

PIC24FV32KA304 FAMILY

20/28/44/48-Pin, General Purpose, 16-Bit Flash Microcontrollers with XLP Technology

Power Management Modes

- Run – CPU, Flash, SRAM and Peripherals On
- Doze – CPU Clock Runs Slower than Peripherals
- Idle – CPU Off, Flash, SRAM and Peripherals On
- Sleep – CPU, Flash and Peripherals Off, and SRAM On
- Deep Sleep – CPU, Flash, SRAM and Most Peripherals Off; Multiple Autonomous Wake-up Sources
- Low-Power Consumption:
 - Run mode currents down to 8 μ A, typical
 - Idle mode currents down to 2.2 μ A, typical
 - Deep Sleep mode currents down to 20 nA, typical
 - Real-Time Clock/Calendar currents down to 700 nA, 32 kHz, 1.8V
 - Watchdog Timer is 500 nA, 1.8V typical

High-Performance CPU

- Modified Harvard Architecture
- Up to 16 MIPS Operation @ 32 MHz
- 8 MHz Internal Oscillator with 4x PLL Option and Multiple Divide Options
- 17-Bit by 17-Bit Single-Cycle Hardware Multiplier
- 32-Bit by 16-Bit Hardware Divider, 16-Bit x 16-Bit Working Register Array
- C Compiler Optimized Instruction Set Architecture

Peripheral Features

- Hardware Real-Time Clock and Calendar (RTCC):
 - Provides clock, calendar and alarm functions
 - Can run in Deep Sleep mode
 - Can use 50/60 Hz power line input as clock source
- Programmable 32-Bit Cyclic Redundancy Check (CRC)
- Multiple Serial Communication modules:
 - Two 3/4-wire SPI modules
 - Two I²C modules with multi-master/slave support
 - Two UART modules, supporting RS-485, RS-232, LIN/J2602, IrDA[®]
- Five 16-Bit Timers/Counters with Programmable Prescaler:
 - Can be paired as 32-bit timers/counters
- Three 16-Bit Capture Inputs with Dedicated Timers
- Three 16-Bit Compare/PWM Outputs with Dedicated Timers
- Configurable Open-Drain Outputs on Digital I/O Pins
- Up to Three External Interrupt Sources

PIC24FV32KA304 FAMILY

Analog Features

- 12-Bit, Up to 16-Channel Analog-to-Digital Converter:
 - 100 ksps conversion rate
 - Conversion available during Sleep and Idle
 - Auto-sampling, timer-based option for Sleep and Idle modes
 - Wake on auto-compare option
- Dual Rail-to-Rail Analog Comparators with Programmable Input/Output Configuration
- On-Chip Voltage Reference
- Internal Temperature Sensor
- Charge Time Measurement Unit (CTMU):
 - Used for capacitance sensing, 16 channels
 - Time measurement, down to 200 ps resolution
 - Delay/pulse generation, down to 1 ns resolution

Special Microcontroller Features

- Wide Operating Voltage Range:
 - 1.8V to 3.6V (PIC24F devices)
 - 2.0V to 5.5V (PIC24FV devices)
- Low-Power Wake-up Sources and Supervisors:
 - Ultra Low-Power Wake-up (ULPWU) for Sleep/Deep Sleep
 - Low-Power Watchdog Timer (DSWDT) for Deep Sleep
 - Extreme Low-Power Brown-out Reset (DSBOR) for Deep Sleep, LPBOR for all other modes
- System Frequency Range Declaration bits:
 - Declaring the frequency range optimizes the current consumption.
- Standard Watchdog Timer (WDT) with On-Chip, Low-Power RC Oscillator for Reliable Operation
- Programmable High/Low-Voltage Detect (HLVD)
- Standard Brown-out Reset (BOR) with 3 Programmable Trip Points that can be Disabled in Sleep
- High-Current Sink/Source (18 mA/18 mA) on All I/O Pins
- Flash Program Memory:
 - Erase/write cycles: 10,000 minimum
 - 40 years' data retention minimum
- Data EEPROM:
 - Erase/write cycles: 100,000 minimum
 - 40 years' data retention minimum
- Fail-Safe Clock Monitor (FSCM)
- Programmable Reference Clock Output
- Self-Programmable under Software Control
- In-Circuit Serial Programming™ (ICSP™) and In-Circuit Debug (ICD) via 2 Pins

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended work arounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

PIC24FV32KA304 FAMILY

NOTES:

1.0 DEVICE OVERVIEW

This document contains device-specific information for the following devices:

- PIC24FV16KA301, PIC24F16KA301
- PIC24FV16KA302, PIC24F16KA302
- PIC24FV16KA304, PIC24F16KA304
- PIC24FV32KA301, PIC24F32KA301
- PIC24FV32KA302, PIC24F32KA302
- PIC24FV32KA304, PIC24F32KA304

The PIC24FV32KA304 family introduces a new line of extreme low-power Microchip devices. This is a 16-bit microcontroller family with a broad peripheral feature set and enhanced computational performance. This family also offers a new migration option for those high-performance applications which may be outgrowing their 8-bit platforms, but do not require the numerical processing power of a Digital Signal Processor (DSP).

1.1 Core Features

1.1.1 16-BIT ARCHITECTURE

Central to all PIC24F devices is the 16-bit modified Harvard architecture, first introduced with Microchip's dsPIC® digital signal controllers. The PIC24F CPU core offers a wide range of enhancements, such as:

- 16-bit data and 24-bit address paths with the ability to move information between data and memory spaces
- Linear addressing of up to 12 Mbytes (program space) and 64 Kbytes (data)
- A 16-element Working register array with built-in software stack support
- A 17 x 17 hardware multiplier with support for integer math
- Hardware support for 32-bit by 16-bit division
- An instruction set that supports multiple addressing modes and is optimized for high-level languages, such as C
- Operational performance up to 16 MIPS

1.1.2 POWER-SAVING TECHNOLOGY

All of the devices in the PIC24FV32KA304 family incorporate a range of features that can significantly reduce power consumption during operation. Key features include:

- **On-the-Fly Clock Switching:** The device clock can be changed under software control to the Timer1 source or the internal, low-power RC oscillator during operation, allowing users to incorporate power-saving ideas into their software designs.
- **Doze Mode Operation:** When timing-sensitive applications, such as serial communications, require the uninterrupted operation of peripherals, the CPU clock speed can be selectively reduced, allowing incremental power savings without missing a beat.
- **Instruction-Based Power-Saving Modes:** There are three instruction-based power-saving modes:
 - Idle Mode: The core is shut down while leaving the peripherals active.
 - Sleep Mode: The core and peripherals that require the system clock are shut down, leaving the peripherals that use their own clock, or the clock from other devices, active.
 - Deep Sleep Mode: The core, peripherals (except RTCC and DSWDT), Flash and SRAM are shut down.

1.1.3 OSCILLATOR OPTIONS AND FEATURES

The PIC24FV32KA304 family offers five different oscillator options, allowing users a range of choices in developing application hardware. These include:

- Two Crystal modes using crystals or ceramic resonators.
- Two External Clock modes offering the option of a divide-by-2 clock output.
- Two Fast Internal oscillators (FRCs): One with a nominal 8 MHz output and the other with a nominal 500 kHz output. These outputs can also be divided under software control to provide clock speed as low as 31 kHz or 2 kHz.
- A Phase Locked Loop (PLL) frequency multiplier, available to the external Oscillator modes and the 8 MHz FRC oscillator, which allows clock speeds of up to 32 MHz.
- A separate internal RC oscillator (LPRC) with a fixed 31 kHz output, which provides a low-power option for timing-insensitive applications.

PIC24FV32KA304 FAMILY

The internal oscillator block also provides a stable reference source for the Fail-Safe Clock Monitor (FSCM). This option constantly monitors the main clock source against a reference signal provided by the internal oscillator and enables the controller to switch to the internal oscillator, allowing for continued low-speed operation or a safe application shutdown.

1.1.4 EASY MIGRATION

Regardless of the memory size, all the devices share the same rich set of peripherals, allowing for a smooth migration path as applications grow and evolve.

The consistent pinout scheme used throughout the entire family also helps in migrating to the next larger device. This is true when moving between devices with the same pin count, or even jumping from 20-pin or 28-pin devices to 44-pin/48-pin devices.

The PIC24F family is pin compatible with devices in the dsPIC33 family, and shares some compatibility with the pinout schema for PIC18 and dsPIC30. This extends the ability of applications to grow from the relatively simple, to the powerful and complex.

1.2 Other Special Features

- **Communications:** The PIC24FV32KA304 family incorporates a range of serial communication peripherals to handle a range of application requirements. There is an I²C module that supports both the Master and Slave modes of operation. It also comprises UARTs with built-in IrDA[®] encoders/decoders and an SPI module.
- **Real-Time Clock/Calendar:** This module implements a full-featured clock and calendar with alarm functions in hardware, freeing up timer resources and program memory space for use of the core application.
- **12-Bit A/D Converter:** This module incorporates programmable acquisition time, allowing for a channel to be selected and a conversion to be initiated without waiting for a sampling period, and faster sampling speed. The 16-deep result buffer can be used either in Sleep to reduce power, or in Active mode to improve throughput.
- **Charge Time Measurement Unit (CTMU) Interface:** The PIC24FV32KA304 family includes the new CTMU interface module, which can be used for capacitive touch sensing, proximity sensing, and also for precision time measurement and pulse generation.

1.3 Details on Individual Family Members

Devices in the PIC24FV32KA304 family are available in 20-pin, 28-pin, 44-pin and 48-pin packages. The general block diagram for all devices is shown in [Figure 1-1](#).

The devices are different from each other in four ways:

1. Flash program memory (16 Kbytes for PIC24FV16KA devices, 32 Kbytes for PIC24FV32KA devices).
2. Available I/O pins and ports (18 pins on two ports for 20-pin devices, 22 pins on two ports for 28-pin devices and 38 pins on three ports for 44/48-pin devices).
3. Alternate SCLx and SDAx pins are available only in 28-pin, 44-pin and 48-pin devices and not in 20-pin devices.
4. Members of the PIC24FV32KA301 family are available as both standard and high-voltage devices. High-voltage devices, designated with an “FV” in the part number (such as PIC24FV32KA304), accommodate an operating VDD range of 2.0V to 5.5V, and have an on-board Voltage Regulator that powers the core. Peripherals operate at VDD. Standard devices, designated by “F” (such as PIC24F32KA304), function over a lower VDD range of 1.8V to 3.6V. These parts do not have an internal regulator, and both the core and peripherals operate directly from VDD.

All other features for devices in this family are identical; these are summarized in [Table 1-1](#).

A list of the pin features available on the PIC24FV32KA304 family devices, sorted by function, is provided in [Table 1-3](#).

Note: [Table 1-1](#) provides the pin location of individual peripheral features and not how they are multiplexed on the same pin. This information is provided in the pinout diagrams on pages [3](#), [4](#), [5](#), [6](#) and [7](#) of the data sheet. Multiplexed features are sorted by the priority given to a feature, with the highest priority peripheral being listed first.

PIC24FV32KA304 FAMILY

TABLE 1-1: DEVICE FEATURES FOR THE PIC24FV32KA304 FAMILY

| Features | PIC24FV16KA301 | PIC24FV32KA301 | PIC24FV16KA302 | PIC24FV32KA302 | PIC24FV16KA304 | PIC24FV32KA304 |
|---|---|----------------|-------------------------------|----------------|--|----------------|

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT MICROCONTROLLERS

2.1 Basic Connection Requirements

Getting started with the PIC24FV32KA304 family of 16-bit microcontrollers requires attention to a minimal set of device pin connections before proceeding with development.

The following pins must always be connected:

- All VDD and VSS pins (see [Section 2.2 “Power Supply Pins”](#))
- All AVDD and AVSS pins, regardless of whether or not the analog device features are used (see [Section 2.2 “Power Supply Pins”](#))
- MCLR pin (see [Section 2.3 “Master Clear \(MCLR\) Pin”](#))
- VCAP pins (see [Section 2.4 “Voltage Regulator Pin \(VCAP\)”](#))

These pins must also be connected if they are being used in the end application:

- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [Section 2.5 “ICSP Pins”](#))
- OSCI and OSCO pins when an external oscillator source is used (see [Section 2.6 “External Oscillator Pins”](#))

Additionally, the following pins may be required:

- VREF+/VREF- pins are used when external voltage reference for analog modules is implemented

Note: The AVDD and AVSS pins must always be connected, regardless of whether any of the analog modules are being used.

The minimum mandatory connections are shown in [Figure 2-1](#).

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTIONS

PIC24FV32KA304 FAMILY

2.2 Power Supply Pins

2.2.1 DECOUPLING CAPACITORS

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD and AVSS, is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A 0.1 μF (100 nF), 10-20V capacitor is recommended. The capacitor should be a low-ESR device, with a resonance frequency in the range of 200 MHz and higher. Ceramic capacitors are recommended.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is no greater than 0.25 inch (6 mm).
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise (upward of tens of MHz), add a second ceramic type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF . Place this second capacitor next to each primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible (e.g., 0.1 μF in parallel with 0.001 μF).
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB trace inductance.

2.2.2 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits, including microcontrollers, to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 μF to 47 μF .

2.3 Master Clear ($\overline{\text{MCLR}}$) Pin

The $\overline{\text{MCLR}}$ pin provides two specific device functions: Device Reset, and Device Programming and Debugging. If programming and debugging are not required in the end application, a direct connection to VDD may be all that is required. The addition of other components, to help increase the application's resistance to spurious Resets from voltage sags, may be beneficial. A typical configuration is shown in Figure 2-1. Other circuit designs may be implemented, depending on the application's requirements.

During programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{\text{MCLR}}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of R1 and C1 will need to be adjusted based on the application and PCB requirements. For example, it is recommended that the capacitor, C1, be isolated from the $\overline{\text{MCLR}}$ pin during programming and debugging operations by using a jumper (Figure 2-2). The jumper is replaced for normal run-time operations.

Any components associated with the $\overline{\text{MCLR}}$ pin should be placed within 0.25 inch (6 mm) of the pin.

FIGURE 2-2: EXAMPLE OF $\overline{\text{MCLR}}$ PIN CONNECTIONS

PIC24FV32KA304 FAMILY

2.4 Voltage Regulator Pin (VCAP)

Note: This section applies only to PIC24F K devices with an On-Chip Voltage Regulator.

Some of the PIC24F K devices have an internal Voltage Regulator. These devices have the Voltage Regulator output brought out on the VCAP pin. On the PIC24F K devices with regulators, a low-ESR ($< 5\Omega$) capacitor is required on the VCAP pin to stabilize the Voltage Regulator output. The VCAP pin must not be connected to VDD and must use a capacitor of 10 μF connected to ground. The type can be ceramic or tantalum. Suitable examples of capacitors are shown in Table 2-1. Capacitors with equivalent specifications can be used.

Designers may use Figure 2-3 to evaluate ESR equivalence of candidate devices.

The placement of this capacitor should be close to VCAP. It is recommended that the trace length not exceed 0.25 inch (6 mm). Refer to Section 29.0 “Electrical Characteristics” for additional information.

Refer to Section 29.0 “Electrical Characteristics” for information on VDD and VDDCORE.

FIGURE 2-3: FREQUENCY vs. ESR PERFORMANCE FOR SUGGESTED VCAP

TABLE 2-1: SUITABLE CAPACITOR EQUIVALENTS

| Make | Part # | Nominal Capacitance | Base Tolerance | Rated Voltage | Temp. Range |
|-----------|--------------------|---------------------|----------------|---------------|--------------|

PIC24FV32KA304 FAMILY

2.4.1 CONSIDERATIONS FOR CERAMIC CAPACITORS

In recent years, large value, low-voltage, surface-mount ceramic capacitors have become very cost effective in sizes up to a few tens of microfarad. The low-ESR, small physical size and other properties make ceramic capacitors very attractive in many types of applications.

Ceramic capacitors are suitable for use with the internal Voltage Regulator of this microcontroller. However, some care is needed in selecting the capacitor to ensure that it maintains sufficient capacitance over the intended operating range of the application.

Typical low-cost, 10 μ F ceramic capacitors are available in X5R, X7R and Y5V dielectric ratings (other types are also available, but are less common). The initial tolerance specifications for these types of capacitors are often specified as $\pm 10\%$ to $\pm 20\%$ (X5R and X7R), or $-20\%/+80\%$ (Y5V). However, the effective capacitance that these capacitors provide in an application circuit will also vary based on additional factors, such as the applied DC bias voltage and the temperature. The total in-circuit tolerance is, therefore, much wider than the initial tolerance specification.

The X5R and X7R capacitors typically exhibit satisfactory temperature stability (ex: $\pm 15\%$ over a wide temperature range, but consult the manufacturer's data sheets for exact specifications). However, Y5V capacitors typically have extreme temperature tolerance specifications of $+22\%/ -82\%$. Due to the extreme temperature tolerance, a 10 μ F nominal rated Y5V type capacitor may not deliver enough total capacitance to meet minimum internal Voltage Regulator stability and transient response requirements. Therefore, Y5V capacitors are not recommended for use with the internal regulator if the application must operate over a wide temperature range.

In addition to temperature tolerance, the effective capacitance of large value ceramic capacitors can vary substantially, based on the amount of DC voltage applied to the capacitor. This effect can be very significant, but is often overlooked or is not always documented.

A typical DC bias voltage vs. capacitance graph for X7R type capacitors is shown in [Figure 2-4](#).

FIGURE 2-4: DC BIAS VOLTAGE vs. CAPACITANCE CHARACTERISTICS

When selecting a ceramic capacitor to be used with the internal Voltage Regulator, it is suggested to select a high-voltage rating, so that the operating voltage is a small percentage of the maximum rated capacitor voltage. For example, choose a ceramic capacitor rated at 16V for the 3.3V or 2.5V core voltage. Suggested capacitors are shown in [Table 2-1](#).

2.5 ICSP Pins

The PGC and PGD pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of ohms, not to exceed 100 Ω .

Pull-up resistors, series diodes and capacitors on the PGC and PGD pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits, and Voltage Input High (V_{IH}) pin and Voltage Input Low (V_{IL}) pin requirements.

For device emulation, ensure that the “Communication Channel Select” (i.e., PGCx/PGDx pins), programmed into the device, matches the physical connections for the ICSP to the Microchip debugger/emulator tool.

For more information on available Microchip development tools connection requirements, refer to [Section 27.0 “Development Support”](#).

2.6 External Oscillator Pins

Many microcontrollers have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 9.0 “Oscillator Configuration”** for details).

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins with no more than 0.5 inch (12 mm) between the circuit components and the pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

Layout suggestions are shown in [Figure 2-5](#). In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

In planning the application’s routing and I/O assignments, ensure that adjacent port pins and other signals, in close proximity to the oscillator, are benign (i.e., free of high frequencies, short rise and fall times, and other similar noise).

For additional information and design guidance on oscillator circuits, please refer to these Microchip Application Notes, available at the corporate web site (www.microchip.com):

- AN849, “Basic PICmicro® Oscillator Design”
- AN943, “Practical PICmicro® Oscillator Analysis and Design”
- AN949, “Making Your Oscillator Work”

2.7 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state. Alternatively, connect a 1 kΩ to 10 kΩ resistor to Vss on unused pins and drive the output to logic low.

FIGURE 2-5: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

PIC24FV32KA304 FAMILY

NOTES:

3.0 CPU

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the CPU, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**CPU**” (DS39703).

The PIC24F CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set and a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M instructions of user program memory space. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction and the table instructions. Overhead-free program loop constructs are supported using the REPEAT instructions, which are interruptible at any point.

PIC24F devices have sixteen, 16-bit Working registers in the programmer's model. Each of the Working registers can act as a data, address or address offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K word boundary of either program memory or data EEPROM memory, defined by the 8-bit Program Space Visibility Page Address (PSVPAG) register. The program to data space mapping feature lets any instruction access program space as if it were data space.

The Instruction Set Architecture (ISA) has been significantly enhanced beyond that of the PIC18, but maintains an acceptable level of backward compatibility. All PIC18 instructions and addressing modes are supported, either directly, or through simple macros. Many of the ISA enhancements have been driven by compiler efficiency needs.

The core supports Inherent (no operand), Relative, Literal, Memory Direct and three groups of addressing modes. All modes support Register Direct and various Register Indirect modes. Each group offers up to seven addressing modes. Instructions are associated with predefined addressing modes depending upon their functional requirements.

For most instructions, the core is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing trinary operations (i.e., $A + B = C$) to be executed in a single cycle.

A high-speed, 17-bit by 17-bit multiplier has been included to significantly enhance the core arithmetic capability and throughput. The multiplier supports Signed, Unsigned and Mixed mode, 16-bit by 16-bit or 8-bit by 8-bit integer multiplication. All multiply instructions execute in a single cycle.

The 16-bit ALU has been enhanced with integer divide assist hardware that supports an iterative non-restoring divide algorithm. It operates in conjunction with the REPEAT instruction looping mechanism and a selection of iterative divide instructions to support 32-bit (or 16-bit), divided by 16-bit integer signed and unsigned division. All divide operations require 19 cycles to complete but are interruptible at any cycle boundary.

The PIC24F has a vectored exception scheme with up to eight sources of non-maskable traps and up to 118 interrupt sources. Each interrupt source can be assigned to one of seven priority levels.

A block diagram of the CPU is illustrated in [Figure 3-1](#).

3.1 Programmer's Model

[Figure 3-2](#) displays the programmer's model for the PIC24F. All registers in the programmer's model are memory mapped and can be manipulated directly by instructions.

[Table 3-1](#) provides a description of each register. All registers associated with the programmer's model are memory mapped.

 1 = Program space is visible in data space
 0 = Program space is not visible in data space
- bit 1-0 **Unimplemented:** Read as '0'

Note 1: User interrupts are disabled when IPL3 = 1.

3.3 Arithmetic Logic Unit (ALU)

The PIC24F ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU may affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array, or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

The PIC24F CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware division for 16-bit divisor.

3.3.1 MULTIPLIER

The ALU contains a high-speed, 17-bit x 17-bit multiplier. It supports unsigned, signed or mixed sign operation in several multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

PIC24FV32KA304 FAMILY

3.3.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

1. 32-bit signed/16-bit signed divide
2. 32-bit unsigned/16-bit unsigned divide
3. 16-bit signed/16-bit signed divide
4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. Sixteen-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn), and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.3.3 MULTI-BIT SHIFT SUPPORT

The PIC24F ALU supports both single bit and single-cycle, multi-bit arithmetic and logic shifts. Multi-bit shifts are implemented using a shifter block, capable of performing up to a 15-bit arithmetic right shift, or up to a 15-bit left shift, in a single cycle. All multi-bit shift instructions only support Register Direct Addressing for both the operand source and result destination.

A full summary of instructions that use the shift operation is provided in [Table 3-2](#).

TABLE 3-2: INSTRUCTIONS THAT USE THE SINGLE AND MULTI-BIT SHIFT OPERATION

| Instruction | Description |
|-------------|---|
| ASR | Arithmetic shift right source register by one or more bits. |
| SL | Shift left source register by one or more bits. |
| LSR | Logical shift right source register by one or more bits. |

PIC24FV32KA304 FAMILY

4.0 MEMORY ORGANIZATION

As Harvard architecture devices, the PIC24F microcontrollers feature separate program and data memory space and busing. This architecture also allows the direct access of program memory from the data space during code execution.

4.1 Program Address Space

The program address memory space of the PIC24FV32KA304 family is 4M instructions. The space is addressable by a 24-bit value derived from either the 23-bit Program Counter (PC) during program execution, or from a table operation or data space remapping, as described in [Section 4.3 “Interfacing Program and Data Memory Spaces”](#).

User access to the program memory space is restricted to the lower half of the address range (000000h to 7FFFFFFh). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

Memory maps for the PIC24FV32KA304 family of devices are shown in [Figure 4-1](#).

FIGURE 4-1: PROGRAM SPACE MEMORY MAP FOR PIC24FV32KA304 FAMILY DEVICES

PIC24FV32KA304 FAMILY

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address, as shown in [Figure 4-2](#).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement also provides compatibility with data memory space addressing and makes it possible to access data in the program memory space.

4.1.2 HARD MEMORY VECTORS

All PIC24F devices reserve the addresses between 00000h and 000200h for hard coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user at 000000h, with the actual address for the start of code at 000002h.

PIC24F devices also have two Interrupt Vector Tables, located from 000004h to 0000FFh and 000104h to 0001FFh. These vector tables allow each of the many device interrupt sources to be handled by separate Interrupt Service Routines (ISRs). A more detailed discussion of the Interrupt Vector Tables (IVT) is provided in [Section 8.1 “Interrupt Vector Table \(IVT\)”](#).

4.1.3 DATA EEPROM

In the PIC24FV32KA304 family, the data EEPROM is mapped to the top of the user program memory space, starting at address, 7FFE00, and expanding up to address, 7FFFFF.

The data EEPROM is organized as 16-bit wide memory and 256 words deep. This memory is accessed using Table Read and write operations similar to the user code memory.

4.1.4 DEVICE CONFIGURATION WORDS

[Table 4-1](#) provides the addresses of the device Configuration Words for the PIC24FV32KA304 family. Their location in the memory map is shown in [Figure 4-1](#).

For more information on device Configuration Words, see [Section 26.0 “Special Features”](#).

TABLE 4-1: DEVICE CONFIGURATION WORDS FOR PIC24FV32KA304 FAMILY DEVICES

| Configuration Words | Configuration Word Addresses |
|---------------------|------------------------------|
| FBS | F80000 |
| FGS | F80004 |
| FOSCSEL | F80006 |
| FOSC | F80008 |
| FWDT | F8000A |
| FPOR | F8000C |
| FICD | F8000E |
| FDS | F80010 |

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

PIC24FV32KA304 FAMILY

4.2 Data Address Space

The PIC24F core has a separate, 16-bit wide data memory space, addressable as a single linear range. The data space is accessed using two Address Generation Units (AGUs), one each for read and write operations. The data space memory map is shown in Figure 4-3.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when EA<15> = 0) is used for implemented memory addresses, while the upper half (EA<15> = 1) is reserved for the Program Space Visibility (PSV) area (see Section 4.3.3 “Reading Data from Program Memory Using Program Space Visibility”).

PIC24FV32KA304 family devices implement a total of 1024 words of data memory. If an EA points to a location outside of this area, an all zero word or byte will be returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all the data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

FIGURE 4-3: DATA SPACE MEMORY MAP FOR PIC24FV32KA304 FAMILY DEVICES

PIC24FV32KA304 FAMILY

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCU devices and improve data space memory usage efficiency, the PIC24F instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address (EA) calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word, which contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and the registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register, which matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap will be generated. If the error occurred on a read, the instruction underway is completed; if it occurred on a write, the instruction will be executed, but the write will not occur. In either case, a trap is then executed, allowing the system and/or user to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB; the MSB is not modified.

A Sign-Extend (SE) instruction is provided to allow the users to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, users

can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

Although most instructions are capable of operating on word or byte data sizes, it should be noted that some instructions operate only on words.

