STM32L451xx

Ultra-low-power Arm[®] Cortex[®]-M4 32-bit MCU+FPU, 100DMIPS, up to 512KB Flash, 160KB SRAM, analog, audio

Datasheet - production data

Features

- Ultra-low-power with FlexPowerControl
 - 1.71 V to 3.6 V power supply
 - -40 °C to 85/125 °C temperature range
 - 145 nA in V_{BAT} mode: supply for RTC and 32x32-bit backup registers
 - 22 nA Shutdown mode (5 wakeup pins)
 - 106 nA Standby mode (5 wakeup pins)
 - 375 nA Standby mode with RTC
 - 2.05 μA Stop 2 mode, 2.40 μA with RTC
 - 84 μA/MHz run mode
 - Batch acquisition mode (BAM)
 - 4 μs wakeup from Stop mode
 - Brown out reset (BOR)
 - Interconnect matrix
- Core: Arm[®] 32-bit Cortex[®]-M4 CPU with FPU, Adaptive real-time accelerator (ART Accelerator[™]) allowing 0-wait-state execution from Flash memory, frequency up to 80 MHz, MPU, 100DMIPS and DSP instructions
- Performance benchmark
 - 1.25 DMIPS/MHz (Drystone 2.1)
 - 273.55 CoreMark[®] (3.42 CoreMark/MHz @ 80 MHz)
- · Energy benchmark
 - 174.5 ULPBench[®] score
- Clock Sources
 - 4 to 48 MHz crystal oscillator
 - 32 kHz crystal oscillator for RTC (LSE)
 - Internal 16 MHz factory-trimmed RC (±1%)
 - Internal low-power 32 kHz RC (±5%)
 - Internal multispeed 100 kHz to 48 MHz oscillator, auto-trimmed by LSE (better than ±0.25 % accuracy)
 - Internal 48 MHz with clock recovery
 - 2 PLLs for system clock, audio, ADC

LQFP100 (14x14) UFBGA100 (7×7) WLCSP64 UFQFPN48 (7x7) LQFP64 (10x10) UFBGA64 (5x5)

- Up to 83 fast I/Os, most 5 V-tolerant
- · RTC with HW calendar, alarms and calibration
- Up to 21 capacitive sensing channels: support touchkey, linear and rotary touch sensors
- 12x timers: 1x 16-bit advanced motor-control, 1x 32-bit and 3x 16-bit general purpose, 2x 16bit basic, 2x low-power 16-bit timers (available in Stop mode), 2x watchdogs, SysTick timer
- Memories
 - Up to 512 KB single bank Flash, proprietary code readout protection
 - 160 KB of SRAM including 32 KB with hardware parity check
 - Quad SPI memory interface
- Rich analog peripherals (independent supply)
 - 1x 12-bit ADC 5 Msps, up to 16-bit with hardware oversampling, 200 μA/Msps
 - 1x 12-bit DAC output channels, low-power sample and hold
 - 1x operational amplifier with built-in PGA
 - 2x ultra-low-power comparators
 - Accurate 2.5 V or 2.048 V reference voltage buffered output
- 16x communication interfaces
 - 1x SAI (serial audio interface)
 - 4x I2C FM+(1 Mbit/s), SMBus/PMBus
 - 3x USARTs (ISO 7816, LIN, IrDA, modem)
 - 1x UART (LIN, IrDA, modem)
 - 1x LPUART (Stop 2 wake-up)
 - 3x SPIs (and 1x Quad SPI)
 - CAN (2.0B Active) and SDMMC interface
 - IRTIM (Infrared interface)
- 14-channel DMA controller

- True random number generator
- CRC calculation unit, 96-bit unique ID
- Development support: serial wire debug (SWD), JTAG, Embedded Trace Macrocell™
- All packages are ECOPACK2[®] compliant

Introduction STM32L451xx

1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32L451xx microcontrollers.

This document should be read in conjunction with the STM32L43xxx/44xxx/45xxx/46xxx reference manual (RM0394). The reference manual is available from the STMicroelectronics website *www.st.com*.

For information on the Arm^{®(a)} Cortex[®]-M4 core, please refer to the Cortex[®]-M4 Technical Reference Manual, available from the www.arm.com website.

STM32L451xx Description

2 Description

The STM32L451xx devices are the ultra-low-power microcontrollers based on the high-performance Arm[®] Cortex[®]-M4 32-bit RISC core operating at a frequency of up to 80 MHz. The Cortex-M4 core features a Floating point unit (FPU) single precision which supports all Arm[®] single-precision data-processing instructions and data types. It also implements a full set of DSP instructions and a memory protection unit (MPU) which enhances application security.

The STM32L451xx devices embed high-speed memories (Flash memory up to 512 Kbyte, 160 Kbyte of SRAM), a Quad SPI flash memories interface (available on all packages) and an extensive range of enhanced I/Os and peripherals connected to two APB buses, two AHB buses and a 32-bit multi-AHB bus matrix.

The STM32L451xx devices embed several protection mechanisms for embedded Flash memory and SRAM: readout protection, write protection, proprietary code readout protection and Firewall.

The devices offer a fast 12-bit ADC (5 Msps), two comparators, one operational amplifier, one DAC channel, an internal voltage reference buffer, a low-power RTC, one general-purpose 32-bit timer, one 16-bit PWM timer dedicated to motor control, four general-purpose 16-bit timers, and two 16-bit low-power timers.

In addition, up to 21 capacitive sensing channels are available.

They also feature standard and advanced communication interfaces.

- Four I2Cs
- Three SPIs
- Three USARTs, one UART and one Low-Power UART.
- One SAI (Serial Audio Interfaces)
- One SDMMC
- One CAN

The STM32L451xx operates in the -40 to +85 $^{\circ}$ C (+105 $^{\circ}$ C junction) and -40 to +125 $^{\circ}$ C (+130 $^{\circ}$ C junction) temperature ranges from a 1.71 to 3.6 V power supply. A comprehensive set of power-saving modes allows the design of low-power applications.

Some independent power supplies are supported: analog independent supply input for ADC, DAC, OPAMP and comparators. A VBAT input allows to backup the RTC and backup registers.

The STM32L451xx family offers six packages from 48 to 100-pin packages.

DS11910 Rev 4 13/201

3 Functional overview

3.1 Arm[®] Cortex[®]-M4 core with FPU

The Arm[®] Cortex[®]-M4 with FPU processor is the latest generation of Arm[®] processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The Arm[®] Cortex[®]-M4 with FPU 32-bit RISC processor features exceptional codeefficiency, delivering the high-performance expected from an Arm[®] core in the memory size usually associated with 8- and 16-bit devices.

The processor supports a set of DSP instructions which allow efficient signal processing and complex algorithm execution.

Its single precision FPU speeds up software development by using metalanguage development tools, while avoiding saturation.

With its embedded Arm[®] core, the STM32L451xx family is compatible with all Arm[®] tools and software.

Figure 1 shows the general block diagram of the STM32L451xx family devices.

3.2 Adaptive real-time memory accelerator (ART Accelerator™)

The ART Accelerator™ is a memory accelerator which is optimized for STM32 industry-standard Arm® Cortex®-M4 processors. It balances the inherent performance advantage of the Arm® Cortex®-M4 over Flash memory technologies, which normally requires the processor to wait for the Flash memory at higher frequencies.

To release the processor near 100 DMIPS performance at 80MHz, the accelerator implements an instruction prefetch queue and branch cache, which increases program execution speed from the 64-bit Flash memory. Based on CoreMark benchmark, the performance achieved thanks to the ART accelerator is equivalent to 0 wait state program execution from Flash memory at a CPU frequency up to 80 MHz.

3.3 Memory protection unit

The memory protection unit (MPU) is used to manage the CPU accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task. This memory area is organized into up to 8 protected areas that can in turn be divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory.

The MPU is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

DS11910 Rev 4 17/201

3.4 Embedded Flash memory

STM32L451xx devices feature up to 512 Kbyte of embedded Flash memory available for storing programs and data in single bank architecture. The Flash memory contains 256 pages of 2 Kbyte.

Flexible protections can be configured thanks to option bytes:

- Readout protection (RDP) to protect the whole memory. Three levels are available:
 - Level 0: no readout protection
 - Level 1: memory readout protection: the Flash memory cannot be read from or written to if either debug features are connected, boot in RAM or bootloader is selected
 - Level 2: chip readout protection: debug features (Cortex-M4 JTAG and serial wire), boot in RAM and bootloader selection are disabled (JTAG fuse). This selection is irreversible.

| Area | Protection | U | ser execution | on | Debug, boot from RAM or boot from system memory (loader) | | | | | |
|-----------|------------|------|---------------|--------------------|--|-------|--------------------|--|--|--|
| | level | Read | Write | Erase | Read | Write | Erase | | | |
| Main | 1 | Yes | Yes | Yes | No | No | No | | | |

Yes

N/A

N/A

N/A

Table 3. Access status versus readout protection level and execution modes

Yes

SRAM2

• Write protection (WRP): the protected area is protected against erasing and programming. Two areas can be selected, with 2-Kbyte granularity.

Yes

Proprietary code readout protection (PCROP): a part of the flash memory can be protected against read and write from third parties. The protected area is execute-only: it can only be reached by the STM32 CPU, as an instruction code, while all other accesses (DMA, debug and CPU data read, write and erase) are strictly prohibited. The PCROP area granularity is 64-bit wide. An additional option bit (PCROP_RDP) allows to select if the PCROP area is erased or not when the RDP protection is changed from Level 1 to Level 0.

^{1.} Erased when RDP change from Level 1 to Level 0.

The whole non-volatile memory embeds the error correction code (ECC) feature supporting:

- single error detection and correction
- double error detection.
- The address of the ECC fail can be read in the ECC register

3.5 Embedded SRAM

STM32L451xx devices feature 160 Kbyte of embedded SRAM. This SRAM is split into two blocks:

- 128 Kbyte mapped at address 0x2000 0000 (SRAM1)
- 32 Kbyte located at address 0x1000 0000 with hardware parity check (SRAM2).

This memory is also mapped at address 0x2002 0000, offering a contiguous address space with the SRAM1 (32 Kbyte aliased by bit band)

This block is accessed through the ICode/DCode buses for maximum performance.

These 32 Kbyte SRAM can also be retained in Standby mode.

The SRAM2 can be write-protected with 1 Kbyte granularity.

The memory can be accessed in read/write at CPU clock speed with 0 wait states.

3.6 Firewall

The device embeds a Firewall which protects code sensitive and secure data from any access performed by a code executed outside of the protected areas.

Each illegal access generates a reset which kills immediately the detected intrusion.

The Firewall main features are the following:

- Three segments can be protected and defined thanks to the Firewall registers:
 - Code segment (located in Flash or SRAM1 if defined as executable protected area)
 - Non-volatile data segment (located in Flash)
 - Volatile data segment (located in SRAM1)
- The start address and the length of each segments are configurable:
 - Code segment: up to 1024 Kbyte with granularity of 256 bytes
 - Non-volatile data segment: up to 1024 Kbyte with granularity of 256 bytes
 - Volatile data segment: up to 128 Kbyte with a granularity of 64 bytes
- Specific mechanism implemented to open the Firewall to get access to the protected areas (call gate entry sequence)
- Volatile data segment can be shared or not with the non-protected code
- Volatile data segment can be executed or not depending on the Firewall configuration

The Flash readout protection must be set to level 2 in order to reach the expected level of protection.

DS11910 Rev 4 19/201

3.7 Boot modes

At startup, BOOT0 pin or nSWBOOT0 option bit, and BOOT1 option bit are used to select one of three boot options:

- Boot from user Flash
- Boot from system memory
- Boot from embedded SRAM

BOOT0 value may come from the PH3-BOOT0 pin or from an option bit depending on the value of a user option bit to free the GPIO pad if needed.

A Flash empty check mechanism is implemented to force the boot from system flash if the first flash memory location is not programmed and if the boot selection is configured to boot from main flash.

The boot loader is located in system memory. It is used to reprogram the Flash memory by using USART, I2C, SPI or CAN.

3.8 Cyclic redundancy check calculation unit (CRC)

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

3.9 Power supply management

3.9.1 Power supply schemes

- V_{DD} = 1.71 to 3.6 V: external power supply for I/Os (V_{DDIO1}), the internal regulator and the system analog such as reset, power management and internal clocks. It is provided externally through VDD pins.
- V_{DDA} = 1.62 V (ADC/COMPs) / 1.8 (DAC/OPAMP) / 2.4 V (VREFBUF) to 3.6 V: external analog power supply for ADC, DAC, OPAMP, Comparators and Voltage reference buffer. The V_{DDA} voltage level is independent from the V_{DD} voltage.
- V_{BAT} = 1.55 to 3.6 V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when V_{DD} is not present.

