

## 2.3V to 5.5V Micropower Bi-CMOS Op Amps

### Features

- Low Input Offset Voltage:  $\pm 150 \mu\text{V}$  (maximum)
- Low Noise:  $2.2 \mu\text{V}_{\text{P-P}}$  (typical, 0.1 Hz to 10 Hz)
- Rail-to-Rail Output
- Low Input Offset Current: 0.3 nA (typical)
- Low Quiescent Current: 25  $\mu\text{A}$  (maximum)
- Power Supply Voltage: 2.3V to 5.5V
- Unity Gain Stable
- Chip Select (CS) Capability: MCP618
- Industrial Temperature Range:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- No Phase Reversal
- Available in Single, Dual and Quad Packages

### Typical Applications

- Battery Power Instruments
- Weight Scales
- Strain Gauges
- Medical Instruments
- Test Equipment

### Design Aids

- SPICE Macro Models
- Microchip Advanced Part Selector (MAPS)
- Mindi™ Circuit Designer & Simulator
- Analog Demonstration and Evaluation Boards
- Application Notes

### Input Offset Voltage

### Description

The MCP616/7/8/9 family of operational amplifiers (op amps) from Microchip Technology Inc. are capable of precision, low-power, single-supply operation. These op amps are unity-gain stable, have low input offset voltage ( $\pm 150 \mu\text{V}$ , maximum), rail-to-rail output swing and low input offset current (0.3 nA, typical). These features make this family of op amps well suited for battery-powered applications.

The single MCP616, the single MCP618 with Chip Select (CS) and the dual MCP617 are all available in standard 8-lead PDIP, SOIC and MSOP packages. The quad MCP619 is offered in standard 14-lead PDIP, SOIC and TSSOP packages. All devices are fully specified from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ , with power supplies from 2.3V to 5.5V.

### Package Types

# MCP616/7/8/9

NOTES:

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

$V_{DD} - V_{SS}$ .....	7.0V
Current at Analog Input Pins ( $V_{IN+}$ and $V_{IN-}$ ).....	$\pm 2$ mA
Analog Inputs ( $V_{IN+}$ and $V_{IN-}$ ) †† ..	$V_{SS} - 0.3V$ to $V_{DD} + 0.3V$
All other Inputs and Outputs .....	$V_{SS} - 0.3V$ to $V_{DD} + 0.3V$
Difference Input Voltage .....	$ V_{DD} - V_{SS} $
Output Short Circuit Current .....	Continuous
Current at Output and Supply Pins .....	$\pm 30$ mA
Storage Temperature .....	$-65^{\circ}C$ to $+150^{\circ}C$
Maximum Junction Temperature ( $T_J$ ).....	$+150^{\circ}C$
ESD Protection On All Pins (HBM; MM) .....	$\geq 4$ kV; 400V

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

†† See Section 4.1.2 “Input Voltage and Current Limits”.

### DC ELECTRICAL CHARACTERISTICS

**Electrical Specifications:** Unless otherwise indicated,  $V_{DD} = +2.3V$  to  $+5.5V$ ,  $V_{SS} = GND$ ,  $T_A = +25^{\circ}C$ ,  $V_{CM} = V_{DD}/2$ ,  $V_{OUT} \approx V_{DD}/2$  and  $R_L = 100$  k $\Omega$  to  $V_{DD}/2$ .

Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>Input Offset</b>						
Input Offset Voltage	$V_{OS}$	-150	—	+150	$\mu V$

## TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, $V_{DD} = +2.3V$ to $+5.5V$ and $V_{SS} = GND$ .						
Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>Temperature Ranges</b>						
Specified Temperature Range	$T_A$	-40	—	+85	°C	
Operating Temperature Range	$T_A$	-40	—	+125	°C	<b>Note 1</b>
Storage Temperature Range	$T_A$	-65	—	+150	°C	
<b>Thermal Package Resistances</b>						
Thermal Resistance, 8L-MSOP	$\theta_{JA}$	—	211	—	°C/W	
Thermal Resistance, 8L-PDIP	$\theta_{JA}$	—	89.3	—	°C/W	
Thermal Resistance, 8L-SOIC	$\theta_{JA}$	—	149.5	—	°C/W	
Thermal Resistance, 14L-PDIP	$\theta_{JA}$	—	70	—	°C/W	
Thermal Resistance, 14L-SOIC	$\theta_{JA}$	—	95.3	—	°C/W	
Thermal Resistance, 14L-TSSOP	$\theta_{JA}$	—	100	—	°C/W	

