWI slave will enter the RX state if the internal 'RX prepared' flag is set.

If the internal 'RX prepared' flag is not set when the write command is received, the TWI slave will stretch the master's clock until the PREPARERX task is triggered and the internal 'RX prepared' flag is set.

The TWI slave will generate the RXSTARTED event and clear the internal 'RX prepared' flag ('unprepare RX') when it enters the RX state. In this state the TWI slave will be able to receive the bytes sent by the TWI master. The TWI slave will consume I_{RX} in this mode.

The TWI slave will go back to the IDLE state if the TWI slave receives a restart command when it is in the RX state.

The TWI slave is stopped when it receives the stop condition from the TWI master. A STOPPED event will be generated when the transaction has stopped. The TWI slave will clear the internal 'RX prepared' flag ('unprepare RX') and go back to the IDLE state when it has stopped.

The receive buffer is located in RAM at the address specified in the TXD.PTR register. The TWI slave will only be able to receive as many bytes as specified in the RXD.MAXCNT register. If the TWI master tries to send more bytes to the slave than the slave is able to receive, these bytes will be discarded and the bytes will be NACKed by the slave. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers, see RXD.PTR etc., are latched when the RXSTARTED event is generated.

The TWI slave can be forced to stop by triggering the STOP task. A STOPPED event will be generated when the TWI slave has stopped. The TWI slave will clear the internal 'RX prepared' flag and go back to the IDLE state when it has stopped, see also [Terminating an ongoing TWI transaction](#) on page 369.

The TWI slave will generate an ACK after every byte received from the master. The RXD.AMOUNT register can be queried after a transaction to see how many bytes were received.

A typical TWI slave write command response is illustrated in [The TWI slave responding to a write command](#) on page 368. Occurrence 2 in the figure illustrates clock stretching performed by the TWI slave following a SUSPEND task.

Figure 141: The TWI slave responding to a write command

6.26.4 Master repeated start sequence

An example of a repeated start sequence is one in which the TWI master writes two bytes to the slave followed by reading four bytes from the slave.

This is illustrated in [A repeated start sequence, where the TWI master writes two bytes followed by reading four bytes from the slave](#) on page 369.

It is here assumed that the receiver does not know in advance what the master wants to read, and that this information is provided in the first two bytes received in the write part of the repeated start sequence. To guarantee that the CPU is able to process the received data before the TWI slave starts to reply to the read command, the SUSPEND task is triggered via a shortcut from the READ event generated when the read command is received. When the CPU has processed the incoming data and prepared the correct data response, the CPU will resume the transaction by triggering the RESUME task.

Figure 142: A repeated start sequence, where the TWI master writes two bytes followed by reading four bytes from the slave

6.26.5 Terminating an ongoing TWI transaction

In some situations, e.g. if the external TWI master is not responding correctly, it may be required to terminate an ongoing transaction.

This can be achieved by triggering the STOP task. In this situation a STOPPED event will be generated when the TWI has stopped independent of whether or not a STOP condition has been generated on the TWI bus. The TWI slave will release the bus when it has stopped and go back to its IDLE state.

6.26.6 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

6.26.7 Slave mode pin configuration

The SCL and SDA signals associated with the TWI slave are mapped to physical pins according to the configuration specified in the PSEL.SCL and PSEL.SDA registers respectively.

The PSEL.SCL and PSEL.SDA registers and their configurations are only used as long as the TWI slave is enabled, and retained only as long as the device is in ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register. PSEL.SCL and PSEL.SDA must only be configured when the TWI slave is disabled.

To secure correct signal levels on the pins used by the TWI slave when the system is in OFF mode, and when the TWI slave is disabled, these pins must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 370.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| TWI slave signal | TWI slave pin | Direction | Output value | Drive strength |
|------------------|--------------------------|-----------|----------------|----------------|
| SCL | As specified in PSEL.SCL | Input | Not applicable | S0D1 |
| SDA | As specified in PSEL.SDA | Input | Not applicable | S0D1 |

Table 109: GPIO configuration before enabling peripheral

6.26.8 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--------------------------|---------------|
| 0x40003000 | TWIS | TWISO | Two-wire interface slave | |

Table 110: Instances

| Register | Offset | Description |
|------------------|--------|---|
| TASKS_STOP | 0x014 | Stop TWI transaction |
| TASKS_SUSPEND | 0x01C | Suspend TWI transaction |
| TASKS_RESUME | 0x020 | Resume TWI transaction |
| TASKS_PREPARERX | 0x030 | Prepare the TWI slave to respond to a write command |
| TASKS_PREPARETX | 0x034 | Prepare the TWI slave to respond to a read command |
| EVENTS_STOPPED | 0x104 | TWI stopped |
| EVENTS_ERROR | 0x124 | TWI error |
| EVENTS_RXSTARTED | 0x14C | Receive sequence started |
| EVENTS_TXSTARTED | 0x150 | Transmit sequence started |
| EVENTS_WRITE | 0x164 | Write command received |
| EVENTS_READ | 0x168 | Read command received |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTEN | 0x300 | Enable or disable interrupt |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ERRORSRC | 0x4D0 | Error source |
| MATCH | 0x4D4 | Status register indicating which address had a match |
| ENABLE | 0x500 | Enable TWIS |
| PSEL.SCL | 0x508 | Pin select for SCL signal |
| PSEL.SDA | 0x50C | Pin select for SDA signal |
| RXD.PTR | 0x534 | RXD Data pointer |
| RXD.MAXCNT | 0x538 | Maximum number of bytes in RXD buffer |
| RXD.AMOUNT | 0x53C | Number of bytes transferred in the last RXD transaction |
| RXD.LIST | 0x540 | EasyDMA list type |
| TXD.PTR | 0x544 | TXD Data pointer |
| TXD.MAXCNT | 0x548 | Maximum number of bytes in TXD buffer |
| TXD.AMOUNT | 0x54C | Number of bytes transferred in the last TXD transaction |
| TXD.LIST | 0x550 | EasyDMA list type |
| ADDRESS[0] | 0x588 | TWI slave address 0 |
| ADDRESS[1] | 0x58C | TWI slave address 1 |
| CONFIG | 0x594 | Configuration register for the address match mechanism |
| ORC | 0x5C0 | Over-read character. Character sent out in case of an over-read of the transmit buffer. |

Table 111: Register overview

6.26.8.1 TASKS_STOP

Address offset: 0x014

Stop TWI transaction

6.27 UART — Universal asynchronous receiver/transmitter

Figure 144: UART configuration

³¹ High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see GPIO chapter for more details.

6.27.1 Functional description

Listed here are the main features of UART.

The UART implements support for the following features:

- Full-duplex operation
- Automatic flow control
- Parity checking and generation for the 9th data bit

As illustrated in [UART configuration](#) on page 380, the UART uses the TXD and RXD registers directly to transmit and receive data. The UART uses one stop bit.

Note: External crystal oscillator must be enabled to obtain sufficient clock accuracy for stable communication. See [CLOCK — Clock control](#) on page 61 for more information.

6.27.2 Pin configuration

The different signals RXD, CTS (Clear To Send, active low), RTS (Request To Send, active low), and TXD associated with the UART are mapped to physical pins according to the configuration specified in the PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers respectively.

If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated UART signal will not be connected to any physical pin. The PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers and their configurations are only used as long as the UART is enabled, and retained only for the duration the device is in ON mode. PSEL.RXD, PSEL.CTS, PSEL.RTS and PSEL.TXD must only be configured when the UART is disabled.

To secure correct signal levels on the pins by the UART when the system is in OFF mode, the pins must be configured in the GPIO peripheral as described in [Pin configuration](#) on page 381.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| UART pin | Direction | Output value |
|----------|-----------|----------------|
| RXD | Input | Not applicable |
| CTS | Input | Not applicable |
| RTS | Output | 1 |
| TXD | Output | 1 |

Table 112: GPIO configuration

6.27.3 Shared resources

The UART shares registers and other resources with other peripherals that have the same ID as the UART.

Therefore, you must disable all peripherals that have the same ID as the UART before the UART can be configured and used. Disabling a peripheral that has the same ID as the UART will not reset any of the registers that are shared with the UART. It is therefore important to configure all relevant UART registers explicitly to ensure that it operates correctly.

See the Instantiation table in [Instantiation](#) on page 18 for details on peripherals and their IDs.

6.27.4 Transmission

A UART transmission sequence is started by triggering the STARTTX task.

Bytes are transmitted by writing to the TXD register. When a byte has been successfully transmitted the UART will generate a TXDRDY event after which a new byte can be written to the TXD register. A UART transmission sequence is stopped immediately by triggering the STOPTH task.

If flow control is enabled a transmission will be automatically suspended when CTS is deactivated and resumed when CTS is activated again, as illustrated in [UART transmission](#) on page 382. A byte that is in transmission when CTS is deactivated will be fully transmitted before the transmission is suspended. For more information, see [Suspending the UART](#) on page 383.

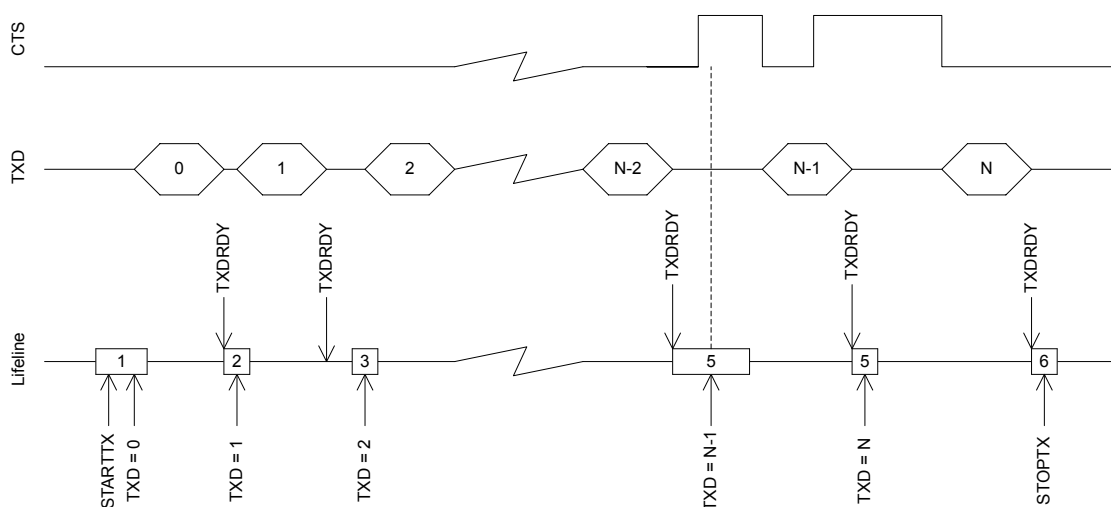

Figure 145: UART transmission

6.27.5 Reception

A UART reception sequence is started by triggering the STARTRX task.

