## Ultra-Low Additive Jitter Fanout Clock Buffers with up to 10 Universal Outputs from Any-Format Input and Wide Frequency Range from 1 MHz to 725 MHz

The Si5330x family of Universal/Any-format fanout buffers is ideal for clock distribution (1 MHz minimum) and redundant clocking applications. These devices feature typical ultra-low jitter characteristics of 50 fs and operate over a wide frequency range. Built-in LDOs deliver high PSRR performance and reduce the need for external components, simplifying low-jitter clock distribution in noisy environments.

The Si5330x family is available in multiple configurations, with some versions offering a selectable input clock using a 2:1 input mux. Other features include independent (synchronous) output enable, glitchless switching, LOS monitor of input clocks, output clock division, and built-in format translation. These buffers can be paired with the Si534x clocks and jitter attenuators, the Si5332 clocks, and the Si5xx oscillators to deliver end-to-end clock tree performance.

### KEY FEATURES

---

- Ultra-low additive jitter: 50 fs rms
- Built-in LDOs for high PSRR performance
- Up to 10 outputs
- Any-format Inputs (LVPECL, Low-power LVPECL, LVDS, CML, HCSSL, LVCMOS)
- Wide frequency range
- Output Enable option
- Multiple configuration options
  - Dual Bank option
  - 2:1 Input Mux operation
- Synchronous output enable
- Loss of signal (LOS) monitors for loss of input clock
- Output clock division: /1, /2, /4
- RoHS compliant, Pb-free
- Temperature range: -40 to +85 °C

**Note:**

- The synchronous features (Glitch-less switching and Synchronous OE) of the Si533xx family require a minimum input clock frequency of 1 MHz. If the selected input clock stops, pauses, or is gapped such that the 1 MHz minimum is not met for any time interval, then the output clock(s) will be disabled (turned off). Once the paused input clock restarts, the output clock may NOT start up immediately. Output start-up (turning back on) may be delayed for several input clock cycles until the internal synchronizer determines the input clock is once again valid.

## 2. Functional Description

The Si5330x family of low-jitter, low-skew, universal/any-format buffers accepts most common differential or LVCMOS input signals. These devices are available in multiple configurations customized for the end application (refer to [1. Ordering Guide](#) for more details on configurations).

### 2.1 Universal, Any-Format Input Termination

The universal input stage enables simple interfacing to a wide variety of clock formats, including LVPECL, low-power LVPECL, LVCMOS, LVDS, HCSL, and CML. The simplified tables below summarize the various ac- and dc-coupling options supported by the device. For the best high-speed performance, the use of differential formats is recommended. For both single-ended and differential input clocks, the fastest possible slew rate is recommended since low slew rates can increase the noise floor and degrade jitter performance. Though not required, a minimum slew rate of 0.75 V/ns is recommended for differential formats and 1.0 V/ns for single-ended formats. See [AN766: Understanding and Optimizing Clock Buffer's Additive Jitter Performance](#) for more information.

**Table 2.1. AC-Coupled Clock Input Options**

Clock Format	1.8 V	2.5/3.3 V
LVPECL/Low-power LVPECL	N/A	Yes
LVCMOS	No	Yes
LVDS	Yes	Yes
HCSL	No	Yes
CML	Yes	Yes

Note:  
Value for  $R_s$  should be chosen so that the total source impedance matches the characteristic impedance of the PCB trace.

**Figure 2.2. DC-Coupled, Single-Ended (LVCMOS) Input Termination**

Notes:

2. Value for  $R_s$  should be chosen so that the total source impedance matches the characteristic impedance of the PCB trace.

**Figure 2.3. AC-Coupled, Single-Ended (LVCMOS) Input Termination**

Note: 33 Ohm series termination is optional depending on the location of the receiver.

**Figure 2.4. Differential DC-Coupled Input Terminations**

Table 2.3. AC/DC-Coupled Clock Input Requirements for Glitchless, Non-Continuous Clocks<sup>1, 2, 3</sup>

Clock Input Type	Input Clock Driver Stop State		
	Low	High	High-Z
DC-Coupled	Yes	Yes	No
AC-Coupled	Yes	No	No

**Note:**

1. "Non-continuous clocks" means any clock that can be stopped, disabled, or gapped.
2. "Yes" means this configuration is supported.
3. "No" indicates that the configuration is not supported. Operating under a "No" condition can result in erroneous clock outputs and/or erroneous LOS indications. Operating the device in unsupported configurations is not recommended.

**2.2 Internal Input Bias Resistors**

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The clock input should not be actively driven when power is not applied to the device. The non-inverting input is biased with a 18.75 k $\Omega$  pull-down to GND and a 75 k $\Omega$  pull-up to V<sub>DD</sub>. The inverting input is biased with a 75 k $\Omega$  pull-up to V<sub>DD</sub>.

