

## 50 mA, 100 mA, and 150 mA CMOS LDOs with Shutdown and Error Output

### Features

- Low Supply Current (55  $\mu$ A Typical) for Longer Battery Life
- Low Dropout Voltage: 140 mV (Typical) @ 150 mA
- High Output Voltage Accuracy:  $\pm 0.4\%$  (Typical)
- Standard or Custom Output Voltages
- Power-Saving Shutdown Mode
- $\overline{\text{ERROR}}$  Output Can Be Used as a Low Battery Detector or Processor Reset Generator
- Fast Shutdown Reponse Time: 60  $\mu$ s (Typical)
- Overcurrent and Overtemperature Protection
- Space-Saving 5-Pin SOT-23A Package
- Pin Compatible Upgrades for Bipolar Regulators
- Standard Output Voltage Options:
  - 1.8V, 2.5V, 2.6V, 2.7V, 2.8V, 2.85V, 3.0V, 3.3V, 5.0V

### Applications

- Battery Operated Systems
- Portable Computers
- Medical Instruments
- Instrumentation
- Cellular / GSMS / PHS Phones
- Pagers

### Typical Application

### General Description

The TC2054, TC2055 and TC2186 are high accuracy (typically  $\pm 0.4\%$ ) CMOS upgrades for older (bipolar) low dropout regulators. Designed specifically for battery-operated systems, the devices' total supply current is typically 55  $\mu$ A at full load (20 to 60 times lower than in bipolar regulators).

The devices' key features include low noise operation, low dropout voltage – typically 45 mV (TC2054); 90 mV (TC2055); and 140 mV (TC2186) at full load - and fast response to step changes in load. An error output ( $\overline{\text{ERROR}}$ ) is asserted when the devices are out-of-regulation (due to a low input voltage or excessive output current). Supply current is reduced to 0.5  $\mu$ A (maximum) and both  $V_{OUT}$  and  $\overline{\text{ERROR}}$  are disabled when the shutdown input is low. The devices also incorporate overcurrent and overtemperature protection.

The TC2054, TC2055 and TC2186 are stable with a low esr ceramic output capacitor of 1  $\mu$ F and have a maximum output current of 50 mA, 100 mA and 150 mA, respectively. This LDO Family also features a fast response time (60  $\mu$ s typically) when released from shutdown.

### Package Type

# TC2054/2055/2186

NOTES:

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Input Voltage .....	6.5V
Output Voltage .....	(-0.3) to (V <sub>IN</sub> + 0.3)
Operating Temperature .....	-40°C < T <sub>J</sub> < 125°C
Storage Temperature .....	-65°C to +150°C
Maximum Voltage on Any Pin .....	V <sub>IN</sub> + 0.3V to -0.3V

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

### ELECTRICAL SPECIFICATIONS

<b>Electrical Specifications:</b> Unless otherwise noted, V <sub>IN</sub> = V <sub>R</sub> + 1V, I <sub>L</sub> = 100 μA, C <sub>L</sub> = 3.3 μF, $\overline{\text{SHDN}} > V_{IH}$ , T <sub>A</sub> = +25°C. <b>BOLDFACE</b> type specifications apply for junction temperature of -40°C to +125°C.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin Number	Symbol	Description
1	$V_{IN}$	Unregulated supply input.
2	GND	Ground terminal.
3	$\overline{\text{SHDN}}$	Shutdown control input. The regulator is fully enabled when a logic high is applied to this input. The regulator enters shutdown when a logic low is applied to this input. During shutdown, output voltage falls to zero, ERROR is open circuited and supply current is reduced to 0.5 $\mu\text{A}$ (maximum).
4	$\overline{\text{ERROR}}$	Out-of-Regulation Flag. (Open-drain output). This output goes low when $V_{OUT}$ is out-of-tolerance by approximately -5%.
5	$V_{OUT}$	Regulated voltage output.

### 3.1 Unregulated Supply Input ( $V_{IN}$ )

Connect the unregulated input supply to the  $V_{IN}$  pin. If there is a large distance between the input supply and the LDO regulator, some input capacitance is necessary for proper operation. A 1  $\mu\text{F}$  capacitor, connected from  $V_{IN}$  to ground, is recommended for most applications.

### 3.2 Ground Terminal (GND)

Connect the unregulated input supply ground return to GND. Also connect one side of the 1  $\mu\text{F}$  typical input decoupling capacitor close to this pin and one side of the output capacitor  $C_{OUT}$  to this pin.