The UART receiver chain implements a FIFO capable of storing six incoming RXD bytes before data is overwritten. Bytes are extracted from this FIFO by reading the RXD register. When a byte is extracted from the FIFO a new byte pending in the FIFO will be moved to the RXD register. The UART will generate an RXDRDY event every time a new byte is moved to the RXD register.

When flow control is enabled, the UART will deactivate the RTS signal when there is only space for four more bytes in the receiver FIFO. The counterpart transmitter is therefore able to send up to four bytes after the RTS signal is deactivated before data is being overwritten. To prevent overwriting data in the FIFO, the counterpart UART transmitter must therefore make sure to stop transmitting data within four bytes after the RTS line is deactivated.

The RTS signal will first be activated again when the FIFO has been emptied, that is, when all bytes in the FIFO have been read by the CPU, see [UART reception](#) on page 383.

The RTS signal will also be deactivated when the receiver is stopped through the STOPRX task as illustrated in [UART reception](#) on page 383. The UART is able to receive four to five additional bytes if they are sent in succession immediately after the RTS signal has been deactivated. This is possible because the UART is, even after the STOPRX task is triggered, able to receive bytes for an extended period of time dependent on the configured baud rate. The UART will generate a receiver timeout event (RXTO) when this period has elapsed.

To prevent loss of incoming data the RXD register must only be read one time following every RXDRDY event.

To secure that the CPU can detect all incoming RXDRDY events through the RXDRDY event register, the RXDRDY event register must be cleared before the RXD register is read. The reason for this is that the UART is allowed to write a new byte to the RXD register, and therefore can also generate a new event, immediately after the RXD register is read (emptied) by the CPU.

Figure 146: UART reception

As indicated in occurrence 2 in the figure, the RXDRDY event associated with byte B is generated first after byte A has been extracted from RXD.

6.27.6 Suspending the UART

The UART can be suspended by triggering the SUSPEND task.

SUSPEND will affect both the UART receiver and the UART transmitter, i.e. the transmitter will stop transmitting and the receiver will stop receiving. UART transmission and reception can be resumed, after being suspended, by triggering STARTTX and STARTRX respectively.

Following a SUSPEND task, an ongoing TXD byte transmission will be completed before the UART is suspended.

When the SUSPEND task is triggered, the UART receiver will behave in the same way as it does when the STOPRX task is triggered.

6.27.7 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. Effectively, a framing error is always generated before a break condition occurs.

6.27.8 Using the UART without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are kept active all the time.

6.27.9 Parity and stop bit configuration

Automatic even parity generation for both transmission and reception can be configured using the register CONFIG on page 392. See the register description for details.

The amount of stop bits can also be configured through the register CONFIG on page 392.

6.27.10 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|---|---------------|
| 0x40002000 | UART | UART0 | Universal asynchronous receiver/transmitter | Deprecated |

Table 113: Instances

| Register | Offset | Description |
|---------------|--------|---|
| TASKS_STARTRX | 0x000 | Start UART receiver |
| TASKS_STOPRX | 0x004 | Stop UART receiver |
| TASKS_STARTTX | 0x008 | Start UART transmitter |
| TASKS_STOPTX | 0x00C | Stop UART transmitter |
| TASKS_SUSPEND | 0x01C | Suspend UART |
| EVENTS_CTS | 0x100 | CTS is activated (set low). Clear To Send. |
| EVENTS_NCTS | 0x104 | CTS is deactivated (set high). Not Clear To Send. |
| EVENTS_RXDRDY | 0x108 | Data received in RXD |
| EVENTS_TXDRDY | 0x11C | Data sent from TXD |
| EVENTS_ERROR | 0x124 | Error detected |
| EVENTS_RXTO | 0x144 | Receiver timeout |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |
| ERRORSRC | 0x480 | Error source |
| ENABLE | 0x500 | Enable UART |
| PSEL.RTS | 0x508 | Pin select for RTS |
| PSEL.TXD | 0x50C | Pin select for TXD |
| PSEL.CTS | 0x510 | Pin select for CTS |
| PSEL.RXD | 0x514 | Pin select for RXD |
| RXD | 0x518 | RXD register |
| TXD | 0x51C | TXD register |
| BAUDRATE | 0x524 | Baud rate. Accuracy depends on the HFCLK source selected. |
| CONFIG | 0x56C | Configuration of parity and hardware flow control |

6.28 UARTE — Universal asynchronous receiver/transmitter with EasyDMA

The Universal asynchronous receiver/transmitter with EasyDMA (UARTE) offers fast, full-duplex, asynchronous serial communication with built-in flow control (CTS, RTS) support in hardware at a rate up to 1 Mbps, and EasyDMA data transfer from/to RAM.

Listed here are the main features for UARTE:

- Full-duplex operation
- Automatic hardware flow control
- Optional even parity bit checking and generation
- EasyDMA
- Up to 1 Mbps baudrate
- Return to IDLE between transactions supported (when using HW flow control)
- One or two stop bit
- Least significant bit (LSB) first

³² High baud rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Figure 147: UARTE configuration

The GPIOs used for each UART interface can be chosen from any GPIO on the device and are independently configurable. This enables great flexibility in device pinout and efficient use of board space and signal routing.