Figure 2.5. Internal Input Bias Resistors

## 2.3 Voltage Reference ( $V_{REF}$ )

The  $V_{REF}$  pin can be used to bias the input receiver, as shown in the figure below, when a single-ended input clock (such as LVCMOS) is used. Note that  $V_{REF} = V_{DD}/2$  and should be compatible with the  $V_{cm}$  rating of the single-ended input clock driving the CLK0 or CLK1 inputs. To optimize jitter and duty cycle performance, use the circuit in [Figure 2.3 AC-Coupled, Single-Ended \(LVCMOS\) Input Termination on page 6](#).  $V_{REF}$  pin should be left floating when differential clocks are used.

Figure 2.6. Using Voltage Reference with Single-Ended Input Clock

## 2.4 Universal, Any-Format Output Buffer

The highly flexible output drivers support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMOS. SFOUTx[1] and SFOUTx[0] are 3-level inputs that can be pinstrapped to select the Bank A and Bank B clock signal formats independently. This feature enables the device to be used for format/level translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMOS drive strength options are available for each  $V_{DDO}$  setting.

**Note:**

1. SFOUTx[1:0] are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin is internally biased to  $V_{DD}/2$ .

## 2.5 Input Mux (Si53301/02/04/05/07 Only)

The Si53301/02/04/05/07 provide two clock inputs for applications that need to select between one of two clock sources. The CLK\_SEL pin selects the active clock input and has an internal pulldown resistor. The following table summarizes the input and output clock based on the input mux pin settings.

**Table 2.5. Input Mux Logic**

CLK_SEL	CLK0	CLK1	Q <sup>1</sup>	Q <sub>b</sub>

L	H	X	H	L
H	X	L	L	H
H	X	H	H	L

**Note:**

## 2.6 Glitchless Clock Input Switching

The Si53301/2/4/5/7 feature glitchless switching between two valid input clocks. The following figure illustrates that switching between input clocks does not generate runt pulses or glitches at the output.

**Figure 2.7. Glitchless Input Clock Switch**

The Si53301/2/4/5/7 support glitchless switching between clock inputs with a frequency variance up to 10x. When a switchover to a new clock is made, the output will disable low after two or three clock cycles of the previously selected input clock. The outputs will remain low for up to three clock cycles of the newly-selected clock, after which the outputs will start from the newly-selected input. If a switchover to an absent clock is made, the output will glitchlessly stop low and wait for edges of the newly-selected clock. A switchover from an absent clock to a live clock will also be glitchless. Note that the CLK\_SEL input should not be toggled faster than 1/250th the frequency of the slower input clock.

## 2.7 Synchronous Output Enable

The Si5330x features a synchronous output enable (disable) feature. The output enable pin is sampled and synchronized to the falling edge of the input clock. This feature prevents runt pulses from being generated when the outputs are enabled or disabled.

When OE is low, Q is held low and Q<sub>b</sub> is held high for differential output formats. For LVCMOS output format options, both Q and Q<sub>b</sub> are held low when OE is set low. The output enable pin has an internal pull-up that enables the outputs when left unconnected. See [Table 3.10 AC Characteristics on page 23](#) for output enable and output disable times.

## 2.8 Loss of Signal (LOS) Indicator

Si53301/2/8 feature a Loss of Signal (LOS) indicator. The LOS0 and LOS1 indicators are used to check for the presence of input clocks CLK0 and CLK1. The LOS0 and LOS1 pins must be checked prior to selecting the clock input or should be polled to check for the presence of the currently selected input clock. In the event that an input clock is not present, the associated LOSx pin will assume a logic high (LOSx = 1) state. When a clock is present at the associated input clock pin, the LOSx pin will assume a logic low (LOSx = 0) state.

## 2.9 Flexible Output Divider

The Si53301/02/03/08 provide optional clock division in addition to clock distribution. The divider setting for each bank of output clocks is selected via 3-level control pins as shown in the table below. Leaving the DIVx pins open will force a divider value of 1, which is the default mode of operation.

**Table 2.6. Divider Selection**

DIVx <sup>1</sup>	Divider Value
Open	÷1 (default)
0	÷2
1	÷4

**Notes:**

1. DIVx are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin is internally biased to  $V_{DD}/2$ .

## 2.10 Power Supply ( $V_{DD}$ and $V_{DDOX}$ )

The device includes separate core ( $V_{DD}$ ) and output driver supplies ( $V_{DDOX}$ ). This feature allows the core to operate at a lower voltage than  $V_{DDO}$ , reducing current consumption in mixed supply applications. The core  $V_{DD}$  supports 3.3, 2.5, or 1.8 V. Control signals, such as CLK\_SEL, DIV, and OE, are in the VDD domain. Each output bank has its own  $V_{DDOX}$  supply, supporting 3.3, 2.5, or 1.8 V.