### 3.3 Shutdown Control Input ( $\overline{\text{SHDN}}$ )

The regulator is fully enabled when a logic-high is applied to  $\overline{\text{SHDN}}$ . The regulator enters shutdown when a logic-low is applied to this input. During shutdown, the output voltage falls to zero and the supply current is reduced to 0.5  $\mu\text{A}$  (maximum).

### 3.4 Out-of-Regulation Flag ( $\overline{\text{ERROR}}$ )

The open-drain  $\overline{\text{ERROR}}$  flag provides indication that the regulator output voltage is not in regulation. The ERROR pin will be low when the output is typically below 5% of its specified value.

### 3.5 Regulated Voltage Output ( $V_{OUT}$ )

Connect the output load to  $V_{OUT}$  of the LDO. Also connect one side of the LDO output decoupling capacitor as close as possible to the  $V_{OUT}$  pin.

NOTES:

## 4.0 DETAILED DESCRIPTION

The TC2054, TC2055 and TC2186 are precision fixed output voltage regulators. (If an adjustable version is desired, refer to the TC1070/TC1071/TC1187 data sheet (DS21353). Unlike bipolar regulators, the TC2054, TC2055 and TC2186 supply current does not increase with load current. In addition,  $V_{OUT}$  remains stable and within regulation over the entire 0 mA to maximum output current operating load range.

Figure 4-1 shows a typical application circuit. The regulator is enabled any time the shutdown input (SHDN) is at or above  $V_{IH}$ , and shutdown (disabled) when SHDN is at or below  $V_{IL}$ . SHDN may be controlled by a CMOS logic gate, or I/O port of a microcontroller. If the SHDN input is not required, it should be connected directly to the input supply. While in shutdown, supply current decreases to 0.05  $\mu$ A (typical),  $V_{OUT}$  falls to zero volts, and ERROR is open-circuited.

FIGURE 4-1: Typical Application Circuit.

### 4.1 ERROR Open-Drain Output

ERROR is driven low whenever  $V_{OUT}$  falls out of regulation by more than -5% (typical). This condition may be caused by low input voltage, output current limiting or thermal limiting. The ERROR threshold is 5% below rated  $V_{OUT}$  regardless of the programmed output voltage value (e.g. ERROR =  $V_{OL}$  at 4.75V (typical) for a 5.0V regulator and 2.85V (typical) for a 3.0V regulator). ERROR output operation is shown in Figure 4-2.

Note that ERROR is active when  $V_{OUT}$  falls to  $V_{TH}$ , and inactive when  $V_{OUT}$  rises above  $V_{TH}$  by  $V_{HYS}$ .

As shown in Figure 4-1, ERROR can be used as a battery low flag or as a processor RESET signal (with the addition of timing capacitor  $C_2$ ).  $R_1 \times C_2$  should be chosen to maintain ERROR below  $V_{IH}$  of the processor RESET input for at least 200 ms to allow time for the system to stabilize. Pull-up resistor  $R_1$  can be tied to  $V_{OUT}$ ,  $V_{IN}$  or any other voltage less than  $(V_{IN} + 0.3V)$ . The ERROR pin sink current is self-limiting to approximately 18 mA.

FIGURE 4-2: Error Output Operation.

### 4.2 Output Capacitor

A 1  $\mu$ F (minimum) capacitor from  $V_{OUT}$  to ground is required. The output capacitor should have an effective series resistance of 0.01 $\Omega$  to 5 $\Omega$  for  $V_{OUT} = 2.5V$ , and 0.05 $\Omega$  to 5 $\Omega$  for  $V_{OUT} < 2.5V$ . Ceramic, tantalum and aluminum electrolytic capacitors can be used. (Since many aluminum electrolytic capacitors freeze at approximately -30 $^{\circ}$ C, solid tantalums are recommended for applications operating below -25 $^{\circ}$ C). When operating from sources other than batteries, supply-noise rejection and transient response can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

### 4.3 Input Capacitor

A 1  $\mu$ F capacitor should be connected from  $V_{IN}$  to GND if there is more than 10 inches of wire between the regulator and this AC filter capacitor, or if a battery is used as the power source. Aluminum electrolytic or tantalum capacitors can be used (since many aluminum electrolytic capacitors freeze at approximately -30 $^{\circ}$ C, solid tantalum are recommended for applications operating below -25 $^{\circ}$ C). When operating from sources other than batteries, supply-noise rejection and transient response can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

NOTES:

## 5.0 THERMAL CONSIDERATIONS

### 5.1 Thermal Shutdown

Integrated thermal protection circuitry shuts the regulator off when the die temperature exceeds approximately 160°C. The regulator remains off until the die temperature cools to approximately 150°C.