Note: External crystal oscillator must be enabled to obtain sufficient clock accuracy for stable communication. See [CLOCK — Clock control](#) on page 61 for more information.

6.28.1 EasyDMA

The UARTE implements EasyDMA for reading and writing to and from the RAM.

If the TXD.PTR and the RXD.PTR are not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 16 for more information about the different memory regions.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next RX/TX transmission immediately after having received the RXSTARTED/TXSTARTED event.

The ENDRX/ENDTX event indicates that EasyDMA has finished accessing respectively the RX/TX buffer in RAM.

6.28.2 Transmission

The first step of a DMA transmission is storing bytes in the transmit buffer and configuring EasyDMA. This is achieved by writing the initial address pointer to TXD.PTR, and the number of bytes in the RAM buffer to TXD.MAXCNT. The UARTE transmission is started by triggering the STARTTX task.

After each byte has been sent over the TXD line, a TXDRDY event will be generated.

When all bytes in the TXD buffer, as specified in the TXD.MAXCNT register, have been transmitted, the UARTE transmission will end automatically and an ENDTX event will be generated.

A UARTE transmission sequence is stopped by triggering the STOPTX task, a TXSTOPPED event will be generated when the UARTE transmitter has stopped.

If the ENDTX event has not already been generated when the UARTE transmitter has come to a stop, the UARTE will generate the ENDTX event explicitly even though all bytes in the TXD buffer, as specified in the TXD.MAXCNT register, have not been transmitted.

If flow control is enabled through the HWFC field in the CONFIG register, a transmission will be automatically suspended when CTS is deactivated and resumed when CTS is activated again, as illustrated in [UARTE transmission](#) on page 394. A byte that is in transmission when CTS is deactivated will be fully transmitted before the transmission is suspended.

Figure 148: UART transmission

The UART transmitter will be in its lowest activity level, and consume the least amount of energy, when it is stopped, i.e. before it is started via `STARTTX` or after it has been stopped via `STOPTX` and the `TXSTOPPED` event has been generated. See [POWER — Power supply](#) on page 48 for more information about power modes.

6.28.3 Reception

The UART receiver is started by triggering the `STARTRX` task. The UART receiver is using EasyDMA to store incoming data in an RX buffer in RAM.

The RX buffer is located at the address specified in the `RXD.PTR` register. The `RXD.PTR` register is double-buffered and it can be updated and prepared for the next `STARTRX` task immediately after the `RXSTARTED` event is generated. The size of the RX buffer is specified in the `RXD.MAXCNT` register and the UART will generate an `ENDRX` event when it has filled up the RX buffer, see [UART reception](#) on page 395.

For each byte received over the `RXD` line, an `RXDRDY` event will be generated. This event is likely to occur before the corresponding data has been transferred to Data RAM.

The `RXD.AMOUNT` register can be queried following an `ENDRX` event to see how many new bytes have been transferred to the RX buffer in RAM since the previous `ENDRX` event.

Figure 149: UARTE reception

The UARTE receiver is stopped by triggering the STOPRX task. An RXTO event is generated when the UARTE has stopped. The UARTE will make sure that an impending ENDRX event will be generated before the RXTO event is generated. This means that the UARTE will guarantee that no ENDRX event will be generated after RXTO, unless the UARTE is restarted or a FLUSHRX command is issued after the RXTO event is generated.

Important: If the ENDRX event has not already been generated when the UARTE receiver has come to a stop, which implies that all pending content in the RX FIFO has been moved to the RX buffer, the UARTE will generate the ENDRX event explicitly even though the RX buffer is not full. In this scenario the ENDRX event will be generated before the RXTO event is generated.

To be able to know how many bytes have actually been received into the RX buffer, the CPU can read the RXD.AMOUNT register following the ENDRX event or the RXTO event.

The UARTE is able to receive up to four bytes after the STOPRX task has been triggered as long as these are sent in succession immediately after the RTS signal is deactivated. This is possible because after the RTS is deactivated the UARTE is able to receive bytes for an extended period equal to the time it takes to send 4 bytes on the configured baud rate.

After the RXTO event is generated the internal RX FIFO may still contain data, and to move this data to RAM the FLUSHRX task must be triggered. To make sure that this data does not overwrite data in the RX buffer, the RX buffer should be emptied or the RXD.PTR should be updated before the FLUSHRX task is triggered. To make sure that all data in the RX FIFO is moved to the RX buffer, the RXD.MAXCNT register must be set to $RXD.MAXCNT > 4$, see [UARTE reception with forced stop via STOPRX](#) on page 396. The UARTE will generate the ENDRX event after completing the FLUSHRX task even if the RX FIFO was empty or if the RX buffer does not get filled up. To be able to know how many bytes have actually been received into the RX buffer in this case, the CPU can read the RXD.AMOUNT register following the ENDRX event.

Figure 150: UARTE reception with forced stop via STOPRX

If HW flow control is enabled through the HWFC field in the CONFIG register, the RTS signal will be deactivated when the receiver is stopped via the STOPRX task or when the UARTE is only able to receive four more bytes in its internal RX FIFO.

With flow control disabled, the UARTE will function in the same way as when the flow control is enabled except that the RTS line will not be used. This means that no signal will be generated when the UARTE has reached the point where it is only able to receive four more bytes in its internal RX FIFO. Data received when the internal RX FIFO is filled up, will be lost.