**Note 1:** The MCP616/7/8/9 operate over this extended temperature range, but with reduced performance. In any case, the Junction Temperature ( $T_J$ ) must not exceed the Absolute Maximum specification of  $+150^\circ\text{C}$ .

### 1.1 Test Circuits

The test circuits used for the DC and AC tests are shown in [Figure 1-2](#) and [Figure 1-3](#). The bypass capacitors are laid out according to the rules discussed in [Section 4.6 “Supply Bypass”](#).

**FIGURE 1-2:** AC and DC Test Circuit for Most Non-Inverting Gain Conditions.

**FIGURE 1-3:** AC and DC Test Circuit for Most Inverting Gain Conditions.

## 3.0 PIN DESCRIPTIONS

Descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

MCP616	MCP617	MCP618	MCP619	Symbol	Description
MSOP, PDIP, SOIC	MSOP, PDIP, SOIC	MSOP, PDIP, SOIC	PDIP, SOIC, TSSOP		
6	1	6	1	$V_{OUT}, V_{OUTA}$	Output (op amp A)
2	2	2	2	$V_{IN}^-, V_{INA}^-$	Inverting Input (op amp A)
3	3	3	3	$V_{IN}^+, V_{INA}^+$	Non-inverting Input (op amp A)
7	8	7	4	$V_{DD}$	Positive Power Supply
—	5	—	5	$V_{INB}^+$	Non-inverting Input (op amp B)
—	6	—	6	$V_{INB}^-$	Inverting Input (op amp B)
—	7	—	7	$V_{OUTB}$	Output (op amp B)
—	—	—	8	$V_{OUTC}$	Output (op amp B)
—	—	—	9	$V_{INC}^-$	Inverting Input (op amp C)
—	—	—	10	$V_{INC}^+$	Non-inverting Input (op amp C)
4	4	4	11	$V_{SS}$	Negative Power Supply
—	—	—	12	$V_{IND}^+$	Non-inverting Input (op amp D)
—	—	—	13	$V_{IND}^-$	Inverting Input (op amp D)
—	—	—	14	$V_{OUTD}$	Output (op amp D)
—	—	8	—	$\overline{CS}$	Chip Select
1, 5, 8	—	1, 5	—	NC	No Internal Connection

### 3.1 Analog Outputs

The output pins are low-impedance voltage sources.

### 3.2 Analog Inputs

The non-inverting and inverting inputs are high-impedance PNP inputs with low bias currents.

### 3.3 Chip Select Digital Input ( $\overline{CS}$ )

This is a CMOS, Schmitt-triggered input that places the MCP618 op amp into a low-power mode of operation.

### 3.4 Power Supply Pins ( $V_{DD}$ , $V_{SS}$ )

The positive power supply ( $V_{DD}$ ) is 2.3V to 5.5V higher than the negative power supply ( $V_{SS}$ ). For normal operation, the other pins are at voltages between  $V_{SS}$  and  $V_{DD}$ .

Typically, these parts are used in a single-supply (positive) supply configuration. In this case,  $V_{SS}$  is connected to ground and  $V_{DD}$  is connected to the supply.  $V_{DD}$  will need bypass capacitors.

# MCP616/7/8/9

---

NOTES:

## 4.0 APPLICATIONS INFORMATION

The MCP616/7/8/9 family of op amps is manufactured using Microchip's state-of-the-art CMOS process, which includes PNP transistors. These op amps are unity-gain stable and suitable for a wide range of general purpose applications.

### 4.1 Rail-to-Rail Inputs

#### 4.1.1 PHASE REVERSAL

The MCP616/7/8/9 op amp is designed to prevent phase reversal when the input pins exceed the supply voltages. Figure 2-36 shows the input voltage exceeding the supply voltage without any phase reversal.