## 2.11 Output Clock Termination Options

The recommended output clock termination options for ac and dc are shown below. Unused outputs should be left unconnected.

### AC-Coupled LVPECL Output Termination Scheme 1

3.3 V LVPECL:  $R_1 = 82.5 \Omega$ ;  $R_2 = 127 \Omega$ ;  $R_b = 120 \Omega$   
2.5 V LVPECL:  $R_1 = 62.5 \Omega$ ;  $R_2 = 250 \Omega$ ;  $R_b = 90 \Omega$

### AC-Coupled LVPECL Output Termination Scheme 2

### 2.12 LVCMOS Output Termination to Support 1.5 V and 1.2 V

LVCMOS clock outputs are natively supported at 1.8, 2.5, and 3.3 V. However, 1.2 V and 1.5 V LVCMOS clock outputs can be supported via a simple resistor divider network that will translate the buffer's 1.8 V output to a lower voltage as shown in the following figure.

## 2.14 Typical Phase Noise Performance (Differential Input Clock)

Each of the phase noise plots superimposes Source Jitter, Total SE Jitter, and Total Diff Jitter on the same diagram.

- **Source Jitter**—Reference clock phase noise (measured Single-ended to PNA).
- **Total Jitter (SE)**—Combined source and clock buffer phase noise measured as a single-ended output to the phase noise analyzer and integrated from 12 kHz to 20 MHz.
- **Total Jitter (Diff)**—Combined source and clock buffer phase noise measured as a differential output to the phase noise analyzer and integrated from 12 kHz to 20 MHz. The differential measurement as shown in each figure is made using a balun. For more information, see 3. Electrical Specifications.

**Note:** To calculate the total RMS phase jitter when adding a buffer to your clock tree, use the root-sum-square (RSS).

Figure 2.17. Total Jitter Single-Ended Input (156.25 MHz)

## 2.16 Input Mux Noise Isolation

The input clock mux is designed to minimize crosstalk between CLK0 and CLK1. This improves phase jitter performance when clocks are present at both the CLK0 and CLK1 inputs. The following figure shows a measurement of the input mux's noise isolation.

Figure 2.18. Input Mux Noise Isolation (Differential Input Clock, 44-QFN Package)

Figure 2.19. Input Mux Noise Isolation (Single-Ended Input Clock, 44-QFN Package)

## 2.17 Power Supply Noise Rejection

The device supports on-chip supply voltage regulation to reject power supply noise and simplify low-jitter operation in real-world environments. This feature enables robust operation alongside FPGAs, ASICs and SoCs and may reduce board-level filtering requirements. See [AN491: Power Supply Rejection for Low-Jitter Clocks](#) for more information.

**Note:**

1. Core supply  $V_{DD}$  and output buffer supplies  $V_{DDOX}$  are independent. LVC MOS clock input is not supported for  $V_{DD} = 1.8$  V but is supported for LVC MOS clock output for  $V_{DDOX} = 1.8$  V. LVC MOS outputs at 1.5 V and 1.2 V can be supported via a simple resistor divider network.

<b>Notes:</b>						
1. HCSL measurements were made with receiver termination and applies for 2.5 V and 3.3 V only. See <a href="#">Figure 2.9 LVDS, CML, HCSL, and Low-Power LVPECL Output Terminations on page 13</a> .						
2. Output to Output skew specified for outputs with an identical configuration.						
3. Defined as skew between any output on different devices operating at the same supply voltage, temperature, and equal load condition. Using the same type of inputs on each device, the outputs are measured at the differential cross points.						
4. Measured for 156.25 MHz carrier frequency. Sine-wave noise added to $V_{DDOX}$ (3.3 V = 100 mV <sub>PP</sub> ) and noise spur amplitude measured. See "AN491: Power Supply Rejection for Low-Jitter Clocks" for further details.						
5. TBD						
6. 50% input duty cycle.						
7. LVCMOS outputs are in phase.

## 5. Pin Descriptions

### 5.1 Si53301 Pin Descriptions

Table 5.1. Si53301 -QFN Pin Descriptions

Pin	Name	Type <sup>1</sup>	Description
1	DIVA	I	Output divider control pin for Bank A Three-level input control. Internally biased at $V_{DD}/2$ . Can be left floating or tied to ground or $V_{DD}$ .
2	SFOUTA[1]	I	Output signal format control pin for Bank A Three-level input control. Internally biased at $V_{DD}/2$ . Can be left floating or tied to ground or $V_{DD}$ .
3	SFOUTA[0]	I	Output signal format control pin for Bank A Three-level input control. Internally biased at $V_{DD}/2$ . Can be left floating or tied to ground or $V_{DD}$ .
4	Q0b	O	Output clock 0 (complement)
5	Q0	O	Output clock 0
6	GND	GND	Ground
7	VDD	P	Core voltage supply. Bypass with 1.0 $\mu$ F capacitor placed as close to the VDD pin as possible.