The UARTE receiver will be in its lowest activity level, and consume the least amount of energy, when it is stopped, i.e. before it is started via STARTRX or after it has been stopped via STOPRX and the RXTO event has been generated. See [POWER — Power supply](#) on page 48 for more information about power modes.

6.28.4 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. Effectively, a framing error is always generated before a break condition occurs.

An ERROR event will not stop reception. If the error was a parity error, the received byte will still be transferred into Data RAM, and so will following incoming bytes. If there was a framing error (wrong stop bit), that specific byte will NOT be stored into Data RAM, but following incoming bytes will.

6.28.5 Using the UARTE without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are kept active all the time.

6.28.6 Parity and stop bit configuration

Automatic even parity generation for both transmission and reception can be configured using the register [CONFIG](#) on page 410. See the register description for details.

The amount of stop bits can also be configured through the register [CONFIG](#) on page 410.

6.28.7 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOPTH and STOPRX tasks may not be always needed (the peripheral might already be stopped), but if STOPTH and/or STOPRX is sent, software shall wait until the TXSTOPPED and/or RXTO event is received in response, before disabling the peripheral through the ENABLE register.

6.28.8 Pin configuration

The different signals RXD, CTS (Clear To Send, active low), RTS (Request To Send, active low), and TXD associated with the UARTE are mapped to physical pins according to the configuration specified in the PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers respectively.

The PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers and their configurations are only used as long as the UARTE is enabled, and retained only for the duration the device is in ON mode. PSEL.RXD, PSEL.RTS, PSEL.RTS and PSEL.TXD must only be configured when the UARTE is disabled.

To secure correct signal levels on the pins by the UARTE when the system is in OFF mode, the pins must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 397.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| UARTE signal | UARTE pin | Direction | Output value |
|--------------|--------------------------|-----------|----------------|
| RXD | As specified in PSEL.RXD | Input | Not applicable |
| CTS | As specified in PSEL.CTS | Input | Not applicable |
| RTS | As specified in PSEL.RTS | Output | 1 |
| TXD | As specified in PSEL.TXD | Output | 1 |

Table 115: GPIO configuration before enabling peripheral

6.28.9 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|--|---------------|
| 0x40002000 | UARTE | UARTE0 | Universal asynchronous receiver/transmitter with EasyDMA | |

Table 116: Instances

| Register | Offset | Description |
|------------------|--------|--|
| TASKS_STARTRX | 0x000 | Start UART receiver |
| TASKS_STOPRX | 0x004 | Stop UART receiver |
| TASKS_STARTTX | 0x008 | Start UART transmitter |
| TASKS_STOPTX | 0x00C | Stop UART transmitter |
| TASKS_FLUSHRX | 0x02C | Flush RX FIFO into RX buffer |
| EVENTS_CTS | 0x100 | CTS is activated (set low). Clear To Send. |
| EVENTS_NCTS | 0x104 | CTS is deactivated (set high). Not Clear To Send. |
| EVENTS_RXDRDY | 0x108 | Data received in RXD (but potentially not yet transferred to Data RAM) |
| EVENTS_ENDRX | 0x110 | Receive buffer is filled up |
| EVENTS_TXDRDY | 0x11C | Data sent from TXD |
| EVENTS_ENDTX | 0x120 | Last TX byte transmitted |
| EVENTS_ERROR | 0x124 | Error detected |
| EVENTS_RXTO | 0x144 | Receiver timeout |
| EVENTS_RXSTARTED | 0x14C | UART receiver has started |
| EVENTS_TXSTARTED | 0x150 | UART transmitter has started |
| EVENTS_TXSTOPPED | 0x158 | Transmitter stopped |
| SHORTS | 0x200 | Shortcuts between local events and tasks |
| INTEN | 0x300 | Enable or disable interrupt |
| INTENSET | 0x304 | Enable interrupt |
| INTENCLR | 0x308 | Disable interrupt |

| Register | Offset | Description |
|------------|--------|---|
| ERRORSRC | 0x480 | Error source |
| | | Note : this register is read / write one to clear. |
| ENABLE | 0x500 | Enable UART |
| PSEL.RTS | 0x508 | Pin select for RTS signal |
| PSEL.TXD | 0x50C | Pin select for TXD signal |
| PSEL.CTS | 0x510 | Pin select for CTS signal |
| PSEL.RXD | 0x514 | Pin select for RXD signal |
| BAUDRATE | 0x524 | Baud rate. Accuracy depends on the HFCLK source selected. |
| RXD.PTR | 0x534 | Data pointer |
| RXD.MAXCNT | 0x538 | Maximum number of bytes in receive buffer |
| RXD.AMOUNT | 0x53C | Number of bytes transferred in the last transaction |
| TXD.PTR | 0x544 | Data pointer |
| TXD.MAXCNT | 0x548 | Maximum number of bytes in transmit buffer |
| TXD.AMOUNT | 0x54C | Number of bytes transferred in the last transaction |
| CONFIG | 0x56C | Configuration of parity and hardware flow control |

Table 117: Register overview

6.28.9.1 TASKS_STARTRX

Address offset: 0x000

Start UART receiver

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|---|---------------|----------|-------|---------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| ID | A | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset 0x00000000 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acces | Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | W | TASKS_STARTRX | | | Start UART receiver | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | Trigger | 1 | Trigger task | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.28.9.2 TASKS_STOPRX

