## Low-Voltage CMOS Octal Transceiver

### With 5 V-Tolerant Inputs and Outputs (3-State, Non-Inverting)

The 74LVC245A is a high performance, non-inverting octal transceiver operating from a 1.2 to 3.6 V supply. High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance. A  $V_I$  specification of 5.5 V allows 74LVC245A inputs to be safely driven from 5 V devices if  $V_{CC}$  is less than 5.0 V. The 74LVC245A is suitable for memory address driving and all TTL level bus oriented transceiver applications.

Current drive capability is 24 mA at both A and B ports. The Transmit/Receive ( $T/\bar{R}$ ) input determines the direction of data flow through the bi-directional transceiver. Transmit (active-HIGH) enables data from A ports to B ports; Receive (active-LOW) enables data from B to A ports. The Output Enable input, when HIGH, disables both A and B ports by placing them in a HIGH Z condition.