Note: When the functions supplied by V_{DDA} are not used, this supply should preferably be shorted to V_{DD} .

Note: If these supplies are tied to ground, the I/Os supplied by these power supplies are not 5 V tolerant.

Note: V_{DDIOx} is the I/Os general purpose digital functions supply. V_{DDIOx} represents V_{DDIO1} , with $V_{DDIO1} = V_{DD}$.

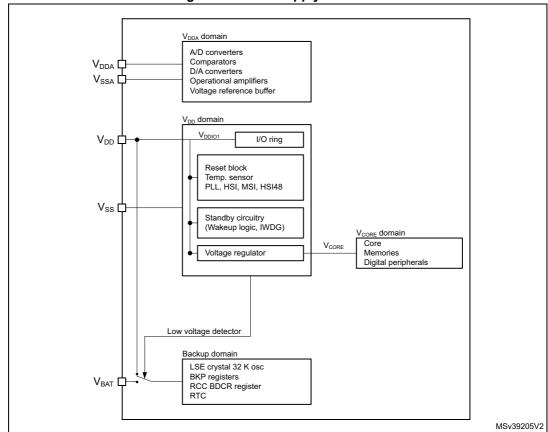

Figure 2. Power supply overview

During power-up and power-down phases, the following power sequence requirements must be respected:

- When V_{DD} is below 1 V, other power supplies (V_{DDA}) must remain below V_{DD} + 300 mV.
- When V_{DD} is above 1 V, all power supplies are independent.

During the power-down phase, V_{DD} can temporarily become lower than other supplies only if the energy provided to the MCU remains below 1 mJ; this allows external decoupling capacitors to be discharged with different time constants during the power- down transient phase.

21/201

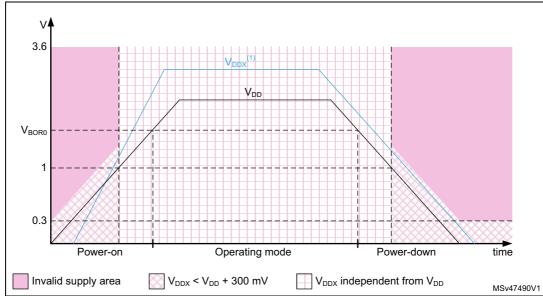

Figure 3. Power-up/down sequence

V_{DDX} refers to V_{DDA}.

3.9.2 Power supply supervisor

The device has an integrated ultra-low-power brown-out reset (BOR) active in all modes except Shutdown and ensuring proper operation after power-on and during power down. The device remains in reset mode when the monitored supply voltage V_{DD} is below a specified threshold, without the need for an external reset circuit.

The lowest BOR level is 1.71V at power on, and other higher thresholds can be selected through option bytes. The device features an embedded programmable voltage detector (PVD) that monitors the V_{DD} power supply and compares it to the VPVD threshold. An interrupt can be generated when V_{DD} drops below the VPVD threshold and/or when V_{DD} is higher than the VPVD threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

In addition, the device embeds a Peripheral Voltage Monitor which compares the independent supply voltage V_{DDA} with a fixed threshold in order to ensure that the peripheral is in its functional supply range.

3.9.3 Voltage regulator

Two embedded linear voltage regulators supply most of the digital circuitries: the main regulator (MR) and the low-power regulator (LPR).

- The MR is used in the Run and Sleep modes and in the Stop 0 mode.
- The LPR is used in Low-Power Run, Low-Power Sleep, Stop 1 and Stop 2 modes. It is also used to supply the 32 Kbyte SRAM2 in Standby with SRAM2 retention.
- Both regulators are in power-down in Standby and Shutdown modes: the regulator output is in high impedance, and the kernel circuitry is powered down thus inducing zero consumption.

The ultralow-power STM32L451xx supports dynamic voltage scaling to optimize its power consumption in run mode. The voltage from the Main Regulator that supplies the logic (V_{CORF}) can be adjusted according to the system's maximum operating frequency.

There are two power consumption ranges:

- Range 1 with the CPU running at up to 80 MHz.
- Range 2 with a maximum CPU frequency of 26 MHz. All peripheral clocks are also limited to 26 MHz.

The V_{CORE} can be supplied by the low-power regulator, the main regulator being switched off. The system is then in Low-power run mode.

 Low-power run mode with the CPU running at up to 2 MHz. Peripherals with independent clock can be clocked by HSI16.

3.9.4 Low-power modes

The ultra-low-power STM32L451xx supports seven low-power modes to achieve the best compromise between low-power consumption, short startup time, available peripherals and available wakeup sources.

- 1. LPR means Main regulator is OFF and Low-power regulator is ON.
- 2. All peripherals can be active or clock gated to save power consumption.
- 3. Typical current at V_{DD} = 1.8 V, 25°C. Consumptions values provided running from SRAM, Flash memory Off, 80 MHz in Range 1, 26 MHz in Range 2, 2 MHz in LPRun/LPSleep.
- 4. The Flash memory can be put in power-down and its clock can be gated off when executing from SRAM.
- 5. The SRAM1 and SRAM2 clocks can be gated on or off independently.
- 6. U(S)ART and LPUART reception is functional in Stop mode, and generates a wakeup interrupt on Start, address match or received frame event.
- 7. I2C address detection is functional in Stop mode, and generates a wakeup interrupt in case of address match.
- 8. The I/Os with wakeup from Standby/Shutdown capability are: PA0, PC13, PE6, PA2, PC5.
- 9. I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

By default, the microcontroller is in Run mode after a system or a power Reset. It is up to the user to select one of the low-power modes described below:

Sleep mode

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

Low-power run mode

This mode is achieved with V_{CORE} supplied by the low-power regulator to minimize the regulator's operating current. The code can be executed from SRAM or from Flash, and the CPU frequency is limited to 2 MHz. The peripherals with independent clock can be clocked by HSI16.

Low-power sleep mode

This mode is entered from the low-power run mode. Only the CPU clock is stopped. When wakeup is triggered by an event or an interrupt, the system reverts to the low-power run mode.

• Stop 0, Stop 1 and Stop 2 modes

Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the V_{CORE} domain are stopped, the PLL, the MSI RC, the HSI16 RC and the HSE crystal oscillators are disabled. The LSE or LSI is still running.

The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

Some peripherals with wakeup capability can enable the HSI16 RC during Stop mode to detect their wakeup condition.

Three Stop modes are available: Stop 0, Stop 1 and Stop 2 modes. In Stop 2 mode, most of the V_{CORE} domain is put in a lower leakage mode.

Stop 1 offers the largest number of active peripherals and wakeup sources, a smaller wakeup time but a higher consumption than Stop 2. In Stop 0 mode, the main regulator remains ON, allowing a very fast wakeup time but with much higher consumption.

The system clock when exiting from Stop 0, Stop 1 or Stop 2 modes can be either MSI up to 48 MHz or HSI16, depending on software configuration.

• Standby mode

The Standby mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the V_{CORE} domain is powered off. The PLL, the MSI RC, the HSI16 RC and the HSE crystal oscillators are also switched off.

The RTC can remain active (Standby mode with RTC, Standby mode without RTC).

The brown-out reset (BOR) always remains active in Standby mode.

The state of each I/O during standby mode can be selected by software: I/O with internal pull-up, internal pull-down or floating.

After entering Standby mode, SRAM1 and register contents are lost except for registers in the Backup domain and Standby circuitry. Optionally, SRAM2 can be retained in Standby mode, supplied by the low-power Regulator (Standby with SRAM2 retention mode).

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wakeup, timestamp, tamper) or a failure is detected on LSE (CSS on LSE).

The system clock after wakeup is MSI up to 8 MHz.

DS11910 Rev 4 27/201

Shutdown mode

The Shutdown mode allows to achieve the lowest power consumption. The internal regulator is switched off so that the V_{CORE} domain is powered off. The PLL, the HSI16, the MSI, the LSI and the HSE oscillators are also switched off.

The RTC can remain active (Shutdown mode with RTC, Shutdown mode without RTC).

The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to Backup domain is not supported.

SRAM1, SRAM2 and register contents are lost except for registers in the Backup domain.

The device exits Shutdown mode when an external reset (NRST pin), a WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wakeup, timestamp, tamper).

The system clock after wakeup is MSI at 4 MHz.

Table 5. Functionalities depending on the working mode⁽¹⁾ (continued)

- 1. Legend: Y = Yes (Enable). O = Optional (Disable by default. Can be enabled by software). = Not available.
- 2. The Flash can be configured in power-down mode. By default, it is not in power-down mode.
- 3. The SRAM clock can be gated on or off.
- 4. SRAM2 content is preserved when the bit RRS is set in PWR CR3 register.
- 5. Some peripherals with wakeup from Stop capability can request HSI16 to be enabled. In this case, HSI16 is woken up by the peripheral, and only feeds the peripheral which requested it. HSI16 is automatically put off when the peripheral does not need it anymore.
- UART and LPUART reception is functional in Stop mode, and generates a wakeup interrupt on Start, address match or received frame event.
- 7. I2C address detection is functional in Stop mode, and generates a wakeup interrupt in case of address match.
- 8. Voltage scaling Range 1 only.
- 9. I/Os can be configured with internal pull-up, pull-down or floating in Standby mode.
- 10. The I/Os with wakeup from Standby/Shutdown capability are: PA0, PC13, PE6, PA2, PC5.
- 11. I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

3.9.5 Reset mode

In order to improve the consumption under reset, the I/Os state under and after reset is "analog state" (the I/O schmitt trigger is disable). In addition, the internal reset pull-up is deactivated when the reset source is internal.

3.9.6 VBAT operation

The VBAT pin allows to power the device VBAT domain from an external battery, an external supercapacitor, or from V_{DD} when no external battery and an external supercapacitor are present. The VBAT pin supplies the RTC with LSE and the backup registers. Three antitamper detection pins are available in VBAT mode.

VBAT operation is automatically activated when V_{DD} is not present.

An internal VBAT battery charging circuit is embedded and can be activated when V_{DD} is present.

Note: When the microcontroller is supplied from VBAT, external interrupts and RTC alarm/events do not exit it from VBAT operation.

DS11910 Rev 4 31/201

3.10 Interconnect matrix

Several peripherals have direct connections between them. This allows autonomous communication between peripherals, saving CPU resources thus power supply consumption. In addition, these hardware connections allow fast and predictable latency.

Depending on peripherals, these interconnections can operate in Run, Sleep, low-power run and sleep, Stop 0, Stop 1 and Stop 2 modes.

Table 6. STM32L451xx peripherals interconnect matrix

3.11 Clocks and startup

The clock controller (see *Figure 4*) distributes the clocks coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness. It features:

- Clock prescaler: to get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler
- **Safe clock switching:** clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- System clock source: four different clock sources can be used to drive the master clock SYSCLK:
 - 4-48 MHz high-speed external crystal or ceramic resonator (HSE), that can supply a PLL. The HSE can also be configured in bypass mode for an external clock.
 - 16 MHz high-speed internal RC oscillator (HSI16), trimmable by software, that can supply a PLL
 - Multispeed internal RC oscillator (MSI), trimmable by software, able to generate 12 frequencies from 100 kHz to 48 MHz. When a 32.768 kHz clock source is available in the system (LSE), the MSI frequency can be automatically trimmed by hardware to reach better than ±0.25% accuracy. The MSI can supply a PLL.
 - System PLL which can be fed by HSE, HSI16 or MSI, with a maximum frequency at 80 MHz.
- RC48 with clock recovery system (HSI48): internal RC48 MHz clock source can be used to drive the SDMMC or the RNG peripherals. This clock can be output on the MCO.
- Auxiliary clock source: two ultralow-power clock sources that can be used to drive the real-time clock:
 - 32.768 kHz low-speed external crystal (LSE), supporting four drive capability modes. The LSE can also be configured in bypass mode for an external clock.
 - 32 kHz low-speed internal RC (LSI), also used to drive the independent watchdog.
 The LSI clock accuracy is ±5% accuracy.
- Peripheral clock sources: Several peripherals (SDMMC, RNG, SAI, USARTs, I2Cs, LPTimers, ADC) have their own independent clock whatever the system clock. Two PLLs, each having three independent outputs allowing the highest flexibility, can generate independent clocks for the ADC, the SDMMC/RNG and the SAI.
- **Startup clock:** after reset, the microcontroller restarts by default with an internal 4 MHz clock (MSI). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- Clock security system (CSS): this feature can be enabled by software. If a HSE clock failure occurs, the master clock is automatically switched to HSI16 and a software

interrupt is generated if enabled. LSE failure can also be detected and generated an interrupt.

- Clock-out capability:
 - MCO: microcontroller clock output: it outputs one of the internal clocks for external use by the application. Low frequency clocks (LSI, LSE) are available down to Stop 1 low power state.
 - LSCO: low speed clock output: it outputs LSI or LSE in all low-power modes down to Standby mode. LSE can also be output on LSCO in Shutdown mode. LSCO is not available in VBAT mode.