#### 4.1.2 INPUT VOLTAGE AND CURRENT LIMITS

The ESD protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors, and to minimize input bias current ( $I_B$ ). The input ESD diodes clamp the inputs when they try to go more than one diode drop below  $V_{SS}$ . They also clamp any voltages that go too far above  $V_{DD}$ ; their breakdown voltage is high enough to allow normal operation, and low enough to bypass quick ESD events within the specified limits.

**FIGURE 4-1:** Simplified Analog Input ESD Structures.

In order to prevent damage and/or improper operation of these op amps, the circuit they are in must limit the currents and voltages at the  $V_{IN+}$  and  $V_{IN-}$  pins (see “**Absolute Maximum Ratings †**” at the beginning of Section 1.0 “**Electrical Characteristics**”). Figure 4-2 shows the recommended approach to protecting these inputs. The internal ESD diodes prevent the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) from going too far below ground, and the resistors  $R_1$  and  $R_2$  limit the possible current drawn out of the input pins. Diodes  $D_1$  and  $D_2$  prevent the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) from going too far above  $V_{DD}$ , and dump any currents onto  $V_{DD}$ . When implemented as shown, resistors  $R_1$  and  $R_2$  also limit the current through  $D_1$  and  $D_2$ .

**FIGURE 4-2:** Protecting the Analog Inputs.

It is also possible to connect the diodes to the left of resistors  $R_1$  and  $R_2$ . In this case, current through the diodes  $D_1$  and  $D_2$  needs to be limited by some other mechanism. The resistors then serve as in-rush current limiters; the DC current into the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) should be very small.

A significant amount of current can flow out of the inputs when the common mode voltage ( $V_{CM}$ ) is below ground ( $V_{SS}$ ). (See Figure 2-36.) Applications that are high impedance may need to limit the usable voltage range.

#### 4.1.3 NORMAL OPERATION

The inputs of the MCP616/7/8/9 op amps connect to a differential PNP input stage. The common mode input voltage range ( $V_{CMR}$ ) includes ground in single-supply systems ( $V_{SS}$ ), but does not include  $V_{DD}$ . This means that the amplifier input behaves linearly as long as the common mode input voltage ( $V_{CM}$ ) is kept within the specified  $V_{CMR}$  limits ( $V_{SS}$  to  $V_{DD}-0.9V$  at  $+25^\circ C$ ).

### 4.2 DC Offsets

The MCP616/7/8/9 family of op amps have a PNP input differential pair that gives good DC performance. They have very low input offset voltage ( $\pm 150 \mu V$ , maximum) at  $T_A = +25^\circ C$ , with a typical bias current of  $-15 \text{ nA}$  (sourced out of the inputs).

There must be a DC path to ground (or power supply) from both inputs, or the op amp will not bias properly. The DC resistances seen by the op amp inputs ( $R_1 || R_2$  and  $R_4 || R_5$  in Figure 4-3) need to be equal and less than  $100 \text{ k}\Omega$ , to minimize the total DC offset.

# MCP616/7/8/9

**FIGURE 4-3:** Example Circuit for Calculating DC Offset.

To calculate the DC bias point and DC offset, convert the circuit to its DC equivalent:

- Replace capacitors with open circuits
- Replace inductors with short circuits
- Replace AC voltage sources with short circuits
- Replace AC current sources with open circuits
- Convert DC sources and resistances into their Thevenin equivalent form

The DC equivalent circuit for Figure 4-3 is shown in Figure 4-4.

**FIGURE 4-4:** Equivalent DC Circuit.

Now calculate the nominal DC bias point with offset:

## EQUATION 4-1:

$$G_N = 1 + R_2/R_1$$

$$V_{OOS} = G_N [V_{OS} + I_B ((R_1 \parallel R_2) - R_{EQ}) - I_{OS} ((R_1 \parallel R_2) + R_{EQ}) / 2]$$

$$V_{CM} = V_{EQ} - (I_B + I_{OS}/2) R_{EQ}$$

$$V_{OUT} = V_{EQ} (G_N) - V_I (G_N - 1) + V_{OOS}$$

Where:

$G_N$	=	op amp's noise gain (from the non-inverting input to the output)
$V_{OOS}$	=	circuit's output offset voltage
$V_{OS}$	=	op amp's input offset voltage
$I_B$	=	op amp's input bias current
$I_{OS}$	=	op amp's input offset current
$V_{CM}$	=	op amp's common mode input voltage

Use the worst-case specs and source values to determine the worst-case output voltage range and offset for your design. Make sure the common mode input voltage range and output voltage range are not exceeded.

## 4.3 Rail-to-Rail Output

There are two specifications that describe the output swing capability of the MCP616/7/8/9 family of op amps. The first specification (Maximum Output Voltage Swing) defines the absolute maximum swing that can be achieved under the specified load conditions. For instance, the output voltage swings to within 15 mV of the negative rail with a 25 kΩ load tied to  $V_{DD}/2$ . Figure 2-33 shows how the output voltage is limited when the input goes beyond the linear region of operation.

The second specification that describes the output swing capability of these amplifiers is the Linear Output Voltage Range. This specification defines the maximum output swing that can be achieved while the amplifier still operates in its linear region. To verify linear operation in this range, the large-signal DC Open-Loop Gain ( $A_{OL}$ ) is measured at points inside the supply rails. The measurement must meet the specified  $A_{OL}$  conditions in the specification table.

## 4.4 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. A unity-gain buffer ( $G = +1$ ) is the most sensitive to capacitive loads, though all gains show the same general behavior.

When driving large capacitive loads with these op amps (e.g.,  $> 60 \text{ pF}$  when  $G = +1$ ), a small series resistor at the output ( $R_{ISO}$  in Figure 4-5) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. The bandwidth will be generally lower than the bandwidth with no capacitive load.

**FIGURE 4-5:** Output Resistor,  $R_{ISO}$  stabilizes large capacitive loads.

Figure 4-6 gives recommended  $R_{ISO}$  values for different capacitive loads and gains. The x-axis is the normalized load capacitance ( $C_L/G_N$ ), where  $G_N$  is the circuit's noise gain. For non-inverting gains,  $G_N$  and the Signal Gain are equal. For inverting gains,  $G_N$  is  $1 + |\text{Signal Gain}|$  (e.g.,  $-1 \text{ V/V}$  gives  $G_N = +2 \text{ V/V}$ ).

**FIGURE 4-6:** Recommended  $R_{ISO}$  Values for Capacitive Loads.

After selecting  $R_{ISO}$  for your circuit, double-check the resulting frequency response peaking and step response overshoot. Modify  $R_{ISO}$ 's value until the response is reasonable. Bench evaluation and simulations with the MCP616/7/8/9 SPICE macro model are helpful.

## 4.5 MCP618 Chip Select ( $\overline{CS}$ )

The MCP618 is a single op amp with Chip Select ( $\overline{CS}$ ). When  $\overline{CS}$  is pulled high, the supply current drops to 50 nA (typical) and flows through the  $\overline{CS}$  pin to  $V_{SS}$ . When this happens, the amplifier output is put into a high-impedance state. By pulling  $\overline{CS}$  low, the amplifier is enabled. The  $\overline{CS}$  pin has an internal  $5 \text{ M}\Omega$  (typical) pull-down resistor connected to  $V_{SS}$ , so it will go low if the  $\overline{CS}$  pins is left floating. Figure 1-1 shows the output voltage and supply current response to a  $\overline{CS}$  pulse.

## 4.6 Supply Bypass

With this family of operational amplifiers, the power supply pin ( $V_{DD}$  for single supply) should have a local bypass capacitor (i.e.,  $0.01 \text{ }\mu\text{F}$  to  $0.1 \text{ }\mu\text{F}$ ) within 2 mm for good high-frequency performance. It may use a bulk capacitor (i.e.,  $1 \text{ }\mu\text{F}$  or larger) within 100 mm to provide large, slow currents. This bulk capacitor is not required and can be shared with other analog parts.

