

General Description

The MAX77801 evaluation kit demonstrates the IC 2A, buck-boost with I²C capability. The EV kit enables user to evaluate MAX77801 performances with preprogrammed output voltage even without I²C interface board (e.g., MINIQUSB). The two output voltages supported by default are 3.3V and 3.4V and it can be set by pulling DVS high/low. With I²C interface board (additional order required if necessary), user can set output voltage from 2.6V to 4.1875V with 12.5mV step. The EV kit comes standard with the MAX77801EWP+ installed.

The MINIQUSB interface board can be used to enable PC communication through the USB interface board. Windows® 2000-, Windows XP®, Windows Vista®, and Windows 7-compatible software along with an extender board allows an IBM-compatible PC to use the USB port to emulate an I²C 2-wire interface. This menu-driven program offers a graphical user interface (GUI) with control buttons.

Benefits and Features

- Kelvin Sense Pins at the Input and Output of the Regulator Ensure Accurate Efficiency Measurement

Ordering Information appears at end of data sheet.

Quick Start

Required Equipment

- MAX77801 EV kit
- MINIQUSB command module (optional, USB cable included)
- Adjustable DC power supply
- 1.8V DC power supply (optional)
- Digital multimeters

Figure 1. MAX77801 Evaluation Board

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation. Use twisted wires of appropriate gauge (20AWG) that are as short as possible to connect the load and power sources.

- 1) Ensure that the EV kit has the correct jumper settings, as shown in [Table 1](#).
- 2) Connect the MINIQUSB interface board (if I²C control is required to test).
- 3) Preset the DC power supply to 3.8V. Turn off the power supply. Do not turn on the power supply until all connections are completed.
- 4) Connect the EV kit to the power supply and meters. Adjust the ammeters to their largest current range to minimize their series impedance. Do not allow the ammeters to operate in their autorange mode. If current readings are not desired, short across the ammeters.
- 5) Turn on the power supply.
- 6) Switch JU2 to VIO (1-2) to enable the MAX77801.
- 7) Apply load for desired test. If reading register (e.g., reading status register) or writing register (e.g., programming specific output voltage) is required, then proceed to step 8.
- 8) Visit www.maximintegrated.com/evkitssoftware to download the latest version of the EV kit software, MAX77801Rxx.ZIP. Save the EV kit software to a temporary folder and uncompress the ZIP file.
- 9) Install the EV kit software on your computer by running the INSTALL.EXE program inside the temporary folder. The program files are copied and icons are created in the Windows **Start | Programs** menu.
- 10) Connect the USB cable from the PC to the MINIQUSB board.
- 11) Start the EV kit software by opening its icon in the **Start | Programs** menu. The EV kit software main window appears, as shown in [Figure 2](#).
- 12) The EV kit is now ready for testing.

Detailed Description of Software

The GUI shown in [Figure 2](#) is the main window of the MAX77801 EV kit software that provides a convenient means to control the MAX77801 IC. Use the mouse or press the Tab key to navigate through the GUI controls.

The EV kit software main window consists of two tabs, **CHIPID/STATUS/CONFIG** ([Figure 2](#)) and **VOUT_DVS**

([Figure 3](#)). The **CHIPID/STATUS/CONFIG** tab sheet provides group boxes, checkboxes, and pushbuttons of the CHIP ID read, STATUS of alarm, CONFIG1, and CONFIG2. **VOUT_DVS** tab sheet provides access to control OUTPUT voltage depending on DVS pin status. Refer to register description in the MAX77801 data sheet.

Detailed Description of Hardware

The MAX77801 EV kit demonstrates the MAX77801 buck-boost. It regulates output from input voltage ranges from 2.3V to 5.5V. Programmable output range is from 2.6V to 4.1875V with 12.5mV step. The EV kit is suited

with a general DC input. By connecting an external MINIQUSB, and launching the EV kit software, the user can adjust output voltage can be reported the status of buck-boost on the EV kit GUI. [Table 1](#) lists jumpers and associated functions that are available on the EV kit.

Table 1. Jumper Functions

JUMPER	NODE OR FUNCTION	SHUNT POSITION	FUNCTION
JU1	VIO	1-2*	VIO is supplied from an onboard 1.8V LDO(U1)
		2-3	VIO is supplied from MINIQUSB board
JU2	EN	1-2	Connecting EN to VIO (MAX77801 is enabled)
		2-3*	Connecting EN to GND (MAX77801 is disabled)
JU3	DVS	1-2	Connecting DVS to VIO, output voltage is set by VOUT_DVS_H register
		2-3*	Connecting DVS to GND, output voltage is set by VOUT_DVS_L register
JU4	Input for onboard LDO	OPEN	Disconnect onboard LDO input
		1-2*	Inboard LDO is supplied from VIN
JU5	SDA pullup	OPEN*	No pullup for SDA
		1-2	SDA pin is pulled up to VIO through 2.2kΩ
JU6	SCL pullup	OPEN*	No pullup for SCL
		1-2	SCL pin is pulled up to VIO through 2.2kΩ

*Default position.

Component List

PART	QTY	DESCRIPTION
C1	1	10 μ F \pm 5%, 6.3V X5R ceramic capacitor (0603) TDK CGB3C1X5R0J106M065AC

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

JONHON

«**JONHON**» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