Several prescalers allow to configure the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the APB domains is 80 MHz.

3.12 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. Fast I/O toggling can be achieved thanks to their mapping on the AHB2 bus.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

3.13 Direct memory access controller (DMA)

The device embeds 2 DMAs. Refer to *Table 7: DMA implementation* for the features implementation.

Direct memory access (DMA) is used in order to provide high-speed data transfer between peripherals and memory as well as memory to memory. Data can be quickly moved by DMA without any CPU actions. This keeps CPU resources free for other operations.

The two DMA controllers have 14 channels in total, each dedicated to managing memory access requests from one or more peripherals. Each has an arbiter for handling the priority between DMA requests.

The DMA supports:

- 14 independently configurable channels (requests)
- Each channel is connected to dedicated hardware DMA requests, software trigger is also supported on each channel. This configuration is done by software.
- Priorities between requests from channels of one DMA are software programmable (4 levels consisting of very high, high, medium, low) or hardware in case of equality (request 1 has priority over request 2, etc.)
- Independent source and destination transfer size (byte, half word, word), emulating packing and unpacking. Source/destination addresses must be aligned on the data size.
- Support for circular buffer management
- 3 event flags (DMA Half Transfer, DMA Transfer complete and DMA Transfer Error) logically ORed together in a single interrupt request for each channel
- Memory-to-memory transfer
- Peripheral-to-memory and memory-to-peripheral, and peripheral-to-peripheral transfers
- Access to Flash, SRAM, APB and AHB peripherals as source and destination
- Programmable number of data to be transferred: up to 65536.

Table 7. DMA implementation

| DMA features | DMA1 | DMA2 |
|----------------------------|------|------|
| Number of regular channels | 7 | 7 |

3.14 Interrupts and events

3.14.1 Nested vectored interrupt controller (NVIC)

The devices embed a nested vectored interrupt controller able to manage 16 priority levels, and handle up to 67 maskable interrupt channels plus the 16 interrupt lines of the Cortex[®]-M4.

The NVIC benefits are the following:

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail chaining
- Processor state automatically saved on interrupt entry, and restored on interrupt exit, with no instruction overhead

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

3.14.2 Extended interrupt/event controller (EXTI)

The extended interrupt/event controller consists of 37 edge detector lines used to generate interrupt/event requests and wake-up the system from Stop mode. Each external line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The internal lines are connected to peripherals with wakeup from Stop mode capability. The EXTI can detect an external line with a pulse width shorter than the internal clock period. Up to 83 GPIOs can be connected to the 16 external interrupt lines.

3.15 Analog to digital converter (ADC)

The device embeds a successive approximation analog-to-digital converter with the following features:

- 12-bit native resolution, with built-in calibration
- 5.33 Msps maximum conversion rate with full resolution
 - Down to 18.75 ns sampling time
 - Increased conversion rate for lower resolution (up to 8.88 Msps for 6-bit resolution)
- Up to 16 external channels.
- 4 internal channels: internal reference voltage, temperature sensor, VBAT/3 and DAC1_OUT1.
- One external reference pin is available on some package, allowing the input voltage range to be independent from the power supply
- Single-ended and differential mode inputs
- Low-power design
 - Capable of low-current operation at low conversion rate (consumption decreases linearly with speed)
 - Dual clock domain architecture: ADC speed independent from CPU frequency
- Highly versatile digital interface
 - Single-shot or continuous/discontinuous sequencer-based scan mode: 2 groups of analog signals conversions can be programmed to differentiate background and high-priority real-time conversions
 - ADC supports multiple trigger inputs for synchronization with on-chip timers and external signals
 - Results stored into data register or in RAM with DMA controller support
 - Data pre-processing: left/right alignment and per channel offset compensation
 - Built-in oversampling unit for enhanced SNR
 - Channel-wise programmable sampling time
 - Three analog watchdog for automatic voltage monitoring, generating interrupts and trigger for selected timers
 - Hardware assistant to prepare the context of the injected channels to allow fast context switching

3.15.1 Temperature sensor

The temperature sensor (TS) generates a voltage V_{TS} that varies linearly with temperature.

The temperature sensor is internally connected to the ADC1_IN17 input channel which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode.

DS11910 Rev 4 39/201

Calibration value nameDescriptionMemory addressTS_CAL1TS_ADC raw data acquired at a temperature of 30 °C (\pm 5 °C), $V_{DDA} = V_{REF+} = 3.0 \text{ V} (\pm 10 \text{ mV})$ 0x1FFF 75A8 - 0x1FFF 75A9TS_CAL2TS_ADC raw data acquired at a temperature of 130 °C (\pm 5 °C), $V_{DDA} = V_{REF+} = 3.0 \text{ V} (\pm 10 \text{ mV})$ 0x1FFF 75CA - 0x1FFF 75CB

Table 8. Temperature sensor calibration values

3.15.2 Internal voltage reference (V_{REFINT})

The internal voltage reference (VREFINT) provides a stable (bandgap) voltage output for the ADC and Comparators. VREFINT is internally connected to the ADC1_IN0 input channel. The precise voltage of VREFINT is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

Table 9. Internal voltage reference calibration values

| Calibration value name | Description | Memory address | | | |
|------------------------|--|---------------------------|--|--|--|
| VREFINT | Raw data acquired at a temperature of 30 °C (± 5 °C), V _{DDA} = V _{REF+} = 3.0 V (± 10 mV) | 0x1FFF 75AA - 0x1FFF 75AB | | | |

3.15.3 V_{BAT} battery voltage monitoring

This embedded hardware feature allows the application to measure the V_{BAT} battery voltage using the internal ADC channel ADC1_IN18 or ADC3_IN18. As the V_{BAT} voltage may be higher than V_{DDA} , and thus outside the ADC input range, the VBAT pin is internally connected to a bridge divider by 3. As a consequence, the converted digital value is one third the V_{BAT} voltage.

3.16 Digital to analog converter (DAC)

One 12-bit buffered DAC channel can be used to convert digital signals into analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This digital interface supports the following features:

- Up to two DAC output channels
- 8-bit or 12-bit output mode
- Buffer offset calibration (factory and user trimming)
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- External triggers for conversion
- Sample and hold low-power mode, with internal or external capacitor

The DAC channels are triggered through the timer update outputs that are also connected to different DMA channels.

3.17 Voltage reference buffer (VREFBUF)

The STM32L451xx devices embed an voltage reference buffer which can be used as voltage reference for ADCs, DAC and also as voltage reference for external components through the VREF+ pin.

The internal voltage reference buffer supports two voltages:

- 2.048 V
- 2.5 V

An external voltage reference can be provided through the VREF+ pin when the internal voltage reference buffer is off.

The VREF+ pin is double-bonded with VDDA on some packages. In these packages the internal voltage reference buffer is not available.

VREFBUF
VDDA DAC, ADC
Bandgap
Low frequency cut-off capacitor

MSv40197V1

Figure 5. Voltage reference buffer

3.18 Comparators (COMP)

The STM32L451xx devices embed two rail-to-rail comparators with programmable reference voltage (internal or external), hysteresis and speed (low speed for low-power) and with selectable output polarity.

The reference voltage can be one of the following:

- External I/O
- DAC output channels
- Internal reference voltage or submultiple (1/4, 1/2, 3/4).

All comparators can wake up from Stop mode, generate interrupts and breaks for the timers and can be also combined into a window comparator.

3.19 Operational amplifier (OPAMP)

The STM32L451xx embeds one operational amplifier with external or internal follower routing and PGA capability.

The operational amplifier features:

- Low input bias current
- Low offset voltage
- Low-power mode
- Rail-to-rail input

3.20 Touch sensing controller (TSC)

The touch sensing controller provides a simple solution for adding capacitive sensing functionality to any application. Capacitive sensing technology is able to detect finger presence near an electrode which is protected from direct touch by a dielectric (glass, plastic, ...). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle.

The touch sensing controller is fully supported by the STMTouch touch sensing firmware library which is free to use and allows touch sensing functionality to be implemented reliably in the end application.

The main features of the touch sensing controller are the following:

- Proven and robust surface charge transfer acquisition principle
- Supports up to 21 capacitive sensing channels
- Up to 3 capacitive sensing channels can be acquired in parallel offering a very good response time
- Spread spectrum feature to improve system robustness in noisy environments
- Full hardware management of the charge transfer acquisition sequence
- Programmable charge transfer frequency
- Programmable sampling capacitor I/O pin
- Programmable channel I/O pin
- Programmable max count value to avoid long acquisition when a channel is faulty
- Dedicated end of acquisition and max count error flags with interrupt capability
- One sampling capacitor for up to 3 capacitive sensing channels to reduce the system components
- Compatible with proximity, touchkey, linear and rotary touch sensor implementation
- Designed to operate with STMTouch touch sensing firmware library

Note: The number of capacitive sensing channels is dependent on the size of the packages and subject to I/O availability.

3.21 Digital filter for Sigma-Delta Modulators (DFSDM)

The device embeds one DFSDM with 2 digital filters modules and 4 external input serial channels (transceivers) or alternately 4 internal parallel inputs support.

The DFSDM peripheral is dedicated to interface the external $\Sigma\Delta$ modulators to microcontroller and then to perform digital filtering of the received data streams (which represent analog value on $\Sigma\Delta$ modulators inputs). DFSDM can also interface PDM (Pulse Density Modulation) microphones and perform PDM to PCM conversion and filtering in

DS11910 Rev 4 43/201

hardware. DFSDM features optional parallel data stream inputs from microcontrollers memory (through DMA/CPU transfers into DFSDM).

DFSDM transceivers support several serial interface formats (to support various $\Sigma\Delta$ modulators). DFSDM digital filter modules perform digital processing according user selected filter parameters with up to 24-bit final ADC resolution.

The DFSDM peripheral supports:

- 4 multiplexed input digital serial channels:
 - configurable SPI interface to connect various SD modulator(s)
 - configurable Manchester coded 1 wire interface support
 - PDM (Pulse Density Modulation) microphone input support
 - maximum input clock frequency up to 20 MHz (10 MHz for Manchester coding)
 - clock output for SD modulator(s): 0..20 MHz
- alternative inputs from 8 internal digital parallel channels (up to 16 bit input resolution):
 - internal sources: device memory data streams (DMA)
- 2 digital filter modules with adjustable digital signal processing:
 - Sinc^x filter: filter order/type (1..5), oversampling ratio (up to 1..1024)
 - integrator: oversampling ratio (1..256)
- up to 24-bit output data resolution, signed output data format
- automatic data offset correction (offset stored in register by user)
- · continuous or single conversion
- start-of-conversion triggered by:
 - software trigger
 - internal timers
 - external events
 - start-of-conversion synchronously with first digital filter module (DFSDM1_FLT0)
- analog watchdog feature:
 - low value and high value data threshold registers
 - dedicated configurable Sincx digital filter (order = 1..3, oversampling ratio = 1..32)
 - input from final output data or from selected input digital serial channels
 - continuous monitoring independently from standard conversion
- short circuit detector to detect saturated analog input values (bottom and top range):
 - up to 8-bit counter to detect 1..256 consecutive 0's or 1's on serial data stream
 - monitoring continuously each input serial channel
- break signal generation on analog watchdog event or on short circuit detector event
- extremes detector:
 - storage of minimum and maximum values of final conversion data
 - refreshed by software
- DMA capability to read the final conversion data
- interrupts: end of conversion, overrun, analog watchdog, short circuit, input serial channel clock absence
- "regular" or "injected" conversions:
 - "regular" conversions can be requested at any time or even in continuous mode

without having any impact on the timing of "injected" conversions

"injected" conversions for precise timing and with high conversion priority

Table 10. DFSDM1 implementation

| DFSDM features | DFSDM1 |
|---------------------------|--------|
| Number of channels | 8 |
| Number of filters | 4 |
| Input from internal ADC | - |
| Supported trigger sources | 10 |
| Pulses skipper | - |
| ID registers support | - |

3.22 Random number generator (RNG)

All devices embed an RNG that delivers 32-bit random numbers generated by an integrated analog circuit.

3.23 Timers and watchdogs

The STM32L451xx includes one advanced control timers, up to five general-purpose timers, two basic timers, two low-power timers, two watchdog timers and a SysTick timer. The table below compares the features of the advanced control, general purpose and basic timers.

Table 11. Timer feature comparison

| Timer type | Timer | Counter resolution | Counter type | Prescaler factor | DMA request generation | Capture/ compare channels | Complementary outputs |
|---------------------|-----------------------|--------------------|----------------------|---------------------------------------|------------------------------|---------------------------------|-----------------------|
| Advanced control | TIM1 | 16-bit | Up, down, Up/down | Any integer between 1 and 65536 | Yes | 4 | 3 |
| General- purpose | TIM2 | 32-bit | Up, down, Up/down | Any integer between 1 and 65536 | Yes | 4 | No |
| General- purpose | TIM3 | 16-bit | Up, down, Up/down | Any integer between 1 and 65536 | Yes | 4 | No |
| General- purpose | I IIM15 16-bit Up | | Up | Any integer between 1 and 65536 | Yes | 2 | 1 |
| General- purpose | TIM16 | 16-bit | Up | Any integer between 1 and 65536 | Yes | 1 | 1 |
| Basic | TIM6 | 16-bit | Up | Any integer between 1 and 65536 | Yes | 0 | No |

3.23.1 Advanced-control timer (TIM1)

The advanced-control timer can each be seen as a three-phase PWM multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead-times. They can also be seen as complete general-purpose timers. The 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes) with full modulation capability (0-100%)
- One-pulse mode output

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled to turn off any power switches driven by these outputs.

Many features are shared with those of the general-purpose TIMx timers (described in Section 3.23.2) using the same architecture, so the advanced-control timer can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

3.23.2 General-purpose timers (TIM2, TIM3, TIM15, TIM16)

There are up to three synchronizable general-purpose timers embedded in the STM32L451xx (see *Table 11* for differences). Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

TIM2, TIM3

They are full-featured general-purpose timers:

- TIM2 has a 32-bit auto-reload up/downcounter and 32-bit prescaler.
- TIM3 has 16-bit auto-reload up/downcounter and 16-bit prescaler.

These timers feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. They can work with the other general-purpose timers via the Timer Link feature for synchronization or event chaining.

The counters can be frozen in debug mode.

All have independent DMA request generation and support quadrature encoder.

TIM15 and 16

They are general-purpose timers with mid-range features:

They have 16-bit auto-reload upcounters and 16-bit prescalers.

- TIM15 has 2 channels and 1 complementary channel
- TIM16 has 1 channel and 1 complementary channel

All channels can be used for input capture/output compare, PWM or one-pulse mode output.

The timers can work together via the Timer Link feature for synchronization or event chaining. The timers have independent DMA request generation.

The counters can be frozen in debug mode.

3.23.3 Basic timer (TIM6)

The basic timer is mainly used for DAC trigger generation. It can also be used as generic 16-bit timebase.

3.23.4 Low-power timer (LPTIM1 and LPTIM2)

The devices embed two low-power timers. These timers have an independent clock and are running in Stop mode if they are clocked by LSE, LSI or an external clock. They are able to wakeup the system from Stop mode.

LPTIM1 is active in Stop 0, Stop 1 and Stop 2 modes.

LPTIM2 is active in Stop 0 and Stop 1 mode.

This low-power timer supports the following features:

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output: pulse, PWM
- · Continuous/ one shot mode
- Selectable software/hardware input trigger
- Selectable clock source
 - Internal clock sources: LSE, LSI, HSI16 or APB clock
 - External clock source over LPTIM input (working even with no internal clock source running, used by pulse counter application).
- Programmable digital glitch filter
- Encoder mode (LPTIM1 only)

3.23.5 Infrared interface (IRTIM)

The STM32L451xx includes one infrared interface (IRTIM). It can be used with an infrared LED to perform remote control functions. It uses TIM15 and TIM16 output channels to generate output signal waveforms on IR_OUT pin.

3.23.6 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC (LSI) and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

3.23.7 System window watchdog (WWDG)

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

DS11910 Rev 4 47/201

3.23.8 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source

3.24 Real-time clock (RTC) and backup registers

The RTC is an independent BCD timer/counter. It supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Two programmable alarms.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision.
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy.
- Three anti-tamper detection pins with programmable filter.
- Timestamp feature which can be used to save the calendar content. This function can
 be triggered by an event on the timestamp pin, or by a tamper event, or by a switch to
 VBAT mode.
- 17-bit auto-reload wakeup timer (WUT) for periodic events with programmable resolution and period.

The RTC and the 32 backup registers are supplied through a switch that takes power either from the V_{DD} supply when present or from the VBAT pin.

The backup registers are 32-bit registers used to store 128 bytes of user application data when V_{DD} power is not present. They are not reset by a system or power reset, or when the device wakes up from Standby or Shutdown mode.

The RTC clock sources can be:

- A 32.768 kHz external crystal (LSE)
- An external resonator or oscillator (LSE)
- The internal low power RC oscillator (LSI, with typical frequency of 32 kHz)
- The high-speed external clock (HSE) divided by 32.

The RTC is functional in VBAT mode and in all low-power modes when it is clocked by the LSE. When clocked by the LSI, the RTC is not functional in VBAT mode, but is functional in all low-power modes except Shutdown mode.

All RTC events (Alarm, WakeUp Timer, Timestamp or Tamper) can generate an interrupt and wakeup the device from the low-power modes.

3.25 Inter-integrated circuit interface (I²C)

The device embeds four I2C. Refer to *Table 12: I2C implementation* for the features implementation.

The I²C bus interface handles communications between the microcontroller and the serial I²C bus. It controls all I²C bus-specific sequencing, protocol, arbitration and timing.

The I2C peripheral supports:

- I²C-bus specification and user manual rev. 5 compatibility:
 - Slave and master modes, multimaster capability
 - Standard-mode (Sm), with a bitrate up to 100 kbit/s
 - Fast-mode (Fm), with a bitrate up to 400 kbit/s
 - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
 - 7-bit and 10-bit addressing mode, multiple 7-bit slave addresses
 - Programmable setup and hold times
 - Optional clock stretching
- System Management Bus (SMBus) specification rev 2.0 compatibility:
 - Hardware PEC (Packet Error Checking) generation and verification with ACK control
 - Address resolution protocol (ARP) support
 - SMBus alert
- Power System Management Protocol (PMBusTM) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent from the PCLK reprogramming. Refer to Figure 4: Clock tree.
- Wakeup from Stop mode on address match
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

Table 12. I2C implementation

| I2C features ⁽¹⁾ | I2C1 | I2C2 | I2C3 | I2C4 |
|---|------|------|------|------|
| Standard-mode (up to 100 kbit/s) | Х | X | X | Х |

| Wakeup from Stop 2 mode on address match | - | - | Х | - |

1. X: supported

DS11910 Rev 4 49/201

3.26 Universal synchronous/asynchronous receiver transmitter (USART)

The STM32L451xx devices have three embedded universal synchronous receiver transmitters (USART1, USART2 and USART3) and one universal asynchronous receiver transmitters (UART4).

These interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability. They provide hardware management of the CTS and RTS signals, and RS485 Driver Enable. They are able to communicate at speeds of up to 10Mbit/s.

USART1, USART2 and USART3 also provide Smart Card mode (ISO 7816 compliant) and SPI-like communication capability.

All USART have a clock domain independent from the CPU clock, allowing the USARTx (x=1,2,3,4) to wake up the MCU from Stop mode using baudrates up to 204 Kbaud. The wake up events from Stop mode are programmable and can be:

- Start bit detection
- Any received data frame
- A specific programmed data frame

All USART interfaces can be served by the DMA controller.

USART3 USART modes/features⁽¹⁾ USART1 USART2 **UART4** LPUART1 Hardware flow control for modem Χ Χ Χ Χ Χ Χ Χ Χ Χ Χ Continuous communication using DMA Multiprocessor communication Χ Χ Χ Χ Χ Χ Synchronous mode Х Х Smartcard mode Χ Χ Χ Χ Χ Χ Single-wire half-duplex communication Х Χ IrDA SIR ENDEC block Χ Χ Χ Χ LIN mode Х Χ Χ Χ Dual clock domain Χ Χ Х Х Х Wakeup from Stop 0 / Stop 1 modes Х Χ Х Χ Х Wakeup from Stop 2 mode _ Χ Receiver timeout interrupt Х Χ Χ Χ Х Χ Χ Modbus communication Х Auto baud rate detection X (4 modes) **Driver Enable** Х Χ Х Х Χ LPUART/USART data length 7, 8 and 9 bits

Table 13. STM32L451xx USART/UART/LPUART features

X = supported.

3.27 Low-power universal asynchronous receiver transmitter (LPUART)

The device embeds one Low-Power UART. The LPUART supports asynchronous serial communication with minimum power consumption. It supports half duplex single wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

The LPUART has a clock domain independent from the CPU clock, and can wakeup the system from Stop mode using baudrates up to 220 Kbaud. The wake up events from Stop mode are programmable and can be:

- Start bit detection
- Any received data frame
- A specific programmed data frame

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher speed clock can be used to reach higher baudrates.

LPUART interface can be served by the DMA controller.

DS11910 Rev 4 51/201

3.28 Serial peripheral interface (SPI)

Three SPI interfaces allow communication up to 40 Mbits/s in master and up to 24 Mbits/s slave modes, in half-duplex, full-duplex and simplex modes. The 3-bit prescaler gives 8 master mode frequencies and the frame size is configurable from 4 bits to 16 bits. The SPI interfaces support NSS pulse mode, TI mode and Hardware CRC calculation.

All SPI interfaces can be served by the DMA controller.

3.29 Serial audio interfaces (SAI)

The device embeds 1 SAI. Refer to *Table 14: SAI implementation* for the features implementation. The SAI bus interface handles communications between the microcontroller and the serial audio protocol.

The SAI peripheral supports:

- Two independent audio sub-blocks which can be transmitters or receivers with their respective FIFO.
- 8-word integrated FIFOs for each audio sub-block.
- Synchronous or asynchronous mode between the audio sub-blocks.
- Master or slave configuration independent for both audio sub-blocks.
- Clock generator for each audio block to target independent audio frequency sampling when both audio sub-blocks are configured in master mode.
- Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit.
- Peripheral with large configurability and flexibility allowing to target as example the following audio protocol: I2S, LSB or MSB-justified, PCM/DSP, TDM, AC'97 and SPDIF out.
- Up to 16 slots available with configurable size and with the possibility to select which
 ones are active in the audio frame.
- Number of bits by frame may be configurable.
- Frame synchronization active level configurable (offset, bit length, level).
- First active bit position in the slot is configurable.
- LSB first or MSB first for data transfer.
- Mute mode.
- Stereo/Mono audio frame capability.
- Communication clock strobing edge configurable (SCK).
- Error flags with associated interrupts if enabled respectively.
 - Overrun and underrun detection.
 - Anticipated frame synchronization signal detection in slave mode.
 - Late frame synchronization signal detection in slave mode.
 - Codec not ready for the AC'97 mode in reception.
- Interruption sources when enabled:
 - Errors.
 - FIFO requests.
- DMA interface with 2 dedicated channels to handle access to the dedicated integrated FIFO of each SAI audio sub-block.

| | •• |
|--|------------------------|
| SAI features | Support ⁽¹⁾ |
| I2S, LSB or MSB-justified, PCM/DSP, TDM, AC'97 | X |
| Mute mode | X |
| Stereo/Mono audio frame capability. | X |
| 16 slots | X |
| Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit | X |
| FIFO Size | X (8 Word) |
| SPDIF | X |

Table 14. SAI implementation

3.30 Controller area network (CAN)

The CAN is compliant with specifications 2.0A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. It has three transmit mailboxes, two receive FIFOs with 3 stages and 14 scalable filter banks.

The CAN peripheral supports:

- Supports CAN protocol version 2.0 A, B Active
- Bit rates up to 1 Mbit/s
- Transmission
 - Three transmit mailboxes
 - Configurable transmit priority
- Reception
 - Two receive FIFOs with three stages
 - 14 Scalable filter banks
 - Identifier list feature
 - Configurable FIFO overrun
- Time-triggered communication option
 - Disable automatic retransmission mode
 - 16-bit free running timer
 - Time Stamp sent in last two data bytes
- Management
 - Maskable interrupts
 - Software-efficient mailbox mapping at a unique address space

3.31 Secure digital input/output and MultiMediaCards Interface (SDMMC)

The card host interface (SDMMC) provides an interface between the APB peripheral bus and MultiMediaCards (MMCs), SD memory cards and SDIO cards.

DS11910 Rev 4 53/201

^{1.} X: supported

The SDMMC features include the following:

• Full compliance with MultiMediaCard System Specification Version 4.2. Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit

- Full compatibility with previous versions of MultiMediaCards (forward compatibility)
- Full compliance with SD Memory Card Specifications Version 2.0
- Full compliance with SD I/O Card Specification Version 2.0: card support for two different databus modes: 1-bit (default) and 4-bit
- Data transfer up to 48 MHz for the 8 bit mode
- Data write and read with DMA capability

3.32 Clock recovery system (CRS)

The STM32L451xx devices embed a special block which allows automatic trimming of the internal 48 MHz oscillator to guarantee its optimal accuracy over the whole device operational range. This automatic trimming is based on the external synchronization signal, which could be either derived from LSE oscillator, from an external signal on CRS_SYNC pin or generated by user software. For faster lock-in during startup it is also possible to combine automatic trimming with manual trimming action.

3.33 Quad SPI memory interface (QUADSPI)

The Quad SPI is a specialized communication interface targeting single, dual or quad SPI flash memories. It can operate in any of the three following modes:

- Indirect mode: all the operations are performed using the QUADSPI registers
- Status polling mode: the external flash status register is periodically read and an interrupt can be generated in case of flag setting
- Memory-mapped mode: the external Flash is memory mapped and is seen by the system as if it were an internal memory

Both throughput and capacity can be increased two-fold using dual-flash mode, where two Quad SPI flash memories are accessed simultaneously.

The Quad SPI interface supports:

- Three functional modes: indirect, status-polling, and memory-mapped
- Dual-flash mode, where 8 bits can be sent/received simultaneously by accessing two flash memories in parallel.
- SDR and DDR support
- Fully programmable opcode for both indirect and memory mapped mode
- Fully programmable frame format for both indirect and memory mapped mode
- Each of the 5 following phases can be configured independently (enable, length, single/dual/quad communication)
 - Instruction phase
 - Address phase
 - Alternate bytes phase
 - Dummy cycles phase
 - Data phase
- Integrated FIFO for reception and transmission
- 8, 16, and 32-bit data accesses are allowed
- DMA channel for indirect mode operations
- Programmable masking for external flash flag management
- Timeout management
- Interrupt generation on FIFO threshold, timeout, status match, operation complete, and access error

DS11910 Rev 4 55/201

3.34 Development support

3.34.1 Serial wire JTAG debug port (SWJ-DP)

The Arm[®] SWJ-DP interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

Debug is performed using 2 pins only instead of 5 required by the JTAG (JTAG pins could be re-use as GPIO with alternate function): the JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

3.34.2 Embedded Trace Macrocell™

The Arm[®] Embedded Trace Macrocell™ provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32L451xx through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. Real-time instruction and data flow activity be recorded and then formatted for display on the host computer that runs the debugger software. TPA hardware is commercially available from common development tool vendors.

The Embedded Trace Macrocell™ operates with third party debugger software tools.

PC13, PC14 and PC15 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 in output mode is limited:

- The speed should not exceed 2 MHz with a maximum load of 30 pF

- These GPIOs must not be used as current sources (e.g. to drive an LED).

After a Backup domain power-up, PC13, PC14 and PC15 operate as GPIOs. Their function then depends on the content of
the RTC registers which are not reset by the system reset. For details on how to manage these GPIOs, refer to the Backup
domain and RTC register descriptions in the RM0394 reference manual.

^{3.} After reset, these pins are configured as JTAG/SW debug alternate functions, and the internal pull-up on PA15, PA13, PB4 pins and the internal pull-down on PA14 pin are activated.

6 Electrical characteristics

6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS}.

6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25$ °C and $T_A = T_{Amax}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean $\pm 3\sigma$).

6.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25$ °C, $V_{DD} = V_{DDA} = 3$ V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean $\pm 2\sigma$).

6.1.3 Typical curves

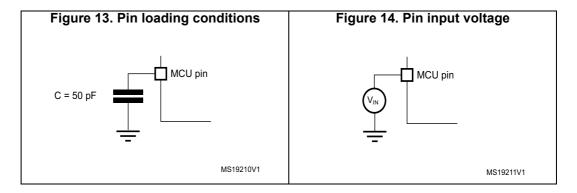

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in Figure 13.

6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in Figure 14.

6.1.6 Power supply scheme

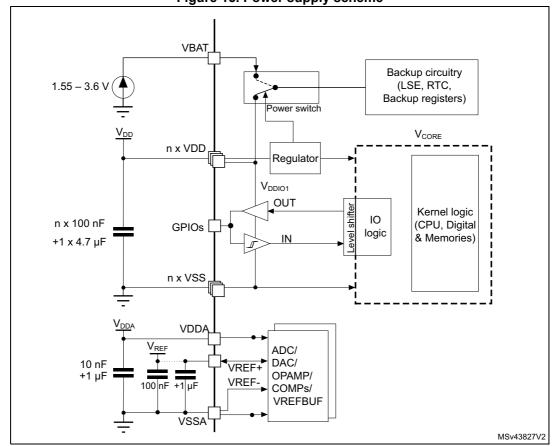

Figure 15. Power supply scheme

Caution:

Each power supply pair (V_{DD}/V_{SS} , V_{DDA}/V_{SSA} etc.) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

6.1.7 Current consumption measurement

IDD_VBAT
VBAT
IDD
VDD
VDD

MSv41629V1

Figure 16. Current consumption measurement scheme

The I_{DD_ALL} parameters given in *Table 27* to *Table 39* represent the total MCU consumption including the current supplying V_{DD} , V_{DDA} and V_{BAT} .

6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in *Table 20: Voltage characteristics*, *Table 21: Current characteristics* and *Table 22: Thermal characteristics* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. Exposure to maximum rating conditions for extended periods may affect device reliability. Device mission profile (application conditions) is compliant with JEDEC JESD47 qualification standard, extended mission profiles are available on demand.

| Symbol | Ratings | Min | Max | Unit |
|------------------------------------|---|----------------------|--|------|
| V _{DDX} - V _{SS} | External main supply voltage (including V_{DD} , V_{DDA} , V_{BAT}) | -0.3 | 4.0 | V |
| | Input voltage on FT_xxx pins | V _{SS} -0.3 | min (V_{DD} , V_{DDA}) + 4.0 ⁽³⁾⁽⁴⁾ | |
| V _{IN} ⁽²⁾ | Input voltage on TT_xx pins | V _{SS} -0.3 | 4.0 | V |
| | Input voltage on any other pins | V _{SS} -0.3 | 4.0 | |
| $ \Delta V_{DDx} $ | Variations between different V _{DDX} power pins of the same domain | - | 50 | mV |
| V _{SSx} -V _{SS} | Variations between all the different ground pins ⁽⁵⁾ | - | 50 | mV |

Table 20. Voltage characteristics⁽¹⁾

88/201 DS11910 Rev 4

All main power (V_{DD}, V_{DDA}, V_{BAT}) and ground (V_{SS}, V_{SSA}) pins must always be connected to the external power supply, in the permitted range.

^{2.} V_{IN} maximum must always be respected. Refer to *Table 21: Current characteristics* for the maximum allowed injected current values

^{3.} This formula has to be applied only on the power supplies related to the IO structure described in the pin definition table.

- 4. To sustain a voltage higher than 4 V the internal pull-up/pull-down resistors must be disabled.
- 5. Include VREF- pin.

Table 21. Current characteristics

| Symbol | Ratings | Max | Unit |
|-------------------------------------|--|----------------------|------|
| Σ IV _{DD} | Total current into sum of all V _{DD} power lines (source) ⁽¹⁾ | 140 | |
| ΣIV _{SS} | Total current out of sum of all V _{SS} ground lines (sink) ⁽¹⁾ | 140 | |
| IV _{DD(PIN)} | Maximum current into each V _{DD} power pin (source) ⁽¹⁾ | 100 | |
| IV _{SS(PIN)} | Maximum current out of each V _{SS} ground pin (sink) ⁽¹⁾ | 100 | |
| | Output current sunk by any I/O and control pin except FT_f | 20 | |
| I _{IO(PIN)} | Output current sunk by any FT_f pin | 20 | |
| | Output current sourced by any I/O and control pin | 20 | mA |
| ~ I | Total output current sunk by sum of all I/Os and control pins ⁽²⁾ | 100 | |
| $\Sigma I_{IO(PIN)}$ | Total output current sourced by sum of all I/Os and control pins ⁽²⁾ | 100 | |
| I _{INJ(PIN)} (3) | Injected current on FT_xxx, TT_xx, RST and B pins, except PA4, PA5 | -5/+0 ⁽⁴⁾ | |
| | Injected current on PA4, PA5 | -5/0 | |
| $\sum I_{\text{INJ}(\text{PIN})} $ | Total injected current (sum of all I/Os and control pins) ⁽⁵⁾ | 25 | 1 |

- All main power (V_{DD}, V_{DDA}, V_{BAT}) and ground (V_{SS}, V_{SSA}) pins must always be connected to the external power supplies, in the permitted range.
- 2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count QFP packages.
- 3. Positive injection (when $V_{IN} > V_{DDIOx}$) is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
- A negative injection is induced by V_{IN} < V_{SS}. I_{INJ(PIN)} must never be exceeded. Refer also to *Table 20: Voltage characteristics* for the maximum allowed input voltage values.
- When several inputs are submitted to a current injection, the maximum ∑|I_{INJ(PIN)}| is the absolute sum of the negative injected currents (instantaneous values).

Table 22. Thermal characteristics

| Symbol | Ratings | Value | Unit |
|------------------|------------------------------|-------------|------|
| T _{STG} | Storage temperature range | -65 to +150 | °C |
| T_J | Maximum junction temperature | 150 | °C |

DS11910 Rev 4 89/201

90/201 DS11910 Rev 4

- 1. When RESET is released functionality is guaranteed down to V_{BOR0} Min.
- This formula has to be applied only on the power supplies related to the IO structure described by the pin definition table. Maximum I/O input voltage is the smallest value between Min(V_{DD}, V_{DDA})+3.6 V and 5.5V.
- 3. For operation with voltage higher than Min (V_{DD}, V_{DDA}) +0.3 V, the internal Pull-up and Pull-Down resistors must be disabled
- 4. If T_A is lower, higher P_D values are allowed as long as T_J does not exceed T_{Jmax} (see Section 7.7: Thermal characteristics).
- In low-power dissipation state, T_A can be extended to this range as long as T_J does not exceed T_{Jmax} (see Section 7.7: Thermal characteristics).

6.3.2 Operating conditions at power-up / power-down

The parameters given in *Table 24* are derived from tests performed under the ambient temperature condition summarized in *Table 23*.

Table 24. Operating conditions at power-up / power-down

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-------------------|---------------------------------|------------|-----|-----|-------|
| 4 | V _{DD} rise time rate | | 0 | 8 | µs/V |
| t _{VDD} | V _{DD} fall time rate | - | 10 | 8 | μ5/ ν |
| + | V _{DDA} rise time rate | | 0 | ∞ | µs/V |
| ^t ∨DDA | V _{DDA} fall time rate | _ | 10 | 8 | μ5/ ν |

The requirements for power-up/down sequence specified in *Section 3.9.1: Power supply schemes* must be respected.

6.3.3 Embedded reset and power control block characteristics

The parameters given in *Table 25* are derived from tests performed under the ambient temperature conditions summarized in *Table 23: General operating conditions*.

Table 25. Embedded reset and power control block characteristics

| Symbol | Parameter | Conditions ⁽¹⁾ | Min | Тур | Max | Unit |
|--------------------------------------|--|---------------------------|------|------|------|------|
| t _{RSTTEMPO} ⁽²⁾ | Reset temporization after BOR0 is detected | V _{DD} rising | - | 250 | 400 | μs |
| V _{BOR0} ⁽²⁾ | Brown-out reset threshold 0 | Rising edge | 1.62 | 1.66 | 1.7 | V |
| VBOR0` | Brown-out reset timeshold o | Falling edge | 1.6 | 1.64 | 1.69 | V |

| I _{DD} (PVM3/PVM4) | PVM3 and PVM4 consumption from V _{DD} | - | - | 2 | - | μΑ |

Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

92/201 DS11910 Rev 4

^{2.} Guaranteed by design.

^{3.} BOR0 is enabled in all modes (except shutdown) and its consumption is therefore included in the supply current characteristics tables.

6.3.4 Embedded voltage reference

The parameters given in *Table 26* are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 23: General operating conditions*.

Table 26. Embedded internal voltage reference

| Symbol | Parameter | Conditions | Min | Тур | Max | Unit |
|---|---|-----------------------------------|------------------|-------|---------------------|--------------------------|
| V _{REFINT} | Internal reference voltage | -40 °C < T _A < +130 °C | 1.182 | 1.212 | 1.232 | V |
| t _{S_vrefint} (1) | ADC sampling time when reading the internal reference voltage | - | 4 ⁽²⁾ | - | - | μs |
| t _{start_vrefint} | Start time of reference voltage buffer when ADC is enable | - | - | 8 | 12 ⁽²⁾ | μs |
| I _{DD} (V _{REFINTBUF}) | V _{REFINT} buffer consumption from V _{DD} when converted by ADC | - | - | 12.5 | 20 ⁽²⁾ | μΑ |
| ΔV_{REFINT} | Internal reference voltage spread over the temperature range | V _{DD} = 3 V | - | 5 | 7.5 ⁽²⁾ | mV |
| T _{Coeff} | Temperature coefficient | -40°C < T _A < +130°C | - | 30 | 50 ⁽²⁾ | ppm/°C |
| A _{Coeff} | Long term stability | 1000 hours, T = 25°C | - | 300 | 1000 ⁽²⁾ | ppm |
| V _{DDCoeff} | Voltage coefficient | 3.0 V < V _{DD} < 3.6 V | - | 250 | 1200 ⁽²⁾ | ppm/V |
| V _{REFINT_DIV1} | 1/4 reference voltage | | 24 | 25 | 26 | |
| V _{REFINT_DIV2} | 1/2 reference voltage | - | 49 | 50 | 51 | % V _{REFINT} |
| V _{REFINT_DIV3} | 3/4 reference voltage | | 74 | 75 | 76 | REFINI |

^{1.} The shortest sampling time can be determined in the application by multiple iterations.