## 4.7 Unused Op Amps

An unused op amp in a quad package (MCP619) should be configured as shown in Figure 4-7. These circuits prevent the output from toggling and causing crosstalk. Circuit A sets the op amp at its minimum noise gain. The resistor divider produces any desired reference voltage within the output voltage range of the op amp; the op amp buffers that reference voltage. Circuit B uses the minimum number of components and operates as a comparator, but it may draw more current.

**FIGURE 4-7:** Unused Op Amps.

# MCP616/7/8/9

## 4.8 PCB Surface Leakage

In applications where low input bias current is critical, Printed Circuit Board (PCB) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is  $10^{12}\Omega$ . A 5V difference would cause 5 pA of current to flow, which is greater than the MCP616/7/8/9 family's bias current at 25°C (1 pA, typical).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example is shown below in Figure 4-8.

**FIGURE 4-8:** Example Guard Ring Layout for Inverting Gain.

1. Non-inverting Gain and Unity Gain Buffer:
  - a) Connect the non-inverting pin ( $V_{IN+}$ ) to the input with a wire that does not touch the PCB surface.
  - b) Connect the guard ring to the inverting input pin ( $V_{IN-}$ ). This biases the guard ring to the common mode input voltage.
2. Inverting Gain and Transimpedance gain (convert current to voltage, such as photo detectors) amplifiers:
  - a) Connect the guard ring to the non-inverting input pin ( $V_{IN+}$ ). This biases the guard ring to the same reference voltage as the op amp (e.g.,  $V_{DD}/2$  or ground).
  - b) Connect the inverting pin ( $V_{IN-}$ ) to the input with a wire that does not touch the PCB surface.

## 4.9 Application Circuits

### 4.9.1 HIGH GAIN PRE-AMPLIFIER

The MCP616/7/8/9 op amps are well suited to amplifying small signals produced by low-impedance sources/sensors. The low offset voltage, low offset current and low noise fit well in this role. Figure 4-9 shows a typical pre-amplifier connected to a low-impedance source ( $V_S$  and  $R_S$ ).

**FIGURE 4-9:** High Gain Pre-amplifier.

For the best noise and offset performance, the source resistance  $R_S$  needs to be less than 15 k $\Omega$ . The DC resistances at the inputs are equal to minimize the offset voltage caused by the input bias currents (Section 4.2 “DC Offsets”). In this circuit, the DC gain is 10 V/V, which will give a typical bandwidth of 19 kHz.

### 4.9.2 TWO OP AMP INSTRUMENTATION AMPLIFIER

The two-op amp instrumentation amplifier shown in Figure 4-10 serves the function of taking the difference of two input voltages, level-shifting it and gaining it to the output. This configuration is best suited for higher gains (i.e., gain > 3 V/V). The reference voltage ( $V_{REF}$ ) is typically at mid-supply ( $V_{DD}/2$ ) in a single-supply environment.

**FIGURE 4-10:** Two-Op Amp Instrumentation Amplifier.

The key specifications that make the MCP616/7/8/9 family appropriate for this application circuit are low input bias current, low offset voltage and high common-mode rejection.

## 4.9.3 THREE OP AMP INSTRUMENTATION AMPLIFIER

A classic, three-op amp instrumentation amplifier is illustrated in Figure 4-11. The two-input op amps provide differential signal gain and a common mode gain of +1. The output op amp is a difference amplifier, which converts its input signal from differential to a single-ended output; it rejects common mode signals at its input. The gain of this circuit is simply adjusted with one resistor ( $R_G$ ). The reference voltage ( $V_{REF}$ ) is typically referenced to mid-supply ( $V_{DD}/2$ ) in single-supply applications.

**FIGURE 4-11:** Three-Op Amp Instrumentation Amplifier.

## 4.9.4 PRECISION GAIN WITH GOOD LOAD ISOLATION

In Figure 4-12, the MCP616 op amp,  $R_1$  and  $R_2$  provide a high gain to the input signal ( $V_{IN}$ ). The MCP616's low offset voltage makes this an accurate circuit.