4.2.3 NEAR DATA SPACE

The 8-Kbyte area between 0000h and 1FFFh is referred to as the Near Data Space (NDS). Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. The remainder of the data space is addressable indirectly. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing (MDA) with a 16-bit address field. For PIC24FV32KA304 family devices, the entire implemented data memory lies in Near Data Space.

4.2.4 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0000h to 07FFh, are primarily occupied with Special Function Registers (SFRs). These are used by the PIC24F core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by the module. Much of the SFR space contains unused addresses; these are read as '0'. The SFR space, where the SFRs are actually implemented, is provided in Table 4-2. Each implemented area indicates a 32-byte region, where at least one address is implemented as an SFR. A complete listing of implemented SFRs, including their addresses, is provided in Table 4-3 through Table 4-25.

TABLE 4-2: IMPLEMENTED REGIONS OF SFR DATA SPACE

| SFR Space Address | | | | | | | | |
|-------------------|------------------|----------|----------------|---------|------------|------|------|------|
| | xx00 | xx20 | xx40 | xx60 | xx80 | xxA0 | xxC0 | xxE0 |

PIC24FV32KA304 FAMILY

4.2.5 SOFTWARE STACK

In addition to its use as a Working register, the W15 register in PIC24F devices is also used as a Software Stack Pointer. The pointer always points to the first available free word and grows from lower to higher addresses. It decrements for stack pops and post-increments for stack pushes, as shown in Figure 4-4.

Note that for a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, ensuring that the MSB is always clear.

Note: A PC push during exception processing will concatenate the SRL register to the MSB of the PC prior to the push.

The Stack Pointer Limit Value (SPLIM) register, associated with the Stack Pointer, sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' as all stack operations must be word-aligned. Whenever an EA is generated, using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal, and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation.

Thus, for example, if it is desirable to cause a stack error trap when the stack grows beyond address, 0DF4 in RAM, initialize the SPLIM with the value, 0DF4.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0800h. This prevents the stack from interfering with the Special Function Register (SFR) space.

Note: A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 4-4: CALL STACK FRAME

4.3 Interfacing Program and Data Memory Spaces

The PIC24F architecture uses a 24-bit wide program space and 16-bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Apart from the normal execution, the PIC24F architecture provides two methods by which the program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the data space, PSV

Table instructions allow an application to read or write small areas of the program memory. This makes the method ideal for accessing data tables that need to be updated from time to time. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. It can only access the least significant word (lsw) of the program word.

4.3.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Memory Page Address register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit (MSb) of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

For remapping operations, the 8-bit Program Space Visibility Page Address register (PSVPAG) is used to define a 16K word page in the program space. When the MSb of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike the table operations, this limits remapping operations strictly to the user memory area.

Table 4-27 and Figure 4-5 show how the program EA is created for table operations and remapping accesses from the data EA. Here, the P<23:0> bits refer to a program space word, whereas the D<15:0> bits refer to a data space word.

PIC24FV32KA304 FAMILY

TABLE 4-27: PROGRAM SPACE ADDRESS CONSTRUCTION

| Access Type | Access Space | Program Space Address | | | | |
|--|---------------|------------------------------|----------------------------|------------------------------|--------|-----|
| | | <23> | <22:16> | <15> | <14:1> | <0> |
| Instruction Access (Code Execution) | User | 0 | PC<22:1> | | | 0 |
| | | 0xx xxxx xxxx xxxx xxxx xxx0 | | | | |
| TBLRD/TBLWT (Byte/Word Read/Write) | User | TBLPAG<7:0> | | Data EA<15:0> | | |
| | | 0xxx xxxx | | xxxx xxxx xxxx xxxx | | |
| | Configuration | TBLPAG<7:0> | | Data EA<15:0> | | |
| | | 1xxx xxxx | | xxxx xxxx xxxx xxxx | | |
| Program Space Visibility (Block Remap/Read) | User | 0 | PSVPAG<7:0> ⁽²⁾ | Data EA<14:0> ⁽¹⁾ | | |
| | | 0 | xxxx xxxx | xxx xxxx xxxx xxxx | | |

- Note 1:** Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.
- Note 2:** PSVPAG can have only two values ('00' to access program memory and FF to access data EEPROM) in the PIC24FV32KA304 family.

FIGURE 4-5: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

- Note 1:** The LSb of program space addresses is always fixed as '0' in order to maintain word alignment of data in the program and data spaces.
- Note 2:** Table operations are not required to be word-aligned. Table Read operations are permitted in the configuration memory space.

PIC24FV32KA304 FAMILY

4.3.2 DATA ACCESS FROM PROGRAM MEMORY AND DATA EEPROM MEMORY USING TABLE INSTRUCTIONS

The `TBLRDL` and `TBLWTL` instructions offer a direct method of reading or writing the lower word of any address within the program memory without going through data space. It also offers a direct method of reading or writing a word of any address within data EEPROM memory. The `TBLRDH` and `TBLWTH` instructions are the only method to read or write the upper 8 bits of a program space word as data.

Note: The `TBLRDH` and `TBLWTH` instructions are not used while accessing data EEPROM memory.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit word-wide address spaces, residing side by side, each with the same address range. `TBLRDL` and `TBLWTL` access the space which contains the least significant data word, and `TBLRDH` and `TBLWTH` access the space which contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

1. `TBLRDL` (Table Read Low): In Word mode, it maps the lower word of the program space location ($P<15:0>$) to a data address ($D<15:0>$). In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when byte select is '1'; the lower byte is selected when it is '0'.
2. `TBLRDH` (Table Read High): In Word mode, it maps the entire upper word of a program address ($P<23:16>$) to a data address. Note that $D<15:8>$, the 'phantom' byte, will always be '0'.

In Byte mode, it maps the upper or lower byte of the program word to $D<7:0>$ of the data address, as above. Note that the data will always be '0' when the upper 'phantom' byte is selected (Byte Select = 1).

PIC24FV32KA304 FAMILY

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in [Section 5.0 “Flash Program Memory”](#).

For all table operations, the area of program memory space to be accessed is determined by the Table Memory Page Address register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When

TBLPAG<7> = 0, the table page is located in the user memory space. When TBLPAG<7> = 1, the page is located in configuration space.

Note: Only Table Read operations will execute in the configuration memory space, and only then, in implemented areas, such as the Device ID. Table Write operations are not allowed.

FIGURE 4-6: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

4.3.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into a 16K word page (in PIC24FV16KA3XX devices) and a 32K word page (in PIC24FV32KA3XX devices) of the program space. This provides transparent access of stored constant data from the data space without the need to use special instructions (i.e., TBLRDL/H).

Program space access through the data space occurs if the MSb of the data space EA is '1' and PSV is enabled by setting the PSV bit in the CPU Control (CORCON<2>) register. The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page Address (PSVPAG) register. This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits.

By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads from this area add an additional cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address, 8000h and higher, maps directly into a corresponding program memory address (see Figure 4-7), only the lower 16 bits of the 24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

Note: PSV access is temporarily disabled during Table Reads/Writes.

For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions will require one instruction cycle in addition to the specified execution time. All other instructions will require two instruction cycles in addition to the specified execution time.

For operations that use PSV, which are executed inside a REPEAT loop, there will be some instances that require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction accessing data, using PSV, to execute in a single cycle.

FIGURE 4-7: PROGRAM SPACE VISIBILITY OPERATION

PIC24FV32KA304 FAMILY

NOTES:

5.0 FLASH PROGRAM MEMORY

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Flash programming, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**PIC24F Flash Program Memory**” (DS30009715).

The PIC24FV32KA304 family of devices contains internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable when operating with VDD over 1.8V.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™)
- Run-Time Self Programming (RTSP)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

ICSP allows a PIC24FV32KA304 device to be serially programmed while in the end application circuit. This is simply done with two lines for the programming clock and programming data (which are named PGECx and PGEDx, respectively), and three other lines for power (VDD), ground (VSS) and Master Clear/Program mode entry voltage (MCLR/VPP). This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or custom firmware to be programmed.

Run-Time Self Programming (RTSP) is accomplished using TBLRD (Table Read) and TBLWT (Table Write) instructions. With RTSP, the user may write program memory data in blocks of 32 instructions (96 bytes) at a time, and erase program memory in blocks of 32, 64 and 128 instructions (96,192 and 384 bytes) at a time.

The NVMOP<1:0> (NVMCON<1:0>) bits decide the erase block size.

5.1 Table Instructions and Flash Programming

Regardless of the method used, Flash memory programming is done with the Table Read and Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using the TBLPAG<7:0> bits and the Effective Address (EA) from a W register, specified in the table instruction, as depicted in Figure 5-1.

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS

PIC24FV32KA304 FAMILY

5.2 RTSP Operation

The PIC24F Flash program memory array is organized into rows of 32 instructions or 96 bytes. RTSP allows the user to erase blocks of 1 row, 2 rows and 4 rows (32, 64 and 128 instructions) at a time, and to program one row at a time. It is also possible to program single words.

The 1-row (96 bytes), 2-row (192 bytes) and 4-row (384 bytes) erase blocks, and single row write block (96 bytes) are edge-aligned from the beginning of program memory.

When data is written to program memory using `TBLWT` instructions, the data is not written directly to memory. Instead, data written using Table Writes is stored in holding latches until the programming sequence is executed.

Any number of `TBLWT` instructions can be executed and a write will be successfully performed. However, 32 `TBLWT` instructions are required to write the full row of memory.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of `TBLWT` instructions to load the buffers. Programming is performed by setting the control bits in the `NVMCON` register.

Data can be loaded in any order and the holding registers can be written to multiple times before performing a write operation. Subsequent writes, however, will wipe out any previous writes.

| |
|--|
| Note: Writing to a location multiple times without erasing it is not recommended. |
|--|

All of the Table Write operations are single-word writes (two instruction cycles), because only the buffers are written. A programming cycle is required for programming each row.

5.3 Enhanced In-Circuit Serial Programming

Enhanced ICSP uses an on-board bootloader, known as the Programming Executive (PE), to manage the programming process. Using an SPI data frame format, the Programming Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

5.4 Control Registers

There are two SFRs used to read and write the program Flash memory: `NVMCON` and `NVMKEY`.

The `NVMCON` register ([Register 5-1](#)) controls the blocks that need to be erased, which memory type is to be programmed and when the programming cycle starts.

`NVMKEY` is a write-only register that is used for write protection. To start a programming or erase sequence, the user must consecutively write 55h and AAh to the `NVMKEY` register. For more information, refer to [Section 5.5 “Programming Operations”](#).

5.5 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. During a program or erase operation, the processor stalls (Waits) until the operation is finished. Setting the `WR` bit (`NVMCON<15>`) starts the operation and the `WR` bit is automatically cleared when the operation is finished.

 011010 = Erases 4 rows of Flash memory⁽³⁾
 011001 = Erases 2 rows of Flash memory⁽³⁾
 011000 = Erases 1 row of Flash memory⁽³⁾
 0101xx = Erases entire configuration block (except code protection bits)
 0100xx = Erases entire data EEPROM⁽⁴⁾
 0011xx = Erases entire general memory block programming operations
 0001xx = Writes 1 row of Flash memory (when ERASE bit is '0')⁽³⁾

- Note 1:** All other combinations of NVMOP<5:0> are no operation.
Note 2: These values are available in ICSP™ mode only. Refer to the device programming specification.
Note 3: The address in the Table Pointer decides which rows will be erased.
Note 4: This bit is used only while accessing data EEPROM.

PIC24FV32KA304 FAMILY

5.5.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

The user can program one row of Flash program memory at a time by erasing the programmable row. The general process is as follows:

1. Read a row of program memory (32 instructions) and store in data RAM.
2. Update the program data in RAM with the desired new data.
3. Erase a row (see [Example 5-1](#)):
 - a) Set the NVMOPx bits (NVMCON<5:0>) to '011000' to configure for row erase. Set the ERASE (NVMCON<6>) and WREN (NVMCON<14>) bits.
 - b) Write the starting address of the block to be erased into the TBLPAG and W registers.
 - c) Write 55h to NVMKEY.
 - d) Write AAh to NVMKEY.
 - e) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.
4. Write the first 32 instructions from data RAM into the program memory buffers (see [Example 5-1](#)).
5. Write the program block to Flash memory:
 - a) Set the NVMOPx bits to '011000' to configure for row programming. Clear the ERASE bit and set the WREN bit.
 - b) Write 55h to NVMKEY.
 - c) Write AAh to NVMKEY.
 - d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs, as shown in [Example 5-5](#).

EXAMPLE 5-1: ERASING A PROGRAM MEMORY ROW – ASSEMBLY LANGUAGE CODE

```
; Set up NVMCON for row erase operation
MOV    #0x4058, W0          ;
MOV    W0, NVMCON          ; Initialize NVMCON
; Init pointer to row to be ERASED
MOV    #tblpage(PROG_ADDR), W0 ;
MOV    W0, TBLPAG          ; Initialize PM Page Boundary SFR
MOV    #tbloffset(PROG_ADDR), W0 ; Initialize in-page EA[15:0] pointer
TBLWTL W0, [W0]           ; Set base address of erase block
DISI   #5                  ; Block all interrupts
                          ; for next 5 instructions

MOV    #0x55, W0
MOV    W0, NVMKEY          ; Write the 55 key
MOV    #0xAA, W1
MOV    W1, NVMKEY          ; Write the AA key
BSET   NVMCON, #WR        ; Start the erase sequence
NOP    ; Insert two NOPs after the erase
NOP    ; command is asserted
```

PIC24FV32KA304 FAMILY

EXAMPLE 5-2: ERASING A PROGRAM MEMORY ROW – ‘C’ LANGUAGE CODE

```
// C example using MPLAB C30

int __attribute__((space(auto_psv))) progAddr = 0x1234; // Global variable located in Pgm Memory
unsigned int offset;

//Set up pointer to the first memory location to be written

TBLPAG = __builtin_tblpage(&progAddr);           // Initialize PM Page Boundary SFR
offset = __builtin_tbloffset(&progAddr);         // Initialize lower word of address

__builtin_tblwtl(offset, 0x0000);               // Set base address of erase block
                                                // with dummy latch write

NVMCON = 0x4058;                               // Initialize NVMCON

asm("DISI #5");                                 // Block all interrupts for next 5
                                                // instructions
__builtin_write_NVM();                          // C30 function to perform unlock
                                                // sequence and set WR
```

EXAMPLE 5-3: LOADING THE WRITE BUFFERS – ASSEMBLY LANGUAGE CODE

```
; Set up NVMCON for row programming operations
MOV    #0x4004, W0                               ;
MOV    W0, NVMCON                               ; Initialize NVMCON
; Set up a pointer to the first program memory location to be written
; program memory selected, and writes enabled
MOV    #0x0000, W0                               ;
MOV    W0, TBLPAG                               ; Initialize PM Page Boundary SFR
MOV    #0x6000, W0                               ; An example program memory address
; Perform the TBLWT instructions to write the latches
; 0th_program_word
MOV    #LOW_WORD_0, W2                           ;
MOV    #HIGH_BYTE_0, W3                           ;
TBLWTL W2, [W0]                                  ; Write PM low word into program latch
TBLWTH W3, [W0++]                                 ; Write PM high byte into program latch
; 1st_program_word
MOV    #LOW_WORD_1, W2                           ;
MOV    #HIGH_BYTE_1, W3                           ;
TBLWTL W2, [W0]                                  ; Write PM low word into program latch
TBLWTH W3, [W0++]                                 ; Write PM high byte into program latch
; 2nd_program_word
MOV    #LOW_WORD_2, W2                           ;
MOV    #HIGH_BYTE_2, W3                           ;
TBLWTL W2, [W0]                                  ; Write PM low word into program latch
TBLWTH W3, [W0++]                                 ; Write PM high byte into program latch
.
.
.
; 32nd_program_word
MOV    #LOW_WORD_31, W2                          ;
MOV    #HIGH_BYTE_31, W3                          ;
TBLWTL W2, [W0]                                  ; Write PM low word into program latch
TBLWTH W3, [W0]                                  ; Write PM high byte into program latch
```

PIC24FV32KA304 FAMILY

EXAMPLE 5-4: LOADING THE WRITE BUFFERS – ‘C’ LANGUAGE CODE

```
// C example using MPLAB C30

#define NUM_INSTRUCTION_PER_ROW 64
int __attribute__((space(auto_psv))) progAddr = 0x1234; // Global variable located in Pgm Memory
unsigned int offset;
unsigned int i;
unsigned int progData[2*NUM_INSTRUCTION_PER_ROW]; // Buffer of data to write

//Set up NVMCON for row programming
NVMCON = 0x4001; // Initialize NVMCON

//Set up pointer to the first memory location to be written
TBLPAG = __builtin_tblpage(&progAddr); // Initialize PM Page Boundary SFR
offset = __builtin_tbloffset(&progAddr); // Initialize lower word of address

//Perform TBLWT instructions to write necessary number of latches
for(i=0; i < 2*NUM_INSTRUCTION_PER_ROW; i++)
{
    __builtin_tblwtl(offset, progData[i++]); // Write to address low word
    __builtin_tblwth(offset, progData[i]); // Write to upper byte
    offset = offset + 2; // Increment address
}
```

EXAMPLE 5-5: INITIATING A PROGRAMMING SEQUENCE – ASSEMBLY LANGUAGE CODE

```
DISI    #5                ; Block all interrupts
                        ; for next 5 instructions

MOV     #0x55, W0
MOV     W0, NVMKEY       ; Write the 55 key
MOV     #0xAA, W1
MOV     W1, NVMKEY       ; Write the AA key
BSET    NVMCON, #WR      ; Start the erase sequence
NOP     ; 2 NOPs required after setting WR
NOP     ;
BTSC    NVMCON, #15     ; Wait for the sequence to be completed
BRA     $-2              ;
```

EXAMPLE 5-6: INITIATING A PROGRAMMING SEQUENCE – ‘C’ LANGUAGE CODE

```
// C example using MPLAB C30

asm("DISI #5"); // Block all interrupts for next 5 instructions

__builtin_write_NVM(); // Perform unlock sequence and set WR
```

6.0 DATA EEPROM MEMORY

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Data EEPROM, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Data EEPROM**” (DS39720).

The data EEPROM memory is a Nonvolatile Memory (NVM), separate from the program and volatile data RAM. Data EEPROM memory is based on the same Flash technology as program memory, and is optimized for both long retention and a higher number of erase/write cycles.

The data EEPROM is mapped to the top of the user program memory space, with the top address at program memory address, 7FFE00h to 7FFFFFFh. The size of the data EEPROM is 256 words in the PIC24FV32KA304 family devices.

The data EEPROM is organized as 16-bit wide memory. Each word is directly addressable, and is readable and writable during normal operation over the entire VDD range.

Unlike the Flash program memory, normal program execution is not stopped during a data EEPROM program or erase operation.

The data EEPROM programming operations are controlled using the three NVM Control registers:

- NVMCON: Nonvolatile Memory Control Register
- NVMKEY: Nonvolatile Memory Key Register
- NVMADR: Nonvolatile Memory Address Register

EXAMPLE 6-1: DATA EEPROM UNLOCK SEQUENCE

```
//Disable Interrupts For 5 instructions
asm volatile ("disi #5");
//Issue Unlock Sequence
asm volatile ("mov #0x55, W0 \n"
             "mov W0, NVMKEY \n"
             "mov #0xAA, W1 \n"
             "mov W1, NVMKEY \n");
// Perform Write/Erase operations
asm volatile ("bset NVMCON, #WR \n"
             "nop \n"
             "nop \n");
```

6.1 NVMCON Register

The NVMCON register ([Register 6-1](#)) is also the primary control register for data EEPROM program/erase operations. The upper byte contains the control bits used to start the program or erase cycle, and the flag bit to indicate if the operation was successfully performed. The lower byte of NVMCOM configures the type of NVM operation that will be performed.

6.2 NVMKEY Register

The NVMKEY is a write-only register that is used to prevent accidental writes or erasures of data EEPROM locations.

To start any programming or erase sequence, the following instructions must be executed first, in the exact order provided:

1. Write 55h to NVMKEY.
2. Write AAh to NVMKEY.

After this sequence, a write will be allowed to the NVMCON register for one instruction cycle. In most cases, the user will simply need to set the WR bit in the NVMCON register to start the program or erase cycle. Interrupts should be disabled during the unlock sequence.

The MPLAB® C30 C compiler provides a defined library procedure (`builtin_write_NVM`) to perform the unlock sequence. [Example 6-1](#) illustrates how the unlock sequence can be performed with in-line assembly.

PIC24FV32KA304 FAMILY

REGISTER 6-1: NVMCON: NONVOLATILE MEMORY CONTROL REGISTER

| | | | | | | | |
|-----------|-------|-------|---------|-----|-----|-------|-----|
| R/S-0, HC | R/W-0 | R/W-0 | R/W-0 | U-0 | U-0 | U-0 | U-0 |

| bit 15 | | | | | | bit 8 | |

| | | | | | | | |
|-------|-------|--------|--------|--------|--------|--------|--------|
| U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| — | ERASE | NVMOP5 | NVMOP4 | NVMOP3 | NVMOP2 | NVMOP1 | NVMOP0 |
| bit 7 | | | | | | bit 0 | |

| | | |
|-------------------|-----------------------------|--|
| Legend: | HC = Hardware Clearable bit | U = Unimplemented bit, read as '0' |
| R = Readable bit | W = Writable bit | S = Settable bit |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared x = Bit is unknown |

- bit 15 **WR:** Write Control bit (program or erase)
 1 = Initiates a data EEPROM erase or write cycle (can be set, but not cleared in software)
 0 = Write cycle is complete (cleared automatically by hardware)
- bit 14 **WREN:** Write Enable bit (erase or program)
 1 = Enables an erase or program operation
 0 = No operation allowed (device clears this bit on completion of the write/erase operation)
- bit 13 **WRERR:** Write Flash Error Flag bit
 1 = A write operation is prematurely terminated (any $\overline{\text{MCLR}}$ or WDT Reset during programming operation)
 0 = The write operation completed successfully
- bit 12 **PGMONLY:** Program Only Enable bit
 1 = Write operation is executed without erasing target address(es) first
 0 = Automatic erase-before-write
 Write operations are preceded automatically by an erase of the target address(es).
- bit 11-7 **Unimplemented:** Read as '0'
- bit 6 **ERASE:** Erase Operation Select bit
 1 = Performs an erase operation when WR is set
 0 = Performs a write operation when WR is set
- bit 5-0 **NVMOP<5:0>:** Programming Operation Command Byte bits
Erase Operations (when ERASE bit is '1'):
 011010 = Erases 8 words
 011001 = Erases 4 words
 011000 = Erases 1 word
 0100xx = Erases entire data EEPROM
Programming Operations (when ERASE bit is '0'):
 0001xx = Writes 1 word

6.3 NVM Address Register

As with Flash program memory, the NVM Address registers, NVMADRU and NVMADR, form the 24-bit Effective Address (EA) of the selected row or word for data EEPROM operations. The NVMADRU register is used to hold the upper 8 bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA. These registers are not mapped into the Special Function Register (SFR) space. Instead, they directly capture the EA<23:0> of the last Table Write instruction that has been executed and selects the data EEPROM row to erase. Figure 6-1 depicts the program memory EA that is formed for programming and erase operations.

Like program memory operations, the Least Significant bit (LSb) of NVMADR is restricted to even addresses. This is because any given address in the data EEPROM space consists of only the lower word of the program memory width; the upper word, including the uppermost “phantom byte”, are unavailable. This means that the LSb of a data EEPROM address will always be ‘0’.

Similarly, the Most Significant bit (MSb) of NVMADRU is always ‘0’, since all addresses lie in the user program space.

FIGURE 6-1: DATA EEPROM ADDRESSING WITH TBLPAG AND NVM ADDRESS REGISTERS

6.4 Data EEPROM Operations

The EEPROM block is accessed using Table Read and Write operations similar to those used for program memory. The TBLWTH and TBLRDH instructions are not required for data EEPROM operations since the memory is only 16 bits wide (data on the lower address is valid only). The following programming operations can be performed on the data EEPROM:

- Erase one, four or eight words
- Bulk erase the entire data EEPROM
- Write one word
- Read one word

Note 1: Unexpected results will be obtained if the user attempts to read the EEPROM while a programming or erase operation is underway.

- 2:** The C30 C compiler includes library procedures to automatically perform the Table Read and Table Write operations, manage the Table Pointer and write buffers, and unlock and initiate memory write sequences. This eliminates the need to create assembler macros or time critical routines in C for each application.

The library procedures are used in the code examples detailed in the following sections. General descriptions of each process are provided for users who are not using the C30 compiler libraries.

PIC24FV32KA304 FAMILY

6.4.1 ERASE DATA EEPROM

The data EEPROM can be fully erased, or can be partially erased, at three different sizes: one word, four words or eight words. The bits, NVMOP<1:0> (NVMCON<1:0>), decide the number of words to be erased. To erase partially from the data EEPROM, the following sequence must be followed:

1. Configure NVMCON to erase the required number of words: one, four or eight.
2. Load TBLPAG and WREG with the EEPROM address to be erased.
3. Clear the NVMIF status bit and enable the NVM interrupt (optional).
4. Write the key sequence to NVMKEY.
5. Set the WR bit to begin the erase cycle.
6. Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).

A typical erase sequence is provided in [Example 6-2](#). This example shows how to do a one-word erase. Similarly, a four-word erase and an eight-word erase can be done. This example uses C library procedures to manage the Table Pointer (`builtin_tblpage` and `builtin_tbloffset`) and the Erase Page Pointer (`builtin_tblwtl`). The memory unlock sequence (`builtin_write_NVM`) also sets the WR bit to initiate the operation and returns control when complete.

EXAMPLE 6-2: SINGLE-WORD ERASE

```
int __attribute__((space(eedata))) eeData = 0x1234;
/*-----
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the erase
-----*/
unsigned int offset;

// Set up NVMCON to erase one word of data EEPROM
NVMCON = 0x4058;

// Set up a pointer to the EEPROM location to be erased
TBLPAG = __builtin_tblpage(&eeData);           // Initialize EE Data page pointer
offset = __builtin_tbloffset(&eeData);         // Initizlize lower word of address
__builtin_tblwtl(offset, 0);                   // Write EEPROM data to write latch

asm volatile ("disi #5");                      // Disable Interrupts For 5 Instructions
__builtin_write_NVM();                         // Issue Unlock Sequence & Start Write Cycle
while(NVMCONbits.WR=1);                       // Optional: Poll WR bit to wait for
                                              // write sequence to complete
```

6.4.1.1 Data EEPROM Bulk Erase

To erase the entire data EEPROM (bulk erase), the address registers do not need to be configured because this operation affects the entire data EEPROM. The following sequence helps in performing a bulk erase:

1. Configure NVMCON to Bulk Erase mode.
2. Clear the NVMIF status bit and enable the NVM interrupt (optional).
3. Write the key sequence to NVMKEY.
4. Set the WR bit to begin the erase cycle.
5. Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).

A typical bulk erase sequence is provided in [Example 6-3](#).