Address offset: 0x004

Stop UART receiver

| Bit number | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|---|--------------|----------|-------|--------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| ID | A | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset 0x00000000 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acces | Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | W | TASKS_STOPRX | | | Stop UART receiver | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | Trigger | 1 | Trigger task | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.28.9.3 TASKS_STARTTX

Address offset: 0x008

Start UART transmitter

| Bit number | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|---|---------------|-------|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| ID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | A |
| Reset 0x00000000 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acce Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | W | TASKS_STARTTX | | Start UART transmitter | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | Trigger | 1 | Trigger task | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.28.9.4 TASKS_STOPTX

Address offset: 0x00C

Stop UART transmitter

| Bit number | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|---|--------------|-------|-----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| ID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | A |
| Reset 0x00000000 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ID | Acce Field | Value ID | Value | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | W | TASKS_STOPTX | | Stop UART transmitter | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | Trigger | 1 | Trigger task | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

6.28.9.5 TASKS_FLUSHRX

Address offset: 0x02C

Flush RX FIFO into RX buffer

| Bit number | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|---|---------------|-------|------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| $t_{UARTE,START}$ | Time from STARTRX/STARTTX task to transmission started | .. | .. | .. | μ s |

6.29 WDT — Watchdog timer

A countdown watchdog timer using the low-frequency clock source (LFCLK) offers configurable and robust protection against application lock-up.

The watchdog timer is started by triggering the START task.

The watchdog can be paused during long CPU sleep periods for low power applications and when the debugger has halted the CPU. The watchdog is implemented as a down-counter that generates a TIMEOUT event when it wraps over after counting down to 0. When the watchdog timer is started through the START task, the watchdog counter is loaded with the value specified in the CRV register. This counter is also reloaded with the value specified in the CRV register when a reload request is granted.

³³ High baud rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

The watchdog's timeout period is given by:

$$\text{timeout [s]} = (\text{CRV} + 1) / 32768$$

When started, the watchdog will automatically force the 32.768 kHz RC oscillator on as long as no other 32.768 kHz clock source is running and generating the 32.768 kHz system clock, see chapter [CLOCK — Clock control](#) on page 61.

6.29.1 Reload criteria

The watchdog has eight separate reload request registers, which shall be used to request the watchdog to reload its counter with the value specified in the CRV register. To reload the watchdog counter, the special value 0x6E524635 needs to be written to all enabled reload registers.

One or more RR registers can be individually enabled through the RREN register.

6.29.2 Temporarily pausing the watchdog

By default, the watchdog will be active counting down the down-counter while the CPU is sleeping and when it is halted by the debugger. It is however possible to configure the watchdog to automatically pause while the CPU is sleeping as well as when it is halted by the debugger.

6.29.3 Watchdog reset

A TIMEOUT event will automatically lead to a watchdog reset.

See [Reset](#) on page 52 for more information about reset sources. If the watchdog is configured to generate an interrupt on the TIMEOUT event, the watchdog reset will be postponed with two 32.768 kHz clock cycles after the TIMEOUT event has been generated. Once the TIMEOUT event has been generated, the impending watchdog reset will always be effectuated.

The watchdog must be configured before it is started. After it is started, the watchdog's configuration registers, which comprise registers CRV, RREN, and CONFIG, will be blocked for further configuration.

The watchdog can be reset from several reset sources, see [Reset behavior](#) on page 53.

When the device starts running again, after a reset, or waking up from OFF mode, the watchdog configuration registers will be available for configuration again.

6.29.4 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|----------------|---------------|
| 0x40010000 | WDT | WDT | Watchdog timer | |

Table 118: Instances

| Register | Offset | Description |
|----------------|--------|--|
| TASKS_START | 0x000 | Start the watchdog |

| F5 | P0.11 | Digital I/O | General purpose I/O |
| F6 | P0.08 | Digital I/O | General purpose I/O |
| G1 | SWDCLK | Digital input | Serial wire debug clock input for debug and programming |
| G2 | P0.20 | Digital I/O | General purpose I/O |
| G3 | P0.16 | Digital I/O | General purpose I/O |
| G4 | P0.15 | Digital I/O | General purpose I/O |
| G5 | P0.12 | Digital I/O | General purpose I/O |
| G6 | VDD | Power | Power (battery) supply |

Table 122: WLCSP ball assignments

7.1.4 GPIO pins located near the radio

Radio performance parameters, such as sensitivity, may be affected by high frequency digital I/O with large sink/source current close to the radio power supply and antenna pins.

[GPIO recommended usage](#) on page 423 identifies some GPIO pins that have recommended usage guidelines for maximizing radio performance in an application.

| GPIO | QFN48 pin | QFN32 pin | Recommended usage |
|-------|-----------|-----------|------------------------------------|
| P0.25 | 37 | 26 | Low drive, low frequency I/O only. |
| P0.26 | 38 | | |
| P0.27 | 39 | | |
| P0.28 | 40 | 27 | |
| P0.29 | 41 | | |

7.3 Reference circuitry

To ensure good RF performance when designing PCBs, it is highly recommended to use the PCB layouts and component values provided by Nordic Semiconductor.

Documentation for the different package reference circuits, including Altium Designer files, PCB layout files, and PCB production files can be downloaded from [Reference layout nRF52 Series](#).