### 5.2 Power Dissipation

The amount of power the regulator dissipates is primarily a function of input and output voltage, and output current.

Equation 5-1 is used to calculate worst case power dissipation:

#### EQUATION 5-1:

$$P_D \approx (V_{INMAX} - V_{OUTMIN})I_{LOADMAX}$$

Where:

$P_D$	=	Worst-case actual power dissipation
$V_{INMAX}$	=	Maximum voltage on $V_{IN}$
$V_{OUTMIN}$	=	Minimum regulator output voltage
$I_{LOADMAX}$	=	Maximum output (load) current

The maximum allowable power dissipation (Equation 5-2) is a function of the maximum ambient temperature ( $T_{AMAX}$ ), the maximum allowable die temperature (125 °C) and the thermal resistance from junction-to-air ( $\theta_{JA}$ ). The 5-Pin SOT-23A package has a  $\theta_{JA}$  of approximately 220°C/Watt when mounted on a typical two layer FR4 dielectric copper clad PC board.

#### EQUATION 5-2:

$$P_{DMAX} = \frac{T_{JMAX} - T_{AMAX}}{\theta_{JA}}$$

Where all terms are previously defined.

Equation 5-1 can be used in conjunction with Equation 5-2 to ensure regulator thermal operation is within limits. For example:

Given:

$$\begin{aligned} V_{INMAX} &= 3.0V + 10\% \\ V_{OUTMIN} &= 2.7V - 2.5\% \\ I_{LOADMAX} &= 40 \text{ mA} \\ T_{AMAX} &= +55^\circ\text{C} \end{aligned}$$

Find:

1. Actual power dissipation
2. Maximum allowable dissipation

Actual power dissipation:

$$\begin{aligned} P_D &= (V_{INMAX} - V_{OUTMIN})I_{LOADMAX} \\ &= [(3.0 \times 1.1) - (2.7 \times 0.975)]40 \times 10^{-3} \\ &= 26.7 \text{ mW} \end{aligned}$$

Maximum allowable power dissipation:

$$\begin{aligned} P_{DMAX} &= \frac{T_{JMAX} - T_{AMAX}}{\theta_{JA}} \\ &= \frac{125 - 55}{220} \\ &= 318 \text{ mW} \end{aligned}$$

In this example, the TC2054 dissipates a maximum of only 26.7 mW; far below the allowable limit of 318 mW. In a similar manner, Equation 5-1 and Equation 5-2 can be used to calculate maximum current and/or input voltage limits.

### 5.3 Layout Considerations

The primary path of heat conduction out of the package is via the package leads. Therefore, layouts having a ground plane, wide traces at the pads, and wide power supply bus lines combine to lower  $\theta_{JA}$  and, therefore, increase the maximum allowable power dissipation limit.

## APPENDIX A: REVISION HISTORY

### Revision D (September 2009)

The following is the list of modifications:

1. Added the 2.6V, and 5.0V option in [Table 6-1](#) in **Section 6.0 “Packaging Information”**.
2. Updated the package outline drawing.
3. Added 2.6V option to **Product Identification System** section.

### Revision C (May 2006)

The following is the list of modifications:

1. Added overtemperature to bullet for overcurrent protection in Features and General Description verbiage.
2. Added “Thermal Shutdown Die Temperature” to the Electrical Specifications table. Changed condition for “Minimum  $V_{IN}$  Operating Voltage”.
3. Added Temperature Characteristics Table.
4. Added **Section 5.1 “Thermal Shutdown”**.
5. Updated the package outline drawing.

### Revision B (May 2002)

- Data Sheet converted to Microchip standards.

### Revision A (May 2001)

- Original Release of this Document under Telcom.

NOTES:

## PRODUCT IDENTIFICATION SYSTEM

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC<sup>®</sup> MCUs and dsPIC<sup>®</sup> DSCs, KEELOQ<sup>®</sup> code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