6.4.2 SINGLE-WORD WRITE

To write a single word in the data EEPROM, the following sequence must be followed:

1. Erase one data EEPROM word (as mentioned in the previous section) if the PGONLY bit (NVMCON<12>) is set to '1'.
2. Write the data word into the data EEPROM latch.
3. Program the data word into the EEPROM:
 - Configure the NVMCON register to program one EEPROM word (NVMCON<5:0> = 0001xx).
 - Clear the NVMIF status bit and enable the NVM interrupt (optional).
 - Write the key sequence to NVMKEY.
 - Set the WR bit to begin the erase cycle.
 - Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).
 - To get cleared, wait until NVMIF is set.

A typical single-word write sequence is provided in [Example 6-4](#).

EXAMPLE 6-3: DATA EEPROM BULK ERASE

```
// Set up NVMCON to bulk erase the data EEPROM
NVMCON = 0x4050;

// Disable Interrupts For 5 Instructions
asm volatile ("disi #5");

// Issue Unlock Sequence and Start Erase Cycle
__builtin_write_NVM();
```

EXAMPLE 6-4: SINGLE-WORD WRITE TO DATA EEPROM

```
int __attribute__((space(eedata))) eeData = 0x1234;
int newData; // New data to write to EEPROM
/*-----
The variable eeData must be a Global variable declared outside of any method
the code following this comment can be written inside the method that will execute the write
-----*/
unsigned int offset;

// Set up NVMCON to erase one word of data EEPROM
NVMCON = 0x4004;

// Set up a pointer to the EEPROM location to be erased
TBLPAG = __builtin_tblpage(&eeData); // Initialize EE Data page pointer
offset = __builtin_tbloffset(&eeData); // Initialize lower word of address
__builtin_tblw1(offset, newData); // Write EEPROM data to write latch

asm volatile ("disi #5"); // Disable Interrupts For 5 Instructions
__builtin_write_NVM(); // Issue Unlock Sequence & Start Write Cycle
while(NVMCONbits.WR=1); // Optional: Poll WR bit to wait for
// write sequence to complete
```

PIC24FV32KA304 FAMILY

6.4.3 READING THE DATA EEPROM

To read a word from data EEPROM, the Table Read instruction is used. Since the EEPROM array is only 16 bits wide, only the TBLRD instruction is needed. The read operation is performed by loading TBLPAG and WREG with the address of the EEPROM location, followed by a TBLRD instruction.

A typical read sequence, using the Table Pointer management (`builtin_tblpage` and `builtin_tbloffset`) and Table Read procedures (`builtin_tblrddl`) from the C30 compiler library, is provided in [Example 6-5](#).

Program Space Visibility (PSV) can also be used to read locations in the data EEPROM.

EXAMPLE 6-5: READING THE DATA EEPROM USING THE TBLRD COMMAND

```
int __attribute__((space(eedata))) eeData = 0x1234;
int data; // Data read from EEPROM
/*-----
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the read
-----
*/
    unsigned int offset;

    // Set up a pointer to the EEPROM location to be erased
    TBLPAG = __builtin_tblpage(&eeData); // Initialize EE Data page pointer
    offset = __builtin_tbloffset(&eeData); // Initialize lower word of address
    data = __builtin_tblrddl(offset); // Write EEPROM data to write latch
```

7.0 RESETS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Resets, refer to the “dsPIC33/PIC24 Family Reference Manual”, “Reset with Programmable Brown-out Reset” (DS39728).

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- MCLR: Pin Reset
- SWR: RESET Instruction
- WDTR: Watchdog Timer Reset
- BOR: Brown-out Reset
- Low-Power BOR/Deep Sleep BOR
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Opcode Reset
- UWR: Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in [Figure 7-1](#).

Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on Power-on Reset (POR) and unchanged by all other Resets.

Note: Refer to the specific peripheral or [Section 3.0 “CPU”](#) of this data sheet for register Reset states.

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 7-1](#)). A Power-on Reset will clear all bits except for the BOR and POR bits (RCON<1:0>) which are set. The user may set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software will not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer (WDT) and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

| IDLE (RCON<2>) | PWRSVAV #IDLE Instruction | POR |
| BOR (RCON<1>) | POR, BOR | — |
| POR (RCON<0>) | POR | — |
| DPSLP (RCON<10>) | PWRSVAV #SLEEP Instruction with DSEN (DSCON<15>) Set | POR |

Note: All Reset flag bits may be set or cleared by the user software.

PIC24FV32KA304 FAMILY

7.1 Clock Source Selection at Reset

If clock switching is enabled, the system clock source at device Reset is chosen, as shown in [Table 7-2](#). If clock switching is disabled, the system clock source is always selected according to the Oscillator Configuration bits. For more information, see [Section 9.0 “Oscillator Configuration”](#).

TABLE 7-2: OSCILLATOR SELECTION vs. TYPE OF RESET (CLOCK SWITCHING ENABLED)

| Reset Type | Clock Source Determinant |
|--------------------------|---|
| POR | FNOSC _x Configuration bits (FNOSC<10:8>) |
| BOR | |
| $\overline{\text{MCLR}}$ | COSC _x Control bits (OSCCON<14:12>) |
| WDTO | |
| SWR | |

7.2 Device Reset Times

The Reset times for various types of device Reset are summarized in [Table 7-3](#). Note that the System Reset Signal, $\overline{\text{SYSRST}}$, is released after the POR and PWRT delay times expire.

The time at which the device actually begins to execute code will also depend on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable $\overline{\text{SYSRST}}$ delay times.

The FSCM delay determines the time at which the FSCM begins to monitor the system clock source after the $\overline{\text{SYSRST}}$ signal is released.

TABLE 7-3: DELAY TIMES FOR VARIOUS DEVICE RESETS

| Reset Type | Clock Source | $\overline{\text{SYSRST}}$ Delay | System Clock Delay | Notes |
|--------------------|--------------|----------------------------------|--------------------|------------|
| POR ⁽⁶⁾ | EC | TPOR + TPWRT | — | 1, 2 |
| | FRC, FRCDIV | TPOR + TPWRT | TFRC | 1, 2, 3 |
| | LPRC | TPOR + TPWRT | TLPRC | 1, 2, 3 |
| | ECPLL | TPOR + TPWRT | TLOCK | 1, 2, 4 |
| | FRCPLL | TPOR + TPWRT | TFRC + TLOCK | 1, 2, 3, 4 |
| | XT, HS, SOSC | TPOR + TPWRT | TOST | 1, 2, 5 |
| | XTPLL, HSPLL | TPOR + TPWRT | TOST + TLOCK | 1, 2, 4, 5 |
| BOR | EC | TPWRT | — | 2 |
| | FRC, FRCDIV | TPWRT | TFRC | 2, 3 |
| | LPRC | TPWRT | TLPRC | 2, 3 |
| | ECPLL | TPWRT | TLOCK | 2, 4 |
| | FRCPLL | TPWRT | TFRC + TLOCK | 2, 3, 4 |
| | XT, HS, SOSC | TPWRT | TOST | 2, 5 |
| | XTPLL, HSPLL | TPWRT | TFRC + TLOCK | 2, 3, 4 |
| All Others | Any Clock | — | — | None |

Note 1: TPOR = Power-on Reset delay.

2: TPWRT = 64 ms nominal if the Power-up Timer (PWRT) is enabled; otherwise, it is zero.

3: TFRC and TLPRC = RC oscillator start-up times.

4: TLOCK = PLL lock time.

5: TOST = Oscillator Start-up Timer (OST). A 10-bit counter waits 1024 oscillator periods before releasing the oscillator clock to the system.

6: If Two-Speed Start-up is enabled, regardless of the primary oscillator selected, the device starts with FRC, and in such cases, FRC start-up time is valid.

Note: For detailed operating frequency and timing specifications, see [Section 29.0 “Electrical Characteristics”](#).

7.2.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) will have a relatively long start-up time. Therefore, one or more of the following conditions is possible after $\overline{\text{SYSRST}}$ is released:

- The oscillator circuit has not begun to oscillate.
- The Oscillator Start-up Timer (OST) has not expired (if a crystal oscillator is used).
- The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

7.2.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it will begin to monitor the system clock source when $\overline{\text{SYSRST}}$ is released. If a valid clock source is not available at this time, the device will automatically switch to the FRC oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine (TSR).

7.3 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the PIC24F CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset with the exception of four registers. The Reset value for the Reset Control register, RCON, will depend on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, will depend on the type of Reset and the programmed values of the FNOSC_x bits in the Flash Configuration Word (FOSCSEL<2:0>); see Table 7-2. The RCFGAL and NVMCON registers are only affected by a POR.

7.4 Deep Sleep BOR (DSBOR)

Deep Sleep BOR is a very low-power BOR circuitry, used when the device is in Deep Sleep mode. Due to low current consumption, accuracy may vary.

The DSBOR trip point is around 2.0V. DSBOR is enabled by configuring DSLPBOR (FDS<6>) = 1. DSLPBOR will re-arm the POR to ensure the device will reset if VDD drops below the POR threshold.

7.5 Brown-out Reset (BOR)

The PIC24FV32KA304 family devices implement a BOR circuit, which provides the user several configuration and power-saving options. The BOR is controlled by the BORV<1:0> and BOREN<1:0> Configuration bits (FPOR<6:5,1:0>). There are a total of four BOR configurations, which are provided in Table 7-3.

The BOR threshold is set by the BORV<1:0> bits. If BOR is enabled (any values of BOREN<1:0>, except '00'), any drop of VDD below the set threshold point will reset the device. The chip will remain in BOR until VDD rises above the threshold.

If the Power-up Timer is enabled, it will be invoked after VDD rises above the threshold. Then, it will keep the chip in Reset for an additional time delay, TPWRT, if VDD drops below the threshold while the Power-up Timer is running. The chip goes back into a BOR and the Power-up Timer will be initialized. Once VDD rises above the threshold, the Power-up Timer will execute the additional time delay.

BOR and the Power-up Timer (PWRT) are independently configured. Enabling the Brown-out Reset does not automatically enable the PWRT.

7.5.1 SOFTWARE ENABLED BOR

When BOREN<1:0> = 01, the BOR can be enabled or disabled by the user in software. This is done with the control bit, SBOREN (RCON<13>). Setting SBOREN enables the BOR to function as previously described. Clearing the SBOREN disables the BOR entirely. The SBOREN bit operates only in this mode; otherwise, it is read as '0'.

Placing BOR under software control gives the user the additional flexibility of tailoring the application to its environment without having to reprogram the device to change the BOR configuration. It also allows the user to tailor the incremental current that the BOR consumes. While the BOR current is typically very small, it may have some impact in low-power applications.

Note: Even when the BOR is under software control, the Brown-out Reset voltage level is still set by the BORV<1:0> Configuration bits; it cannot be changed in software.

PIC24FV32KA304 FAMILY

7.5.2 DETECTING BOR

When BOR is enabled, the BOR bit (RCON<1>) is always reset to '1' on any BOR or POR event. This makes it difficult to determine if a BOR event has occurred just by reading the state of BOR alone. A more reliable method is to simultaneously check the state of both POR and BOR. This assumes that the POR and BOR bits are reset to '0' in the software immediately after any POR event. If the BOR bit is '1' while POR is '0', it can be reliably assumed that a BOR event has occurred.

Note: Even when the device exits from Deep Sleep mode, both the POR and BOR bits are set.

7.5.3 DISABLING BOR IN SLEEP MODE

When BOREN<1:0> = 10, BOR remains under hardware control and operates as previously described. However, whenever the device enters Sleep mode, BOR is automatically disabled. When the device returns to any other operating mode, BOR is automatically re-enabled.

This mode allows for applications to recover from brown-out situations, while actively executing code when the device requires BOR protection the most. At the same time, it saves additional power in Sleep mode by eliminating the small incremental BOR current.

Note: BOR levels differ depending on device type; PIC24FV32KA3XX devices are at different levels than those of PIC24F32KA3XX devices. See [Section 29.0 “Electrical Characteristics”](#) for BOR voltage levels.

8.0 INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Interrupt Controller, refer to the “dsPIC33/PIC24 Family Reference Manual”, “**Interrupts**” (DS70000600).

The PIC24F interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the CPU. It has the following features:

- Up to Eight Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with up to 118 Vectors
- Unique Vector for each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Alternate Interrupt Vector Table (AIVT) for Debug Support
- Fixed Interrupt Entry and Return Latencies

8.1 Interrupt Vector Table (IVT)

The IVT is shown in [Figure 8-1](#). The IVT resides in the program memory, starting at location, 000004h. The IVT contains 126 vectors, consisting of eight non-maskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this is linked to their position in the vector table. All other things being equal, lower addresses have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

PIC24FV32KA304 family devices implement non-maskable traps and unique interrupts; these are summarized in [Table 8-1](#) and [Table 8-2](#).

8.1.1 ALTERNATE INTERRUPT VECTOR TABLE (AIVT)

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in [Figure 8-1](#). Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes will use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports emulation and debugging efforts by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

8.2 Reset Sequence

A device Reset is not a true exception, because the interrupt controller is not involved in the Reset process. The PIC24F devices clear their registers in response to a Reset, which forces the Program Counter (PC) to zero. The microcontroller then begins program execution at location, 000000h. The user programs a GOTO instruction at the Reset address, which redirects the program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

PIC24FV32KA304 FAMILY

8.3 Interrupt Control and Status Registers

The PIC24FV32KA304 family of devices implements a total of 23 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFS0, IFS1, IFS3 and IFS4
- IEC0, IEC1, IEC3 and IEC4
- IPC0 through IPC5, IPC7 and IPC15 through IPC19
- INTTREG

Global Interrupt Enable (GIE) control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit, as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the AIVT.

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals, or external signal, and is cleared via software.

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM<6:0>) and the Interrupt Level (ILR<3:0>) bit fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence listed in [Table 8-2](#). For example, the INTO (External Interrupt 0) is depicted as having a vector number and a natural order priority of 0. The INTOIF status bit is found in IFS0<0>, the INTOIE enable bit in IEC0<0> and the INTOIP<2:0> priority bits are in the first position of IPC0 (IPC0<2:0>).

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. The ALU STATUS Register (SR) contains the IPL<2:0> bits (SR<7:5>). These indicate the current CPU Interrupt Priority Level. The user may change the current CPU Interrupt Priority Level by writing to the IPLx bits.

The CORCON register contains the IPL3 bit, which together with IPL<2:0>, also indicates the current CPU Interrupt Priority Level. IPL3 is a read-only bit so that the trap events cannot be masked by the user's software.

All Interrupt registers are described in [Register 8-1](#) through [Register 8-33](#), in the following sections.

PIC24FV32KA304 FAMILY

REGISTER 8-1: SR: ALU STATUS REGISTER

- 001 = CPU Interrupt Priority Level is 1 (9)
- 000 = CPU Interrupt Priority Level is 0 (8)

- Note 1:** See [Register 3-1](#) for the description of these bits, which are not dedicated to interrupt control functions.
- 2:** The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the Interrupt Priority Level if IPL3 = 1.
- 3:** The IPLx Status bits are read-only when NSTDIS (INTCON1<15>) = 1.

Note: Bit 8 and bits 4 through 0 are described in [Section 3.0 "CPU"](#).

8.4 Interrupt Setup Procedures

8.4.1 INITIALIZATION

To configure an interrupt source:

1. Set the NSTDIS control bit (INTCON1<15>) if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources may be programmed to the same non-zero value.

Note: At a device Reset, the IPCx registers are initialized, such that all user interrupt sources are assigned to Priority Level 4.

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

8.4.2 INTERRUPT SERVICE ROUTINE

The method that is used to declare an ISR (Interrupt Service Routine) and initialize the IVT with the correct vector address depends on the programming language (i.e., C or assembly) and the language development toolsuite that is used to develop the application. In general, the user must clear the interrupt flag in the appropriate IFSx register for the source of the interrupt that the ISR handles. Otherwise, the ISR will be re-entered immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a `RETFIE` instruction to unstack the saved PC value, SRL value and old CPU priority level.

8.4.3 TRAP SERVICE ROUTINE (TSR)

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

8.4.4 INTERRUPT DISABLE

All user interrupts can be disabled using the following procedure:

1. Push the current SR value onto the software stack using the `PUSH` instruction.
2. Force the CPU to Priority Level 7 by inclusive ORing the value, `OEH` with `SRL`.

To enable user interrupts, the `POP` instruction may be used to restore the previous SR value.

Only user interrupts with a priority level of 7 or less can be disabled. Trap sources (Level 8-15) cannot be disabled.

The `DISI` instruction provides a convenient way to disable interrupts of Priority Levels 1-6 for a fixed period. Level 7 interrupt sources are not disabled by the `DISI` instruction.

PIC24FV32KA304 FAMILY

NOTES:

9.0 OSCILLATOR CONFIGURATION

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Oscillator Configuration, refer to the “dsPIC33/PIC24 Family Reference Manual”, “Oscillator with 500 kHz Low-Power FRC” (DS39726).

- Software-controllable switching between various clock sources.
- Software-controllable postscaler for selective clocking of CPU for system power savings.
- System frequency range declaration bits for EC mode. When using an external clock source, the current consumption is reduced by setting the declaration bits to the expected frequency range.
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown.

The oscillator system for the PIC24FV32KA304 family of devices has the following features:

- A total of five external and internal oscillator options as clock sources, providing 11 different clock modes.
- On-chip 4x Phase Locked Loop (PLL) to boost internal operating frequency on select internal and external oscillator sources.

A simplified diagram of the oscillator system is shown in [Figure 9-1](#).

FIGURE 9-1: PIC24FV32KA304 FAMILY CLOCK DIAGRAM

PIC24FV32KA304 FAMILY

9.1 CPU Clocking Scheme

The system clock source can be provided by one of four sources:

- Primary Oscillator (POSC) on the OSC1 and OSC0 pins
- Secondary Oscillator (SOSC) on the SOSC1 and SOSC0 pins

The PIC24FV32KA304 family devices consist of two types of secondary oscillator:

 - High-Power Secondary Oscillator
 - Low-Power Secondary Oscillator

These can be selected by using the SOSSEL (FOSC<5>) bit.
- Fast Internal RC (FRC) Oscillator
 - 8 MHz FRC Oscillator
 - 500 kHz Lower Power FRC Oscillator
- Low-Power Internal RC (LPRC) Oscillator with two modes:
 - High-Power/High Accuracy mode
 - Low-Power/Low Accuracy mode

The primary oscillator and 8 MHz FRC sources have the option of using the internal 4x PLL. The frequency of the FRC clock source can optionally be reduced by the programmable clock divider. The selected clock source generates the processor and peripheral clock sources.

The processor clock source is divided by two to produce the internal instruction cycle clock, F_{CY}. In this document, the instruction cycle clock is also denoted by FOSC/2. The internal instruction cycle clock, FOSC/2, can be provided on the OSC0 I/O pin for some operating modes of the primary oscillator.

9.2 Initial Configuration on POR

The oscillator source (and operating mode) that is used at a device Power-on Reset (POR) event is selected using Configuration bit settings. The Oscillator Configuration bit settings are located in the Configuration registers in the program memory (for more information, see [Section 26.1 “Configuration Bits”](#)). The Primary Oscillator Configuration bits, POSCMD<1:0> (FOSC<1:0>), and the Initial Oscillator Select Configuration bits, FNOOSC<2:0> (FOSCSEL<2:0>), select the oscillator source that is used at a POR. The FRC Primary Oscillator with Postscaler (FRCDIV) is the default (unprogrammed) selection. The secondary oscillator, or one of the internal oscillators, may be chosen by programming these bit locations. The EC mode Frequency Range Configuration bits, POSCFREQ<1:0> (FOSC<4:3>), optimize power consumption when running in EC mode. The default configuration is “frequency range is greater than 8 MHz”.

The Configuration bits allow users to choose between the various clock modes, shown in [Table 9-1](#).

9.2.1 CLOCK SWITCHING MODE CONFIGURATION BITS

The FCKSMx Configuration bits (FOSC<7:6>) are used jointly to configure device clock switching and the FSCM. Clock switching is enabled only when FCKSM1 is programmed ('0'). The FSCM is enabled only when FCKSM<1:0> are both programmed ('00').

TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

| Oscillator Mode | Oscillator Source | POSCMD<1:0> | FNOOSC<2:0> | Notes |
|---|-------------------|-------------|-------------|-------------|
| 8 MHz FRC Oscillator with Postscaler (FRCDIV) | Internal | 11 | 111 | 1, 2 |
| 500 kHz FRC Oscillator with Postscaler (LPFRCDIV) | Internal | 11 | 110 | 1 |
| Low-Power RC Oscillator (LPRC) | Internal | 11 | 101 | 1 |
| Secondary (Timer1) Oscillator (SOSC) | Secondary | 00 | 100 | 1 |
| Primary Oscillator (HS) with PLL Module (HSPLL) | Primary | 10 | 011 | |
| Primary Oscillator (EC) with PLL Module (ECPLL) | Primary | 00 | 011 | |
| Primary Oscillator (HS) | Primary | 10 | 010 | |
| Primary Oscillator (XT) | Primary | 01 | 010 | |
| Primary Oscillator (EC) | Primary | 00 | 010 | |
| 8 MHz FRC Oscillator with PLL Module (FRCPLL) | Internal | 11 | 001 | 1 |
| 8 MHz FRC Oscillator (FRC) | Internal | 11 | 000 | 1 |

Note 1: The OSC0 pin function is determined by the OSCIOFNC Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

PIC24FV32KA304 FAMILY

9.3 Control Registers

The operation of the oscillator is controlled by three Special Function Registers (SFRs):

- OSCCON
- CLKDIV
- OSCTUN

The OSCCON register (Register 9-1) is the main control register for the oscillator. It controls clock source switching and allows the monitoring of clock sources.

The Clock Divider register (Register 9-2) controls the features associated with Doze mode, as well as the postscaler for the FRC oscillator.

The FRC Oscillator Tune register (Register 9-3) allows the user to fine tune the FRC oscillator over a range of approximately $\pm 5.25\%$. Each bit increment or decrement changes the factory calibrated frequency of the FRC oscillator by a fixed amount.

000000 = Center frequency, oscillator is running at factory calibrated frequency

111111

•

•

•

100001

100000 = Minimum frequency deviation

Note 1: Increments or decrements of TUN<5:0> may not change the FRC frequency in equal steps over the FRC tuning range and may not be monotonic.

9.4 Clock Switching Operation

With few limitations, applications are free to switch between any of the four clock sources (POSC, SOSC, FRC and LPRC) under software control and at any time. To limit the possible side effects that could result from this flexibility, PIC24F devices have a safeguard lock built into the switching process.

Note: The Primary Oscillator mode has three different submodes (XT, HS and EC), which are determined by the POSCMDx Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch between the different primary submodes without reprogramming the device.

9.4.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the FOSC Configuration register must be programmed to '0'. (Refer to [Section 26.0 "Special Features"](#) for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and FSCM function are disabled. This is the default setting.

The NOSCx control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSCx bits (OSCCON<14:12>) will reflect the clock source selected by the FNOSCx Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled; it is held at '0' at all times.

9.4.2 OSCILLATOR SWITCHING SEQUENCE

At a minimum, performing a clock switch requires this basic sequence:

1. If desired, read the COSCx bits (OSCCON<14:12>) to determine the current oscillator source.
2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
3. Write the appropriate value to the NOSCx bits (OSCCON<10:8>) for the new oscillator source.
4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
5. Set the OSWEN bit to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically, as follows:

1. The clock switching hardware compares the COSCx bits with the new value of the NOSCx bits. If they are the same, then the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.
2. If a valid clock switch has been initiated, the LOCK (OSCCON<5>) and CF (OSCCON<3>) bits are cleared.
3. The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware will wait until the OST expires. If the new source is using the PLL, then the hardware waits until a PLL lock is detected (LOCK = 1).
4. The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
5. The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSCx bits value is transferred to the COSCx bits.
6. The old clock source is turned off at this time, with the exception of LPRC (if WDT, FSCM or RTCC with LPRC as a clock source is enabled) or SOSC (if SOSSEN remains enabled).

Note 1: The processor will continue to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.

- 2: Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

PIC24FV32KA304 FAMILY

The following code sequence for a clock switch is recommended:

1. Disable interrupts during the OSCCON register unlock and write sequence.
2. Execute the unlock sequence for the OSCCON high byte by writing 78h and 9Ah to OSCCON<15:8>, in two back-to-back instructions.
3. Write new oscillator source to the NOSCx bits in the instruction immediately following the unlock sequence.
4. Execute the unlock sequence for the OSCCON low byte by writing 46h and 57h to OSCCON<7:0>, in two back-to-back instructions.
5. Set the OSWEN bit in the instruction immediately following the unlock sequence.
6. Continue to execute code that is not clock-sensitive (optional).
7. Invoke an appropriate amount of software delay (cycle counting) to allow the selected oscillator and/or PLL to start and stabilize.
8. Check to see if OSWEN is '0'. If it is, the switch was successful. If OSWEN is still set, then check the LOCK bit to determine the cause of failure.

The core sequence for unlocking the OSCCON register and initiating a clock switch is shown in [Example 9-1](#).

EXAMPLE 9-1: BASIC CODE SEQUENCE FOR CLOCK SWITCHING

```
;Place the new oscillator selection in W0
;OSCCONH (high byte) Unlock Sequence
MOV      #OSCCONH, w1
MOV      #0x78, w2
MOV      #0x9A, w3
MOV.b    w2, [w1]
MOV.b    w3, [w1]
;Set new oscillator selection
MOV.b    WREG, OSCCONH
;OSCCONL (low byte) unlock sequence
MOV      #OSCCONL, w1
MOV      #0x46, w2
MOV      #0x57, w3
MOV.b    w2, [w1]
MOV.b    w3, [w1]
;Start oscillator switch operation
BSET     OSCCON,#0
```

9.5 Reference Clock Output

In addition to the CLKO output (Fosc/2) available in certain oscillator modes, the device clock in the PIC24FV32KA304 family devices can also be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application.

This reference clock output is controlled by the REFOCON register ([Register 9-4](#)). Setting the ROEN bit (REFOCON<15>) makes the clock signal available on the REFO pin. The RODIVx bits (REFOCON<11:8>) enable the selection of 16 different clock divider options.

The ROSSLP and ROSEL bits (REFOCON<13:12>) control the availability of the reference output during Sleep mode. The ROSEL bit determines if the oscillator on OSC1 and OSC2, or the current system clock source, is used for the reference clock output. The ROSSLP bit determines if the reference source is available on REFO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSSLP and ROSEL bits must be set. The device clock must also be configured for one of the primary modes (EC, HS or XT); otherwise, if the ROSEL bit is not also set, the oscillator on OSC1 and OSC2 will be powered down when the device enters Sleep mode. Clearing the ROSEL bit allows the reference output frequency to change as the system clock changes during any clock switches.

Note 1: The crystal oscillator must be enabled using the FOSC<2:0> bits; the crystal maintains the operation in Sleep mode.

PIC24FV32KA304 FAMILY

NOTES:

10.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Power-Saving Features with Deep Sleep**” (DS39727).

The PIC24FV32KA304 family of devices provides the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. All PIC24F devices manage power consumption in four different ways:

- Clock Frequency
- Instruction-Based Sleep, Idle and Deep Sleep modes
- Software Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application’s power consumption, while still maintaining critical application features, such as timing-sensitive communications.

