Description

Atmel's Fast Logic 16-Bit Buffer/Line driver provides bus interface and signal buffering at the fastest speeds available in the industry. The Tri-state outputs can be set for either 4-bit, 8-bit, or 16-bit independent operation. The AT16244 also has bus-hold circuitry which retains the last state of the input whenever a high impedance level is detected, and eliminates the need for pull-up or pull-down resistors. Minimal ground bounce and high input noise rejection make this device excellent for use in all high speed interface applications.

Definitions:

C_L = Load capacitance; Includes jig and probe capacitance.
 R_T =Termination resistance; Should be equal to Z_{OUT} of the Pulse Generator.

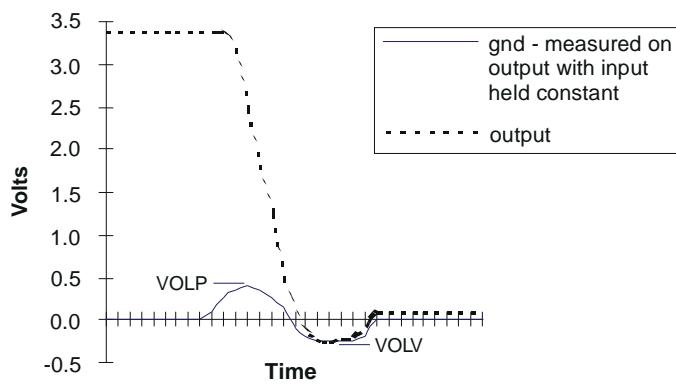

Note: 1. Pulse Generator: Rate $\leq 1.0 \text{ MHz}$, $t_F \leq 2.5 \text{ ns}$, $t_R \leq 2.5 \text{ ns}$.
 2. AC tests are done with a single bit switching, and
 timings need to be derated when multiple outputs are
 switching in the same direction simultaneously. This derating
 should not exceed 0.5 ns for 16 inputs switching
 simultaneously.

Ground Bounce for High to Low Transitions⁽¹⁾

Supply Bounce for Low to High Transitions⁽²⁾

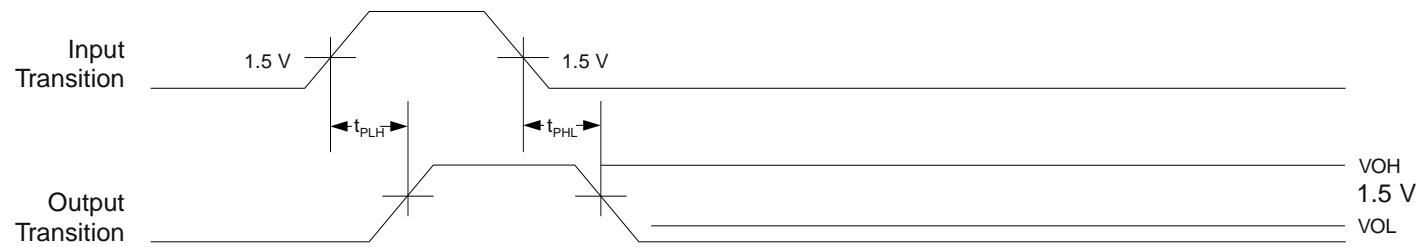

Typical Values

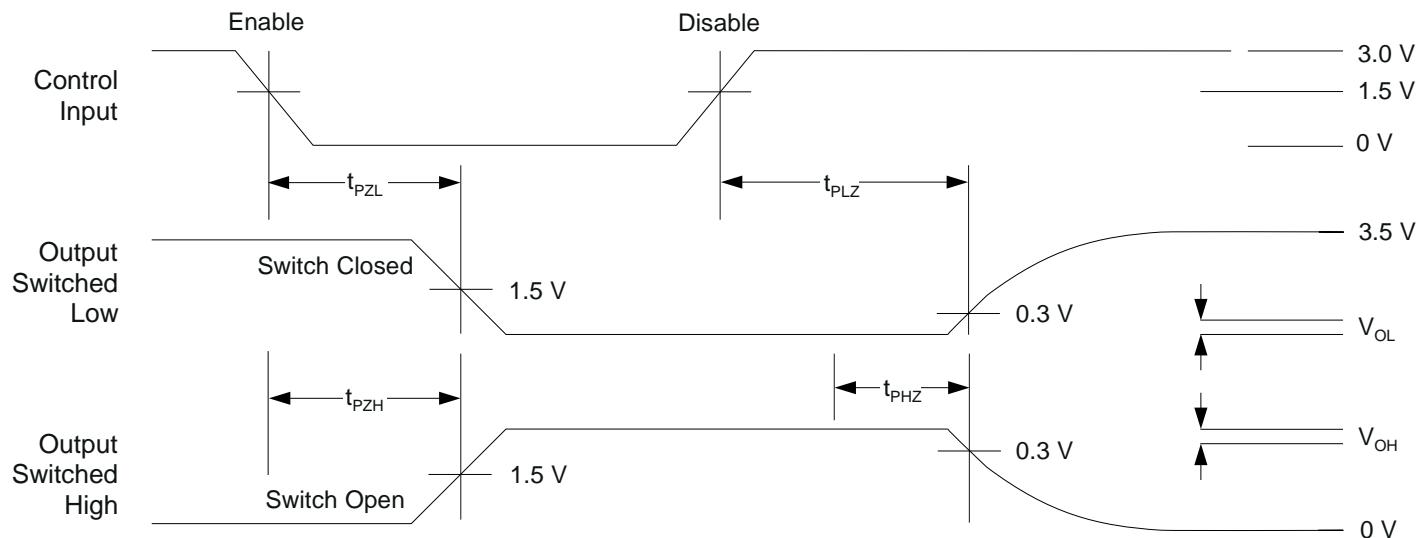

Parameter	Value	Units
VOLP	0.4	V
VOLV	-0.26	V
VOHV	$V_{CC} - 0.13$	V
VOHP	$V_{CC} + 0.6$	V

- Note:
1. When multiple outputs are switched at the same time, rapidly changing current on the ground and V_{CC} paths causes a voltage to develop across the parasitic inductance of the wire bond and package pins. This occurrence is called simultaneous switching noise. Atmel's AT16244 products have minimized this phenomenon as shown on the graph. Output data is for 15 outputs switching simultaneously at a frequency of 1 MHz. The ground data is measured on the one remaining output, which is set to logic low and will reflect any device ground movement.
 2. As on the graph for Ground Bounce, a similar condition occurs for low to high transitions. Output data is for 15 outputs switching simultaneously at a frequency of 1 MHz. V_{CC} droop is measured on the one remaining output pin, which is set to a logic high. This output will reflect any movement on the device V_{CC} .
