## Description

The MAAD-000523 is a 6-bit, 0.5-dB step GaAs MMIC digital attenuator in a lead-free 4 mm 24 lead PQFN surface mount plastic package. This device is ideally suited for use where high accuracy, very low power consumption and low intermodulation products are required. Typical applications include Cellular Basestation R<sub>X</sub>/T<sub>X</sub> Line-up, Femtocells, and other gain / level control circuits.

This attenuator is controlled with either a SPI compatible serial interface or a 6 bit parallel word.

## Handling Procedures

Please observe the following precautions to avoid damage:

## Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

## Functionality

### Modes of Operation: Serial, Direct Parallel, and Latched Parallel

**Mode Truth Table**

P/S	LE	Mode
1	X	Serial
0	Constant High	Direct Parallel
0	Pulsed	Latched Parallel

### **Serial Mode**

The serial control interface (SERIN, CLK, LE, SEROUT) is compatible with the SPI protocol. SPI mode is activated when P/S is kept high. The 6-bit serial word must be loaded with the MSB first. After shifting in the 6 bit word, bringing LE high will set the attenuator to the desired state. While LE is high the CLK is masked to protect the data while implementing the change. SEROUT is the SERIN delayed by 6 clock cycles.

When P/S is low, the serial control interface is disabled and the serial input register is loaded asynchronously with parallel digital inputs.

For all modes of operations, the outputs will stay constant while LE is kept low.

### **Direct Parallel Mode**

The parallel mode is enabled when P/S is set to low. In the direct parallel mode, the attenuator is controlled by the parallel control inputs directly. The LE must be at logic high to control the attenuator in this mode.

### **Latched Parallel Mode**

In the latched parallel mode, the parallel control inputs will be buffered by registers, and loaded to the outputs when LE is high. The outputs shall not change states when LE is low.

### **Power-up States**

The power-up (PUP) states will work in both serial and parallel modes, and initiate the attenuator according to the PUP truth table. During power up, the digital inputs shall be held constant for at least 1  $\mu$ s after  $V_{CC}$  reaches 90% of final value. For serial mode, the PUP states will only work when LE is held low. The PUP state shall be locked out after the first LE pulse.