The MCP606 is configured as a unity-gain buffer. It isolates the MCP616's output from the load, increasing the high gain stage's precision. Since the MCP606 has a higher output current, and the two amplifiers are housed in separate packages, there is minimal change in the MCP616's offset voltage due to loading effect.

**FIGURE 4-12:** Precision Gain with Good Load Isolation.

NOTES:

## 5.0 DESIGN AIDS

Microchip provides the basic design tools needed for the MCP616/7/8/9 family of op amps.

### 5.1 SPICE Macro Model

The latest SPICE macro model for the MCP616/7/8/9 op amps is available on the Microchip web site at [www.microchip.com](http://www.microchip.com). This model is intended to be an initial design tool that works well in the op amp's linear region of operation over the temperature range. See the model file for information on its capabilities.

Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specifications and characteristic curves.

### 5.2 Mindi™ Circuit Designer & Simulator

Microchip's Mindi™ Circuit Designer & Simulator aids in the design of various circuits useful for active filter, amplifier and power-management applications. It is a free online circuit designer & simulator available from the Microchip web site at [www.microchip.com/mindi](http://www.microchip.com/mindi). This interactive circuit designer & simulator enables designers to quickly generate circuit diagrams, simulate circuits. Circuits developed using the Mindi Circuit Designer & Simulator can be downloaded to a personal computer or workstation.

### 5.3 Microchip Advanced Part Selector (MAPS)

MAPS is a software tool that helps semiconductor professionals efficiently identify Microchip devices that fit a particular design requirement. Available at no cost from the Microchip website at [www.microchip.com/maps](http://www.microchip.com/maps), the MAPS is an overall selection tool for Microchip's product portfolio that includes Analog, Memory, MCUs and DSCs. Using this tool you can define a filter to sort features for a parametric search of devices and export side-by-side technical comparison reports. Helpful links are also provided for Datasheets, Purchase, and Sampling of Microchip parts.

## 5.4 Analog Demonstration and Evaluation Boards

Microchip offers a broad spectrum of Analog Demonstration and Evaluation Boards that are designed to help you achieve faster time to market. For a complete listing of these boards and their corresponding user's guides and technical information, visit the Microchip web site at [www.microchip.com/analogtools](http://www.microchip.com/analogtools).

Two of our boards that are especially useful are:

- **P/N SOIC8EV:** *8-Pin SOIC/MSOP/TSSOP/DIP Evaluation Board*
- **P/N SOIC14EV:** *14-Pin SOIC/TSSOP/DIP Evaluation Board*

## 5.5 Application Notes

The following Microchip Application Notes are available on the Microchip web site at [www.microchip.com/appnotes](http://www.microchip.com/appnotes) and are recommended as supplemental reference resources.

**ADN003:** *"Select the Right Operational Amplifier for your Filtering Circuits"*, DS21821

**AN722:** *"Operational Amplifier Topologies and DC Specifications"*, DS00722

**AN723:** *"Operational Amplifier AC Specifications and Applications"*, DS00723

**AN884:** *"Driving Capacitive Loads With Op Amps"*, DS00884

**AN990:** *"Analog Sensor Conditioning Circuits – An Overview"*, DS00990

These application notes and others are listed in the design guide:

*"Signal Chain Design Guide"*, DS21825

NOTES:

## 6.0 PACKAGING INFORMATION

### 6.1 Package Marking Information

8-Lead MSOP

Example:

8-Lead PDIP (300 mil)

Examples:

8-Lead SOIC (150 mil)

Examples:

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

# MCP616/7/8/9

## Package Marking Information (Continued)

14-Lead PDIP (300 mil) (MCP619)

Examples:

OR

14-Lead SOIC (150 mil) (MCP619)

Examples:

OR

14-Lead TSSOP (MCP619)

Example:

## 8-Lead Plastic Micro Small Outline Package (MS) [MSOP]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Number of Pins	N	8		
Pitch	e	0.65 BSC		
Overall Height	A	–	–	1.10
Molded Package Thickness	A2	0.75	0.85	0.95
Standoff	A1	0.00	–	0.15
Overall Width	E	4.90 BSC		
Molded Package Width	E1	3.00 BSC		
Overall Length	D	3.00 BSC		
Foot Length	L	0.40	0.60	0.80
Footprint	L1	0.95 REF		
Foot Angle	$\phi$	0°	–	8°
Lead Thickness	c	0.08	–	0.23
Lead Width	b	0.22	–	0.40

**Notes:**

- Pin 1 visual index feature may vary, but must be located within the hatched area.
- Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15 mm per side.
- Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

REF: Reference Dimension, usually without tolerance, for information purposes only.