10.1 Clock Frequency and Clock Switching

PIC24F devices allow for a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits. The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in [Section 9.0 “Oscillator Configuration”](#).

10.2 Instruction-Based Power-Saving Modes

PIC24F devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution; Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. Deep Sleep mode stops clock operation, code execution and all peripherals, except RTCC and DSWDT. It also freezes I/O states and removes power to SRAM and Flash memory.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV    #SLEEP_MODE    ; Put the device into SLEEP mode
PWRSAV    #IDLE_MODE     ; Put the device into IDLE mode
BSET      DSCON, #DSEN   ; Enable Deep Sleep
PWRSAV    #SLEEP_MODE    ; Put the device into Deep SLEEP mode
```

The assembly syntax of the PWRSAV instruction is shown in [Example 10-1](#).

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to “wake-up”.

10.2.1 SLEEP MODE

Sleep mode includes these features:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption will be reduced to a minimum provided that no I/O pin is sourcing current.
- The I/O pin directions and states are frozen.
- The Fail-Safe Clock Monitor does not operate during Sleep mode since the system clock source is disabled.
- The LPRC clock will continue to run in Sleep mode if the WDT or RTCC with LPRC as the clock source is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals may continue to operate in Sleep mode. This includes items, such as the Input Change Notification on the I/O ports, or peripherals that use an external clock input. Any peripheral that requires the system clock source for its operation will be disabled in Sleep mode.

The device will wake-up from Sleep mode on any of these events:

- On any interrupt source that is individually enabled
- On any form of device Reset
- On a WDT time-out

On wake-up from Sleep, the processor will restart with the same clock source that was active when Sleep mode was entered.

PIC24FV32KA304 FAMILY

10.2.2 IDLE MODE

Idle mode has these features:

- The CPU will stop executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 10.6 “Selective Peripheral Module Control”](#)).
- If the WDT or FSCM is enabled, the LPRC will also remain active.

The device will wake from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle, the clock is re-applied to the CPU and instruction execution begins immediately, starting with the instruction following the `PWRSVAV` instruction or the first instruction in the ISR.

10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a `PWRSVAV` instruction will be held off until entry into Sleep or Idle mode has completed. The device will then wake-up from Sleep or Idle mode.

10.2.4 DEEP SLEEP MODE

In PIC24FV32KA304 family devices, Deep Sleep mode is intended to provide the lowest levels of power consumption available without requiring the use of external switches to completely remove all power from the device. Entry into Deep Sleep mode is completely under software control. Exit from Deep Sleep mode can be triggered from any of the following events:

- POR Event
- $\overline{\text{MCLR}}$ Event
- RTCC Alarm (if the RTCC is present)
- External Interrupt 0
- Deep Sleep Watchdog Timer (DSWDT) Time-out
- Ultra Low-Power Wake-up (ULPWU) Event

In Deep Sleep mode, it is possible to keep the device Real-Time Clock and Calendar (RTCC) running without the loss of clock cycles.

The device has a dedicated Deep Sleep Brown-out Reset (DSBOR) and a Deep Sleep Watchdog Timer Reset (DSWDT) for monitoring voltage and time-out events. The DSBOR and DSWDT are independent of the standard BOR and WDT used with other power-managed modes (Sleep, Idle and Doze).

10.2.4.1 Entering Deep Sleep Mode

Deep Sleep mode is entered by setting the DSEN bit in the DSCON register and then executing a Sleep command (`PWRSVAV #SLEEP_MODE`). An unlock sequence is required to set the DSEN bit. Once the DSEN bit has been set, there is no time limit before the `SLEEP` command can be executed. The DSEN bit is automatically cleared when exiting the Deep Sleep mode.

Note: To re-enter Deep Sleep after a Deep Sleep wake-up, allow a delay of at least 3 T_{CY} after clearing the RELEASE bit.

The sequence to enter Deep Sleep mode is:

1. If the application requires the Deep Sleep WDT, enable it and configure its clock source. For more information on Deep Sleep WDT, see [Section 10.2.4.5 “Deep Sleep WDT”](#).
2. If the application requires Deep Sleep BOR, enable it by programming the DSLPBOR Configuration bit (`FDS<6>`).
3. If the application requires wake-up from Deep Sleep on RTCC alarm, enable and configure the RTCC module. For more information on RTCC, see [Section 19.0 “Real-Time Clock and Calendar \(RTCC\)”](#).
4. If needed, save any critical application context data by writing it to the DSGPR0 and DSGPR1 registers (optional).
5. Enable Deep Sleep mode by setting the DSEN bit (`DSCON<15>`).

Note: An unlock sequence is required to set the DSEN bit.

6. Enter Deep Sleep mode by issuing a `PWRSVAV #0` instruction.

Any time the DSEN bit is set, all bits in the DSWAKE register will be automatically cleared.

To set the DSEN bit, the unlock sequence in [Example 10-2](#) is required:

EXAMPLE 10-2: THE UNLOCK SEQUENCE

```
//Disable Interrupts For 5 instructions
asm volatile("disi #5");
//Issue Unlock Sequence
asm volatile
mov #0x55, W0;
mov W0, NVMKEY;
mov #0xAA, W1;
mov W1, NVMKEY;
bset DSCON, #DSEN
```

10.2.4.2 Exiting Deep Sleep Mode

Deep Sleep mode exits on any one of the following events:

- A POR event on VDD supply. If there is no DSBOR circuit to re-arm the VDD supply POR circuit, the external VDD supply must be lowered to the natural arming voltage of the POR circuit.
- A DSWDT time-out. When the DSWDT timer times out, the device exits Deep Sleep.
- An RTCC alarm (if RTCEN = 1).
- An assertion ('0') of the $\overline{\text{MCLR}}$ pin.
- An assertion of the INT0 pin (if the interrupt was enabled before Deep Sleep mode was entered). The polarity configuration is used to determine the assertion level ('0' or '1') of the pin that will cause an exit from Deep Sleep mode. Exiting from Deep Sleep mode requires a change on the INT0 pin while in Deep Sleep mode.

Note: Any interrupt pending when entering Deep Sleep mode is cleared.

Exiting Deep Sleep mode generally does not retain the state of the device and is equivalent to a Power-on Reset (POR) of the device. Exceptions to this include the RTCC (if present), which remains operational through the wake-up, the DSGPRx registers and DSWDT.

Wake-up events that occur after Deep Sleep exits, but before the POR sequence completes, are ignored and are not be captured in the DSWAKE register.

The sequence for exiting Deep Sleep mode is:

1. After a wake-up event, the device exits Deep Sleep and performs a POR. The DSEN bit is cleared automatically. Code execution resumes at the Reset vector.
2. To determine if the device exited Deep Sleep, read the Deep Sleep bit, DPSTP (RCON<10>). This bit will be set if there was an exit from Deep Sleep mode; if the bit is set, clear it.
3. Determine the wake-up source by reading the DSWAKE register.
4. Determine if a DSBOR event occurred during Deep Sleep mode by reading the DSBOR bit (DSCON<1>).
5. If application context data has been saved, read it back from the DSGPR0 and DSGPR1 registers.
6. Clear the RELEASE bit (DSCON<0>).

10.2.4.3 Saving Context Data with the DSGPR0/DSGPR1 Registers

As exiting Deep Sleep mode causes a POR, most Special Function Registers reset to their default POR values. In addition, because V_{CORE} power is not supplied in Deep Sleep mode, information in data RAM may be lost when exiting this mode.

Applications which require critical data to be saved prior to Deep Sleep may use the Deep Sleep General Purpose registers, DSGPR0 and DSGPR1 or data EEPROM (if available). Unlike other SFRs, the contents of these registers are preserved while the device is in Deep Sleep mode. After exiting Deep Sleep, software can restore the data by reading the registers and clearing the RELEASE bit (DSCON<0>).

10.2.4.4 I/O Pins During Deep Sleep

During Deep Sleep, the general purpose I/O pins retain their previous states and the Secondary Oscillator (SOSC) will remain running, if enabled. Pins that are configured as inputs (TRISx bit is set), prior to entry into Deep Sleep, remain high-impedance during Deep Sleep. Pins that are configured as outputs (TRISx bit is clear), prior to entry into Deep Sleep, remain as output pins during Deep Sleep. While in this mode, they continue to drive the output level determined by their corresponding LATx bit at the time of entry into Deep Sleep.

Once the device wakes back up, all I/O pins continue to maintain their previous states, even after the device has finished the POR sequence and is executing application code again. Pins configured as inputs during Deep Sleep remain high-impedance and pins configured as outputs continue to drive their previous value. After waking up, the TRIS and LAT registers, and the SOSCEN bit (OSCCON<1>) are reset. If firmware modifies any of these bits or registers, the I/O will not immediately go to the newly configured states. Once the firmware clears the RELEASE bit (DSCON<0>), the I/O pins are "released". This causes the I/O pins to take the states configured by their respective TRISx and LATx bit values.

This means that keeping the SOSC running after waking up requires the SOSCEN bit to be set before clearing RELEASE.

If the Deep Sleep BOR (DSBOR) is enabled, and a DSBOR or a true POR event occurs during Deep Sleep, the I/O pins will be immediately released, similar to clearing the RELEASE bit. All previous state information will be lost, including the general purpose DSGPR0 and DSGPR1 contents.

If a $\overline{\text{MCLR}}$ Reset event occurs during Deep Sleep, the DSGPRx, DSCON and DSWAKE registers will remain valid, and the RELEASE bit will remain set. The state of the SOSC will also be retained. The I/O pins, however, will be reset to their $\overline{\text{MCLR}}$ Reset state. Since RELEASE is still set, changes to the SOSCEN bit (OSCCON<1>) cannot take effect until the RELEASE bit is cleared.

In all other Deep Sleep wake-up cases, application firmware must clear the RELEASE bit in order to reconfigure the I/O pins.

PIC24FV32KA304 FAMILY

10.2.4.5 Deep Sleep WDT

To enable the DSWDT in Deep Sleep mode, program the Configuration bit, DSWDTEN (FDS<7>). The device Watchdog Timer (WDT) need not be enabled for the DSWDT to function. Entry into Deep Sleep mode automatically resets the DSWDT.

The DSWDT clock source is selected by the DSWDTOSC Configuration bit (FDS<4>). The post-scaler options are programmed by the DSWDTPS<3:0> Configuration bits (FDS<3:0>). The minimum time-out period that can be achieved is 2.1 ms and the maximum is 25.7 days. For more details on the FDS Configuration register and DSWDT configuration options, refer to [Section 26.0 “Special Features”](#).

10.2.4.6 Switching Clocks in Deep Sleep Mode

Both the RTCC and the DSWDT may run from either SOSC or the LPRC clock source. This allows both the RTCC and DSWDT to run without requiring both the LPRC and SOSC to be enabled together, reducing power consumption.

Running the RTCC from LPRC will result in a loss of accuracy in the RTCC of approximately 5 to 10%. If a more accurate RTCC is required, it must be run from the SOSC clock source. The RTCC clock source is selected with the RTCOSC Configuration bit (FDS<5>).

Under certain circumstances, it is possible for the DSWDT clock source to be off when entering Deep Sleep mode. In this case, the clock source is turned on automatically (if DSWDT is enabled), without the need for software intervention; however, this can cause a delay in the start of the DSWDT counters. In order to avoid this delay when using SOSC as a clock source, the application can activate SOSC prior to entering Deep Sleep mode.

10.2.4.7 Checking and Clearing the Status of Deep Sleep

Upon entry into Deep Sleep mode, the status bit, DPSTP (RCON<10>), becomes set and must be cleared by the software.

On power-up, the software should read this status bit to determine if the Reset was due to an exit from Deep Sleep mode and clear the bit if it is set. Of the four possible combinations of DPSTP and POR bit states, three cases can be considered:

- Both the DPSTP and POR bits are cleared. In this case, the Reset was due to some event other than a Deep Sleep mode exit.
- The DPSTP bit is clear, but the POR bit is set; this is a normal POR.
- Both the DPSTP and POR bits are set. This means that Deep Sleep mode was entered, the device was powered down and Deep Sleep mode was exited.

10.2.4.8 Power-on Resets (PORs)

VDD voltage is monitored to produce PORs. Since exiting from Deep Sleep functionally looks like a POR, the technique described in [Section 10.2.4.7 “Checking and Clearing the Status of Deep Sleep”](#) should be used to distinguish between Deep Sleep and a true POR event.

When a true POR occurs, the entire device, including all Deep Sleep logic (Deep Sleep registers: RTCC, DSWDT, etc.) is reset.

10.2.4.9 Summary of Deep Sleep Sequence

To review, these are the necessary steps involved in invoking and exiting Deep Sleep mode:

1. The device exits Reset and begins to execute its application code.
2. If DSWDT functionality is required, program the appropriate Configuration bit.
3. Select the appropriate clock(s) for the DSWDT and RTCC (optional).
4. Enable and configure the DSWDT (optional).
5. Enable and configure the RTCC (optional).
6. Write context data to the DSGPRx registers (optional).
7. Enable the INT0 interrupt (optional).
8. Set the DSEN bit in the DSCON register.
9. Enter Deep Sleep by issuing a PWRSV #SLEEP_MODE command.
10. The device exits Deep Sleep when a wake-up event occurs.
11. The DSEN bit is automatically cleared.
12. Read and clear the DPSTP status bit in RCON, and the DS_WAKE status bits.
13. Read the DSGPRx registers (optional).
14. Once all state related configurations are complete, clear the RELEASE bit.
15. The application resumes normal operation.

- Note 1:** All register bits are cleared when the DSEN (DSCON<15>) bit is set.
- Note 2:** All register bits are reset only in the case of a POR event outside of Deep Sleep mode, except bit, DSPOR, which does not reset on a POR event that is caused due to a Deep Sleep exit.
- Note 3:** Unlike the other bits in this register, this bit can be set outside of Deep Sleep.

10.3 Ultra Low-Power Wake-up

The Ultra Low-Power Wake-up (ULPWU) on pin, RB0, allows a slow falling voltage to generate an interrupt without excess current consumption.

To use this feature:

1. Charge the capacitor on RB0 by configuring the RB0 pin to an output and setting it to '1'.
2. Stop charging the capacitor by configuring RB0 as an input.
3. Discharge the capacitor by setting the ULPEN and ULPSINK bits in the ULPWCON register.
4. Configure Sleep mode.
5. Enter Sleep mode.

When the voltage on RB0 drops below V_{IL} , the device wakes up and executes the next instruction.

This feature provides a low-power technique for periodically waking up the device from Sleep mode.

The time-out is dependent on the discharge time of the RC circuit on RB0.

When the ULPWU module wakes the device from Sleep mode, the ULPWUIF bit (IFS5<0>) is set. Software can check this bit upon wake-up to determine the wake-up source. See [Example 10-3](#) for initializing the ULPWU module.

A series resistor, between RB0 and the external capacitor, provides overcurrent protection for the RB0/AN0/ULPWU pin and enables software calibration of the time-out (see [Figure 10-1](#)).

EXAMPLE 10-3: ULTRA LOW-POWER WAKE-UP INITIALIZATION

```

//*****
// 1. Charge the capacitor on RB0
//*****
    TRISBbits.TRISB0 = 0;
    LATBbits.LATB0 = 1;
    for(i = 0; i < 10000; i++) Nop();
//*****
//2. Stop Charging the capacitor
//   on RB0
//*****
    TRISBbits.TRISB0 = 1;
//*****
//3. Enable ULPWU Interrupt
//*****
IFS5bits.ULPWUIF = 0;
IEC5bits.ULPWUIE = 1;
IPC21bits.ULPWUIP = 0x7;
//*****
//4. Enable the Ultra Low Power
//   Wakeup module and allow
//   capacitor discharge
//*****
    ULPWCONbits.ULPEN = 1;
    ULPWCONbit.ULPSINK = 1;
//*****
//5. Enter Sleep Mode
//*****
    Sleep();
//for sleep, execution will
//resume here
    
```

FIGURE 10-1: SERIES RESISTOR

A timer can be used to measure the charge time and discharge time of the capacitor. The charge time can then be adjusted to provide the desired delay in Sleep. This technique compensates for the affects of temperature, voltage and component accuracy. The peripheral can also be configured as a simple, programmable Low-Voltage Detect (LVD) or temperature sensor.

10.4 Voltage Regulator-Based Power-Saving Features

The PIC24FV32KA304 series devices have a Voltage Regulator that has the ability to alter functionality to provide power savings. The on-board regulator is made up of two basic modules: the Voltage Regulator (VREG) and the Retention Regulator (RETREG). With the combination of VREG and RETREG, the following power modes are available:

10.4.1 RUN MODE

In Run mode, the main VREG is providing a regulated voltage with enough current to supply a device running at full speed, and the device is not in Sleep or Deep Sleep Mode. The Retention Regulator may or may not be running, but is unused.

10.4.2 SLEEP (STANDBY) MODE

In Sleep mode, the device is in Sleep and the main VREG is providing a regulated voltage at a reduced (standby) supply current. This mode provides for limited functionality due to the reduced supply current. It requires a longer time to wake-up from Sleep.

10.4.3 RETENTION SLEEP MODE

In Retention Sleep mode, the device is in Sleep and all regulated voltage is provided solely by the Retention Regulator. Consequently, this mode has lower power consumption than regular Sleep mode, but is also limited in terms of how much functionality can be enabled. Retention Sleep wake-up time is longer than Sleep mode due to the extra time required to raise the V_{CORE} supply rail back to normal regulated levels.

Note: PIC24F32KA30X family devices do not use an On-Chip Voltage Regulator, so they do not support Retention Sleep mode.

10.4.4 DEEP SLEEP MODE

In Deep Sleep mode, both the main Voltage Regulator and Retention Regulator are shut down, providing the lowest possible device power consumption. However, this mode provides no retention or functionality of the device and has the longest wake-up time.

TABLE 10-1: VOLTAGE REGULATION CONFIGURATION SETTINGS FOR PIC24FV32KA304 FAMILY DEVICES

| RETCGF Bit (FPOR<2>) | RETEN Bit (RCON<12>) | PMSLP Bit (RCON<8>) | Power Mode During Sleep | Description |
|----------------------|----------------------|---------------------|-------------------------|--|
| 0 | 0 | 1 | Sleep | VREG mode (normal) is unchanged during Sleep. RETREG is unused. |
| 0 | 0 | 0 | Sleep (Standby) | VREG goes to Low-Power Standby mode during Sleep. RETREG is unused. |
| 0 | 1 | 0 | Retention Sleep | VREG is off during Sleep. RETREG is enabled and provides Sleep voltage regulation. |
| 1 | X | 1 | Sleep | VREG mode (normal) is unchanged during Sleep. RETREG is disabled at all times. |
| 1 | X | 0 | Sleep (Standby) | VREG goes to Low-Power Standby mode during Sleep. RETREG is disabled at all times. |

PIC24FV32KA304 FAMILY

10.5 Doze Mode

Generally, changing clock speed and invoking one of the power-saving modes are the preferred strategies for reducing power consumption. There may be circumstances, however, where this is not practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed may introduce communication errors, while using a power-saving mode may stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default.

It is also possible to use Doze mode to selectively reduce power consumption in event driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption. Meanwhile, the CPU Idles, waiting for something to invoke an interrupt routine. Enabling the automatic return to full-speed CPU operation on interrupts is enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

10.6 Selective Peripheral Module Control

Idle and Doze modes allow users to substantially reduce power consumption by slowing or stopping the CPU clock. Even so, peripheral modules still remain clocked, and thus, consume power. There may be cases where the application needs what these modes do not provide: the allocation of power resources to CPU processing, with minimal power consumption from the peripherals.

PIC24F devices address this requirement by allowing peripheral modules to be selectively disabled, reducing or eliminating their power consumption. This can be done with two control bits:

- The Peripheral Enable bit, generically named, “XXXEN”, located in the module’s main control SFR.
- The Peripheral Module Disable (PMD) bit, generically named, “XXXMD”, located in one of the PMD Control registers.

Both bits have similar functions in enabling or disabling its associated module. Setting the PMDx bits for a module disables all clock sources to that module, reducing its power consumption to an absolute minimum. In this state, the control and status registers associated with the peripheral will also be disabled, so writes to those registers will have no effect, and read values will be invalid. Many peripheral modules have a corresponding PMDx bit.

In contrast, disabling a module by clearing its XXXEN bit, disables its functionality, but leaves its registers available to be read and written to. Power consumption is reduced, but not by as much as the PMDx bits are used. Most peripheral modules have an enable bit; exceptions include capture, compare and RTCC.

To achieve more selective power savings, peripheral modules can also be selectively disabled when the device enters Idle mode. This is done through the control bit of the generic name format, “XXXIDL”. By default, all modules that can operate during Idle mode will do so. Using the disable on Idle feature disables the module while in Idle mode, allowing further reduction of power consumption during Idle mode, enhancing power savings for extremely critical power applications.

11.0 I/O PORTS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the I/O Ports, refer to the “dsPIC33/PIC24 Family Reference Manual”, “I/O Ports with Peripheral Pin Select (PPS)” (DS39711). Note that the PIC24FV32KA304 family devices do not support Peripheral Pin Select features.

All of the device pins (except VDD and VSS) are shared between the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

11.1 Parallel I/O (PIO) Ports

A parallel I/O port that shares a pin with a peripheral is, in general, subservient to the peripheral. The peripheral’s output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents “loop through”, in which a port’s digital output can drive the input of a peripheral that shares the same pin. Figure 11-1 illustrates how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin may be read, but the output driver for the parallel port bit will be disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin may be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a ‘1’, then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the Data Latch register (LAT), read the latch. Writes to the latch, write the latch. Reads from the port (PORT), read the port pins; writes to the port pins, write the latch.

Any bit and its associated data and control registers that are not valid for a particular device will be disabled. That means the corresponding LATx and TRISx registers, and the port pin will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

Note: The I/O pins retain their state during Deep Sleep. They will retain this state at wake-up until the software restore bit (RELEASE) is cleared.

FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

PIC24FV32KA304 FAMILY

11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORT, LAT and TRIS registers for data control, each port pin can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The maximum open-drain voltage allowed is the same as the maximum V_{IH} specification.

11.2 Configuring Analog Port Pins

The use of the ANS and TRIS registers control the operation of the A/D port pins. The port pins that are desired as analog inputs must have their corresponding TRISx bit set (input). If the TRISx bit is cleared (output), the digital output level (V_{OH} or V_{OL}) will be converted.

When reading the PORT register, all pins configured as analog input channels will read as cleared (a low level). Analog levels on any pin that is defined as a digital input (including the ANx pins) may cause the input buffer to consume current that exceeds the device specifications.

11.2.1 ANALOG SELECTION REGISTERS

I/O pins with shared analog functionality, such as A/D inputs and comparator inputs, must have their digital inputs shut off when analog functionality is used. Note that analog functionality includes an analog voltage being applied to the pin externally.

To allow for analog control, the ANSx registers are provided. There is one ANS register for each port (ANSA, ANSB and ANSC). Within each ANSx register, there is a bit for each pin that shares analog functionality with the digital I/O functionality.

If a particular pin does not have an analog function, that bit is unimplemented. See [Register 11-1](#) to [Register 11-3](#) for implementation.

Note 1: These bits are not available on 20-pin or 28-pin devices.

PIC24FV32KA304 FAMILY

11.2.2 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a `NOP`.

11.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows the PIC24FV32KA304 family of devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature is capable of detecting input Change-of-States, even in Sleep mode, when the clocks are disabled. Depending on the device pin count, there are up to 23 external signals (CN0 through CN22) that may be selected (enabled) for generating an interrupt request on a Change-of-State.

There are six control registers associated with the ICN module. The `CNEN1` and `CNEN2` registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up/pull-down connected to it. The pull-ups act as a current source that is connected to the pin. The pull-downs act as a current sink to eliminate the need for external resistors when push button or keypad devices are connected.

On any pin, only the pull-up resistor or the pull-down resistor should be enabled, but not both of them. If the push button or the keypad is connected to `VDD`, enable the pull-down, or if they are connected to `VSS`, enable the pull-up resistors. The pull-ups are enabled separately, using the `CNPU1` and `CNPU2` registers, which contain the control bits for each of the CN pins.

Setting any of the control bits enables the weak pull-ups for the corresponding pins. The pull-downs are enabled separately, using the `CNPD1` and `CNPD2` registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-downs for the corresponding pins.

When the internal pull-up is selected, the pin uses `VDD` as the pull-up source voltage. When the internal pull-down is selected, the pins are pulled down to `VSS` by an internal resistor. Make sure that there is no external pull-up source/pull-down sink when the internal pull-ups/pull-downs are enabled.

Note: Pull-ups and pull-downs on Change Notification pins should always be disabled whenever the port pin is configured as a digital output.

EXAMPLE 11-1: PORT WRITE/READ EXAMPLE

```
MOV    0xFF00, W0;           //Configure PORTB<15:8> as inputs and PORTB<7:0> as outputs
MOV    W0, TRISB;
NOP;                          //Delay 1 cycle
BTSS   PORTB, #13;          //Next Instruction