^{2.} Guaranteed by design.

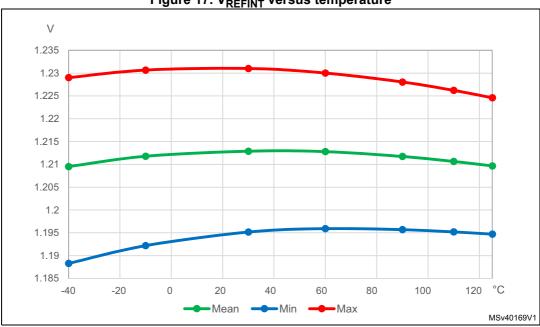

Figure 17. V_{REFINT} versus temperature

6.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in *Figure 16: Current consumption measurement scheme*.

Typical and maximum current consumption

The MCU is placed under the following conditions:

- · All I/O pins are in analog input mode
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted with the minimum wait states number, depending on the f_{HCLK} frequency (refer to the table "Number of wait states according to CPU clock (HCLK) frequency" available in the RM0394 reference manual).
- When the peripherals are enabled f_{PCLK} = f_{HCLK}

The parameters given in *Table 27* to *Table 40* are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 23: General operating conditions*.

I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in *Table 61: I/O static characteristics*.

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

Caution:

Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

I/O dynamic current consumption

In addition to the internal peripheral current consumption measured previously (see *Table 41: Peripheral current consumption*), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the I/O supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DDIOx} \times f_{SW} \times C$$

where

 $I_{\mbox{\scriptsize SW}}$ is the current sunk by a switching I/O to charge/discharge the capacitive load

V_{DDIOx} is the I/O supply voltage

f_{SW} is the I/O switching frequency

C is the total capacitance seen by the I/O pin: $C = C_{INT} + C_{EXT} + C_{S}$

C_S is the PCB board capacitance including the pad pin.

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in *Table 41*. The MCU is placed under the following conditions:

- All I/O pins are in Analog mode
- The given value is calculated by measuring the difference of the current consumptions:
 - when the peripheral is clocked on
 - when the peripheral is clocked off
- Ambient operating temperature and supply voltage conditions summarized in Table 20: Voltage characteristics
- The power consumption of the digital part of the on-chip peripherals is given in *Table 41*. The power consumption of the analog part of the peripherals (where applicable) is indicated in each related section of the datasheet.

- 3. The AHB to APB1 Bridge is automatically active when at least one peripheral is ON on the APB1.
- 4. The AHB to APB2 Bridge is automatically active when at least one peripheral is ON on the APB2.

6.3.6 Wakeup time from low-power modes and voltage scaling transition times

The wakeup times given in *Table 42* are the latency between the event and the execution of the first user instruction.

The device goes in low-power mode after the WFE (Wait For Event) instruction.

Table 42. Low-power mode wakeup timings⁽¹⁾

| Symbol | Parameter | Conditions | Тур | Max | Unit |
|------------------------|---|---|-----|-----|---------------|
| t _{WUSLEEP} | Wakeup time from Sleep mode to Run mode | - | 6 | 6 | Nb of |
| t _{WULPSLEEP} | Wakeup time from Low- power sleep mode to Low- power run mode | Wakeup in Flash with Flash in power-down during low-power sleep mode (SLEEP_PD=1 in FLASH_ACR) and with clock MSI = 2 MHz | 6 | 9 | CPU cycles |

The GPIOx (x= A...H) dynamic current consumption is approximately divided by a factor two versus this table values when
the GPIO port is locked thanks to LCKK and LCKy bits in the GPIOx_LCKR register. In order to save the full GPIOx current
consumption, the GPIOx clock should be disabled in the RCC when all port I/Os are used in alternate function or analog
mode (clock is only required to read or write into GPIO registers, and is not used in AF or analog modes).

Table 42. Low-power mode wakeup timings⁽¹⁾ (continued)

6.3.7 **External clock source characteristics**

High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in Section 6.3.14. However, the recommended clock input waveform is shown in Figure 18: High-speed external clock source AC timing diagram.

Table 45. High-speed external user clock characteristics⁽¹⁾

| Symbol | Parameter | Conditions | Min | Тур | Max | Unit | |

Figure 18. High-speed external clock source AC timing diagram

Low-speed external user clock generated from an external source

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO.

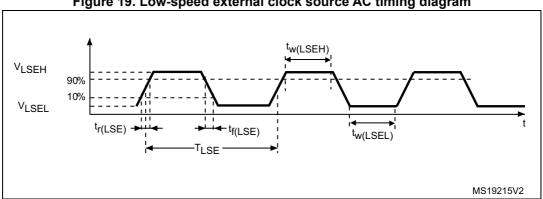

The external clock signal has to respect the I/O characteristics in Section 6.3.14. However, the recommended clock input waveform is shown in Figure 19.

High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 48 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in *Table 47*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 47. HSE oscillator characteristics⁽¹⁾

For C_{L1} and C_{L2} , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 20 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see *Figure 20*). C_{L1} and C_{L2} are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2} . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C_{L1} and C_{L2} .

6.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports). the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- Electrostatic discharge (ESD) (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- FTB: A Burst of Fast Transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in *Table 56*. They are based on the EMS levels and classes defined in application note AN1709.

Level/ **Symbol Parameter Conditions** Class $V_{DD} = 3.3 \text{ V}, T_A = +25 ^{\circ}\text{C},$ Voltage limits to be applied on any I/O pin $f_{HCLK} = 80 \text{ MHz}.$ 3B V_{FESD} to induce a functional disturbance conforming to IEC 61000-4-2 Fast transient voltage burst limits to be $V_{DD} = 3.3 \text{ V}, T_A = +25 ^{\circ}\text{C},$ $f_{HCLK} = 80 \text{ MHz},$ applied through 100 pF on V_{DD} and V_{SS} 5A V_{EFTB} pins to induce a functional disturbance conforming to IEC 61000-4-4

Table 56. EMS characteristics

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

| Symbol Parameter | | Conditions | Monitored frequency band | Max vs. [f _{HSE} /f _{HCLK}] | Unit | |
|------------------|------------|--|--------------------------|---|------|--|
| | | | moquomoy bama | 8 MHz/ 80 MHz | | |
| | | V _{DD} = 3.6 V, T _A = 25 °C, LQFP100 package compliant with IEC 61967-2 | 0.1 MHz to 30 MHz | -8 | | |
| | | | 30 MHz to 130 MHz | 2 | dBµV | |
| S _{EMI} | Peak level | | 130 MHz to 1 GHz | 5 | ивμν | |
| | | | 1 GHz to 2 GHz | 8 | | |
| | | | EMI Level | 2.5 | - | |

Table 57. EMI characteristics

6.3.12 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the ANSI/JEDEC standard.

| Symbol | Ratings | Conditions | Class | Maximum value ⁽¹⁾ | Unit | | | | |
|-----------------------|---|---|-------|---------------------------------|------|--|--|--|--|
| V _{ESD(HBM)} | Electrostatic discharge voltage (human body model) | T _A = +25 °C, conforming to ANSI/ESDA/JEDEC JS-001 | 2 | 2000 | V | | | | |
| V _{ESD(CDM)} | Electrostatic discharge voltage (charge device model) | T _A = +25 °C, conforming to ANSI/ESD STM5.3.1 | C3 | 250 | V | | | | |

Table 58. ESD absolute maximum ratings

^{1.} Guaranteed by characterization results.

Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin.
- A current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 59. Electrical sensitivities

| Symbol | Parameter | Conditions | Class |
|--------|-----------------------|--|-------|
| LU | Static latch-up class | T _A = +105 °C conforming to JESD78A | II |

6.3.13 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DDIOX} (for standard, 3.3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of the -5 μ A/+0 μ A range) or other functional failure (for example reset occurrence or oscillator frequency deviation).

The characterization results are given in *Table 60*.

Negative induced leakage current is caused by negative injection and positive induced leakage current is caused by positive injection.

Table 60. I/O current injection susceptibility⁽¹⁾

| Symbol | Description | | tional ptibility | Unit |
|------------------|--|--------------------|---------------------|-------|
| Symbol | Description | Negative injection | Positive injection | Oille |
| | Injected current on all pins except PA4, PA5, PE8, PE9, PE10, PE11, PE12 | -5 | N/A ⁽²⁾ | |
| I _{INJ} | Injected current on PE8, PE9, PE10, PE11, PE12 | -0 | N/A ⁽²⁾ | mA |
| | Injected current on PA4, PA5 pins | -5 | 0 | |

- 1. Guaranteed by characterization results.
- 2. Injection is not possible.

6.3.14 I/O port characteristics

General input/output characteristics

Unless otherwise specified, the parameters given in *Table 61* are derived from tests performed under the conditions summarized in *Table 23: General operating conditions*. All I/Os are designed as CMOS- and TTL-compliant.

Table 61. I/O static characteristics

| C _{IO} | I/O pin capacitance | - | - | 5 | - | pF |

- 1. Refer to Figure 25: I/O input characteristics.
- 2. Tested in production.
- 3. Guaranteed by design.
- 4. All FT_xx IO except PA11, PA12 and PC3 I/O.
- 5. Max(V_{DDXXX}) is the maximum value of all the I/O supplies.
- $6. \quad \text{To sustain a voltage higher than } \text{Min}(\text{V}_{\text{DD}},\text{V}_{\text{DDA}}) + 0.3 \text{ V}, \text{ the internal Pull-up and Pull-Down resistors must be disabled.}$
- 7. This value represents the pad leakage of the IO itself. The total product pad leakage is provided by this formula: $I_{Total_Ileak_max} = 10 \ \mu A + [number of IOs where V_{IN} is applied on the pad]_x I_{Ikg}(Max).$
- 8. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).

All I/Os are CMOS- and TTL-compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in *Figure 25* for standard I/Os, and in *Figure 25* for 5 V tolerant I/Os.

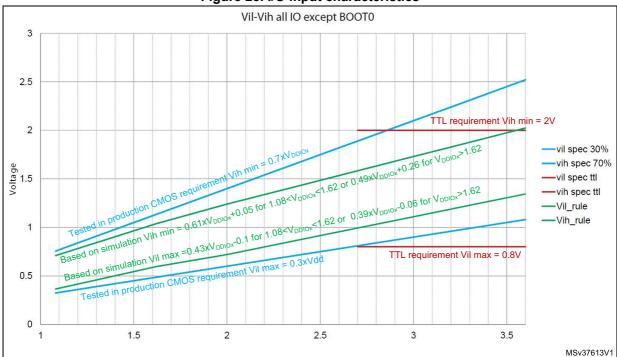

Figure 25. I/O input characteristics

Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to ± 8 mA, and sink or source up to ± 20 mA (with a relaxed V_{OL}/V_{OH}).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in Section 6.2:

- The sum of the currents sourced by all the I/Os on V_{DDIOX}, plus the maximum consumption of the MCU sourced on V_{DD}, cannot exceed the absolute maximum rating ΣI_{VDD} (see *Table 20: Voltage characteristics*).
- The sum of the currents sunk by all the I/Os on V_{SS}, plus the maximum consumption of the MCU sunk on V_{SS}, cannot exceed the absolute maximum rating ΣI_{VSS} (see *Table 20: Voltage characteristics*).

Output voltage levels

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 23: General operating conditions*. All I/Os are CMOS- and TTL-compliant (FT OR TT unless otherwise specified).

