

### Bipolar IC

#### Overview

#### Features

- 2 × 0.75 A / 50 V outputs
- Integrated driver, control logic and current control (chopper)
- Fast free-wheeling diodes
- Low standby-current drain
- Full, half, quarter, mini step

Type	Ordering Code	Package
TLE 4726 G	Q67006-A9297	P-DSO-24-3

#### Description

TLE 4726 is a bipolar, monolithic IC for driving bipolar stepper motors, DC motors and other inductive loads that operate on constant current. The control logic and power output stages for two bipolar windings are integrated on a single chip which permits switched current control of motors with 0.75 A per phase at operating voltages up to 50 V.

The direction and value of current are programmed for each phase via separate control inputs. A common oscillator generates the timing for the current control and turn-on with phase offset of the two output stages. The two output stages in a full-bridge configuration have integrated, fast free-wheeling diodes and are free of crossover current. The logic is supplied either separately with 5 V or taken from the motor supply voltage by way of a series resistor and an integrated Z-diode. The device can be driven directly by a microprocessor with the possibility of all modes from full step through half step to mini step.

### Pin Definitions and Functions

Pin No.	Function																				
1, 2, 23, 24	<p><b>Digital control inputs IX0, IX1</b> for the magnitude of the <b>current</b> of the particular phase.</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>IX1</th> <th>IX0</th> <th>Phase Current</th> <th>Example of Motor Status</th> </tr> </thead> <tbody> <tr> <td>H</td> <td>H</td> <td>0</td> <td>No current</td> </tr> <tr> <td>H</td> <td>L</td> <td><math>1/3 I_{max}</math></td> <td>Hold</td> </tr> <tr> <td>L</td> <td>H</td> <td><math>2/3 I_{max}</math></td> <td>Set</td> </tr> <tr> <td>L</td> <td>L</td> <td><math>I_{max}</math></td> <td>Accelerate</td> </tr> </tbody> </table> <p style="margin-left: 100px;">typical <math>I_{max}</math> with <math>R_{sense} = 1 \Omega</math>: 750 mA</p>	IX1	IX0	Phase Current	Example of Motor Status	H	H	0	No current	H	L	$1/3 I_{max}$	Hold	L	H	$2/3 I_{max}$	Set	L	L	$I_{max}$	Accelerate
IX1	IX0	Phase Current	Example of Motor Status																		
H	H	0	No current																		
H	L	$1/3 I_{max}$	Hold																		
L	H	$2/3 I_{max}$	Set																		
L	L	$I_{max}$	Accelerate																		
3	<b>Input Phase 1</b> ; controls the current through phase winding 1. On H-potential the phase current flows from Q11 to Q12, on L-potential in the reverse direction.																				
5, 6, 7, 8, 17, 18, 19, 20	<b>Ground</b> ; all pins are connected internally.																				
4	<b>Oscillator</b> ; works at approx. 25 kHz if this pin is wired to ground across 2.2 nF.																				
10	<b>Resistor <math>R_1</math></b> for sensing the current in phase 1.																				
9, 12	<b>Push-pull outputs Q11, Q12</b> for phase 1 with integrated free-wheeling diodes.																				
11	<b>Supply voltage</b> ; block to ground, as close as possible to the IC, with a stable electrolytic capacitor of at least 10 $\mu$ F in parallel with a ceramic capacitor of 220 nF.																				
14	<b>Logic supply voltage</b> ; either supply with 5 V or connect to + $V_S$ across a series resistor. A Z-diode of approx. 7 V is integrated. In both cases block to ground directly on the IC with a stable electrolytic capacitor of 10 $\mu$ F in parallel with a ceramic capacitor of 100 nF.																				
13, 16	<b>Push-pull outputs Q22, Q21</b> for phase 2 with integrated free-wheeling diodes.																				
15	<b>Resistor <math>R_2</math></b> for sensing the current in phase 2.																				
21	<b>Inhibit input</b> ; the IC can be put on standby by low potential on this pin. This reduces the current consumption substantially.																				
22	<b>Input phase 2</b> ; controls the current flow through phase winding 2. On H-potential the phase current flows from Q21 to Q22, on L potential in the reverse direction.

### Calculation of Power Dissipation

The total power dissipation  $P_{tot}$  is made up of

- saturation losses**  $P_{sat}$  (transistor saturation voltage and diode forward voltages),
- quiescent losses**  $P_q$  (quiescent current times supply voltage) and
- switching losses**  $P_s$  (turn-ON / turn-OFF operations).