Equivalent 'C' Code
TRISB = 0xFF00;             //Configure PORTB<15:8> as inputs and PORTB<7:0> as outputs
NOP();                      //Delay 1 cycle
if(PORTBbits.RB13 == 1)    // execute following code if PORTB pin 13 is set.
{
}
```

12.0 TIMER1

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Timers, refer to the “dsPIC33/PIC24 Family Reference Manual”, “Timers” (DS39704).

The Timer1 module is a 16-bit timer which can serve as the time counter for the Real-Time Clock (RTC) or operate as a free-running, interval timer/counter. Timer1 can operate in three modes:

- 16-Bit Timer
- 16-Bit Synchronous Counter
- 16-Bit Asynchronous Counter

Timer1 also supports these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation During CPU Idle and Sleep modes
- Interrupt on 16-Bit Period Register Match or Falling Edge of External Gate Signal

Figure 12-1 illustrates a block diagram of the 16-bit Timer1 module.

To configure Timer1 for operation:

1. Set the TON bit (= 1).
2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Set or clear the TSYNC bit to configure synchronous or asynchronous operation.
5. Load the timer period value into the PR1 register.
6. If interrupts are required, set the Timer1 Interrupt Enable bit, T1IE. Use the Timer1 Interrupt Priority bits, T1IP<2:0>, to set the interrupt priority.

13.0 TIMER2/3 AND TIMER4/5

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Timers, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Timers**” (DS39704).

The Timer2/3 and Timer4/5 modules are 32-bit timers, which can also be configured as four independent, 16-bit timers with selectable operating modes.

As a 32-bit timer, Timer2/3 or Timer4/5 operate in three modes:

- Two Independent 16-Bit Timers (Timer2 and Timer3) with all 16-Bit Operating modes (except Asynchronous Counter mode)
- Single 32-Bit Timer
- Single 32-Bit Synchronous Counter

They also support these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during Idle mode
- Interrupt on a 32-Bit Period Register Match
- A/D Event Trigger

Individually, all four of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed above, except for the A/D event trigger (this is implemented only with Timer3). The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, T4CON and T5CON registers. The T2CON, T3CON, T4CON and T5CON registers are provided in generic form in [Register 13-1](#) and [Register 13-2](#), respectively.

For 32-bit timer/counter operation, Timer2/Timer4 is the least significant word (lsw) and Timer3/Timer5 is the most significant word (msw) of the 32-bit timer.

Note: For 32-bit operation, T3CON or T5CON control bits are ignored. Only T2CON or T4CON control bits are used for setup and control. Timer2 or Timer4 clock and gate inputs are utilized for the 32-bit timer modules, but an interrupt is generated with the Timer3 or Timer5 interrupt flags.

To configure Timer2/3 or Timer4/5 for 32-bit operation:

1. Set the T32 bit (T2CON<3> or T4CON<3> = 1).
2. Select the prescaler ratio for Timer2 or Timer4 using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Load the timer period value. PR3 (or PR5) will contain the most significant word of the value, while PR2 (or PR4) contains the least significant word.
5. If interrupts are required, set the Timerx Interrupt Enable bit, TxIE. Use the Timerx Interrupt Priority bits, TxIP<2:0>, to set the interrupt priority.
6. Set the TON bit (TxCON<15> = 1).

The timer value, at any point, is stored in the register pair, TMR3:TMR2 (or TMR5:TMR4). TMR3 (TMR5) always contains the most significant word of the count, while TMR2 (TMR4) contains the least significant word.

To configure any of the timers for individual 16-bit operation:

1. Clear the T32 bit corresponding to that timer (T2CON<3> for Timer2 and Timer3 or T4CON<3> for Timer4 and Timer5).
2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Load the timer period value into the PRx register.
5. If interrupts are required, set the Timerx Interrupt Enable bit, TxIE; use the Timerx Interrupt Priority bits, TxIP<2:0>, to set the interrupt priority.
6. Set the TON bit (TxCON<15> = 1).

NOTES:

14.0 INPUT CAPTURE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the “dsPIC33/PIC24 Family Reference Manual”, “Input Capture with Dedicated Timer” (DS70000352).

All devices in the PIC24FV32KA304 family feature three independent input capture modules. Each of the modules offers a wide range of configuration and operating options for capturing external pulse events, and generating interrupts.

Key features of the input capture module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 20 user-selectable Sync/trigger sources available
- A 4-level FIFO buffer for capturing and holding timer values for several events
- Configurable interrupt generation
- Up to 6 clock sources available for each module, driving a separate internal 16-bit counter

The module is controlled through two registers: ICxCON1 (Register 14-1) and ICxCON2 (Register 14-2). A general block diagram of the module is shown in Figure 14-1.

14.1 General Operating Modes

14.1.1 SYNCHRONOUS AND TRIGGER MODES

By default, the input capture module operates in a Free-Running mode. The internal 16-bit counter, ICxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow, with its period synchronized to the selected external clock source. When a capture event occurs, the current 16-bit value of the internal counter is written to the FIFO buffer.

In Synchronous mode, the module begins capturing events on the ICx pin as soon as its selected clock source is enabled. Whenever an event occurs on the selected Sync source, the internal counter is reset. In Trigger mode, the module waits for a Sync event from another internal module to occur before allowing the internal counter to run.

Standard, free-running operation is selected by setting the SYNCSELx bits to '00000' and clearing the ICTRIG bit (ICxCON2<7>). Synchronous and Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The ICTRIG bit selects either Synchronous or Trigger mode; setting the bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the Sync/trigger source.

When the SYNCSELx bits are set to '00000' and ICTRIG is set, the module operates in Software Trigger mode. In this case, capture operations are started by manually setting the TRIGSTAT bit (ICxCON2<6>).

FIGURE 14-1: INPUT CAPTURE x BLOCK DIAGRAM

PIC24FV32KA304 FAMILY

14.1.2 CASCADED (32-BIT) MODE

By default, each module operates independently with its own 16-bit timer. To increase resolution, adjacent even and odd modules can be configured to function as a single 32-bit module. (For example, Modules 1 and 2 are paired, as are Modules 3 and 4, and so on.) The odd numbered module (ICx) provides the Least Significant 16 bits of the 32-bit register pairs, and the even numbered module (ICy) provides the Most Significant 16 bits. Wraparounds of the ICx registers cause an increment of their corresponding ICy registers.

Cascaded operation is configured in hardware by setting the IC32 bit (ICxCON2<8>) for both modules.

14.2 Capture Operations

The input capture module can be configured to capture timer values and generate interrupts on rising edges on ICx or all transitions on ICx. Captures can be configured to occur on all rising edges or just some (every 4th or 16th). Interrupts can be independently configured to generate on each event or a subset of events.

To set up the module for capture operations:

1. If Synchronous mode is to be used, disable the Sync source before proceeding.
2. Make sure that any previous data has been removed from the FIFO by reading ICxBUF until the ICBNE bit (ICxCON1<3>) is cleared.
3. Set the SYNCSELx bits (ICxCON2<4:0>) to the desired Sync/trigger source.
4. Set the ICTSELx bits (ICxCON1<12:10>) for the desired clock source. If the desired clock source is running, set the ICTSELx bits before the input capture module is enabled, for proper synchronization with the desired clock source.
5. Set the ICIX bits (ICxCON1<6:5>) to the desired interrupt frequency.
6. Select Synchronous or Trigger mode operation:
 - a) Check that the SYNCSELx bits are not set to '00000'.
 - b) For Synchronous mode, clear the ICTRIG bit (ICxCON2<7>).
 - c) For Trigger mode, set ICTRIG and clear the TRIGSTAT bit (ICxCON2<6>).
7. Set the ICMx bits (ICxCON1<2:0>) to the desired operational mode.
8. Enable the selected Sync/trigger source.

For 32-bit cascaded operations, the setup procedure is slightly different:

1. Set the IC32 bits for both modules (ICyCON2<8> and ICxCON2<8>), enabling the even numbered module first. This ensures the modules will start functioning in unison.
2. Set the ICTSELx and SYNCSELx bits for both modules to select the same Sync/trigger and time base source. Set the even module first, then the odd module. Both modules must use the same ICTSELx and SYNCSELx bit settings.
3. Clear the ICTRIG bit of the even module (ICyCON2<7>). This forces the module to run in Synchronous mode with the odd module, regardless of its trigger setting.
4. Use the odd module's ICIX bits (ICxCON1<6:5>) to the desired interrupt frequency.
5. Use the ICTRIG bit of the odd module (ICxCON2<7>) to configure Trigger or Synchronous mode operation.

Note: For Synchronous mode operation, enable the Sync source as the last step. Both input capture modules are held in Reset until the Sync source is enabled.

6. Use the ICMx bits of the odd module (ICxCON1<2:0>) to set the desired capture mode.

The module is ready to capture events when the time base and the Sync/trigger source are enabled. When the ICBNE bit (ICxCON1<3>) becomes set, at least one capture value is available in the FIFO. Read input capture values from the FIFO until the ICBNE clears to '0'.

For 32-bit operation, read both the ICxBUF and ICyBUF for the full 32-bit timer value (ICxBUF for the lsw, ICyBUF for the msw). At least one capture value is available in the FIFO buffer when the odd module's ICBNE bit (ICxCON1<3>) becomes set. Continue to read the buffer registers until ICBNE is cleared (performed automatically by hardware).

15.0 OUTPUT COMPARE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Output Compare with Dedicated Timer**” (DS70005159).

All devices in the PIC24FV32KA304 family feature 3 independent output compare modules. Each of these modules offers a wide range of configuration and operating options for generating pulse trains on internal device events. Also, the modules can produce Pulse-Width Modulated (PWM) waveforms for driving power applications.

Key features of the output compare module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 21 user-selectable Sync/trigger sources available
- Two separate Period registers (a main register, OCxR, and a secondary register, OCxRS) for greater flexibility in generating pulses of varying widths
- Configurable for single pulse or continuous pulse generation on an output event, or continuous PWM waveform generation
- Up to 6 clock sources available for each module, driving a separate internal 16-bit counter

15.1 General Operating Modes

15.1.1 SYNCHRONOUS AND TRIGGER MODES

By default, the output compare module operates in a Free-Running mode. The internal 16-bit counter, OCxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow, with its period synchronized to the selected external clock source. Compare or PWM events are generated each time a match between the internal counter and one of the Period registers occurs.

In Synchronous mode, the module begins performing its compare or PWM operation as soon as its selected clock source is enabled. Whenever an event occurs on the selected Sync source, the module's internal counter is reset. In Trigger mode, the module waits for a Sync event from another internal module to occur before allowing the counter to run.

Free-Running mode is selected by default or any time that the SYNCSELx bits (OCxCON2<4:0>) are set to '00000'. Synchronous or Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The OCTRIG bit (OCxCON2<7>) selects either Synchronous or Trigger mode. Setting this bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the Sync/trigger source.

15.1.2 CASCADED (32-BIT) MODE

By default, each module operates independently with its own set of 16-bit Timer and Duty Cycle registers. To increase the range, adjacent even and odd numbered modules can be configured to function as a single 32-bit module. (For example, Modules 1 and 2 are paired, as are Modules 3 and 4, and so on.) The odd numbered module (OCx) provides the Least Significant 16 bits of the 32-bit register pairs, and the even numbered module (OCy) provides the Most Significant 16 bits. Wraparounds of the OCx registers cause an increment of their corresponding OCy registers.

Cascaded operation is configured in hardware by setting the OC32 bit (OCxCON2<8>) for both modules.

PIC24FV32KA304 FAMILY

FIGURE 15-1: OUTPUT COMPARE x BLOCK DIAGRAM (16-BIT MODE)

15.2 Compare Operations

In Compare mode (Figure 15-1), the output compare module can be configured for single-shot or continuous pulse generation. It can also repeatedly toggle an output pin on each timer event.

To set up the module for compare operations:

1. Calculate the required values for the OCxR and (for Double Compare modes) OCxRS Duty Cycle registers:
 - a) Determine the instruction clock cycle time. Take into account the frequency of the external clock to the timer source (if one is used) and the timer prescaler settings.
 - b) Calculate the time to the rising edge of the output pulse relative to the timer start value (0000h).
 - c) Calculate the time to the falling edge of the pulse, based on the desired pulse width and the time to the rising edge of the pulse.
2. Write the rising edge value to OCxR and the falling edge value to OCxRS.
3. For Trigger mode operations, set OCTRIG to enable Trigger mode. Set or clear TRIGMODE to configure the trigger operation and TRIGSTAT to select a hardware or software trigger. For Synchronous mode, clear OCTRIG.
4. Set the SYNCSEL<4:0> bits to configure the trigger or synchronization source. If free-running timer operation is required, set the SYNCSELx bits to '00000' (no Sync/trigger source).
5. Select the time base source with the OCTSEL<2:0> bits. If the desired clock source is running, set the OCTSEL<2:0> bits before the output compare module is enabled for proper synchronization with the desired clock source. If necessary, set the TON bit for the selected timer which enables the compare time base to count. Synchronous mode operation starts as soon as the synchronization source is enabled; Trigger mode operation starts after a trigger source event occurs.
6. Set the OCM<2:0> bits for the appropriate compare operation ('0xx').

For 32-bit cascaded operation, these steps are also necessary:

1. Set the OC32 bits for both registers (OCyCON2<8> and OCxCON2<8>). Enable the even numbered module first to ensure the modules will start functioning in unison.
2. Clear the OCTRIG bit of the even module (OCyCON2), so the module will run in Synchronous mode.
3. Configure the desired output and Fault settings for OCy.
4. Force the output pin for OCx to the output state by clearing the OCTRIS bit.
5. If Trigger mode operation is required, configure the trigger options in OCx by using the OCTRIG (OCxCON2<7>), TRIGSTAT (OCxCON2<6>) and SYNCSELx (OCxCON2<4:0>) bits.
6. Configure the desired Compare or PWM mode of operation (OCM<2:0>) for OCy first, then for OCx.

Depending on the output mode selected, the module holds the OCx pin in its default state and forces a transition to the opposite state when OCxR matches the timer. In Double Compare modes, OCx is forced back to its default state when a match with OCxRS occurs. The OCxIF interrupt flag is set after an OCxR match in Single Compare modes and after each OCxRS match in Double Compare modes.

Single-shot pulse events only occur once, but may be repeated by simply rewriting the value of the OCxCON1 register. Continuous pulse events continue indefinitely until terminated.

PIC24FV32KA304 FAMILY

15.3 Pulse-Width Modulation (PWM) Mode

In PWM mode, the output compare module can be configured for edge-aligned or center-aligned pulse waveform generation. All PWM operations are double-buffered (buffer registers are internal to the module and are not mapped into SFR space).

To configure the output compare module for edge-aligned PWM operation:

1. Calculate the desired ON time and load it into the OCxR register.
2. Calculate the desired period and load it into the OCxRS register.
3. Select the current OCx as the synchronization source by writing 0x1F to SYNCSEL<4:0> (OCxCON2<4:0>) and '0' to OCTRIG (OCxCON2<7>).

4. Select a clock source by writing the OCTSEL2<2:0> (OCxCON<12:10>) bits.
5. Enable interrupts, if required, for the timer and output compare modules. The output compare interrupt is required for PWM Fault pin utilization.
6. Select the desired PWM mode in the OCM<2:0> (OCxCON1<2:0>) bits.
7. If a timer is selected as a clock source, set the TMRy prescale value and enable the time base by setting the TON (TxCON<15>) bit.

FIGURE 15-2: OUTPUT COMPARE x BLOCK DIAGRAM (DOUBLE-BUFFERED, 16-BIT PWM MODE)

15.3.1 PWM PERIOD

In Edge-Aligned PWM mode, the period is specified by the value of the OCxRS register. In Center-Aligned PWM mode, the period of the synchronization source, such as the Timers' PRy, specifies the period. The period in both cases can be calculated using [Equation 15-1](#).

EQUATION 15-1: CALCULATING THE PWM PERIOD⁽¹⁾

$$\text{PWM Period} = [\text{Value} + 1] \times \text{TCY} \times (\text{Prescaler Value})$$

Where:

Value = OCxRS in Edge-Aligned PWM mode and can be PRy in Center-Aligned PWM mode (if TMRy is the Sync source).

Note 1: Based on TCY = TOSC * 2; Doze mode and PLL are disabled.

15.3.2 PWM DUTY CYCLE

The PWM duty cycle is specified by writing to the OCxRS and OCxR registers. The OCxRS and OCxR registers can be written to at any time, but the duty cycle value is not latched until a period is complete. This provides a double buffer for the PWM duty cycle and is essential for glitchless PWM operation.

Some important boundary parameters of the PWM duty cycle include:

- Edge-Aligned PWM:
 - If OCxR and OCxRS are loaded with 0000h, the OCx pin will remain low (0% duty cycle).
 - If OCxRS is greater than OCxR, the pin will remain high (100% duty cycle).
- Center-Aligned PWM (with TMRy as the Sync source):
 - If OCxR, OCxRS and PRy are all loaded with 0000h, the OCx pin will remain low (0% duty cycle).
 - If OCxRS is greater than PRy, the pin will go high (100% duty cycle).

See [Example 15-3](#) for PWM mode timing details. [Table 15-1](#) and [Table 15-2](#) show example PWM frequencies and resolutions for a device operating at 4 MIPS and 10 MIPS, respectively.

EQUATION 15-2: CALCULATION FOR MAXIMUM PWM RESOLUTION⁽¹⁾

$$\text{Maximum PWM Resolution (bits)} = \frac{\log_{10}\left(\frac{\text{FCY}}{\text{FPWM} \cdot (\text{Prescale Value})}\right)}{\log_{10}(2)} \text{ bits}$$

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

EQUATION 15-3: PWM PERIOD AND DUTY CYCLE CALCULATIONS⁽¹⁾

1. Find the OCxRS register value for a desired PWM frequency of 52.08 kHz, where FOSC = 8 MHz with PLL (32 MHz device clock rate) and a prescaler setting of 1:1 using Edge-Aligned PWM mode:

$$\begin{aligned} \text{TCY} &= 2 \cdot \text{TOSC} = 62.5 \text{ ns} \\ \text{PWM Period} &= 1/\text{PWM Frequency} = 1/52.08 \text{ kHz} = 19.2 \text{ } \mu\text{s} \\ \text{PWM Period} &= (\text{OCxRS} + 1) \cdot \text{TCY} \cdot (\text{OCx Prescale Value}) \\ 19.2 \text{ } \mu\text{s} &= (\text{OCxRS} + 1) \cdot 62.5 \text{ ns} \cdot 1 \\ \text{OCxRS} &= 306 \end{aligned}$$

2. Find the maximum resolution of the duty cycle that can be used with a 52.08 kHz frequency and a 32 MHz device clock rate:

$$\begin{aligned} \text{PWM Resolution} &= \log_{10}(\text{FCY}/\text{FPWM})/\log_{10}(2) \text{ bits} \\ &= (\log_{10}(16 \text{ MHz}/52.08 \text{ kHz})/\log_{10}(2)) \text{ bits} \\ &= 8.3 \text{ bits} \end{aligned}$$

Note 1: Based on TCY = 2 * TOSC; Doze mode and PLL are disabled.

PIC24FV32KA304 FAMILY

15.4 Subcycle Resolution

The DCBx bits (OCxCON2<10:9>) provide for resolution better than one instruction cycle. When used, they delay the falling edge generated from a match event by a portion of an instruction cycle.

For example, setting DCB<1:0> = 10 causes the falling edge to occur halfway through the instruction cycle in which the match event occurs, instead of at the beginning. These bits cannot be used when OCM<2:0> = 001. When operating the module in PWM mode (OCM<2:0> = 110 or 111), the DCBx bits will be double-buffered.

The DCBx bits are intended for use with a clock source identical to the system clock. When an OCx module with enabled prescaler is used, the falling edge delay caused by the DCBx bits will be referenced to the system clock period, rather than the OCx module's period.

16.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Serial Peripheral Interface, refer to the “dsPIC33/PIC24 Family Reference Manual”, “Serial Peripheral Interface (SPI)” (DS70005185).

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial data EEPROMs, shift registers, display drivers, A/D Converters, etc. The SPI module is compatible with Motorola® SPI and SIOP interfaces.

The module supports operation in two buffer modes. In Standard mode, data is shifted through a single serial buffer. In Enhanced Buffer mode, data is shifted through an 8-level FIFO buffer.

Note: Do not perform Read-Modify-Write operations (such as bit-oriented instructions) on the SPI1BUF register in either Standard or Enhanced Buffer mode.

The module also supports a basic framed SPI protocol while operating in either Master or Slave mode. A total of four framed SPI configurations are supported.

The SPI serial interface consists of four pins:

- SDI1: Serial Data Input
- SDO1: Serial Data Output
- SCK1: Shift Clock Input or Output
- SS1: Active-Low Slave Select or Frame Synchronization I/O Pulse

The SPI module can be configured to operate using 2, 3 or 4 pins. In the 3-pin mode, $\overline{SS1}$ is not used. In the 2-pin mode, both SDO1 and $\overline{SS1}$ are not used.

Block diagrams of the module, in Standard and Enhanced Buffer modes, are shown in [Figure 16-1](#) and [Figure 16-2](#).

The devices of the PIC24FV32KA304 family offer two SPI modules on a device.

Note: In this section, the SPI modules are referred to as SPIx. Special Function Registers (SFRs) will follow a similar notation. For example, SPI1CON1 or SPI1CON2 refers to the control register for the SPI1 module.

To set up the SPI1 module for the Standard Master mode of operation:

1. If using interrupts:
 - a) Clear the SPI1IF bit in the IFS0 register.
 - b) Set the SPI1IE bit in the IEC0 register.
 - c) Write the respective SPI1IPx bits in the IPC2 register to set the interrupt priority.
2. Write the desired settings to the SPI1CON1 and SPI1CON2 registers with the MSTEN bit (SPI1CON1<5>) = 1.
3. Clear the SPIROV bit (SPI1STAT<6>).
4. Enable SPI operation by setting the SPIEN bit (SPI1STAT<15>).
5. Write the data to be transmitted to the SPI1BUF register. Transmission (and reception) will start as soon as data is written to the SPI1BUF register.

To set up the SPI1 module for the Standard Slave mode of operation:

1. Clear the SPI1BUF register.
2. If using interrupts:
 - a) Clear the SPI1IF bit in the IFS0 register.
 - b) Set the SPI1IE bit in the IEC0 register.
 - c) Write the respective SPI1IPx bits in the IPC2 register to set the interrupt priority.
3. Write the desired settings to the SPI1CON1 and SPI1CON2 registers with the MSTEN bit (SPI1CON1<5>) = 0.
4. Clear the SMP bit.
5. If the CKE bit is set, then the SSEN bit (SPI1CON1<7>) must be set to enable the $\overline{SS1}$ pin.
6. Clear the SPIROV bit (SPI1STAT<6>).
7. Enable SPI operation by setting the SPIEN bit (SPI1STAT<15>).

PIC24FV32KA304 FAMILY

FIGURE 16-1: SPI1 MODULE BLOCK DIAGRAM (STANDARD BUFFER MODE)

PIC24FV32KA304 FAMILY

To set up the SPI1 module for the Enhanced Buffer Master (EBM) mode of operation:

- If using interrupts:
 - Clear the SPI1IF bit in the IFS0 register.
 - Set the SPI1IE bit in the IEC0 register.
 - Write the respective SPI1IPx bits in the IPC2 register.
- Write the desired settings to the SPI1CON1 and SPI1CON2 registers with the MSTEN bit (SPI1CON1<5>) = 1.
- Clear the SPIROV bit (SPI1STAT<6>).
- Select Enhanced Buffer mode by setting the SPIBEN bit (SPI1CON2<0>).
- Enable SPI operation by setting the SPIEN bit (SPI1STAT<15>).
- Write the data to be transmitted to the SPI1BUF register. Transmission (and reception) will start as soon as data is written to the SPI1BUF register.

To set up the SPI1 module for the Enhanced Buffer Slave mode of operation:

- Clear the SPI1BUF register.
- If using interrupts:
 - Clear the SPI1IF bit in the IFS0 register.
 - Set the SPI1IE bit in the IEC0 register.
 - Write the respective SPI1IPx bits in the IPC2 register to set the interrupt priority.
- Write the desired settings to the SPI1CON1 and SPI1CON2 registers with the MSTEN bit (SPI1CON1<5>) = 0.
- Clear the SMP bit.
- If the CKE bit is set, then the SSEN bit must be set, thus enabling the $\overline{SS1}$ pin.
- Clear the SPIROV bit (SPI1STAT<6>).
- Select Enhanced Buffer mode by setting the SPIBEN bit (SPI1CON2<0>).
- Enable SPI operation by setting the SPIEN bit (SPI1STAT<15>).

1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode
- bit 12-11 **Unimplemented:** Read as '0'
- bit 10-8 **SPIBEC<2:0>:** SPIx Buffer Element Count bits (valid in Enhanced Buffer mode)
Master mode:
Number of SPI transfers pending.
Slave mode:
Number of SPI transfers unread.
- bit 7 **SRMPT:** SPIx Shift Register (SPIxSR) Empty bit (valid in Enhanced Buffer mode)
1 = SPIx Shift register is empty and ready to send or receive
0 = SPIx Shift register is not empty
- bit 6 **SPIROV:** SPIx Receive Overflow Flag bit
1 = A new byte/word is completely received and discarded (the user software has not read the previous data in the SPI1BUF register)
0 = No overflow has occurred
- bit 5 **SRXMPT:** SPIx Receive FIFO Empty bit (valid in Enhanced Buffer mode)
1 = Receive FIFO is empty
0 = Receive FIFO is not empty
- bit 4-2 **SISEL<2:0>:** SPIx Buffer Interrupt Mode bits (valid in Enhanced Buffer mode)
111 = Interrupt when SPIx transmit buffer is full (SPITBF bit is set)
110 = Interrupt when last bit is shifted into SPIxSR; as a result, the TX FIFO is empty
101 = Interrupt when the last bit is shifted out of SPIxSR; now the transmit is complete
100 = Interrupt when one data byte is shifted into the SPIxSR; as a result, the TX FIFO has one open spot
011 = Interrupt when SPIx receive buffer is full (SPIRBF bit is set)
010 = Interrupt when SPIx receive buffer is 3/4 or more full
001 = Interrupt when data is available in receive buffer (SRMPT bit is set)
000 = Interrupt when the last data in the receive buffer is read; as a result, the buffer is empty (SRXMPT bit is set)

PIC24FV32KA304 FAMILY