Table 62. Output voltage characteristics⁽¹⁾

| Symbol | Parameter | Conditions | Min | Max | Unit |
|--------------------------------|---|--|--------------------------------------|-------------------|------|
| V _{OL} | Output low level voltage for an I/O pin | CMOS port ⁽²⁾ | - | 0.4 | |
| V _{OH} | Output high level voltage for an I/O pin | I _{IO} = 8 mA V _{DDIOx} ≥ 2.7 V | V _{DDIOx} -0.4 | - | |
| V _{OL} ⁽³⁾ | Output low level voltage for an I/O pin | TTL port ⁽²⁾ | - | 0.4 | |
| V _{OH} ⁽³⁾ | Output high level voltage for an I/O pin | I _{IO} = 8 mA V _{DDIOx} ≥ 2.7 V | 2.4 | - | |
| V _{OL} ⁽³⁾ | Output low level voltage for an I/O pin | I _{IO} = 20 mA | - | 1.3 | |
| V _{OH} ⁽³⁾ | Output high level voltage for an I/O pin | V _{DDIOx} ≥ 2.7 V | V _{DDIOx} -1.3 | - | |
| V _{OL} ⁽³⁾ | Output low level voltage for an I/O pin | I _{IO} = 4 mA | - | 0.45 | |
| V _{OH} ⁽³⁾ | Output high level voltage for an I/O pin | V _{DDIOx} ≥ 1.62 V | V _{DDIOx} -0.45 | - | V |
| V _{OL} ⁽³⁾ | Output low level voltage for an I/O pin | I _{IO} = 2 mA | - | 0.35_xV_{DDIOx} | |
| V _{OH} ⁽³⁾ | Output high level voltage for an I/O pin | 1.62 V ≥ V _{DDIOx} ≥ 1.08 V | 0.65 _x V _{DDIOx} | - | |
| | | $ I_{IO} = 20 \text{ mA}$ $V_{DDIOx} \ge 2.7 \text{ V}$ | - | 0.4 | |
| V _{OLFM+} | Output low level voltage for an FT I/O pin in FM+ mode (FT I/O with "f" option) | I _{IO} = 10 mA V _{DDIOx} ≥ 1.62 V | - | 0.4 | |
| | . , | I _{IO} = 2 mA 1.62 V ≥ V _{DDIOx} ≥ 1.08 V | - | 0.4 | |

The I_{IO} current sourced or sunk by the device must always respect the absolute maximum rating specified in *Table 20:* Voltage characteristics, and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings ΣI_{IO}.

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in *Figure 26* and *Table 63*, respectively.

^{2.} TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.

^{3.} Guaranteed by design.

Unless otherwise specified, the parameters given are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 23: General operating conditions*.

| Fm+ | Tf | Output fall time ⁽⁴⁾ | - C=50 pF, 1.6 V≤V _{DDIOx} ≤3.6 V | - | 5 | ns |

The I/O speed is configured using the OSPEEDRy[1:0] bits. The Fm+ mode is configured in the SYSCFG_CFGR1 register. Refer to the RM0394 reference manual for a description of GPIO Port configuration register.

^{2.} Guaranteed by design.

^{3.} This value represents the I/O capability but the maximum system frequency is limited to 80 MHz.

^{4.} The fall time is defined between 70% and 30% of the output waveform accordingly to I²C specification.

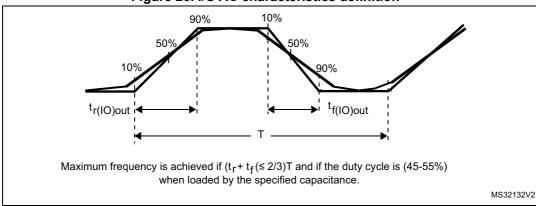

Figure 26. I/O AC characteristics definition⁽¹⁾

1. Refer to Table 63: I/O AC characteristics.

6.3.15 NRST pin characteristics

The NRST pin input driver uses the CMOS technology. It is connected to a permanent pull-up resistor, R_{PU} .

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 23: General operating conditions*.

| Symbol | Parameter | Conditions | Min | Тур | Max | Unit |
|------------------------|---|-----------------------------------|-------------------------------------|-----|-------------------------------------|------|
| V _{IL(NRST)} | NRST input low level voltage | - | - | - | 0.3 _x V _{DDIOx} | V |
| V _{IH(NRST)} | NRST input high level voltage | - | 0.7 _x V _{DDIOx} | - | - | |
| V _{hys(NRST)} | NRST Schmitt trigger voltage hysteresis | - | - | 200 | - | mV |
| R _{PU} | Weak pull-up equivalent resistor ⁽²⁾ | V _{IN} = V _{SS} | 25 | 40 | 55 | kΩ |
| V _{F(NRST)} | NRST input filtered pulse | - | - | - | 70 | ns |
| V _{NF(NRST)} | NRST input not filtered pulse | 1.71 V ≤ V _{DD} ≤ 3.6 V | 350 | - | - | ns |

Table 64. NRST pin characteristics⁽¹⁾

^{1.} Guaranteed by design.

^{2.} The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

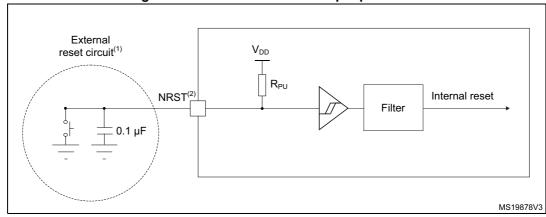

Figure 27. Recommended NRST pin protection

- 1. The reset network protects the device against parasitic resets.
- The user must ensure that the level on the NRST pin can go below the V_{IL(NRST)} max level specified in Table 64: NRST pin characteristics. Otherwise the reset will not be taken into account by the device.
- 3. The external capacitor on NRST must be placed as close as possible to the device.

6.3.16 Extended interrupt and event controller input (EXTI) characteristics

The pulse on the interrupt input must have a minimal length in order to guarantee that it is detected by the event controller.

Table 65. EXTI Input Characteristics⁽¹⁾

| Symbol | Parameter | Conditions | Min | Тур | Max | Unit |
|--------|----------------------------------|------------|-----|-----|-----|------|
| PLEC | Pulse length to event controller | - | 20 | - | - | ns |

^{1.} Guaranteed by design.

6.3.17 Analog switches booster

Table 66. Analog switches booster characteristics⁽¹⁾

| Symbol | Parameter | Min | Тур | Max | Unit |

^{1.} Guaranteed by design

The maximum value of R_{AIN} can be found in *Table 68: Maximum ADC RAIN*.

^{2.} The I/O analog switch voltage booster is enable when V_{DDA} < 2.4 V (BOOSTEN = 1 in the SYSCFG_CFGR1 when V_{DDA} < 2.4V). It is disable when $V_{DDA} \ge 2.4$ V.

V_{REF+} can be internally connected to V_{DDA} and V_{REF-} can be internally connected to V_{SSA}, depending on the package. Refer to Section 4: Pinouts and pin description for further details.

Figure 28. ADC accuracy characteristics

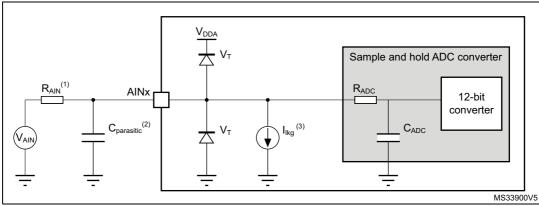

Figure 29. Typical connection diagram using the ADC

- 1. Refer to Table 67: ADC characteristics for the values of R_{AIN} and C_{ADC} .
- C_{parasitic} represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (refer to *Table 61: I/O static characteristics* for the value of the pad capacitance). A high C_{parasitic} value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.
- 3. Refer to Table 61: I/O static characteristics for the values of Ilkg.

General PCB design guidelines

Power supply decoupling should be performed as shown in *Figure 15: Power supply scheme*. The 10 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

6.3.19 Digital-to-Analog converter characteristics

Table 73. DAC characteristics⁽¹⁾

| Symbol | Parameter | Conditions | | Min | Тур | Max | Unit |

12-bit digital to analog converter

Alignment of the buffered of thorseless of the buffered data.

Buffer (1)

DACX_OUT

RLOAD

CLOAD

ai17157d

Figure 30. 12-bit buffered / non-buffered DAC

The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly
without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the
DAC_CR register.

- 2. The temperature range is limited to 0 °C-125 °C when V_{DDA} is below 2 V
- 3. Guaranteed by characterization results.
- 4. Mostly I/O leakage, when used in analog mode. Refer to I_{lkg} parameter in *Table 61: I/O static characteristics*.
- R2 is the internal resistance between OPAMP output and OPAMP inverting input. R1 is the internal resistance between OPAMP inverting input and ground. The PGA gain =1+R2/R1

6.3.23 Temperature sensor characteristics

Table 78. TS characteristics

| Symbol | Parameter | Min | Тур | Max | Unit |
|---|---|-------|------|-------|-------|
| $T_L^{(1)}$ | V _{TS} linearity with temperature | - | ±1 | ±2 | °C |
| Avg_Slope ⁽²⁾ | Average slope | 2.3 | 2.5 | 2.7 | mV/°C |
| V ₃₀ | Voltage at 30°C (±5 °C) ⁽³⁾ | 0.742 | 0.76 | 0.785 | V |
| t _{START} (TS_BUF) ⁽¹⁾ | Sensor Buffer Start-up time in continuous mode ⁽⁴⁾ | - | 8 | 15 | μs |
| t _{START} (1) | Start-up time when entering in continuous mode ⁽⁴⁾ | - | 70 | 120 | μs |
| t _{S_temp} ⁽¹⁾ | ADC sampling time when reading the temperature | 5 | - | - | μs |
| I _{DD} (TS) ⁽¹⁾ | Temperature sensor consumption from V_{DD} , when selected by ADC | - | 4.7 | 7 | μΑ |

- 1. Guaranteed by design.
- 2. Guaranteed by characterization results.
- Measured at V_{DDA} = 3.0 V ±10 mV. The V₃₀ ADC conversion result is stored in the TS_CAL1 byte. Refer to Table 8: Temperature sensor calibration values.
- 4. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

6.3.24 V_{BAT} monitoring characteristics

Table 79. V_{BAT} monitoring characteristics

| Symbol | Parameter | Min | Тур | Max | Unit |
|------------------------------------|---|-----|-----|-----|------|
| R | Resistor bridge for V _{BAT} | - | 39 | - | kΩ |
| Q | Ratio on V _{BAT} measurement | - | 3 | - | - |
| Er ⁽¹⁾ | Error on Q | -10 | - | 10 | % |
| t _{S_vbat} ⁽¹⁾ | ADC sampling time when reading the VBAT | 12 | - | - | μs |

^{1.} Guaranteed by design.

Table 80. V_{BAT} charging characteristics

| Symbol | Parameter | Conditions | Min | Тур | Max | Unit |
|-----------------|-------------------|------------|-----|-----|-----|------|
| R _{BC} | Battery | VBRS = 0 | - | 5 | - | |
| | charging resistor | VBRS = 1 | - | 1.5 | - | kΩ |

6.3.25 Timer characteristics

The parameters given in the following tables are guaranteed by design.

Refer to *Section 6.3.14: I/O port characteristics* for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 81. TIMx⁽¹⁾ characteristics

| Symbol | Parameter | Conditions | Min | Max | Unit |
|------------------------|-------------------------|-------------------------------|--------|-------------------------|----------------------|
| + | Timer resolution time | - | 1 | - | t _{TIMxCLK} |
| t _{res(TIM)} | Timer resolution time | f _{TIMxCLK} = 80 MHz | 12.5 | - | ns |
| f | Timer external clock | - | 0 | f _{TIMxCLK} /2 | MHz |
| f _{EXT} | frequency on CH1 to CH4 | f _{TIMxCLK} = 80 MHz | 0 | 40 | MHz |
| Res _{TIM} | Timer resolution | TIMx (except TIM2) | - | 16 | bit |
| | | TIM2 | - | 32 | |
| + | 16-bit counter clock | - | 1 | 65536 | t _{TIMxCLK} |
| ^t COUNTER | period | f _{TIMxCLK} = 80 MHz | 0.0125 | 819.2 | μs |
| t | Maximum possible count | - | - | 65536 × 65536 | t _{TIMxCLK} |
| t _{MAX_COUNT} | with 32-bit counter | f _{TIMxCLK} = 80 MHz | - | 53.68 | s |

^{1.} TIMx is used as a general term in which x stands for 1,2,3,4,5,6,7,8,15,16 or 17.

| Prescaler divider | PR[2:0] bits | Min timeout RL[11:0]= 0x000 | Max timeout RL[11:0]= 0xFFF | Unit |
|-------------------|--------------|--------------------------------|--------------------------------|------|
| /4 | 0 | 0.125 | 512 | |
| /8 | 1 | 0.250 | 1024 | |
| /16 | 2 | 0.500 | 2048 | |
| /32 | 3 | 1.0 | 4096 | ms |
| /64 | 4 | 2.0 | 8192 | |
| /128 | 5 | 4.0 | 16384 | |
| /256 | 6 or 7 | 8.0 | 32768 | |

Table 82. IWDG min/max timeout period at 32 kHz (LSI)⁽¹⁾

The exact timings still depend on the phasing of the APB interface clock versus the LSI clock so that there is always a full RC period of uncertainty.

| i de la constitución de la const | | | | | | |
|--|-------|-------------------|-------------------|------|--|--|
| Prescaler | WDGTB | Min timeout value | Max timeout value | Unit | | |
| 1 | 0 | 0.0512 | 3.2768 | | | |
| 2 | 1 | 0.1024 | 6.5536 | me | | |
| 4 | 2 | 0.2048 | 13.1072 | ms | | |
| 8 | 3 | 0.4096 | 26.2144 | | | |

Table 83. WWDG min/max timeout value at 80 MHz (PCLK)

6.3.26 Communication interfaces characteristics

I²C interface characteristics

The I2C interface meets the timings requirements of the I²C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The I2C timings requirements are guaranteed by design when the I2C peripheral is properly configured (refer to RM0394 reference manual).