The following equations give the power dissipation for chopper operation without phase reversal. This is the worst case, because full current flows for the entire time and switching losses occur in addition.

$$P_{tot} = 2 \times P_{sat} + P_q + 2 \times P_s$$

where 
$$P_{sat} \cong I_N \{ V_{satl} \times d + V_{Fu} (1 - d) + V_{satuC} \times d + V_{satuD} (1 - d) \}$$

$$P_q = I_q \times V_S + I_L \times V_L$$

$$P_s \cong \frac{V_S}{T} \left\{ \frac{i_D \times t_{DON}}{2} + \frac{i_D + i_R \times t_{ON}}{4} + \frac{I_N}{2} t_{DOFF} + t_{OFF} \right\}$$

- $I_N$  = nominal current (mean value)
- $I_q$  = quiescent current
- $i_D$  = reverse current during turn-on delay
- $i_R$  = peak reverse current
- $t_p$  = conducting time of chopper transistor
- $t_{ON}$  = turn-ON time
- $t_{OFF}$  = turn-OFF time
- $t_{DON}$  = turn-ON delay
- $t_{DOFF}$  = turn-OFF delay
- $T$  = cycle duration
- $d$  = duty cycle  $t_p/T$
- $V_{satl}$  = saturation voltage of sink transistor (T3, T4)
- $V_{satuC}$  = saturation voltage of source transistor (T1, T2) during charge cycle
- $V_{satuD}$  = saturation voltage of source transistor (T1, T2) during discharge cycle
- $V_{Fu}$  = forward voltage of free-wheeling diode (D1, D2)
- $V_S$  = supply voltage
- $V_L$  = logic supply voltage
- $I_L$  = current from logic supply

Figure 11

Figure 12

## Application Hints

The TLE 4726 is intended to drive both phases of a stepper motor. Special care has been taken to provide high efficiency, robustness and to minimize external components.

## Power Supply

The TLE 4726 will work with supply voltages ranging from 5 V to 50 V at pin  $V_S$ . As the circuit operates with chopper regulation of the current, interference generation problems can arise in some applications. Therefore the power supply should be decoupled by a 0.22  $\mu$ F ceramic capacitor located near the package. Unstabilized supplies may even afford higher capacities.

## Current Sensing

The current in the windings of the stepper motor is sensed by the voltage drop across  $R_1$  and  $R_2$ . Depending on the selected current internal comparators will turn off the sink transistor as soon as the voltage drop reaches certain thresholds (typical 0 V, 0.25 V, 0.5 V and 0.75 V); ( $R_1, R_2 = 1 \Omega$ ). These thresholds are neither affected by variations of  $V_L$  nor by variations of  $V_S$ .

Due to chopper control fast current rises (up to 10 A/ $\mu$ s) will occur at the sensing resistors  $R_1$  and  $R_2$ . To prevent malfunction of the current sensing mechanism  $R_1$  and  $R_2$  should be pure ohmic. The resistors should be wired to GND as directly as possible. Capacitive loads such as long cables (with high wire to wire capacity) to the motor should be avoided for the same reason.

## Synchronizing Several Choppers

In some applications synchronizing chopping of several stepper motor drivers may be desirable to reduce acoustic interference. This can be done by forcing the oscillator of the TLE 4726 by a pulse generator overdriving the oscillator loading currents (approximately  $\pm 100 \mu$ A). In these applications low level should be between 0 V and 1 V while high level should be between 2.6 V and  $V_L$ .

## Optimizing Noise Immunity

Unused inputs should always be wired to proper voltage levels in order to obtain highest possible noise immunity.

To prevent crossconduction of the output stages the TLE 4726 uses a special break before make timing of the power transistors. This timing circuit can be triggered by short glitches (some hundred nanoseconds) at the Phase inputs causing the output stage to become high resistive during some microseconds. This will lead to a fast current decay during that time. To achieve maximum current accuracy such glitches at the Phase inputs should be avoided by proper control signals.

## **Thermal Shut Down**

To protect the circuit against thermal destruction, thermal shut down has been implemented. To provide a warning in critical applications, the current of the sensing element is wired to input Inhibit. Before thermal shut down occurs Inhibit will start to pull down by some hundred microamperes. This current can be sensed to build a temperature prealarm.

## Package Outlines

### P-DSO-24-3 (Plastic Dual Small Outline Package)

- 1) Does not include plastic or metal protrusions of 0.15 max per side
- 2) Does not include dambar protrusion of 0.05 max per side

GPS05144

### Sorts of Packing

Package outlines for tubes, trays etc. are contained in our Data Book "Package Information".

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