REGISTER 16-1: SPIxSTAT: SPIx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 1 **SPITBF:** SPIx Transmit Buffer Full Status bit
1 = Transmit has not yet started, SPIxTXB is full
0 = Transmit has started, SPIxTXB is empty
In Standard Buffer mode:
Automatically set in hardware when the CPU writes the SPIxBUF location, loading SPIxTXB. Automatically cleared in hardware when the SPIx module transfers data from SPIxTXB to SPIxSR.
In Enhanced Buffer mode:
Automatically set in hardware when the CPU writes the SPIxBUF location, loading the last available buffer location. Automatically cleared in hardware when a buffer location is available for a CPU write.
- bit 0 **SPIRBF:** SPIx Receive Buffer Full Status bit
1 = Receive is complete, SPIxRXB is full
0 = Receive is not complete, SPIxRXB is empty
In Standard Buffer mode:
Automatically set in hardware when the SPIx transfers data from the SPIxSR to SPIxRXB. Automatically cleared in hardware when the core reads the SPIxBUF location, reading SPIxRXB.
In Enhanced Buffer mode:
Automatically set in hardware when SPIx transfers data from SPIxSR to buffer, filling the last unread buffer location. Automatically cleared in hardware when a buffer location is available for a transfer from SPIxSR.

17.0 INTER-INTEGRATED CIRCUIT (I²C)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Inter-Integrated Circuit, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Inter-Integrated Circuit (I²C)**” (DS70000195).

The Inter-Integrated Circuit (I²C) module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial data EEPROMs, display drivers, A/D Converters, etc.

The I²C modules support these features:

- Independent master and slave logic
- 7-bit and 10-bit device addresses
- General call address, as defined in the I²C protocol
- Clock stretching to provide delays for the processor to respond to a slave data request
- Both 100 kHz and 400 kHz bus specifications
- Configurable address masking
- Multi-Master modes to prevent loss of messages in arbitration
- Bus Repeater mode, allowing the acceptance of all messages as a slave, regardless of the address
- Automatic SCL

A block diagram of the module is shown in [Figure 17-1](#).

17.1 Pin Remapping Options

The I²C modules are tied to a fixed pin. To allow flexibility with peripheral multiplexing, the I2C1 module in 28-pin devices, can be reassigned to the alternate pins. These alternate pins are designated as SCL1 and SDA1 during device configuration.

Pin assignment is controlled by the I2CxSEL Configuration bit. Programming this bit (= 0) multiplexes the module to the SCL1 and SDA1 pins.

Note: Throughout this section, references to register and bit names that may be associated with a specific I²C module are referred to generically by the use of ‘x’ in place of the specific module number. Thus, “I2CxSTAT” might refer to the Receive Status register for either I2C1 or I2C2.

17.2 Communicating as a Master in a Single Master Environment

The details of sending a message in Master mode depends on the communication protocols for the device being communicated with. Typically, the sequence of events is as follows:

1. Assert a Start condition on SDAx and SCLx.
2. Send the I²C device address byte to the slave with a write indication.
3. Wait for and verify an Acknowledge from the slave.
4. Send the first data byte (sometimes known as the command) to the slave.
5. Wait for and verify an Acknowledge from the slave.
6. Send the serial memory address low byte to the slave.
7. Repeat Steps 4 and 5, until all data bytes are sent.
8. Assert a Repeated Start condition on SDAx and SCLx.
9. Send the device address byte to the slave with a read indication.
10. Wait for and verify an Acknowledge from the slave.
11. Enable master reception to receive serial memory data.
12. Generate an ACK or NACK condition at the end of a received byte of data.
13. Generate a Stop condition on SDAx and SCLx.

PIC24FV32KA304 FAMILY

FIGURE 17-1: I²C BLOCK DIAGRAM (I2C1 MODULE IS SHOWN)

17.3 Setting Baud Rate When Operating as a Bus Master

To compute the Baud Rate Generator (BRG) reload value, use [Equation 17-1](#).

EQUATION 17-1: COMPUTING BAUD RATE RELOAD VALUE⁽¹⁾

$$F_{SCL} = \frac{F_{CY}}{I2CxBRG + 1 + \frac{F_{CY}}{10,000,000}}$$

or

$$I2CxBRG = \left(\frac{F_{CY}}{F_{SCL}} - \frac{F_{CY}}{10,000,000} \right) - 1$$

Note 1: Based on $F_{CY} = F_{OSC}/2$; Doze mode and PLL are disabled.

17.4 Slave Address Masking

The I2CxMSK register ([Register 17-3](#)) designates address bit positions as “don’t care” for both 7-Bit and 10-Bit Addressing modes. Setting a particular bit location (= 1) in the I2CxMSK register causes the slave module to respond, whether the corresponding address bit value is ‘0’ or ‘1’. For example, when I2CxMSK is set to ‘00100000’, the slave module will detect both addresses: ‘00000000’ and ‘00100000’.

To enable address masking, the Intelligent Peripheral Management Interface (IPMI) must be disabled by clearing the IPMIEN bit (I2C1CON<11>).

Note: As a result of changes in the I²C protocol, the addresses in [Table 17-2](#) are reserved and will not be Acknowledged in Slave mode. This includes any address mask settings that include any of these addresses.

TABLE 17-1: I²C CLOCK RATES⁽¹⁾

| Required System F _{SCL} | F _{CY} | I2CxBRG Value | | Actual F _{SCL} |
|----------------------------------|-----------------|---------------|---------------|-------------------------|
| | | (Decimal) | (Hexadecimal) | |
| 100 kHz | 16 MHz | 157 | 9D | 100 kHz |
| 100 kHz | 8 MHz | 78 | 4E | 100 kHz |
| 100 kHz | 4 MHz | 39 | 27 | 99 kHz |
| 400 kHz | 16 MHz | 37 | 25 | 404 kHz |
| 400 kHz | 8 MHz | 18 | 12 | 404 kHz |
| 400 kHz | 4 MHz | 9 | 9 | 385 kHz |
| 400 kHz | 2 MHz | 4 | 4 | 385 kHz |
| 1 MHz | 16 MHz | 13 | D | 1.026 MHz |
| 1 MHz | 8 MHz | 6 | 6 | 1.026 MHz |
| 1 MHz | 4 MHz | 3 | 3 | 0.909 MHz |

Note 1: Based on $F_{CY} = F_{OSC}/2$; Doze mode and PLL are disabled.

TABLE 17-2: I²C RESERVED ADDRESSES⁽¹⁾

| Slave Address | R/W Bit | Description |
|---------------|---------|--|
| 0000 000 | 0 | General Call Address ⁽²⁾ |
| 0000 000 | 1 | Start Byte |
| 0000 001 | x | CBus Address |
| 0000 010 | x | Reserved |
| 0000 011 | x | Reserved |
| 0000 1xx | x | HS Mode Master Code |
| 1111 1xx | x | Reserved |
| 1111 0xx | x | 10-Bit Slave Upper Byte ⁽³⁾ |

Note 1: The address bits listed here will never cause an address match, independent of the address mask settings.

2: This address will be Acknowledged only if GCEN = 1.

3: A match on this address can only occur on the upper byte in 10-Bit Addressing mode.

- bit 15 **I2CEN:** I2Cx Enable bit
 1 = Enables the I2Cx module, and configures the SDAx and SCLx pins as serial port pins
 0 = Disables the I2Cx module; all I²C pins are controlled by port functions
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **I2CSIDL:** I2Cx Stop in Idle Mode bit
 1 = Discontinues module operation when the device enters an Idle mode
 0 = Continues module operation in Idle mode
- bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C slave)
 1 = Releases SCLx clock
 0 = Holds SCLx clock low (clock stretch)
 If STREN = 1:
 The bit is R/W (i.e., software may write '0' to initiate stretch and write '1' to release clock). Hardware is clear at the beginning of the slave transmission. Hardware is clear at the end of slave reception.
 If STREN = 0:
 The bit is R/S (i.e., software may only write '1' to release clock). Hardware is clear at the beginning of slave transmission.
- bit 11 **IPMIEN:** Intelligent Peripheral Management Interface (IPMI) Enable bit
 1 = IPMI Support mode is enabled; all addresses are Acknowledged
 0 = IPMI Support mode is disabled
- bit 10 **A10M:** 10-Bit Slave Addressing bit
 1 = I2CxADD is a 10-bit slave address
 0 = I2CxADD is a 7-bit slave address
- bit 9 **DISSLW:** Disable Slew Rate Control bit
 1 = Slew rate control is disabled
 0 = Slew rate control is enabled
- bit 8 **SMEN:** SMBus Input Levels bit
 1 = Enables I/O pin thresholds compliant with the SMBus specification
 0 = Disables the SMBus input thresholds
- bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
 1 = Enables interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
 0 = General call address is disabled
- bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C slave)
 Used in conjunction with the SCLREL bit.
 1 = Enables software or receives clock stretching
 0 = Disables software or receives clock stretching

REGISTER 17-1: I2CxCON: I2Cx CONTROL REGISTER (CONTINUED)

- bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C master; applicable during master receive)
Value that will be transmitted when the software initiates an Acknowledge sequence.
1 = Sends NACK during Acknowledge
0 = Sends ACK during Acknowledge
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit
(when operating as I²C master; applicable during master receive)
1 = Initiates the Acknowledge sequence on the SDAx and SCLx pins, and transmits the ACKDT data bit;
hardware is clear at the end of the master Acknowledge sequence
0 = Acknowledge sequence is not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I²C master)
1 = Enables Receive mode for I²C; hardware is clear at the end of the eighth bit of the master receive
data byte
0 = Receive sequence is not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C master)
1 = Initiates Stop condition on SDAx and SCLx pins; hardware is clear at end of master Stop sequence
0 = Stop condition is not in progress
- bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C master)
1 = Initiates Repeated Start condition on SDAx and SCLx pins; hardware is clear at the end of the
master Repeated Start sequence
0 = Repeated Start condition is not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I²C master)
1 = Initiates Start condition on SDAx and SCLx pins; hardware is clear at the end of the
master Start sequence
0 = Start condition is not in progress

- bit 15 **ACKSTAT:** Acknowledge Status bit
 1 = NACK was detected last
 0 = ACK was detected last
 Hardware is set or clear at the end of Acknowledge.
- bit 14 **TRSTAT:** Transmit Status bit
 (when operating as I²C master; applicable to master transmit operation)
 1 = Master transmit is in progress (8 bits + ACK)
 0 = Master transmit is not in progress
 Hardware is set at the beginning of the master transmission; hardware is clear at the end of slave Acknowledge.
- bit 13-11 **Unimplemented:** Read as '0'
- bit 10 **BCL:** Master Bus Collision Detect bit
 1 = A bus collision has been detected during a master operation
 0 = No collision
 Hardware is set at the detection of a bus collision.
- bit 9 **GCSTAT:** General Call Status bit
 1 = General call address was received
 0 = General call address was not received
 Hardware is set when an address matches the general call address; hardware is clear at Stop detection.
- bit 8 **ADD10:** 10-Bit Address Status bit
 1 = 10-bit address was matched
 0 = 10-bit address was not matched
 Hardware is set at a match of the 2nd byte of the matched 10-bit address; hardware is clear at Stop detection.
- bit 7 **IWCOL:** I2Cx Write Collision Detect bit
 1 = An attempt to write to the I2CxTRN register failed because the I²C module is busy
 0 = No collision
 Hardware is set at an occurrence of a write to I2CxTRN while busy (cleared by software).
- bit 6 **I2COV:** I2Cx Receive Overflow Flag bit
 1 = A byte was received while the I2CxRCV register is still holding the previous byte
 0 = No overflow
 Hardware is set at an attempt to transfer I2CxRSR to I2CxRCV (cleared by software).
- bit 5 **D/Ā:** Data/Address bit (when operating as I²C slave)
 1 = Indicates that the last byte received was data
 0 = Indicates that the last byte received was the device address
 Hardware is clear at a device address match; hardware is set by a write to I2CxTRN or by reception of a slave byte.

REGISTER 17-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

- bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware is set or cleared when a Start, Repeated Start or Stop is detected.
- bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware is set or clear when a Start, Repeated Start or Stop is detected.
- bit 2 **\overline{RW} :** Read/Write Information bit (when operating as I²C slave)
1 = Read – indicates data transfer is output from the slave
0 = Write – indicates data transfer is input to the slave
Hardware is set or clear after the reception of an I²C device address byte.
- bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive is complete, I2CxRCV is full
0 = Receive is not complete, I2CxRCV is empty
Hardware is set when I2CxRCV is written with a received byte; hardware is clear when the software reads I2CxRCV.
- bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit is in progress, I2CxTRN is full
0 = Transmit is complete, I2CxTRN is empty
Hardware is set when the software writes to I2CxTRN; hardware is clear at the completion of data transmission.

18.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Universal Asynchronous Receiver Transmitter, refer to the “dsPIC33/PIC24 Family Reference Manual”, “**Universal Asynchronous Receiver Transmitter (UART)**” (DS70000582).

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in this PIC24F device family. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. This module also supports a hardware flow control option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA[®] encoder and decoder.

The primary features of the UART module are:

- Full-Duplex, 8-Bit or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins
- Fully Integrated Baud Rate Generator (IBRG) with 16-Bit Prescaler

- Baud Rates Ranging from 1 Mbps to 15 bps at 16 MIPS
- 4-Deep, First-In-First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-Bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- Loopback mode for Diagnostic Support
- Support for Sync and Break Characters
- Supports Automatic Baud Rate Detection
- IrDA[®] Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA Support

A simplified block diagram of the UARTx is shown in Figure 18-1. The UARTx module consists of these important hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

Note: Throughout this section, references to register and bit names that may be associated with a specific USART module are referred to generically by the use of ‘x’ in place of the specific module number. Thus, “ UxSTA ” might refer to the USART Status register for either USART1 or USART2.

FIGURE 18-1: UARTx SIMPLIFIED BLOCK DIAGRAM

PIC24FV32KA304 FAMILY

18.1 UARTx Baud Rate Generator (BRG)

The UARTx module includes a dedicated 16-bit Baud Rate Generator (BRG). The UxBRG register controls the period of a free-running, 16-bit timer. Equation 18-1 provides the formula for computation of the baud rate with BRGH = 0.

EQUATION 18-1: UARTx BAUD RATE WITH BRGH = 0⁽¹⁾

$$\text{Baud Rate} = \frac{\text{FCY}}{16 \cdot (\text{UxBRG} + 1)}$$

$$\text{UxBRG} = \frac{\text{FCY}}{16 \cdot \text{Baud Rate}} - 1$$

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

Example 18-1 provides the calculation of the baud rate error for the following conditions:

- FCY = 4 MHz
- Desired Baud Rate = 9600

EXAMPLE 18-1: BAUD RATE ERROR CALCULATION (BRGH = 0)⁽¹⁾

$$\text{Desired Baud Rate} = \text{FCY}/(16 (\text{UxBRG} + 1))$$

Solving for UxBRG value:

$$\text{UxBRG} = ((\text{FCY}/\text{Desired Baud Rate})/16) - 1$$

$$\text{UxBRG} = ((4000000/9600)/16) - 1$$

$$\text{UxBRG} = 25$$

$$\begin{aligned} \text{Calculated Baud Rate} &= 4000000/(16 (25 + 1)) \\ &= 9615 \end{aligned}$$

$$\begin{aligned} \text{Error} &= (\text{Calculated Baud Rate} - \text{Desired Baud Rate}) \\ &\quad \text{Desired Baud Rate} \\ &= (9615 - 9600)/9600 \\ &= 0.16\% \end{aligned}$$

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

The maximum baud rate (BRGH = 0) possible is FCY/16 (for UxBRG = 0) and the minimum baud rate possible is FCY/(16 * 65536).

Equation 18-2 shows the formula for computation of the baud rate with BRGH = 1.

EQUATION 18-2: UARTx BAUD RATE WITH BRGH = 1⁽¹⁾

$$\text{Baud Rate} = \frac{\text{FCY}}{4 \cdot (\text{UxBRG} + 1)}$$

$$\text{UxBRG} = \frac{\text{FCY}}{4 \cdot \text{Baud Rate}} - 1$$

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

The maximum baud rate (BRGH = 1) possible is FCY/4 (for UxBRG = 0) and the minimum baud rate possible is FCY/(4 * 65536).

Writing a new value to the UxBRG register causes the BRG timer to be reset (cleared). This ensures the BRG does not wait for a timer overflow before generating the new baud rate.

18.2 Transmitting in 8-Bit Data Mode

1. Set up the UARTx:
 - a) Write appropriate values for data, parity and Stop bits.
 - b) Write appropriate baud rate value to the UxBRG register.
 - c) Set up transmit and receive interrupt enable and priority bits.
2. Enable the UARTx.
3. Set the UTXEN bit (causes a transmit interrupt, two cycles after being set).
4. Write the data byte to the lower byte of the UxTXREG word. The value will be immediately transferred to the Transmit Shift Register (TSR) and the serial bit stream will start shifting out with the next rising edge of the baud clock.
5. Alternately, the data byte may be transferred while UTXEN = 0 and then, the user may set UTXEN. This will cause the serial bit stream to begin immediately, because the baud clock will start from a cleared state.
6. A transmit interrupt will be generated as per interrupt control bit, UTXISELx.

18.3 Transmitting in 9-Bit Data Mode

1. Set up the UARTx (as described in [Section 18.2 “Transmitting in 8-Bit Data Mode”](#)).
2. Enable the UARTx.
3. Set the UTXEN bit (causes a transmit interrupt, two cycles after being set).
4. Write UxTXREG as a 16-bit value only.
5. A word write to UxTXREG triggers the transfer of the 9-bit data to the TSR. The serial bit stream will start shifting out with the first rising edge of the baud clock.
6. A transmit interrupt will be generated as per the setting of control bit, UTXISELx.

18.4 Break and Sync Transmit Sequence

The following sequence will send a message frame header made up of a Break, followed by an auto-baud Sync byte.

1. Configure the UARTx for the desired mode.
2. Set UTXEN and UTXBRK – this sets up the Break character.
3. Load the UxTXREG with a dummy character to initiate transmission (value is ignored).
4. Write ‘55h’ to UxTXREG – loads the Sync character into the transmit FIFO.
5. After the Break has been sent, the UTXBRK bit is reset by hardware. The Sync character now transmits.

18.5 Receiving in 8-Bit or 9-Bit Data Mode

1. Set up the UARTx (as described in [Section 18.2 “Transmitting in 8-Bit Data Mode”](#)).
2. Enable the UARTx.
3. A receive interrupt will be generated when one or more data characters have been received, as per interrupt control bit, URXISELx.
4. Read the OERR bit to determine if an overrun error has occurred. The OERR bit must be reset in software.
5. Read UxRXREG.

The act of reading the UxRXREG character will move the next character to the top of the receive FIFO, including a new set of PERR and FERR values.

18.6 Operation of $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Control Pins

UARTx Clear-to-Send ($\overline{\text{UxCTS}}$) and Request-to-Send ($\overline{\text{UxRTS}}$) are the two hardware-controlled pins that are associated with the UARTx module. These two pins allow the UARTx to operate in Simplex and Flow Control modes. They are implemented to control the transmission and reception between the Data Terminal Equipment (DTE). The UEN<1:0> bits in the UxMODE register configure these pins.

18.7 Infrared Support

The UARTx module provides two types of infrared UARTx support: one is the IrDA clock output to support an external IrDA encoder and decoder device (legacy module support), and the other is the full implementation of the IrDA encoder and decoder.

As the IrDA modes require a 16x baud clock, they will only work when the BRGH bit (UxMODE<3>) is ‘0’.

18.7.1 EXTERNAL IrDA SUPPORT – IrDA CLOCK OUTPUT

To support external IrDA encoder and decoder devices, the UxBCLK pin (same as the $\overline{\text{UxRTS}}$ pin) can be configured to generate the 16x baud clock. When UEN<1:0> = 11, the UxBCLK pin will output the 16x baud clock if the UARTx module is enabled; it can be used to support the IrDA codec chip.

18.7.2 BUILT-IN IrDA ENCODER AND DECODER

The UARTx has full implementation of the IrDA encoder and decoder as part of the UARTx module. The built-in IrDA encoder and decoder functionality is enabled using the IREN bit (UxMODE<12>). When enabled (IREN = 1), the receive pin (UxRX) acts as the input from the infrared receiver. The transmit pin (UxTX) acts as the output to the infrared transmitter.

- bit 15,13 **UTXISEL<1:0>**: UARTx Transmission Interrupt Mode Selection bits
 11 = Reserved; do not use
 10 = Interrupt when a character is transferred to the Transmit Shift Register (TSR) and as a result, the transmit buffer becomes empty
 01 = Interrupt when the last character is shifted out of the Transmit Shift Register; all transmit operations are completed
 00 = Interrupt when a character is transferred to the Transmit Shift Register (this implies there is at least one character open in the transmit buffer)
- bit 14 **UTXINV**: IrDA[®] Encoder Transmit Polarity Inversion bit
 If IREN = 0:
 1 = UxTX Idle '0'
 0 = UxTX Idle '1'
 If IREN = 1:
 1 = UxTX Idle '1'
 0 = UxTX Idle '0'
- bit 12 **Unimplemented**: Read as '0'
- bit 11 **UTXBRK**: UARTx Transmit Break bit
 1 = Sends Sync Break on next transmission – Start bit, followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
 0 = Sync Break transmission is disabled or completed
- bit 10 **UTXEN**: UARTx Transmit Enable bit
 1 = Transmit is enabled; UxTX pin is controlled by UARTx
 0 = Transmit is disabled; any pending transmission is aborted and the buffer is reset. UxTX pin is controlled by the PORT register.
- bit 9 **UTXBF**: UARTx Transmit Buffer Full Status bit (read-only)
 1 = Transmit buffer is full
 0 = Transmit buffer is not full, at least one more character can be written
- bit 8 **TRMT**: Transmit Shift Register Empty bit (read-only)
 1 = Transmit Shift Register is empty and the transmit buffer is empty (the last transmission has completed)
 0 = Transmit Shift Register is not empty; a transmission is in progress or queued
- bit 7-6 **URXISEL<1:0>**: UARTx Receive Interrupt Mode Selection bits
 11 = Interrupt is set on a RSR transfer, making the receive buffer full (i.e., has 4 data characters)
 10 = Interrupt is set on a RSR transfer, making the receive buffer 3/4 full (i.e., has 3 data characters)
 0x = Interrupt is set when any character is received and transferred from the RSR to the receive buffer; receive buffer has one or more characters.

REGISTER 18-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
 1 = Address Detect mode is enabled; if 9-bit mode is not selected, this does not take effect
 0 = Address Detect mode is disabled
- bit 4 **RIDLE:** Receiver Idle bit (read-only)
 1 = Receiver is Idle
 0 = Receiver is active
- bit 3 **PERR:** Parity Error Status bit (read-only)
 1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
 0 = Parity error has not been detected
- bit 2 **FERR:** Framing Error Status bit (read-only)
 1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
 0 = Framing error has not been detected
- bit 1 **OERR:** Receive Buffer Overrun Error Status bit (clear/read-only)
 1 = Receive buffer has overflowed
 0 = Receive buffer has not overflowed (clearing a previously set OERR bit (1 → 0 transition) will reset the receiver buffer and the RSR to the empty state)
- bit 0 **URXDA:** UARTx Receive Buffer Data Available bit (read-only)
 1 = Receive buffer has data; at least one more characters can be read
 0 = Receive buffer is empty

19.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Real-Time Clock and Calendar, refer to the “dsPIC33/PIC24 Family Reference Manual”, “RTCC with External Power Control” (DS39745).

The RTCC provides the user with a Real-Time Clock and Calendar (RTCC) function that can be calibrated.

Key features of the RTCC module are:

- Operates in Deep Sleep mode
- Selectable clock source
- Provides hours, minutes and seconds using 24-hour format
- Visibility of one half second period
- Provides calendar – weekday, date, month and year
- Alarm-configurable for half a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month or one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat chime
- Year 2000 to 2099 leap year correction

- BCD format for smaller software overhead
- Optimized for long-term battery operation
- User calibration of the 32.768 kHz clock crystal/32K INTRC frequency with periodic auto-adjust
- Optimized for long-term battery operation
- Fractional second synchronization
- Calibration to within ± 2.64 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Ability to periodically wake-up external devices without CPU intervention (external power control)
- Power control output for external circuit control
- Calibration takes effect every 15 seconds
- Runs from any one of the following:
 - External Real-Time Clock of 32.768 kHz
 - Internal 31.25 kHz LPRC Clock
 - 50 Hz or 60 Hz External Input

19.1 RTCC Source Clock

The user can select between the SOSC crystal oscillator, LPRC internal oscillator or an external 50 Hz/60 Hz power line input as the clock reference for the RTCC module. This gives the user an option to trade off system cost, accuracy and power consumption, based on the overall system needs.

FIGURE 19-1: RTCC BLOCK DIAGRAM

PIC24FV32KA304 FAMILY

19.2 RTCC Module Registers

The RTCC module registers are organized into three categories:

- RTCC Control Registers
- RTCC Value Registers
- Alarm Value Registers

19.2.1 REGISTER MAPPING

To limit the register interface, the RTCC Timer and Alarm Time registers are accessed through corresponding register pointers. The RTCC Value Register Window (RTCVALH and RTCVALL) uses the RTCPTR bits (RCFGCAL<9:8>) to select the desired Timer register pair (see [Table 19-1](#)).

By writing the RTCVALH byte, the RTCC Pointer value, the RTCPTR<1:0> bits decrement by one until they reach '00'. Once they reach '00', the MINUTES and SECONDS value will be accessible through RTCVALH and RTCVALL until the pointer value is manually changed.

TABLE 19-1: RTCVAL REGISTER MAPPING

| RTCPTR<1:0> | RTCC Value Register Window | |
|-------------|----------------------------|-------------|
| | RTCVAL<15:8> | RTCVAL<7:0> |
| 00 | MINUTES | SECONDS |
| 01 | WEEKDAY | HOURS |
| 10 | MONTH | DAY |
| 11 | — | YEAR |

The Alarm Value Register Window (ALRMVALH and ALRMVALL) uses the ALRMPTRx bits (ALCFGAL<9:8>) to select the desired Alarm register pair (see [Table 19-2](#)).

By writing the ALRMVALH byte, the Alarm Pointer value (ALRMPTR<1:0> bits) decrements by one until they reach '00'. Once they reach '00', the ALRMMIN and ALRMSEC value will be accessible through ALRMVALH and ALRMVALL, until the pointer value is manually changed.

EXAMPLE 19-1: SETTING THE RTCWREN BIT