## APPENDIX A: REVISION HISTORY

### Revision C (October 2008)

The following is the list of modifications:

1. Added **Section 1.1 “Test Circuits”**.
2. Added [Figure 2-36](#).
3. Added **Section 4.1.1 “Phase Reversal”**, **Section 4.1.2 “Input Voltage and Current Limits”**, and **Section 4.1.3 “Normal Operation”**.
4. Updated [Figure 4-7](#).
5. Updated **Section 5.0 “Design Aids”**.
6. Updated **Section 6.0 “Packaging Information”**

### Revision B (April 2005)

The following is the list of modifications:

1. Clarified specifications found in **Section 1.0 “Electrical Characteristics”**.
2. Updated **Section 2.0 “Typical Performance Curves”** and added input noise current density plot.
3. Added **Section 3.0 “Pin Descriptions”**.
4. Updated **Section 4.0 “Applications Information”**.
5. Updated the SPICE macro model and added information on the FilterLab software, in **Section 5.0 “Design Aids”**.
6. Corrected package marking information (**Section 6.0 “Packaging Information”**).
7. Added **Appendix A: “Revision History”**.

### Revision A (April 2001)

- Original Release of this Document.

# MCP616/7/8/9

---

NOTES:

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X	/XX	
Device	Temperature Range	Package	
Device:	MCP616:	Single Operational Amplifier	
	MCP616T:	Single Operational Amplifier (Tape and Reel for SOIC, MSOP)	
	MCP617:	Dual Operational Amplifier	
	MCP617T:	Dual Operational Amplifier (Tape and Reel for SOIC and MSOP)	
	MCP618:	Single Operational Amplifier w/Chip Select ( $\overline{CS}$ )	
	MCP618T:	Single Operational Amplifier w/Chip Select ( $\overline{CS}$ ) (Tape and Reel for SOIC and MSOP)	
	MCP619:	Quad Operational Amplifier	
	MCP619T:	Quad Operational Amplifier (Tape and Reel for SOIC and TSSOP)	
Temperature Range:	I	= -40°C to +85°C	
Package:	MS	= Plastic MSOP, 8-lead	
	P	= Plastic DIP (300 mil Body), 8-lead, 14-lead	
	SN	= Plastic SOIC (3.90 mm body), 8-lead	
	SL	= Plastic SOIC (3.90 mm Body), 14-lead (MCP619)	
	ST	= Plastic TSSOP (4.4mm Body), 14-lead (MCP619)	
			<b>Examples:</b>
			a) MCP616-I/P: Industrial Temperature, 8 lead PDIP.
			b) MCP616-I/SN: Industrial Temperature, 8 lead SOIC.
			c) MCP616T-I/MS: Tape and Reel, Industrial Temperature, 8 lead MSOP.
			a) MCP617-I/MS: Industrial Temperature, 8 lead MSOP.
			b) MCP617T-I/MS: Tape and Reel, Industrial Temperature, 8 lead MSOP.
			c) MCP617-I/P: Industrial Temperature, 8 lead PDIP.
			a) MCP618-I/SN: Industrial Temperature, 8 lead SOIC.
			b) MCP618T-I/SN: Tape and Reel, Industrial Temperature, 8 lead SOIC.
			c) MCP618-I/P: Industrial Temperature, 8 lead PDIP.
			a) MCP619T-I/SL: Tape and Reel, Industrial Temperature, 14 lead SOIC.
			b) MCP619T-I/ST: Tape and Reel, Industrial Temperature, 14 lead TSSOP.
			c) MCP619-I/P: Industrial Temperature, 14 lead PDIP.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