7.3.1 Schematic QFAA QFN48 with internal LDO regulator setup

In addition to the schematic, the bill of material (BOM) is also provided.

| Designator | Value | Description | Footprint |
|------------------|---------------|--|-----------|
| C1, C2, C11, C12 | 12 pF | Capacitor, NPO, ±2% | 0402 |

7.3.8 PCB guidelines

A well designed PCB is necessary to achieve good RF performance. Poor layout can lead to loss in performance or functionality.

A qualified RF layout for the IC and its surrounding components, including matching networks, can be downloaded from [Reference layout nRF52 Series](#).

To ensure optimal performance it is essential that you follow the schematics and layout references closely. Especially in the case of the antenna matching circuitry (components between device pin ANT and the antenna), any changes to the layout can change the behavior, resulting in degradation of RF performance or a need to change component values. All reference circuits are designed for use with a 50 Ω single-ended antenna.

A PCB with a minimum of two layers, including a ground plane, is recommended for optimal performance. On PCBs with more than two layers, put a keep-out area on the inner layers directly below the antenna matching circuitry (components between device pin ANT and the antenna) to reduce the stray capacitances that influence RF performance.

A matching network is needed between the RF pin ANT and the antenna, to match the antenna impedance (normally 50 Ω) to the optimum RF load impedance for the chip. For optimum performance, the impedance for the matching network should be set as described in the recommended package reference circuitry in [Reference circuitry](#) on page 425 above.

The DC supply voltage should be decoupled as close as possible to the VDD pins with high performance RF capacitors. See the schematics for recommended decoupling capacitor values. The supply voltage for the chip should be filtered and routed separately from the supply voltages of any digital circuitry.

Long power supply lines on the PCB should be avoided. All device grounds, VDD connections, and VDD bypass capacitors must be connected as close as possible to the IC. For a PCB with a top-side RF ground plane, the VSS pins should be connected directly to the ground plane. For a PCB with a bottom ground plane, the best technique is to have via holes as close as possible to the VSS pads. A minimum of one via hole should be used for each VSS pin.

Fast switching digital signals should not be routed close to the crystal or the power supply lines. Capacitive loading of fast switching digital output lines should be minimized in order to avoid radio interference.

7.3.9 PCB layout example

The PCB layout shown as the example is a reference layout for the QFN48 package with internal LDO setup.

Important: Pay attention to how the capacitor C3 is grounded. It is not directly connected to the ground plane, but grounded via VSS pin 31. This is done to create additional filtering of harmonic components.

For all available reference layouts, see [Reference layout nRF52 Series](#).

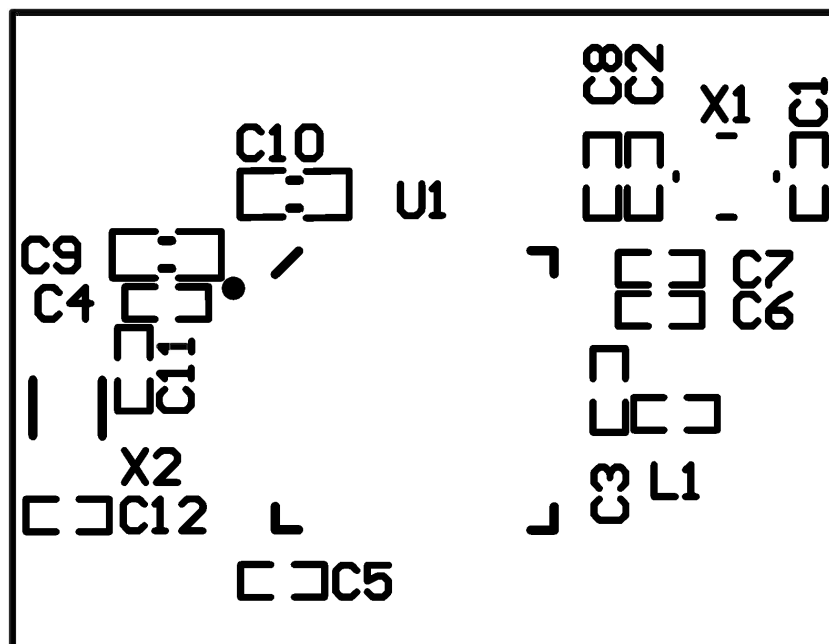

Figure 164: Top silk layer

Figure 165: Top layer

Figure 166: Bottom layer

Important: No components in bottom layer.

8 Recommended operating conditions

The operating conditions are the physical parameters that the chip can operate within.

| Symbol | Parameter | Notes | Min. | Nom. | Max. | Units |
|--------------------|--|-------|------|------|------|-------|
| VDD | Supply voltage, independent of DCDC enable | | 1.7 | 3.0 | 3.6 | V |
| t _{R_VDD} | Supply rise time (0 V to 1.7 V) | | | | 60 | ms |
| TA | Operating temperature | | -40 | 25 | 85 | °C |

Table 134: Recommended operating conditions

Important: The on-chip power-on reset circuitry may not function properly for rise times longer than the specified maximum.

8.1 WLCSP light sensitivity

WLCSP package variants are sensitive to visible and near infrared light, which means that a final product design must shield the chip properly.

For the CAAA package variant, the marking side is covered with a light absorbing film, while the side edges of the chip and the ball side must be protected by coating or other means.