```
asm volatile ("push w7");
asm volatile ("push w8");
asm volatile ("disi #5");
asm volatile ("mov #0x55, w7");
asm volatile ("mov w7, _NVMKEY");
asm volatile ("mov #0xAA, w8");
asm volatile ("mov w8, _NVMKEY");
asm volatile ("bset _RCFGCAL, #13"); //set the RTCWREN bit
asm volatile ("pop w8");
asm volatile ("pop w7");
```

TABLE 19-2: ALRMVAL REGISTER MAPPING

| ALRMPTR <1:0> | Alarm Value Register Window | |
|------------------|-----------------------------|--------------|
| | ALRMVAL<15:8> | ALRMVAL<7:0> |
| 00 | ALRMMIN | ALRMSEC |
| 01 | ALRMWD | ALRMHR |
| 10 | ALRMMNTH | ALRMDAY |
| 11 | PWCSTAB | PWCSTAMP |

Considering that the 16-bit core does not distinguish between 8-bit and 16-bit read operations, the user must be aware that when reading either the ALRMVALH or ALRMVALL bytes, the ALRMPTR<1:0> value will be decremented. The same applies to the RTCVALH or RTCVALL bytes with the RTCPTR<1:0> being decremented.

Note: This only applies to read operations and not write operations.

19.2.2 WRITE LOCK

In order to perform a write to any of the RTCC Timer registers, the RTCWREN bit (RCFPWC<13>) must be set (see [Example 19-1](#)).

Note: To avoid accidental writes to the timer, it is recommended that the RTCWREN bit (RCFPWC<13>) is kept clear at any other time. For the RTCWREN bit to be set, there is only one instruction cycle time window allowed between the 55h/AA sequence and the setting of RTCWREN. Therefore, it is recommended that code follow the procedure in [Example 19-1](#).

19.2.3 SELECTING RTCC CLOCK SOURCE

There are four reference source clock options that can be selected for the RTCC using the RTCCSEL<1:0> bits: 00 = Secondary Oscillator, 01 = LPRC, 10 = 50 Hz External Clock and 11 = 60 Hz External Clock.

| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

- bit 15 **RTCEN:** RTCC Enable bit⁽²⁾
 1 = RTCC module is enabled
 0 = RTCC module is disabled
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **RTCWREN:** RTCC Value Registers Write Enable bit
 1 = RTCVALH and RTCVALL registers can be written to by the user
 0 = RTCVALH and RTCVALL registers are locked out from being written to by the user
- bit 12 **RTCSYNC:** RTCC Value Registers Read Synchronization bit
 1 = RTCVALH, RTCVALL and ALCFGRPT registers can change while reading due to a rollover ripple resulting in an invalid data read. If the register is read twice and results in the same data, the data can be assumed to be valid.
 0 = RTCVALH, RTCVALL or ALCFGRPT registers can be read without concern over a rollover ripple
- bit 11 **HALFSEC:** Half Second Status bit⁽³⁾
 1 = Second half period of a second
 0 = First half period of a second
- bit 10 **RTCOE:** RTCC Output Enable bit
 1 = RTCC output is enabled
 0 = RTCC output is disabled
- bit 9-8 **RTCPTR<1:0>:** RTCC Value Register Window Pointer bits
 Points to the corresponding RTCC Value registers when reading the RTCVALH and RTCVALL registers. The RTCPTR<1:0> value decrements on every read or write of RTCVALH until it reaches '00'.
 RTCVAL<15:8>:
 00 = MINUTES
 01 = WEEKDAY
 10 = MONTH
 11 = Reserved
 RTCVAL<7:0>:
 00 = SECONDS
 01 = HOURS
 10 = DAY
 11 = YEAR

- Note 1:** The RCFGAL register is only affected by a POR.
2: A write to the RTCEN bit is only allowed when RTCWREN = 1.
3: This bit is read-only; it is cleared to '0' on a write to the lower half of the MINSEC register.

PIC24FV32KA304 FAMILY

REGISTER 19-1: RCFGAL: RTCC CALIBRATION AND CONFIGURATION REGISTER⁽¹⁾ (CONTINUED)

bit 7-0 **CAL<7:0>**: RTC Drift Calibration bits

- 01111111 = Maximum positive adjustment; adds 508 RTC clock pulses every one minute
-
-
- 00000001 = Minimum positive adjustment; adds 4 RTC clock pulses every one minute
- 00000000 = No adjustment
- 11111111 = Minimum negative adjustment; subtracts 4 RTC clock pulses every one minute
-
-
- 10000000 = Maximum negative adjustment; subtracts 512 RTC clock pulses every one minute

- Note 1:** The RCFGAL register is only affected by a POR.
- 2:** A write to the RTCEN bit is only allowed when RTCWREN = 1.
- 3:** This bit is read-only; it is cleared to '0' on a write to the lower half of the MINSEC register.

 1 = Power control is enabled
 0 = Power control is disabled
- bit 14 **PWCPOL:** Power Control Polarity bit
 1 = Power control output is active-high
 0 = Power control output is active-low
- bit 13 **PWCCPRE:** Power Control Control/Stability Prescaler bits
 1 = PWC stability window clock is divide-by-2 of source RTCC clock
 0 = PWC stability window clock is divide-by-1 of source RTCC clock
- bit 12 **PWCSPRE:** Power Control Sample Prescaler bits
 1 = PWC sample window clock is divide-by-2 of source RTCC clock
 0 = PWC sample window clock is divide-by-1 of source RTCC clock
- bit 11-10 **RTCCLK<1:0>:** RTCC Clock Select bits⁽²⁾
 Determines the source of the internal RTCC clock, which is used for all RTCC timer operations.
 00 = External Secondary Oscillator (SOSC)
 01 = Internal LPRC Oscillator
 10 = External power line source – 50 Hz
 11 = External power line source – 60 Hz
- bit 9-8 **RTCOUT<1:0>:** RTCC Output Select bits
 Determines the source of the RTCC pin output.
 00 = RTCC alarm pulse
 01 = RTCC seconds clock
 10 = RTCC clock
 11 = Power control
- bit 7-0 **Unimplemented:** Read as '0'

Note 1: The RTCPWC register is only affected by a POR.

2: When a new value is written to these register bits, the Seconds Value register should also be written to properly reset the clock prescalers in the RTCC.

11111111 = Stability window is 255 TPWCCLK clock periods

-
-
-

00000000 = Stability window is 0 TPWCCLK clock periods

The sample window starts when the alarm event triggers. The stability window timer starts counting from every alarm event when PWCEN = 1.

bit 7-0 **PWCSAMP<7:0>**: PWM Sample Window Timer bits

11111111 = Sample window is always enabled, even when PWCEN = 0

11111110 = Sample window is 254 TPWCCLK clock periods

-
-
-

00000000 = Sample window is 0 TPWCCLK clock periods

The sample window timer starts counting at the end of the stability window when PWCEN = 1. If PWCSTAB<7:0> = 00000000, the sample window timer starts counting from every alarm event when PWCEN = 1.

Note 1: A write to this register is only allowed when RTCWREN = 1.

PIC24FV32KA304 FAMILY

19.3 Calibration

The real-time crystal input can be calibrated using the periodic auto-adjust feature. When properly calibrated, the RTCC can provide an error of less than 3 seconds per month. This is accomplished by finding the number of error clock pulses and storing the value into the lower half of the RCFGAL register. The 8-bit signed value, loaded into the lower half of RCFGAL, is multiplied by four and will be either added or subtracted from the RTCC timer, once every minute. Refer to the steps below for RTCC calibration:

1. Using another timer resource on the device, the user must find the error of the 32.768 kHz crystal.
2. Once the error is known, it must be converted to the number of error clock pulses per minute.
3. a) If the oscillator is faster than ideal (negative result from Step 2), the RCFGAL register value must be negative. This causes the specified number of clock pulses to be subtracted from the timer counter, once every minute.
b) If the oscillator is slower than ideal (positive result from Step 2), the RCFGAL register value must be positive. This causes the specified number of clock pulses to be subtracted from the timer counter, once every minute.

EQUATION 19-1:

$$\frac{(\text{Ideal Frequency} \uparrow - \text{Measured Frequency}) * 60}{\text{Clocks per Minute}} \\ \uparrow \text{Ideal Frequency} = 32,768 \text{ Hz}$$

Writes to the lower half of the RCFGAL register should only occur when the timer is turned off, or immediately after the rising edge of the seconds pulse, except when SECONDS = 00, 15, 30 or 45. This is due to the auto-adjust of the RTCC at 15 second intervals.

Note: It is up to the user to include, in the error value, the initial error of the crystal: drift due to temperature and drift due to crystal aging.

19.4 Alarm

- Configurable from half second to one year
- Enabled using the ALRMEN bit (ALCFGRPT<15>)
- One-time alarm and repeat alarm options are available

19.4.1 CONFIGURING THE ALARM

The alarm feature is enabled using the ALRMEN bit. This bit is cleared when an alarm is issued. Writes to ALRMVAL should only take place when ALRMEN = 0.

As shown in [Figure 19-2](#), the interval selection of the alarm is configured through the AMASKx bits (ALCFGRPT<13:10>). These bits determine which and how many digits of the alarm must match the clock value for the alarm to occur.

The alarm can also be configured to repeat based on a preconfigured interval. The amount of times this occurs, once the alarm is enabled, is stored in the ARPT<7:0> bits (ALCFGRPT<7:0>). When the value of the ARPTx bits equals 00h and the CHIME bit (ALCFGRPT<14>) is cleared, the repeat function is disabled, and only a single alarm will occur. The alarm can be repeated up to 255 times by loading ARPT<7:0> with FFh.

After each alarm is issued, the value of the ARPTx bits is decremented by one. Once the value has reached 00h, the alarm will be issued one last time, after which, the ALRMEN bit will be cleared automatically and the alarm will turn off.

Indefinite repetition of the alarm can occur if the CHIME bit = 1. Instead of the alarm being disabled when the value of the ARPTx bits reaches 00h, it rolls over to FFh and continues counting indefinitely while CHIME is set.

19.4.2 ALARM INTERRUPT

At every alarm event, an interrupt is generated. In addition, an alarm pulse output is provided that operates at half the frequency of the alarm. This output is completely synchronous to the RTCC clock and can be used as a trigger clock to other peripherals.

Note: Changing any of the registers, other than the RCFGAL and ALCFGRPT registers, and the CHIME bit while the alarm is enabled (ALRMEN = 1), can result in a false alarm event leading to a false alarm interrupt. To avoid a false alarm event, the timer and alarm values should only be changed while the alarm is disabled (ALRMEN = 0). It is recommended that the ALCFGRPT register and CHIME bit be changed when RTCSYNC = 0.

FIGURE 19-2: ALARM MASK SETTINGS

Note 1: Annually, except when configured for February 29.

19.5 POWER CONTROL

The RTCC includes a power control feature that allows the device to periodically wake-up an external device, wait for the device to be stable before sampling wake-up events from that device and then shut down the external device. This can be done completely autonomously by the RTCC, without the need to wake from the current low-power mode (Sleep, Deep Sleep, etc.).

To enable this feature, the RTCC must be enabled (RTCCEN = 1), the PWCEN register bit must be set and the RTCC pin must be driving the PWC control signal (RTCCOE = 1 and RTCOUT<1:0> = 11).

The polarity of the PWC control signal may be chosen using the PWC POL register bit. Active-low or active-high may be used with the appropriate external switch to turn on or off the power to one or more external devices. The active-low setting may also be used in conjunction with an open-drain setting on the RTCC pin. This setting is able to drive the GND pin(s) of the external device directly (with the appropriate external VDD pull-up device), without the need for external switches. Finally, the CHIME bit should be set to enable the PWC periodicity.

PIC24FV32KA304 FAMILY

NOTES:

20.0 32-BIT PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the “dsPIC33/PIC24 Family Reference Manual”, “32-Bit Programmable Cyclic Redundancy Check (CRC)” (DS30009729).

The programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-programmable CRC polynomial equation, up to 32 bits
- Programmable shift direction (little or big-endian)
- Independent data and polynomial lengths
- Configurable interrupt output
- Data FIFO

A simplified block diagram of the CRC generator is shown in [Figure 20-1](#). A simple version of the CRC shift engine is shown in [Figure 20-2](#).

FIGURE 20-1: CRC BLOCK DIAGRAM

FIGURE 20-2: CRC SHIFT ENGINE DETAIL

PIC24FV32KA304 FAMILY

20.1 User Interface

20.1.1 POLYNOMIAL INTERFACE

The CRC module can be programmed for CRC polynomials of up to the 32nd order, using up to 32 bits. Polynomial length, which reflects the highest exponent in the equation, is selected by the PLEN<4:0> bits (CRCCON2<4:0>).

The CRCXORL and CRCXORH registers control which exponent terms are included in the equation. Setting a particular bit includes that exponent term in the equation. Functionally, this includes an XOR operation on the corresponding bit in the CRC engine. Clearing this bit disables the XOR.

For example, consider two CRC polynomials, one is a 16-bit equation and the other is a 32-bit equation:

| |
|---|
| $x^{16} + x^{12} + x^5 + 1$ |
| <p style="text-align: center;">and</p> |
| $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ |

To program these polynomials into the CRC generator, set the register bits, as shown in [Table 20-1](#).

Note that the appropriate positions are set to '1' to indicate that they are used in the equation (for example, X26 and X23). The 0 bit required by the equation is always XORed; thus, X0 is a don't care. For a polynomial of length, N, it is assumed that the Mth bit will always be used, regardless of the bit setting. Therefore, for a polynomial length of 32, there is no 32nd bit in the CRCXOR register.

20.1.2 DATA INTERFACE

The module incorporates a FIFO that works with a variable data width. Input data width can be configured to any value, between 1 and 32 bits, using the DWIDTH<4:0> bits (CRCCON2<12:8>). When the data width is greater than 15, the FIFO is 4 words deep. When the DWIDTHx value is between 15 and 8, the FIFO is 8 words deep. When the DWIDTHx value is less than 8, the FIFO is 16 words deep.

The data for which the CRC is to be calculated must first be written into the FIFO. Even if the data width is less than 8, the smallest data element that can be written into the FIFO is one byte. For example, if the DWIDTHx value is 5, then the size of the data is DWIDTHx + 1 or 6. The data is written as a whole byte; the two unused upper bits are ignored by the module.

Once data is written into the MSb of the CRCDAT registers (that is, MSb as defined by the data width), the value of the VWORD<4:0> bits (CRCCON1<12:8>) increments by one. For example, if the DWIDTHx value is 24, the VWORDx bits will increment when bit 7 of CRCDATH is written. Therefore, CRCDATL must always be written before CRCDATH.

The CRC engine starts shifting data when the CRCGO bit is set and the value of the VWORDx bits is greater than zero. Each word is copied out of the FIFO into a buffer register, which decrements VWORDx. The data is then shifted out of the buffer. The CRC engine continues shifting at a rate of two bits per instruction cycle until the VWORDx value reaches zero. This means that for a given data width, it takes half that number of instructions for each word to complete the calculation. For example, it takes 16 cycles to calculate the CRC for a single word of 32-bit data.

When the VWORDx value reaches the maximum value for the configured value of DWIDTHx (4, 8 or 16), the CRCFUL bit becomes set. When the VWORDx value reaches zero, the CRCMPT bit becomes set. The FIFO is emptied and the VWORD<4:0> bits are set to '00000' whenever CRGEN is '0'.

At least one instruction cycle must pass, after a write to CRCDAT, before a read of the VWORDx bits is done.

TABLE 20-1: CRC SETUP EXAMPLES FOR 16 AND 32-BIT POLYNOMIAL

| CRC Control Bits | Bit Values | |
|------------------|---------------------|---------------------|
| | 16-Bit Polynomial | 32-Bit Polynomial |
| PLEN<4:0> | 01111 | 11111 |
| X<31:16> | 0000 0000 0000 000x | 0000 0100 1100 0001 |
| X<15:0> | 0001 0000 0010 000x | 0001 1101 1011 011x |

20.1.3 DATA SHIFT DIRECTION

The LENDIAN bit (CRCCON1<3>) is used to control the shift direction. By default, the CRC will shift data through the engine, MSb first. Setting LENDIAN (= 1) causes the CRC to shift data, LSb first. This setting allows better integration with various communication schemes and removes the overhead of reversing the bit order in software. Note that this only changes the direction of the data that is shifted into the engine. The result of the CRC calculation will still be a normal CRC result, not a reverse CRC result.

20.1.4 INTERRUPT OPERATION

The module generates an interrupt that is configurable by the user for either of two conditions. If CRCISEL is '0', an interrupt is generated when the VWORD<4:0> bits make a transition from a value of '1' to '0'. If CRCISEL is '1', an interrupt will be generated after the CRC operation finishes and the module sets the CRCGO bit to '0'. Manually setting CRCGO to '0' will not generate an interrupt.

20.1.5 TYPICAL OPERATION

To use the module for a typical CRC calculation:

1. Set the CRCEN bit to enable the module.
2. Configure the module for the desired operation:
 - a) Program the desired polynomial using the CRCXORL and CRCXORH registers, and the PLEN<4:0> bits.
 - b) Configure the data width and shift direction using the DWIDTHx and LENDIAN bits.
 - c) Select the desired interrupt mode using the CRCISEL bit.
3. Preload the FIFO by writing to the CRCDATL and CRCDATH registers until the CRCFUL bit is set or no data is left.
4. Clear old results by writing 00h to CRCWDATL and CRCWDATH. CRCWDAT can also be left unchanged to resume a previously halted calculation.
5. Set the CRCGO bit to start calculation.
6. Write the remaining data into the FIFO as space becomes available.
7. When the calculation completes, CRCGO is automatically cleared. An interrupt will be generated if CRCISEL = 1.
8. Read CRCWDATL and CRCWDATH for the result of the calculation.

20.2 Registers

There are eight registers associated with the module:

- CRCCON1
- CRCCON2
- CRCXORL
- CRCXORH
- CRCDATL
- CRCDATH
- CRCWDATL
- CRCWDATH

The CRCCON1 and CRCCON2 registers ([Register 20-1](#) and [Register 20-2](#)) control the operation of the module, and configure the various settings. The CRCXOR registers ([Register 20-3](#) and [Register 20-4](#)) select the polynomial terms to be used in the CRC equation. The CRCDAT and CRCWDAT registers are each register pairs that serve as buffers for the double-word, input data and CRC processed output, respectively.

21.0 HIGH/LOW-VOLTAGE DETECT (HLVD)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the High/Low-Voltage Detect, refer to the “dsPIC33/PIC24 Family Reference Manual”, Section 36. “High-Level Integration with Programmable High/Low-Voltage Detect (HLVD)” (DS39725).

An interrupt flag is set if the device experiences an excursion past the trip point in the direction of change. If the interrupt is enabled, the program execution will branch to the interrupt vector address and the software can then respond to the interrupt.

The HLVD Control register (see Register 21-1) completely controls the operation of the HLVD module. This allows the circuitry to be “turned off” by the user under software control, which minimizes the current consumption for the device.

The High/Low-Voltage Detect module (HLVD) is a programmable circuit that allows the user to specify both the device voltage trip point and the direction of change.

22.0 12-BIT A/D CONVERTER WITH THRESHOLD DETECT

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the 12-Bit A/D Converter with Threshold Detect, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**12-Bit A/D Converter with Threshold Detect**” (DS39739).

The PIC24F 12-bit A/D Converter has the following key features:

- Successive Approximation Register (SAR) Conversion
- Conversion Speeds of up to 100 ksps
- Up to 32 Analog Input Channels (Internal and External)
- Multiple Internal Reference Input Channels
- External Voltage Reference Input Pins
- Unipolar Differential Sample-and-Hold (S/H) Amplifier
- Automated Threshold Scan and Compare Operation to Pre-Evaluate Conversion Results
- Selectable Conversion Trigger Source
- Fixed-Length (one word per channel), Configurable Conversion Result Buffer
- Four Options for Results Alignment
- Configurable Interrupt Generation
- Operation During CPU Sleep and Idle modes

The 12-bit A/D Converter module is an enhanced version of the 10-bit module offered in some PIC24 devices. Both modules are Successive Approximation Register (SAR) converters at their cores, surrounded by a range of hardware features for flexible configuration. This version of the module extends functionality by providing 12-bit resolution, a wider range of automatic sampling options and tighter integration with other analog modules, such as the CTMU and a configurable results buffer. This module also includes a unique Threshold Detect feature that allows the module itself to make simple decisions based on the conversion results.

A simplified block diagram for the module is illustrated in [Figure 22-1](#).

PIC24FV32KA304 FAMILY

FIGURE 22-1: 12-BIT A/D CONVERTER BLOCK DIAGRAM

PIC24FV32KA304 FAMILY

To perform an A/D conversion:

1. Configure the A/D module:
 - a) Configure the port pins as analog inputs and/or select band gap reference inputs (ANS<12:10>, ANS<5:0>).
 - b) Select voltage reference source to match the expected range on the analog inputs (AD1CON2<15:13>).
 - c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
 - d) Select the appropriate sample/conversion sequence (AD1CON1<7:4> and AD1CON3<12:8>).
 - e) Select how conversion results are presented in the buffer (AD1CON1<9:8>).
 - f) Select the interrupt rate (AD1CON2<6:2>).
 - g) Turn on the A/D module (AD1CON1<15>).
2. Configure the A/D interrupt (if required):
 - a) Clear the AD1IF bit.
 - b) Select the A/D interrupt priority.

To perform an A/D sample and conversion using Threshold Detect scanning:

1. Configure the A/D module:
 - a) Configure the port pins as analog inputs (ANS<12:10>, ANS<5,0>).
 - b) Select the voltage reference source to match the expected range on the analog inputs (AD1CON2<15:13>).
 - c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
 - d) Select the appropriate sample/conversion sequence (AD1CON1<7:4>, AD1CON3<12:8>).
 - e) Select how the conversion results are presented in the buffer (AD1CON1<9:8>).
 - f) Select the interrupt rate (AD1CON2<6:2>).
2. Configure the threshold compare channels:
 - a) Enable auto-scan – ASEN bit (AD1CON5<15>).
 - b) Select the Compare mode, “Greater Than, Less Than or Windowed” – CMx bits (AD1CON5<1:0>).
 - c) Select the threshold compare channels to be scanned (ADCSSH, ADCSSL).
 - d) If the CTMU is required as a current source for a threshold compare channel, enable the corresponding CTMU channel (ADCCTMUENH, ADCCTMUENL).
 - e) Write the threshold values into the corresponding ADC1BUF_n registers.
 - f) Turn on the A/D module (AD1CON1<15>).

| |
|---|
| Note: If performing an A/D sample and conversion using Threshold Detect in Sleep Mode, the RC A/D clock source must be selected before entering into Sleep mode. |
|---|

3. Configure the A/D interrupt (OPTIONAL):
 - a) Clear the AD1IF bit.
 - b) Select the A/D interrupt priority.

PIC24FV32KA304 FAMILY

22.1 A/D Control Registers

The 12-bit A/D Converter module uses up to 43 registers for its operation. All registers are mapped in the data memory space.

22.1.1 CONTROL REGISTERS

Depending on the specific device, the module has up to eleven control and status registers:

- AD1CON1: A/D Control Register 1
- AD1CON2: A/D Control Register 2
- AD1CON3: A/D Control Register 3
- AD1CON5: A/D Control Register 5
- AD1CHS: A/D Sample Select Register
- AD1CHITH and AD1CHITL: A/D Scan Compare Hit Registers
- AD1CSSL and AD1CSSH: A/D Input Scan Select Registers
- AD1CTMUENH and AD1CTMUENL: CTMU Enable Registers

The AD1CON1, AD1CON2 and AD1CON3 registers ([Register 22-1](#), [Register 22-2](#) and [Register 22-3](#)) control the overall operation of the A/D module. This includes enabling the module, configuring the conversion clock and voltage reference sources, selecting the sampling and conversion triggers, and manually controlling the sample/convert sequences. The AD1CON5 register ([Register 22-4](#)) specifically controls features of the Threshold Detect operation, including its function in power-saving modes.

The AD1CHS register ([Register 22-5](#)) selects the input channels to be connected to the S/H amplifier. It also allows the choice of input multiplexers and the selection of a reference source for differential sampling.

The AD1CHITH and AD1CHITL registers ([Register 22-6](#) and [Register 22-7](#)) are semaphore registers used with Threshold Detect operations. The status of individual bits, or bit pairs in some cases,

indicate if a match condition has occurred. AD1CHITL is always implemented, whereas AD1CHITH may not be implemented in devices with 16 or fewer channels.

The AD1CSSH/L registers ([Register 22-8](#) and [Register 22-9](#)) select the channels to be included for sequential scanning.

The AD1CTMUENH/L registers ([Register 22-10](#) and [Register 22-11](#)) select the channel(s) to be used by the CTMU during conversions. Selecting a particular channel allows the A/D Converter to control the CTMU (particularly, its current source) and read its data through that channel. AD1CTMUENL is always implemented, whereas AD1CTMUENH may not be implemented in devices with 16 or fewer channels.

22.1.2 A/D RESULT BUFFERS

The module incorporates a multi-word, dual port RAM, called ADC1BUF. The buffer is composed of at least the same number of word locations as there are external analog channels for a particular device, with a maximum number of 32. The number of buffer addresses is always even. Each of the locations is mapped into the data memory space and is separately addressable. The buffer locations are referred to as ADC1BUF0 through ADC1BUF n (up to 31).

The A/D result buffers are both readable and writable. When the module is active (AD1CON<15> = 1), the buffers are read-only, and store the results of A/D conversions. When the module is inactive (AD1CON<15> = 0), the buffers are both readable and writable. In this state, writing to a buffer location programs a conversion threshold for Threshold Detect operations.

Buffer contents are not cleared when the module is deactivated with the ADON bit (AD1CON1<15>). Conversion results and any programmed threshold values are maintained when ADON is set or cleared.

PIC24FV32KA304 FAMILY

22.2 A/D Sampling Requirements

The analog input model of the 12-bit A/D Converter is shown in Figure 22-2. The total sampling time for the A/D is a function of the holding capacitor charge time.

For the A/D Converter to meet its specified accuracy, the Charge Holding Capacitor (CHOLD) must be allowed to fully charge to the voltage level on the analog input pin. The Source (R_s) impedance, the Interconnect (R_{IC}) impedance and the internal Sampling Switch (R_{SS}) impedance combine to directly affect the time required to charge CHOLD. The combined impedance of the analog sources must, therefore, be small enough to fully charge the holding capacitor within the chosen sample time. To minimize the effects of pin leakage currents on the accuracy of the A/D Converter, the maximum recommended Source impedance, R_s , is 2.5 k Ω . After the analog input channel is selected (changed), this

sampling function must be completed prior to starting the conversion. The internal holding capacitor will be in a discharged state prior to each sample operation.

At least 1 TAD time period should be allowed between conversions for the sample time. For more details, see Section 29.0 “Electrical Characteristics”.

EQUATION 22-1: A/D CONVERSION CLOCK PERIOD

$$T_{AD} = T_{CY}(ADCS + 1)$$

$$ADCS = \frac{T_{AD}}{T_{CY}} - 1$$

Note: Based on $T_{CY} = 2/F_{OSC}$; Doze mode and PLL are disabled.

FIGURE 22-2: 12-BIT A/D CONVERTER ANALOG INPUT MODEL

22.3 Transfer Function

The transfer functions of the A/D Converter in 12-bit resolution are shown in Figure 22-3. The difference of the input voltages, $(V_{INH} - V_{INL})$, is compared to the reference, $((V_{R+}) - (V_{R-}))$.

- The first code transition occurs when the input voltage is $((V_{R+}) - (V_{R-}))/4096$ or 1.0 LSB.
- The '0000 0000 0001' code is centered at $V_{R-} + (1.5 * ((V_{R+}) - (V_{R-}))/4096)$.
- The '0010 0000 0000' code is centered at $V_{REFL} + (2048.5 * ((V_{R+}) - (V_{R-}))/4096)$.
- An input voltage less than $V_{R-} + (((V_{R-}) - (V_{R-}))/4096)$ converts as '0000 0000 0000'.
- An input voltage greater than $(V_{R-}) + (4095 * ((V_{R+}) - (V_{R-}))/4096)$ converts as '1111 1111 1111'.

FIGURE 22-3: 12-BIT A/D TRANSFER FUNCTION

PIC24FV32KA304 FAMILY

22.4 Buffer Data Formats

The A/D conversions are fully differential 12-bit values when MODE12 = 1 (AD1CON1<10>) and 10-bit values when MODE12 = 0. When absolute fractional or absolute integer formats are used, the results are 12 or 10 bits wide, respectively. When signed decimal formatting is used, the conversion also includes a sign bit, making 12-bit conversions 13 bits wide, and 10-bit

conversions 11 bits wide. The signed decimal format yields 12-bit and 10-bit values, respectively. The sign bit (bit 12 or bit 10) is sign-extended to fill the buffer. The FORM<1:0> bits (AD1CON1<9:8>) select the format. Figure 22-4 and Figure 22-5 show the data output formats that can be selected. Table 22-1 through Table 22-4 show the numerical equivalents for the various conversion result codes.

23.0 COMPARATOR MODULE

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Comparator module, refer to the “dsPIC33/PIC24 Family Reference Manual”, “**Scalable Comparator Module**” (DS39734).