Pin	Name	Type <sup>1</sup>	Description
8	CLK_SEL	I	Mux input select pin Clock inputs are switched without the introduction of glitches. When CLK_SEL is high, CLK1 is selected. When CLK_SEL is low, CLK0 is selected. CLK_SEL contains an internal pull-down resistor.
9	LOS0	O	The LOS0 status pin indicates whether a clock is present at the CLK0 input. CLK0 input clock present LOS0 = 0 CLK0 input clock not present LOS0 = 1
10	CLK0	I	Input clock 0
11	CLK0b	I	Input clock 0 (complement) When the CLK0 is driven by a single-end input, connect CLK0b to $V_{DD}/2$ .
12	OEA	I	Output enable—Bank A (Outputs Q0 to Q2). When OE = high, the Bank A outputs are enabled. When OE = low, Q is held low, and Qb is held high for differential formats. For LVCMOS, both Q and Qb are held low when OE is set low. OEA contains an internal pull-up resistor.
13	OEB	I	Output enable—Bank B (Outputs Q3 to Q5) When OE = high, the Bank B outputs are enabled. When OE = low, Q is held low, and Qb is held high for differential formats. For LVCMOS, both Q and Qb are held low when OE is set low. OEB contains an internal pull-up resistor.
14	CLK1	I	Input clock 1
15	CLK1b	I	Input clock 1 (complement) When the CLK1 is driven by a single-end input, connect CLK1b to $V_{DD}/2$ .
16	LOS1	O	The LOS1 status pin indicates whether a clock is present at the CLK1 input: CLK1 input clock present LOS1 = 0 CLK1 input clock not present LOS1 = 1
17	VREF	O	Reference voltage output.
18	VDDOA	P	Output voltage supply—Bank A (Outputs: Q0 to Q2) Bypass with 1.0 $\mu$ F capacitor and place as close to the VDDOA pin as possible.
19	VDDOB	P	Output voltage supply—Bank B (Outputs: Q3 to Q5) Bypass with 1.0 $\mu$ F capacitor and place as close to the VDDOB pin as possible.
20	Q5b	O	Output clock 5 (complement)
21	Q5	O	Output clock 5
22	SFOUTB[0]	I	Output signal format control pin for Bank B. Three-level input control. Internally biased at $V_{DD}/2$ . Can be left floating or tied to ground or $V_{DD}$ .

Pin	Name	Type <sup>1</sup>	Description
23	SFOUTB[1]	I	Output signal format control pin for Bank B. Three-level input control. Internally biased at $V_{DD}/2$ . Can be left floating or tied to ground or $V_{DD}$ .
24	DIVB	I	Output divider configuration bit for Bank B. Three-level input control. Internally biased at $V_{DD}/2$ . Can be left floating or tied to ground or $V_{DD}$ .
25	Q4b	O	Output clock 4 (complement)
26	Q4	O	Output clock 4
27	Q3b	O	Output clock 3 (complement)
28	Q3	O	Output clock 3
29	Q2b	O	Output clock 2 (complement)
30	Q2	O	Output clock 2
31	Q1b	O	Output clock 1 (complement)
32	Q1	O	Output clock 1
GND Pad	GND	GND	Power supply ground and thermal relief.

**Note:**

1. Pin types are: I = input, O = output, P = power, GND = ground.

## 7. Land Patterns

### 7.1 16-QFN Land Pattern

Figure 7.1. 3x3 mm 16-QFN Land Pattern

Table 7.1. PCB Land Pattern

Dimension	mm
C1	3.00
C2	3.00
E	0.50
X1	0.30
Y1	0.80
X2	1.80
Y2	1.80

#### Notes:

##### General

1. All dimensions shown are in millimeters (mm).
2. This Land Pattern Design is based on the IPC-7351 guidelines.
3. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.

##### Solder Mask Design

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60µm minimum, all the way around the pad.

##### Stencil Design

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2 x 2 array of 0.65 mm square openings on a 0.90 mm pitch should be used for the center ground pad.

##### Card Assembly

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

**Notes:****General**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

**Solder Mask Design**

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60  $\mu\text{m}$  minimum, all the way around the pad.

**Stencil Design**

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 0.75 mm square openings on 1.15 mm pitch should be used for the center ground pad.

**Card Assembly**

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 1.0 mm square openings on 1.45 mm pitch should be used for the center ground pad.

**Card Assembly**

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