The SDA and SCL I/O requirements are met with the following restrictions: the SDA and SCL I/O pins are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and $V_{\rm DDIOx}$ is disabled, but is still present. Only FT_f I/O pins support Fm+ low level output current maximum requirement. Refer to Section 6.3.14: I/O port characteristics for the I2C I/Os characteristics.

All I2C SDA and SCL I/Os embed an analog filter. Refer to the table below for the analog filter characteristics:

Table 84. I2C analog filter characteristics⁽¹⁾

| Symbol | Parameter | Min | Max | Unit |
|-----------------|--|-------------------|--------------------|------|
| t _{AF} | Maximum pulse width of spikes that are suppressed by the analog filter | 50 ⁽²⁾ | 260 ⁽³⁾ | ns |

- 1. Guaranteed by design.
- 2. Spikes with widths below $t_{\mbox{\scriptsize AF}(\mbox{\scriptsize min})}$ are filtered.
- 3. Spikes with widths above $t_{\mbox{\scriptsize AF}(\mbox{\scriptsize max})}$ are not filtered

SPI characteristics

Unless otherwise specified, the parameters given in *Table 85* for SPI are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and supply voltage conditions summarized in *Table 23: General operating conditions*.

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels: 0.5 x V_{DD}

Refer to Section 6.3.14: I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

Table 85. SPI characteristics⁽¹⁾

| t _{h(MO)} | Data output hold time | Master mode | 0 | - | - | 113 |

^{1.} Guaranteed by characterization results.

Figure 31. SPI timing diagram - slave mode and CPHA = 0

Maximum frequency in Slave transmitter mode is determined by the sum of t_{v(SO)} and t_{su(MI)} which has to fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having t_{su(MI)} = 0 while Duty(SCK) = 50 %.

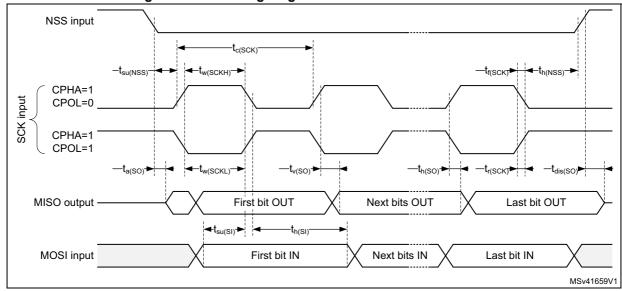

Figure 32. SPI timing diagram - slave mode and CPHA = 1

1. Measurement points are done at CMOS levels: 0.3 $\rm V_{DD}$ and 0.7 $\rm V_{DD}$.

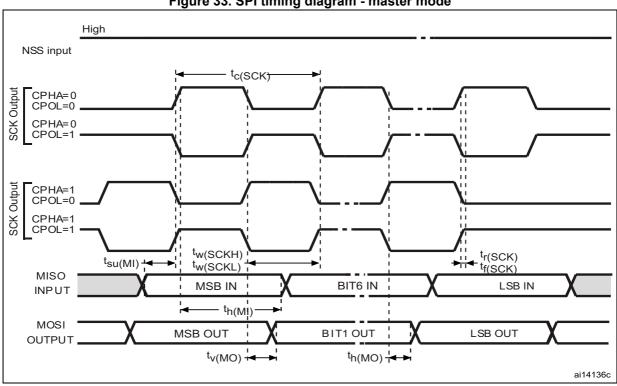

Figure 33. SPI timing diagram - master mode

1. Measurement points are done at CMOS levels: 0.3 $\rm V_{DD}$ and 0.7 $\rm V_{DD}$

Quad SPI characteristics

Unless otherwise specified, the parameters given in *Table 86* and *Table 87* for Quad SPI are derived from tests performed under the ambient temperature, f_{AHB} frequency and V_{DD} supply voltage conditions summarized in *Table 23: General operating conditions*, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 15 or 20 pF
- Measurement points are done at CMOS levels: 0.5 x V_{DD}

Refer to Section 6.3.14: I/O port characteristics for more details on the input/output alternate function characteristics.

STM32L451xx Package information

7.7 Thermal characteristics

The maximum chip-junction temperature, T_J max, in degrees Celsius, may be calculated using the following equation:

$$T_J \max = T_A \max + (P_D \max x \Theta_{JA})$$

Where:

- T_A max is the maximum ambient temperature in °C,
- Θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W,
- P_D max is the sum of P_{INT} max and $P_{I/O}$ max (P_D max = P_{INT} max + $P_{I/O}$ max),
- P_{INT} max is the product of all I_{DDXXX} and V_{DDXXX}, expressed in Watts. This is the maximum chip internal power.

P_{I/O} max represents the maximum power dissipation on output pins where:

$$P_{I/O}$$
 max = $\Sigma (V_{OL} \times I_{OL}) + \Sigma ((V_{DDIOx} - V_{OH}) \times I_{OH})$,

taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low and high level in the application.

| Symbol | Parameter | Value | Unit | |
|-----------------------|---|-------|------|--|
| $\Theta_{	extsf{JA}}$ | Thermal resistance junction-ambient LQFP100 - 14 × 14 mm / 0.5 mm pitch | 56 | | |
| | Thermal resistance junction-ambient UFBGA100 - 7 × 7 mm / 0.5 mm pitch | 75 | °C/W | |
| | Thermal resistance junction-ambient LQFP64 - 10 × 10 mm / 0.5 mm pitch | 58 | | |
| | Thermal resistance junction-ambient UFBGA64 - 5 × 5 mm / 0.5 mm pitch | 65 | | |
| | Thermal resistance junction-ambient WLCSP64 3.141 x 3.127 / 0.35 mm pitch | 53 | | |
| | Thermal resistance junction-ambient UFQFPN48 - 7 × 7 mm / 0.5 mm pitch | 29 | | |

Table 100. Package thermal characteristics

7.7.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from www.jedec.org

7.7.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in *Section 8: Ordering information*.

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32L451xx at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

DS11910 Rev 4 195/201

The following examples show how to calculate the temperature range needed for a given application.

Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature T_{Amax} = 75 °C (measured according to JESD51-2), I_{DDmax} = 50 mA, V_{DD} = 3.5 V, maximum 20 I/Os used at the same time in output at low level with I_{OL} = 8 mA, V_{OL} = 0.4 V and maximum 8 I/Os used at the same time in output at low level with I_{OL} = 20 mA, V_{OL} = 1.3 V

 P_{INTmax} = 50 mA × 3.5 V= 175 mW

 $P_{IOmax} = 20 \times 8 \text{ mA} \times 0.4 \text{ V} + 8 \times 20 \text{ mA} \times 1.3 \text{ V} = 272 \text{ mW}$

This gives: P_{INTmax} = 175 mW and P_{IOmax} = 272 mW:

 $P_{Dmax} = 175 + 272 = 447 \text{ mW}$

Using the values obtained in Table 100 T_{Jmax} is calculated as follows:

For LQFP64, 58 °C/W

 T_{Jmax} = 75 °C + (58 °C/W × 447 mW) = 75 °C + 25.926 °C = 100.926 °C

This is within the range of the suffix 6 version parts ($-40 < T_J < 105$ °C) see Section 8: Ordering information.

In this case, parts must be ordered at least with the temperature range suffix 6 (see Part numbering).

Note:

With this given P_{Dmax} we can find the T_{Amax} allowed for a given device temperature range (order code suffix 6 or 3).

Suffix 6:
$$T_{Amax} = T_{Jmax}$$
 - $(58^{\circ}C/W \times 447 \text{ mW}) = 105-25.926 = 79.074 ^{\circ}C$
Suffix 3: $T_{Amax} = T_{Jmax}$ - $(58^{\circ}C/W \times 447 \text{ mW}) = 130-25.926 = 104.074 ^{\circ}C$

Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature T_J remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature T_{Amax} = 100 °C (measured according to JESD51-2), I_{DDmax} = 20 mA, V_{DD} = 3.5 V, maximum 20 I/Os used at the same time in output at low level with I_{OL} = 8 mA, V_{OL} = 0.4 V

 P_{INTmax} = 20 mA × 3.5 V= 70 mW

 $P_{IOmax} = 20 \times 8 \text{ mA} \times 0.4 \text{ V} = 64 \text{ mW}$

This gives: $P_{INTmax} = 70 \text{ mW}$ and $P_{IOmax} = 64 \text{ mW}$:

 $P_{Dmax} = 70 + 64 = 134 \text{ mW}$

Thus: P_{Dmax} = 134 mW

Using the values obtained in *Table 100* T_{Jmax} is calculated as follows:

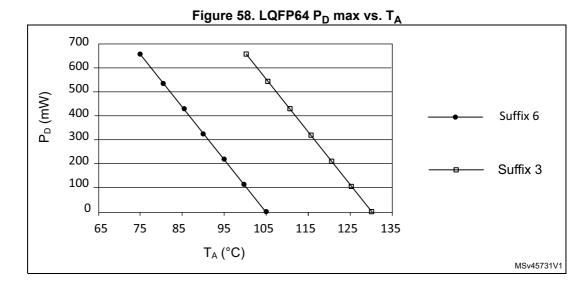

For LQFP64, 58 °C/W

 T_{Jmax} = 100 °C + (58 °C/W × 134 mW) = 100 °C + 7.772 °C = 107.772 °C

This is above the range of the suffix 6 version parts ($-40 < T_{.l} < 105$ °C).

In this case, parts must be ordered at least with the temperature range suffix 3 (see Section 8: Ordering information) unless we reduce the power dissipation in order to be able to use suffix 6 parts.

Refer to *Figure 58* to select the required temperature range (suffix 6 or 3) according to your ambient temperature or power requirements.

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST sales office.

STM32L451xx Revision history

9 Revision history

Table 102. Document revision history

| Date | Revision | Changes | |
|-------------|----------|--|--|
| 21-Apr-2017 | 1 | Initial release. | |
| 05-May-2017 | 2 | Updated some power consumptions on cover page. Added Table 4: STM32L451xx modes overview. Updated Table 35: Current consumption in Stop 2 mode. Updated Table 36: Current consumption in Stop 1 mode. Updated Table 38: Current consumption in Standby mode. Updated Table 67: ADC characteristics. Update note below Figure 29: Typical connection diagram using the ADC. | |
| 26-May-2017 | 3 | Added missing LPUART communication interface on cover page. Fixed OPAMP index in <i>Table 4: STM32L451xx modes overview</i> . Replaced RAM2 by SRAM2 in <i>Section 3.9.3: Voltage regulator</i> and <i>Section 3.9.4: Low-power modes</i> . Updated <i>Section 3.7: Boot modes</i> . Added <i>Table 10: DFSDM1 implementation</i> . Updated <i>Table 61: I/O static characteristics</i> . Updated <i>Section 7.2: UFBGA100 package information</i> . | |
| 21-May-2018 | 4 | Updated DAC terminology in all the document for clarification: single DAC instance (= DAC1) with 2 output channels. Added ECOPACK2® information in Features. Updated LPUART bullet in Features. Updated Section 3.9.1: Power supply schemes. Added Figure 3: Power-up/down sequence. Added DFSDM1 in Table 6: STM32L451xx peripherals interconnect matrix. Updated Clock-out capability in Section 3.11: Clocks and startup. Updated Figure 4: Clock tree. Updated Section 3.14.1: Nested vectored interrupt controller (NVIC). Removed a footnote in Table 16: STM32L451xx pin definitions. Updated Section 6.3.2: Operating conditions at power-up / power-down. Updated A _{Coeff} in Table 26: Embedded internal voltage reference. Updated Table 41: Peripheral current consumption. | |

Revision history STM32L451xx

Table 102. Document revision history (continued)

| Date | Revision | Changes |
|-------------|------------------|--|
| 21-May-2018 | 4 (continued) | Added Section 6.3.16: Extended interrupt and event controller input (EXTI) characteristics. Updated Table 61: I/O static characteristics. Updated Table 73: DAC characteristics. |

IMPORTANT NOTICE - PLEASE READ CAREFULLY

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgement.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of Purchasers' products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