9 Absolute maximum ratings

Maximum ratings are the extreme limits to which the chip can be exposed for a limited amount of time without permanently damaging it. Exposure to absolute maximum ratings for prolonged periods of time may affect the reliability of the device.

| | Note | Min. | Max. | Unit |
|---|----------------------------|------------------|-------------|--------------------|
| Supply voltages | | | | |
| VDD | | -0.3 | +3.9 | V |
| VSS | | | 0 | V |
| I/O pin voltage | | | | |
| $V_{I/O}, VDD \leq 3.6\text{ V}$ | | -0.3 | $VDD + 0.3$ | V |
| $V_{I/O}, VDD > 3.6\text{ V}$ | | -0.3 | 3.9 | V |
| Radio | | | | |
| RF input level | | | 10 | dBm |

10.3 Order code

Here are the nRF52811 order codes and definitions.

| | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|----|----|----|----|---|----|----|
| n | R | F | 5 | 2 | 8 | 1 | 1 | - | <P | P> | <V | V> | - | <C | C> |
|---|---|---|---|---|---|---|---|---|----|----|----|----|---|----|----|

Figure 170: Order code

| Abbreviation | Definition and implemented codes |
|--------------|--|
| N52/nRF52 | nRF52 Series product |
| 811 | Part code |
| <PP> | Package variant code |
| <VV> | Function variant code |
| <H><P><F> | Build code H - Hardware version code P - Production configuration code (production site, etc.) F - Firmware version code (only visible on shipping container label) |
| <YY><WW><LL> | Tracking code YY - Year code WW - Assembly week number LL - Wafer lot code |
| <CC> | Container code |

Table 136: Abbreviations

10.4 Code ranges and values

Defined here are the nRF52811 code ranges and values.

| <PP> | Package | Size (mm) | Pin/Ball count | Pitch (mm) |
|------|---------|---------------|----------------|------------|
| QF | QFN | 6 x 6 | 48 | 0.4 |
| QC | QFN | 5 x 5 | 32 | 0.5 |
| CA | WLCSP | 2.482 x 2.464 | 33 | 0.4 |

Table 137: Package variant codes

| <VV> | Flash (kB) | RAM (kB) |
|------|------------|----------|
| AA | 192 | 24 |

Table 138: Function variant codes

| <H> | Description |
|-----------|--|
| [A . . Z] | Hardware version/revision identifier (incremental) |

Table 139: Hardware version codes

| <P> | Description |
|-----------|---|
| [0 . . 9] | Production device identifier (incremental) |
| [A . . Z] | Engineering device identifier (incremental) |

Table 140: Production configuration codes

| <F> | Description |
|--------------------|--|
| [A . . N, P . . Z] | Version of preprogrammed firmware |
| [0] | Delivered without preprogrammed firmware |

Table 141: Production version codes

| <YY> | Description |
|-------------|-------------------------------|
| [15 . . 99] | Production year: 2015 to 2099 |

Table 142: Year codes

| <WW> | Description |
|------------|--------------------|
| [1 . . 52] | Week of production |

Table 143: Week codes

| <LL> | Description |
|-------------|---------------------------------|
| [AA . . ZZ] | Wafer production lot identifier |

Table 144: Lot codes

| <CC> | Description |
|------|-------------|
| R7 | 7" Reel |
| R | 13" Reel |
| T | Tray |

Table 145: Container codes

10.5 Product options

Defined here are the nRF52811 product options.

| Order code | MOQ (minimum ordering quantity) | Comment |
|------------------|---------------------------------|-------------------------------|
| nRF52811-QFAA-R7 | 1000 | Availability to be announced. |
| nRF52811-QFAA-R | 3000 | |
| nRF52811-QFAA-T | 490 | |
| nRF52811-QCAA-R7 | 1500 | |
| nRF52811-QCAA-R | 4000 | |
| nRF52811-QCAA-T | 490 | |
| nRF52811-CAAA-R7 | 1500 | |
| nRF52811-CAAA-R | 7000 | |

Table 146: nRF IC order codes

| Order code | Description |
|-------------|--|
| nRF52840-DK | nRF52840 development kit with tools to support nRF52811 development. |

Table 147: Development tools order code

11 Legal notices

By using this documentation you agree to our terms and conditions of use. Nordic Semiconductor ASA may change these terms and conditions at any time without notice.

11.1 Liability disclaimer

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

Information in this document is believed to be accurate and reliable. Nordic Semiconductor ASA does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. If there are any discrepancies, ambiguities or conflicts in Nordic Semiconductor's documentation, the Product Specification prevails.

Nordic Semiconductor ASA reserves the right to make corrections, enhancements, and other changes to this document without notice.

11.2 Life support applications

Nordic Semiconductor ASA products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury.

Nordic Semiconductor ASA customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nordic Semiconductor ASA for any damages resulting from such improper use or sale.

11.3 RoHS and REACH statement

Nordic Semiconductor products meet the requirements of Directive 2002/95/EC of the European Parliament and of the Council on the Restriction of Hazardous Substances (RoHS) and the requirements of the REACH regulation (EC 1907/2006) on Registration, Evaluation, Authorization and Restriction of Chemicals.

The SVHC (Substances of Very High Concern) candidate list is continually being updated. Complete hazardous substance reports, material composition reports and latest version of Nordic Semiconductor's REACH statement can be found on our website <http://www.nordicsemi.com>.

11.4 Trademarks

All trademarks, service marks, trade names, product names and logos appearing in this documentation are the property of their respective owners.

11.5 Copyright notice

© 2018 Nordic Semiconductor ASA. All rights are reserved. Reproduction in whole or in part is prohibited without the prior written permission of the copyright holder.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
