

## Features

- Fast read access time – 55ns
- Low-power CMOS operation
  - 100µA max standby
  - 40mA max active at 5MHz
- JEDEC standard packages
  - 40-lead PDIP
  - 44-lead PLCC
- Direct upgrade from 512Kbit, 1Mbit, and 2Mbit Atmel® AT27C516, AT27C1024, and AT27C2048) EPROMs
- 5V ± 10% supply
- High-reliability CMOS technology
  - 2,000V ESD protection
  - 200mA latchup immunity
- Rapid programming algorithm – 50µs/word (typical)
- CMOS- and TTL-compatible inputs and outputs
- Integrated product identification code
- Industrial temperature range
- Green (Pb/halide-free) packaging option

### 1. Description

The Atmel AT27C4096 is a low-power, high-performance, 4,194,304-bit, one-time programmable, read-only memory (OTP EPROM) organized as 256K by 16 bits. It requires a single 5V power supply in normal read mode operation. Any word can be accessed in less than 55ns, eliminating the need for speed reducing WAIT states. The x16 organization makes this part ideal for high-performance, 16- and 32-bit microprocessor systems.

In read mode, the AT27C4096 typically consumes 15mA. Standby mode supply current is typically less than 10µA.

The AT27C4096 is available in industry-standard, JEDEC-approved, one-time programmable (OTP) PDIP and PLCC packages. The device features two-line control ( $\overline{CE}$ ,  $\overline{OE}$ ) to eliminate bus contention in high speed systems.

With high-density 256K word storage capability, the AT27C4096 allows firmware to be stored reliably and to be accessed by the system without the delays of mass storage media.

The AT27C4096 has additional features that ensure high quality and efficient production use. The rapid programming algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 50µs/word. The Integrated product identification code electronically identifies the device and manufacturer. This feature is used by industry-standard programming equipment to select the proper programming algorithms and voltages.

## 2. Pin configurations

Pin name	Function
A0 - A17	Addresses
O0 - O15	Outputs
$\overline{CE}$	Chip enable
$\overline{OE}$	Output enable
NC	No connect

Note: Both GND pins must be connected

## 3. System considerations

Switching between active and standby conditions via the chip enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed datasheet limits, resulting in device nonconformance. At a minimum, a 0.1 $\mu$ F, high-frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the  $V_{CC}$  and ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 $\mu$ F bulk electrolytic capacitor should be utilized, again connected between the  $V_{CC}$  and ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

Voltage on A9 with respect to ground . . . . .	-2.0V to +14.0V <sup>(1)</sup>
V <sub>pp</sub> supply voltage with respect to ground . . . . .	-2.0V to +14.0V <sup>(1)</sup>

\*NOTICE: Stresses beyond those listed under “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Maximum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is V<sub>CC</sub> + 0.75V DC, which may overshoot to +7.0V for pulses of less than 20ns.

- Notes:
1. X can be V<sub>IL</sub> or V<sub>IH</sub>.
  2. Refer to the Programming characteristics.
  3. V<sub>H</sub> = 12.0 ± 0.5V.
  4. Two identifier words may be selected. All Ai inputs are held low (V<sub>IL</sub>), except A9, which is set to V<sub>H</sub>, and A0, which is toggled low (V<sub>IL</sub>) to select the manufacturer’s identification word and high (V<sub>IH</sub>) to select the device code word.
  5. Standby V<sub>CC</sub> current (I<sub>SB</sub>) is specified with V<sub>pp</sub> = V<sub>CC</sub>. V<sub>CC</sub> > V<sub>pp</sub> will cause a slight increase in I<sub>SB</sub>.

1. Timing measurement references are 0.8V and 2.0V. Input AC drive levels are 0.45V and 2.4V, unless otherwise specified.
  2.  $\overline{OE}$  may be delayed up to  $t_{CE} - t_{OE}$  after the falling edge of  $\overline{CE}$  without impact on  $t_{CE}$ .
  3.  $\overline{OE}$  may be delayed up to  $t_{ACC} - t_{OE}$  after the address is valid without impact on  $t_{ACC}$ .
  4. This parameter is only sampled, and is not 100% tested.
  5. Output float is defined as the point when data is no longer driven.

## 6. Rapid programming algorithm

A  $50\mu\text{s}$   $\overline{\text{CE}}$  pulse width is used to program. The address is set to the first location.  $V_{\text{CC}}$  is raised to 6.5V and  $V_{\text{PP}}$  is raised to 13.0V. Each address is first programmed with one  $50\mu\text{s}$   $\overline{\text{CE}}$  pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a word fails to pass verification, up to 10 successive  $50\mu\text{s}$  pulses are applied with a verification after each pulse. If the word fails to verify after 10 pulses have been applied, the part is considered failed. After the word verifies properly, the next address is selected until all have been checked.  $V_{\text{PP}}$  is then lowered to 5.0V and  $V_{\text{CC}}$  to 5.0V. All words are read again and compared with the original data to determine if the device passes or fails.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:
