TC1300

300 mA CMOS LDO with Shutdown, Bypass and Independent Delayed Reset Function

Features

- LDO with Integrated Microcontroller Reset Monitor Functionality
- Low Input Supply Current (80 µA, typical)
- Very Low Dropout Voltage
- 10 µsec (typ.) Wake-Up Time from $\overline{SHDN}$
- 300 mA Output Current
- Standard or Custom Output and Detected Voltages
- Power-Saving Shutdown Mode
- Bypass Input for Quiet Operation
- Separate Input for Detected Voltage
- 140 msec Minimum $\overline{RESET}$ Output Duration
- Space-Saving MSOP Package
- Specified Junction Temperature Range: -40°C to +125°C

Applications

- Battery-Operated Systems
- Portable Computers
- Medical Instruments
- Pagers
- Cellular / GSM / PHS Phones

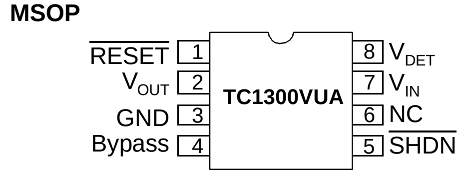
Package Type



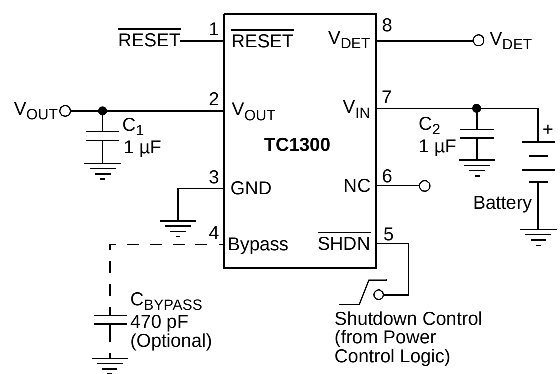
General Description

The TC1300 combines a low dropout regulator and a microcontroller reset monitor in an 8-Pin MSOP package. Total supply current is 80 µA (typical), 20 to 60 times lower than bipolar regulators.

The TC1300 has a precise output with a typical accuracy of ±0.5%. Other key features include low noise operation, low dropout voltage and internal feed-forward compensation for fast response to step changes in load. The TC1300 has both over-temperature and over-current protection. When the shutdown control ($\overline{SHDN}$) is low, the regulator output voltage falls to zero, $\overline{RESET}$ output remains valid and supply current is reduced to 30 µA (typical). The TC1300 is rated for 300 mA of output current and stable with a 1 µF output capacitor.

An active-low $\overline{RESET}$ is asserted when the detected voltage (V_{DET}) falls below the reset voltage threshold. The $\overline{RESET}$ output remains low for 300 msec (typical) after V_{DET} rises above reset threshold. The TC1300 also has a fast wake-up response time (10 µsec., typical) when released from shutdown.

Typical Application Circuit



1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

Input Voltage 6.5V
Output Voltage .... (V_{SS} - 0.3) to (V_{IN} + 0.3)
Power Dissipation .... Internally Limited **(Note 6)**
Operating Junction Temperature, T_J .... – 40°C < T_J< 150°C
Maximum Junction Temperature, Tj ....150°C
Storage Temperature...................................– 65°C to +150°C
Maximum Voltage on Any Pin .... (V_{SS}-0.3) to (V_{IN}+0.3)

***Notice:** Stresses above those listed under “maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

PIN DESCRIPTIONS

Pin	Description
$\overline{\text{RESET}}$	$\overline{\text{RESET}}$ output remains low while V_{DET} is below the reset voltage threshold and for 300 msec after V_{DET} rises above reset threshold.
V_{OUT}	Regulated Voltage Output
GND	Ground Terminal
Bypass	Reference Bypass Input. Connecting an optional 470 pF to this input further reduces output noise.
$\overline{\text{SHDN}}$	Shutdown Control Input. The regulator is fully enabled when a logic high is applied to this input. The regulator enters shutdown when a logic low is applied to this input. During shutdown, regulator output voltage falls to zero, $\overline{\text{RESET}}$ output remains valid and supply current is reduced to 30 µA (typ.).
NC	No connect
V_{IN}	Power Supply Input
V_{DET}	Detected Input Voltage. V_{DET} and V_{IN} can be connected together.

ELECTRICAL CHARACTERISTICS

V_{IN} = V_{OUT} + 1V, I_L = 0.1 mA, C_L = 3.3 µF, $\overline{\text{SHDN}}$ > V_{IH}, T_A = 25°C, unless otherwise noted. **BOLDFACE** type specifications apply for junction temperature **(Note 8)** of -40°C to +125°C.

Parameters	Sym	Min	Typ	Max	Units	Conditions
Input Operating Voltage	V_{IN}	**2.7**	—	**6.0**	V	**Note 7**
Maximum Output Current	$IOUT_{MAX}$	**300**	—	—	mA	
Output Voltage	V_{OUT}	— **V_R - 2.5%**	V_R ± 0.5% —	— **V_R + 2.5%**	V	**Note 1**
V_{OUT} Temperature Coefficient	$\Delta V_{OUT}/\Delta T$	—	**25**	—	ppm/°C	**Note 2**
Line Regulation	$\Delta V_{OUT}/\Delta V_{IN}$	—	0.02	**0.35**	%	(V_R + 1V) ≤ V_{IN} ≤ 6V
Load Regulation	$\Delta V_{OUT}/V_{OUT}$	—	0.5	**2.0**	%	I_L = 0.1 mA to I_{OUTMAX}, **Note 3**

Note 1: V_R is the regulator output voltage setting.

2: $$TCV_{OUT} = \frac{(V_{OUTMAX} - V_{OUTMIN}) \times 10^6}{V_{OUT} \times \Delta T}$$

3: Regulation is measured at a constant junction temperature using low duty cycle pulse testing. Load regulation is tested over a load range from 0.1 mA to the maximum specified output current. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

4: Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at a 1V differential.

5: Thermal Regulation is defined as the change in output voltage at a time t after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a current pulse equal to $I_{L_{MAX}}$ at V_{IN} = 6V for t = 10 msec.

6: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction-to-air (i.e. T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation causes the device to initiate thermal shutdown. Please see Section 4.0, “Thermal Considerations”, of this data sheet for more details.

7: The minimum V_{IN} has to meet two conditions: V_{IN} ≥ 2.7V and V_{IN} ≥ (V_R + $V_{DROPOUT}$).

8: The junction temperature of the device is approximated by soaking the device under test at an ambient temperature equal to the desired junction temperature. The test time is small enough such that the rise in the junction temperature over the ambient temperature is not significant.

ELECTRICAL CHARACTERISTICS (CONTINUED)

$V_{IN} = V_{OUT} + 1V$, $I_L = 0.1$ mA, $C_L = 3.3$ µF, $\overline{SHDN} > V_{IH}$, $T_A = 25°C$, unless otherwise noted. **BOLDFACE** type specifications apply for junction temperature **(Note 8)** of -40°C to +125°C.

Parameters	Sym	Min	Typ	Max	Units	Conditions

2.0 TYPICAL CHARACTERISTICS

Note:	The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Junction temperature (T_J) is approximated by soaking the device under test at an ambient temperature equal to the desired Junction temperature. The test time is small enough such that the rise in the Junction temperature over the Ambient temperature is not significant.

3.0 DETAILED DESCRIPTION

The TC1300 is a combination of a fixed output, low dropout regulator and a microcontroller monitor/RESET. Unlike bipolar regulators, the TC1300 supply current does not increase with load current. In addition, V_{OUT} remains stable and within regulation over the entire specified operating load range (0 mA to 300 mA) and operating input voltage range (2.7V to 6.0V).

Figure 3-1 shows a typical application circuit. The regulator is enabled any time the shutdown input (SHDN) is above V_{IH}. The regulator is shutdown (disabled) when SHDN is at or below V_{IL}. SHDN may be controlled by a CMOS logic gate or an I/O port of a microcontroller. If the SHDN input is not required, it should be connected directly to the input supply. While in shutdown, supply current decreases to 30 µA (typical), V_{OUT} falls to zero and RESET remains valid.

3.1 RESET Output

The RESET output is driven active-low within 160 µsec of V_{DET} falling through the reset voltage threshold. RESET is maintained active for a minimum of 140 msec after V_{DET} rises above the reset threshold. The TC1300 has an active-low RESET output. The output of the TC1300 is valid down to V_{DET} = 1V and is optimized to reject fast transient glitches on the V_{DET} line.

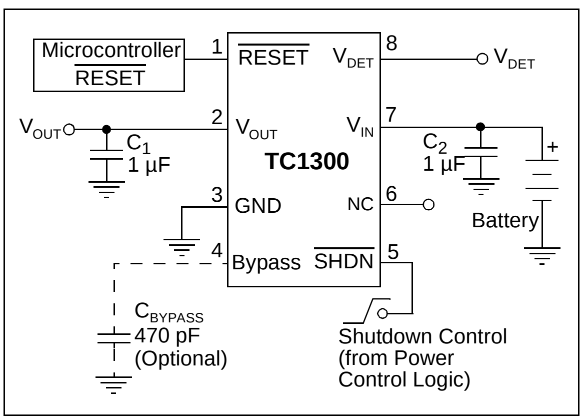

FIGURE 3-1: *Typical Application Circuit.*

3.2 Output Capacitor

A 1 µF (min) capacitor from V_{OUT} to ground is required. A 1 µF capacitor should also be connected from V_{IN} to GND if there is more than 10 inches of wire between the regulator and the AC filter capacitor, or if a battery is used as the power source. As with all low dropout regulators, a minimum output capacitance is required to stabilize the output voltage. For the TC1300, a minimum of 1 µF of output capacitance is enough to stabilize the device over the entire operating load and line range. The selected output capacitor plays an important role is compensating the LDO regulator. For the TC1300, the selected output capacitor equivalent series resistance (ESR) range is 0.1 ohms to 5 ohms when using 1 µF of output capacitance, and 0.01 ohms to 5 ohms when using 10 µF of output capacitance. Because of the ESR requirement, tantalum and aluminum electrolytic capacitors are recommended. Aluminum electrolytic capacitors are not recommended for operation at temperatures below -25°C. When operating from sources other than batteries, rejection and transient responses can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

3.3 Bypass Input (Optional)

An optional 470 pF capacitor connected from the Bypass input to ground reduces noise present on the internal reference, which in turn significantly reduces output noise and improves PSRR performance. This input may be left unconnected. Larger capacitor values may be used, but results in a longer time period to rated output voltage when power is initially applied.

3.4 Turn On Response

The turn-on response is defined as two separate response categories, Wake-Up Time (t_{WK}) and Settling Time (t_S).

The TC1300 has a fast Wake-Up Time (10 µsec typical) when released from shutdown. See Figure 3-2 for the Wake-Up Time designated as t_{WK}. The Wake-Up Time is defined as the time it takes for the output to rise to 2% of the V_{OUT} value after being released from shutdown.

The total turn-on response is defined as the Settling Time (t_S) (see Figure 3-2). Settling Time (inclusive with t_{WK}) is defined as the condition when the output is within 2% of its fully enabled value (50 µsec typical) when released from shutdown. The settling time of the output voltage is dependent on load conditions and output capacitance on V_{OUT} (RC response).

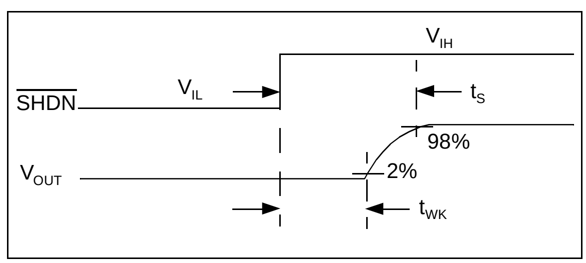

FIGURE 3-2: *Wake-Up Response Time.*

4.0 THERMAL CONSIDERATIONS

4.1 Thermal Shutdown

Integrated thermal protection circuitry shuts the regulator off when the die temperature exceeds 150°C. The regulator remains off until the die temperature drops to approximately 140°C.

4.2 Power Dissipation

The amount of power the regulator dissipates is primarily a function of input and output voltage, and output current. The following equation is used to calculate worst case *actual* power dissipation:

EQUATION

$$P_D \approx (V_{INMAX} - V_{OUTMIN}) I_{LOADMAX}$$

Where:

P_D = worst case actual power dissipation
V_{INMAX} = maximum voltage on V_{IN}
V_{OUTMIN} = minimum regulator output voltage
$I_{LOADMAX}$ = maximum output (load) current

The maximum allowable power dissipation, P_{DMAX}, is a function of the maximum ambient temperature (T_{AMAX}), the maximum recommended die temperature (125°C) and the thermal resistance from junction-to-air (θ_{JA}). The MSOP-8 package has a θ_{JA} of approximately 200°C/Watt when mounted on a FR4 dielectric copper clad PC board.

EQUATION

$$P_{DMAX} = \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}}$$

The worst case actual power dissipation equation can be used in conjunction with the LDO maximum allowable power dissipation equation to ensure regulator thermal operation is within limits. For example:

Given:

V_{INMAX}	=	4.1V
V_{OUTMIN}	=	3.0V -2.5%
$I_{LOADMAX}$	=	200 mA
T_{JMAX}	=	125°C
T_{AMAX}	=	55°C
θ_{JA}	=	200°C/W

Find:

EQUATION: ACTUAL POWER DISSIPATION

$$\begin{aligned} P_D &\approx (V_{INMAX} - V_{OUTMIN}) I_{LOADMAX} \\ &= [(4.1) - (3.0 \times .975)] 200 \times 10^{-3} \\ &= 220\ mW \end{aligned}$$

EQUATION: MAXIMUM ALLOWABLE POWER DISSIPATION

$$\begin{aligned} P_{DMAX} &= \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}} \\ &= \frac{(125 - 55)}{200} \\ &= 350\ mW \end{aligned}$$

In this example, the TC1300 dissipates a maximum of only 220 mW; below the allowable limit of 350 mW. In a similar manner, the maximum actual power dissipation equation and the maximum allowable power dissipation equation can be used to calculate maximum current and/or input voltage limits. For example, the maximum allowable V_{IN} is found by substituting the maximum allowable power dissipation of 350 mW into the actual power dissipation equation, from which $V_{IN_{MAX}}$ = 4.97V.

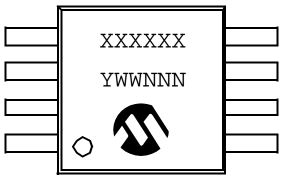
4.3 Layout Considerations

The primary path of heat conduction out of the package is via the package leads. Therefore, layouts having a ground plane, wide traces at the pads and wide power supply bus lines combine to lower θ_{JA} and, therefore, increase the maximum allowable power dissipation limit.

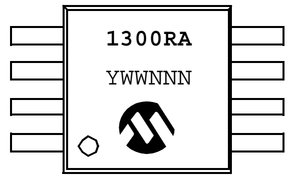
5.0 PACKAGING INFORMATION

5.1 Package Marking Information

8-Lead MSOP



Example:



Part Number	Marking Code (XXXXXX)
TC1300R - 2.5VUA	1300RA
TC1300Y - 2.7VUA	1300YF
TC1300R - 2.8VUA	1300RB
TC1300R - 2.85VUA	1300RC
TC1300R - 3.0VUA	1300RD
TC1300R - 3.3VUA	1300RE

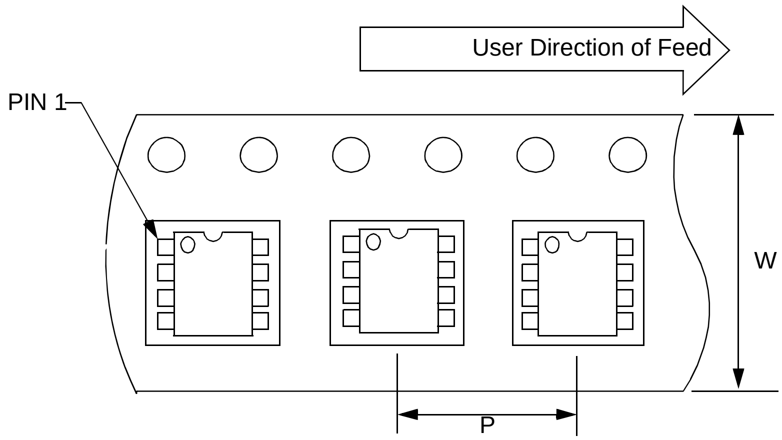
Legend:

XX...X	Customer-specific information
Y	Year code (last digit of calendar year)
YY	Year code (last 2 digits of calendar year)
WW	Week code (week of January 1 is week '01')
NNN	Alphanumeric traceability code
(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

5.2 Package Dimensions

Component Taping Orientation for 8-Pin MSOP Devices



Standard Reel Component Orientation
for TR Suffix Device

Carrier Tape, Number of Components Per Reel and Reel Size:

Package	Carrier Width (W)	Pitch (P)	Part Per Full Reel	Reel Size
8-Pin MSOP	12 mm	8 mm	2500	13 in.

8-Lead Plastic Micro Small Outline Package (UA) (MSOP)

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

OCEAN CHIPS

Океан Электроники

Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения **«JONHON»**, а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов **«FORSTAR»**.

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