The comparator module provides three dual input comparators. The inputs to the comparator can be configured to use any one of four external analog inputs, as well as a voltage reference input from either the internal band gap reference, divided by 2 ($V_{BG}/2$), or the comparator voltage reference generator.

The comparator outputs may be directly connected to the CxOUT pins. When the respective COE equals ‘1’, the I/O pad logic makes the unsynchronized output of the comparator available on the pin.

A simplified block diagram of the module is shown in Figure 23-1. Diagrams of the possible individual comparator configurations are shown in Figure 23-2.

Each comparator has its own control register, CMxCON (Register 23-1), for enabling and configuring its operation. The output and event status of all three comparators is provided in the CMSTAT register (Register 23-2).

24.0 COMPARATOR VOLTAGE REFERENCE

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Comparator Voltage Reference, refer to the “dsPIC33/PIC24 Family Reference Manual”, “**Comparator Voltage Reference Module**” (DS39709).

24.1 Configuring the Comparator Voltage Reference

The comparator voltage reference module is controlled through the CVRCON register ([Register 24-1](#)). The comparator voltage reference provides a range of output voltages, with 32 distinct levels.

The comparator voltage reference supply voltage can come from either VDD and VSS or the external VREF+ and VREF-. The voltage source is selected by the CVRSS bit (CVRCON<5>).

The settling time of the comparator voltage reference must be considered when changing the CVREF output.

When CVRSS = 0:

$\text{CVREF} = (\text{AVSS}) + (\text{CVR}<4:0>/32) \cdot (\text{AVDD} - \text{AVSS})$

25.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Charge Measurement Unit, refer to the “dsPIC33/PIC24 Family Reference Manual”, “Charge Time Measurement Unit (CTMU) and CTMU Operation with Threshold Detect” (DS30009743).

The Charge Time Measurement Unit (CTMU) is a flexible analog module that provides charge measurement, accurate differential time measurement between pulse sources and asynchronous pulse generation. Its key features include:

- Thirteen external edge input trigger sources
- Polarity control for each edge source
- Control of edge sequence
- Control of response to edge levels or edge transitions
- Time measurement resolution of one nanosecond
- Accurate current source suitable for capacitive measurement

Together with other on-chip analog modules, the CTMU can be used to precisely measure time, measure capacitance, measure relative changes in capacitance or generate output pulses that are independent of the system clock. The CTMU module is ideal for interfacing with capacitive-based touch sensors.

The CTMU is controlled through three registers: CTMUCON1, CTMUCON2 and CTMUICON. CTMUCON1 enables the module and controls the mode of operation of the CTMU, as well as controlling edge sequencing. CTMUCON2 controls edge source selection and edge source polarity selection. The CTMUICON register selects the current range of current source and trims the current.

25.1 Measuring Capacitance

The CTMU module measures capacitance by generating an output pulse, with a width equal to the time between edge events, on two separate input channels. The pulse edge events to both input channels can be selected from several internal peripheral modules (OC1, Timer1, any input capture or comparator module) and up to 13 external pins (CTED1 through CTED13). This pulse is used with the module’s precision current source to calculate capacitance according to the relationship:

EQUATION 25-1:

$$I = C \cdot \frac{dV}{dT}$$

For capacitance measurements, the A/D Converter samples an external capacitor (CAPP) on one of its input channels after the CTMU output’s pulse. A Precision Resistor (RPR) provides current source calibration on a second A/D channel. After the pulse ends, the converter determines the voltage on the capacitor. The actual calculation of capacitance is performed in software by the application.

Figure 25-1 illustrates the external connections used for capacitance measurements, and how the CTMU and A/D modules are related in this application. This example also shows the edge events coming from Timer1, but other configurations using external edge sources are possible. A detailed discussion on measuring capacitance and time with the CTMU module is provided in the “dsPIC33/PIC24 Family Reference Manual”.

PIC24FV32KA304 FAMILY

FIGURE 25-1: TYPICAL CONNECTIONS AND INTERNAL CONFIGURATION FOR CAPACITANCE MEASUREMENT

25.2 Measuring Time

Time measurements on the pulse width can be similarly performed using the A/D module's Internal Capacitor (CAD) and a precision resistor for current calibration. Figure 25-2 displays the external connections used for

time measurements, and how the CTMU and A/D modules are related in this application. This example also shows both edge events coming from the external CTEDx pins, but other configurations using internal edge sources are possible.

FIGURE 25-2: TYPICAL CONNECTIONS AND INTERNAL CONFIGURATION FOR TIME MEASUREMENT

25.3 Pulse Generation and Delay

The CTMU module can also generate an output pulse with edges that are not synchronous with the device's system clock. More specifically, it can generate a pulse with a programmable delay from an edge event input to the module.

When the module is configured for pulse generation delay by setting the TGEN bit (CTMUCON<12>), the internal current source is connected to the B input of Comparator 2. A capacitor (CDELAY) is connected to the Comparator 2 pin, C2INB, and the Comparator Voltage Reference, CVREF, is connected to C2INA. CVREF is then configured for a specific trip point. The module begins to charge CDELAY when an edge event is detected. While CVREF is greater than the voltage on CDELAY, CTPLS is high. When the voltage on CDELAY equals CVREF, CTPLS goes low. With Comparator 2 configured as the second edge, this stops the CTMU from charging. In this state event, the CTMU automatically connects to ground. The IDISSEN bit doesn't need to be set and cleared before the next CTPLS cycle.

When the voltage on CDELAY equals CVREF, CTPLS goes low. With Comparator 2 configured as the second edge, this stops the CTMU from charging. In this state event, the CTMU automatically connects to ground. The IDISSEN bit doesn't need to be set and cleared before the next CTPLS cycle.

Figure 25-3 illustrates the external connections for pulse generation, as well as the relationship of the different analog modules required. While CTED1 is shown as the input pulse source, other options are available. A detailed discussion on pulse generation with the CTMU module is provided in the "dsPIC33/PIC24 Family Reference Manual".

NOTES:

26.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Watchdog Timer, High-Level Device Integration and Programming Diagnostics, refer to the individual sections of the “dsPIC33/PIC24 Family Reference Manual” provided below:

- “**Watchdog Timer (WDT)**” (DS39697)
- “**High-Level Integration with Programmable High/Low-Voltage Detect (HLVD)**” (DS39725)
- **Section 33. “Programming and Diagnostics”** (DS39716)

PIC24FV32KA304 family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

26.1 Configuration Bits

The Configuration bits can be programmed (read as ‘0’), or left unprogrammed (read as ‘1’), to select various device configurations. These bits are mapped, starting at program memory location, F80000h. A complete list of Configuration register locations is provided in [Table 26-1](#). A detailed explanation of the various bit functions is provided in [Register 26-1](#) through [Register 26-8](#).

The address, F80000h, is beyond the user program memory space. In fact, it belongs to the configuration memory space (800000h-FFFFFFh), which can only be accessed using Table Reads and Table Writes.

TABLE 26-1: CONFIGURATION REGISTERS LOCATIONS

| Configuration Register | Address |
|------------------------|---------|
| FBS | F80000 |
| FGS | F80004 |
| FOSCSEL | F80006 |
| FOSC | F80008 |
| FWDT | F8000A |
| FPOR | F8000C |
| FICD | F8000E |
| FDS | F80010 |

PIC24FV32KA304 FAMILY

26.2 On-Chip Voltage Regulator

All of the PIC24FV32KA304 family devices power their core digital logic at a nominal 3.0V. This may create an issue for designs that are required to operate at a higher typical voltage, as high as 5.0V. To simplify system design, all devices in the “FV” family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator is always enabled and provides power to the core from the other VDD pins. A low-ESR capacitor (such as ceramic) must be connected to the VCAP pin (Figure 26-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is discussed in Section 2.4 “Voltage Regulator Pin (VCAP)”, and in Section 29.1 “DC Characteristics”.

For “F” devices, the regulator is disabled. Instead, core logic is powered directly from VDD. This allows the devices to operate at an overall lower allowable voltage range (1.8V-3.6V).

26.2.1 VOLTAGE REGULATOR TRACKING MODE AND LOW-VOLTAGE DETECTION

For all PIC24FV32KA304 devices, the on-chip regulator provides a constant voltage of 3.2V nominal to the digital core logic. The regulator can provide this level from a VDD of about 3.2V, all the way up to the device’s VDDMAX. It does not have the capability to boost VDD levels below 3.2V. In order to prevent “brown-out” conditions when the voltage drops too low for the regulator, the regulator enters Tracking mode. In Tracking mode, the regulator output follows VDD with a typical voltage drop of 150 mV.

When the device enters Tracking mode, it is no longer possible to operate at full speed. To provide information about when the device enters Tracking mode, the on-chip regulator includes a simple, High/Low-Voltage Detect (HLVD) circuit. When VDD drops below full-speed operating voltage, the circuit sets the High/Low-Voltage Detect Interrupt Flag, HLVDIF (IFS4<8>). This can be used to generate an interrupt and put the application into a low-power operational mode or trigger an orderly shutdown. Maximum device speeds as a function of VDD are shown in Section 29.1 “DC Characteristics”, in Figure 29-1 and Figure 29-1.

26.2.2 ON-CHIP REGULATOR AND POR

For PIC24FV32KA304 devices, it takes a brief time, designated as TPM, for the Voltage Regulator to generate a stable output. During this time, code execution is disabled. TPM (DC Specification SY71) is applied every time the device resumes operation after any power-down, including Sleep mode.

FIGURE 26-1: CONNECTIONS FOR THE ON-CHIP REGULATOR

26.3 Watchdog Timer (WDT)

For the PIC24FV32KA304 family of devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

The nominal WDT clock source from LPRC is 31 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the FWPSA Configuration bit. With a 31 kHz input, the prescaler yields a nominal WDT time-out period (TWDT) of 1 ms in 5-bit mode or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the Configuration bits, WDTPS<3:0> (FWDT<3:0>), which allow the selection of a total of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler time-out periods, ranging from 1 ms to 131 seconds, can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

If the WDT is enabled in hardware (FWDTEN<1:0> = 11), it will continue to run during Sleep or Idle modes. When the WDT time-out occurs, the device will wake and code execution will continue from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bit (RCON<3:2>) will need to be cleared in software after the device wakes up.

The WDT Flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

26.3.1 WINDOWED OPERATION

The Watchdog Timer has an optional Fixed Window mode of operation. In this Windowed mode, CLRWDT instructions can only reset the WDT during the last 1/4 of the programmed WDT period. A CLRWDT instruction executed before that window causes a WDT Reset, similar to a WDT time-out.

Windowed WDT mode is enabled by programming the Configuration bit, WINDIS (FWDT<6>), to '0'.

26.3.2 CONTROL REGISTER

The WDT is enabled or disabled by the FWDTEN<1:0> Configuration bits. When both the FWDTEN<1:0> Configuration bits are set, the WDT is always enabled.

The WDT can be optionally controlled in software when the FWDTEN<1:0> Configuration bits have been programmed to '10'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user to enable the WDT for critical code segments, and disable the WDT during non-critical segments, for maximum power savings. When the FWDTEN<1:0> bits are set to '01', the WDT is only enabled in Run and Idle modes, and is disabled in Sleep. Software control of the SWDTEN bit (RCON<5>) is disabled with this setting.

FIGURE 26-2: WDT BLOCK DIAGRAM

PIC24FV32KA304 FAMILY

26.4 Deep Sleep Watchdog Timer (DSWDT)

In PIC24FV32KA304 family devices, in addition to the WDT module, a DSWDT module is present which runs while the device is in Deep Sleep, if enabled. It is driven by either the SOSC or LPRC oscillator. The clock source is selected by the Configuration bit, DSWDTOSC (FDS<4>).

The DSWDT can be configured to generate a time-out, at 2.1 ms to 25.7 days, by selecting the respective postscaler. The postscaler can be selected by the Configuration bits, DSWDTPS<3:0> (FDS<3:0>). When the DSWDT is enabled, the clock source is also enabled.

DSWDT is one of the sources that can wake-up the device from Deep Sleep mode.

26.5 Program Verification and Code Protection

For all devices in the PIC24FV32KA304 family, code protection for the Boot Segment (BS) is controlled by the Configuration bit, BSS0, and the General Segment (GS) by the Configuration bit, GSS0. These bits inhibit external reads and writes to the program memory space. This has no direct effect in normal execution mode.

Write protection is controlled by bit, BWRP, for the Boot Segment and bit, GWRP, for the General Segment in the Configuration Word. When these bits are programmed to '0', internal write and erase operations to program memory are blocked.

26.6 In-Circuit Serial Programming

PIC24FV32KA304 family microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock (PGECx) and data (PGEDx), and three other lines for power, ground and the programming voltage. This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

26.7 In-Circuit Debugger

When MPLAB® ICD 3, MPLAB REAL ICE™ or PICKit™ 3 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx and PGEDx pins.

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, Vss, PGECx, PGEDx and the pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

27.0 DEVELOPMENT SUPPORT

The PIC[®] microcontrollers (MCU) and dsPIC[®] digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
 - MPLAB[®] X IDE Software
- Compilers/Assemblers/Linkers
 - MPLAB XC Compiler
 - MPASM[™] Assembler
 - MPLINK[™] Object Linker/
MPLIB[™] Object Librarian
 - MPLAB Assembler/Linker/Librarian for
Various Device Families
- Simulators
 - MPLAB X SIM Software Simulator
- Emulators
 - MPLAB REAL ICE[™] In-Circuit Emulator
- In-Circuit Debuggers/Programmers
 - MPLAB ICD 3
 - PICKit[™] 3
- Device Programmers
 - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards,
Evaluation Kits and Starter Kits
- Third-party development tools

27.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows[®], Linux and Mac OS[®] X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

PIC24FV32KA304 FAMILY

27.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16 and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

27.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

27.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

27.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

27.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

27.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

27.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

27.9 PICkit 3 In-Circuit Debugger/Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

27.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

PIC24FV32KA304 FAMILY

27.11 Demonstration/Development Boards, Evaluation Kits and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

27.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

28.0 INSTRUCTION SET SUMMARY

Note: This chapter is a brief summary of the PIC24F instruction set architecture and is not intended to be a comprehensive reference source.

The PIC24F instruction set adds many enhancements to the previous PIC[®] MCU instruction sets, while maintaining an easy migration from previous PIC MCU instruction sets. Most instructions are a single program memory word. Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction. The instruction set is highly orthogonal and is grouped into four basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- Control operations

Table 28-1 lists the general symbols used in describing the instructions. The PIC24F instruction set summary in Table 28-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value, 'f'
- The destination, which could either be the file register, 'f', or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement may use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by the value of 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The control instructions may use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

All instructions are a single word, except for certain double-word instructions, which were made double-word instructions so that all of the required information is available in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it will execute as a NOP.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the Program Counter (PC) is changed as a result of the instruction. In these cases, the execution takes two instruction cycles, with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all Table Reads and Writes, and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles.

Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles. The double-word instructions execute in two instruction cycles.

PIC24FV32KA304 FAMILY

TABLE 28-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

| Field | Description |
|-----------------|---|
| #text | Means literal defined by "text" |
| (text) | Means "content of text" |
| [text] | Means "the location addressed by text" |
| { } | Optional field or operation |
| <n:m> | Register bit field |
| .b | Byte mode selection |
| .d | Double-Word mode selection |
| .S | Shadow register select |
| .w | Word mode selection (default) |
| bit4 | 4-bit bit selection field (used in word addressed instructions) $\in \{0...15\}$ |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero |
| Expr | Absolute address, label or expression (resolved by the linker) |
| f | File register address $\in \{0000h...1FFFh\}$ |
| lit1 | 1-bit unsigned literal $\in \{0,1\}$ |
| lit4 | 4-bit unsigned literal $\in \{0...15\}$ |
| lit5 | 5-bit unsigned literal $\in \{0...31\}$ |
| lit8 | 8-bit unsigned literal $\in \{0...255\}$ |
| lit10 | 10-bit unsigned literal $\in \{0...255\}$ for Byte mode, $\{0:1023\}$ for Word mode |
| lit14 | 14-bit unsigned literal $\in \{0...16384\}$ |
| lit16 | 16-bit unsigned literal $\in \{0...65535\}$ |
| lit23 | 23-bit unsigned literal $\in \{0...8388608\}$; LSB must be '0' |
| None | Field does not require an entry, may be blank |
| PC | Program Counter |
| Slit10 | 10-bit signed literal $\in \{-512...511\}$ |
| Slit16 | 16-bit signed literal $\in \{-32768...32767\}$ |
| Slit6 | 6-bit signed literal $\in \{-16...16\}$ |
| Wb | Base W register $\in \{W0..W15\}$ |
| Wd | Destination W register $\in \{Wd, [Wd], [Wd++] , [Wd--], [++Wd], [--Wd] \}$ |
| Wdo | Destination W register $\in \{Wnd, [Wnd], [Wnd++] , [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] \}$ |
| Wm,Wn | Dividend, Divisor Working register pair (direct addressing) |
| Wn | One of 16 Working registers $\in \{W0..W15\}$ |
| Wnd | One of 16 destination Working registers $\in \{W0..W15\}$ |
| Wns | One of 16 source Working registers $\in \{W0..W15\}$ |
| WREG | W0 (Working register used in File register instructions) |
| Ws | Source W register $\in \{Ws, [Ws], [Ws++] , [Ws--], [++Ws], [--Ws] \}$ |
| Wso | Source W register $\in \{Wns, [Wns], [Wns++] , [Wns--], [++Wns], [--Wns], [Wns+Wb] \}$ |

PIC24FV32KA304 FAMILY

NOTES:

PIC24FV32KA304 FAMILY

29.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC24FV32KA304 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC24FV32KA304 family devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings^(†)

| | |
|--|-----------------------|
| Ambient temperature under bias | -40°C to +125°C |
| Storage temperature | -65°C to +150°C |
| Voltage on VDD with respect to VSS (PIC24FVXXKA30X) | -0.3V to +6.5V |
| Voltage on VDD with respect to VSS (PIC24FXXKA30X) | -0.3V to +4.5V |
| Voltage on any combined analog and digital pin with respect to VSS | -0.3V to (VDD + 0.3V) |
| Voltage on any digital only pin with respect to VSS | -0.3V to (VDD + 0.3V) |
| Voltage on MCLR/VPP pin with respect to VSS | -0.3V to +9.0V |
| Maximum current out of VSS pin | 300 mA |
| Maximum current into VDD pin ⁽¹⁾ | 250 mA |
| Maximum output current sunk by any I/O pin | 25 mA |
| Maximum output current sourced by any I/O pin | 25 mA |
| Maximum current sunk by all ports | 200 mA |
| Maximum current sourced by all ports ⁽¹⁾ | 200 mA |

Note 1: Maximum allowable current is a function of the device maximum power dissipation (see [Table 29-1](#)).

† **NOTICE:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

FIGURE 29-2: PIC24F32KA304 FAMILY VOLTAGE-FREQUENCY GRAPH (INDUSTRIAL AND EXTENDED)

PIC24FV32KA304 FAMILY

TABLE 29-1: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Typ | Max | Unit |
|--|--------------------|-------------------------------------|-----|------|------|
| Operating Junction Temperature Range | T _J | -40 | — | +140 | °C |
| Operating Ambient Temperature Range | T _A | -40 | — | +125 | °C |
| Power Dissipation: Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \sum I_{OH})$ I/O Pin Power Dissipation: $P_{I/O} = \sum (\{V_{DD} - V_{OH}\} \times I_{OH}) + \sum (V_{OL} \times I_{OL})$ | P _D | P _{INT} + P _{I/O} | | | W |
| Maximum Allowed Power Dissipation | P _D MAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

TABLE 29-2: THERMAL PACKAGING CHARACTERISTICS

| Characteristic | Symbol | Typ | Max | Unit | Notes |
|--|---------------|------|-----|------|-------|
| Package Thermal Resistance, 20-Pin SPDIP | θ_{JA} | 62.4 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SPDIP | θ_{JA} | 60 | — | °C/W | 1 |
| Package Thermal Resistance, 20-Pin SSOP | θ_{JA} | 108 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SSOP | θ_{JA} | 71 | — | °C/W | 1 |
| Package Thermal Resistance, 20-Pin SOIC | θ_{JA} | 75 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SOIC | θ_{JA} | 80.2 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin QFN | θ_{JA} | 32 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin QFN | θ_{JA} | 29 | — | °C/W | 1 |
| Package Thermal Resistance, 48-Pin UQFN | θ_{JA} | — | — | °C/W | 1 |

Note 1: Junction to ambient thermal resistance, Theta-JA (θ_{JA}) numbers are achieved by package simulations.

TABLE 29-3: DC CHARACTERISTICS: TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | Standard Operating Conditions: 1.8V to 3.6V PIC24F32KA3XX 2.0V to 5.5V PIC24FV32KA3XX | | | | | |
|--------------------|------------------|---|-----------------|--------------------|-----|-------|---|
| | | Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | | |
| Param No. | Symbol | Characteristic | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| DC10 | V _{DD} | Supply Voltage | 1.8 | — | 3.6 | V | For F devices |
| | | | 2.0 | — | 5.5 | V | For FV devices |
| DC12 | V _{DR} | RAM Data Retention Voltage ⁽²⁾ | 1.5 | — | — | V | For F devices |
| | | | 1.7 | — | — | V | For FV devices |
| DC16 | V _{POR} | V _{DD} Start Voltage to Ensure Internal Power-on Reset Signal | V _{SS} | — | 50 | mV | V _{DD} must be maintained in this range for at least 64ms. |
| DC17 | S _{VDD} | V _{DD} Rise Rate to Ensure Internal Power-on Reset Signal | 0.05 | — | — | V/ms | 0-3.3V in 0.1s 0-2.5V in 60 ms |

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This is the limit to which V_{DD} can be lowered without losing RAM data.

PIC24FV32KA304 FAMILY

TABLE 29-4: HIGH/LOW-VOLTAGE DETECT CHARACTERISTICS

| Standard Operating Conditions: 1.8V to 3.6V PIC24F32KA3XX 2.0V to 5.5V PIC24FV32KA3XX | | | | | | | | |
|--|--------|---|----------------------------------|------|-----|---------------------|-------|------------|
| Operating temperature | | -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | | |
| Param No. | Symbol | Characteristic | | Min | Typ | Max | Units | Conditions |
| DC18 | VHLVD | HLVD Voltage on VDD Transition | HLVDL<3:0> = 0000 ⁽²⁾ | — | — | 1.90 | V | |
| | | | HLVDL<3:0> = 0001 | 1.86 | — | 2.13 | V | |
| | | | HLVDL<3:0> = 0010 | 2.08 | — | 2.35 | V | |
| | | | HLVDL<3:0> = 0011 | 2.22 | — | 2.53 | V | |
| | | | HLVDL<3:0> = 0100 | 2.30 | — | 2.62 | V | |
| | | | HLVDL<3:0> = 0101 | 2.49 | — | 2.84 | V | |
| | | | HLVDL<3:0> = 0110 | 2.73 | — | 3.10 | V | |
| | | | HLVDL<3:0> = 0111 | 2.86 | — | 3.25 | V | |
| | | | HLVDL<3:0> = 1000 | 3.00 | — | 3.41 | V | |
| | | | HLVDL<3:0> = 1001 | 3.16 | — | 3.59 ⁽¹⁾ | V | |
| | | | HLVDL<3:0> = 1010 ⁽¹⁾ | 3.33 | — | 3.79 | V | |
| | | | HLVDL<3:0> = 1011 ⁽¹⁾ | 3.53 | — | 4.01 | V | |
| | | | HLVDL<3:0> = 1100 ⁽¹⁾ | 3.74 | — | 4.26 | V | |
| | | | HLVDL<3:0> = 1101 ⁽¹⁾ | 4.00 | — | 4.55 | V | |
| HLVDL<3:0> = 1110 ⁽¹⁾ | 4.28 | — | 4.87 | V | | | | |

Note 1: These trip points should not be used on PIC24FXXKA30X devices.

Note 2: This trip point should not be used on PIC24FVXXKA30X devices.

TABLE 29-5: BOR TRIP POINTS

| Standard Operating Conditions: 1.8V to 3.6V PIC24F32KA3XX 2.0V to 5.5V PIC24FV32KA3XX | | | | | | | | | |
|--|-----|---|----------------|------|------|------|-------|---------------------------------------|----------|
| Operating temperature | | -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | | | |
| Param No. | Sym | Characteristic | | Min | Typ | Max | Units | Conditions | |
| DC15 | | BOR Hysteresis | | — | 5 | — | mV | | |
| DC19 | | BOR Voltage on VDD Transition | BORV<1:0> = 00 | — | — | — | — | Valid for LPBOR and DSBOR (Note 1) | |
| | | | BORV<1:0> = 01 | 2.90 | 3 | 3.38 | V | | |
| | | | BORV<1:0> = 10 | 2.53 | 2.7 | 3.07 | V | | |
| | | | BORV<1:0> = 11 | 1.75 | 1.85 | 2.05 | V | | (Note 2) |
| | | | BORV<1:0> = 11 | 1.95 | 2.05 | 2.16 | V | | (Note 3) |

Note 1: LPBOR re-arms the POR circuit but does not cause a BOR.

Note 2: This is valid for PIC24F (3.3V) devices.

Note 3: This is valid for PIC24FV (5V) devices.

| OS15 | | Oscillator Frequency | 0.2 4 4 31 | — — — — | 4 25 8 33 | MHz MHz MHz kHz | XT HS XTPLL SOSC |
| OS20 | Tosc | Tosc = 1/Fosc | — | — | — | — | See Parameter OS10 for Fosc value |
| OS25 | Tcy | Instruction Cycle Time ⁽²⁾ | 62.5 | — | DC | ns | |
| OS30 | TosL, TosH | External Clock in (OSCI) High or Low Time | 0.45 x Tosc | — | — | ns | EC |
| OS31 | TosR, TosF | External Clock in (OSCI) Rise or Fall Time | — | — | 20 | ns | EC |
| OS40 | TckR | CLKO Rise Time ⁽³⁾ | — | 6 | 10 | ns | |
| OS41 | TckF | CLKO Fall Time ⁽³⁾ | — | 6 | 10 | ns | |

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The instruction cycle period (Tcy) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “Min.” values with an external clock applied to the OSCI/CLKI pin. When an external clock input is used, the “Max.” cycle time limit is “DC” (no clock) for all devices.

3: Measurements are taken in EC mode. The CLKO signal is measured on the OSCO pin. CLKO is low for the Q1-Q2 period (1/2 Tcy) and high for the Q3-Q4 period (1/2 Tcy).

30.0 DC AND AC CHARACTERISTICS GRAPHS AND TABLES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

Data for VDD levels greater than 3.3V are applicable to PIC24FV32KA304 family devices only.

31.2 Package Details

The following sections give the technical details of the packages.

20-Lead Plastic Dual In-Line (P) – 300 mil Body [PDIP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

| | | Units | INCHES | | |
|----------------------------|----|-------|----------|-------|------|
| Dimension Limits | | | MIN | NOM | MAX |
| Number of Pins | N | | 20 | | |
| Pitch | e | | .100 BSC | | |
| Top to Seating Plane | A | – | – | – | .210 |
| Molded Package Thickness | A2 | .115 | .130 | .195 | |
| Base to Seating Plane | A1 | .015 | – | – | |
| Shoulder to Shoulder Width | E | .300 | .310 | .325 | |
| Molded Package Width | E1 | .240 | .250 | .280 | |
| Overall Length | D | .980 | 1.030 | 1.060 | |
| Tip to Seating Plane | L | .115 | .130 | .150 | |
| Lead Thickness | c | .008 | .010 | .015 | |
| Upper Lead Width | b1 | .045 | .060 | .070 | |
| Lower Lead Width | b | .014 | .018 | .022 | |
| Overall Row Spacing § | eB | – | – | – | .430 |

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. § Significant Characteristic.
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" per side.
4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

PIC24FV32KA304 FAMILY

NOTES:

APPENDIX A: REVISION HISTORY

Revision A (March 2011)

Original data sheet for the PIC24FV32KA304 family of devices.

Revision B (April 2011)

Section 25.0 “Charge Time Measurement Unit (CTMU)” was revised to change the description of the IRNGx bits in CTMUICON (**Register 25-3**). Setting ‘01’ is the base current level (0.55 μA nominal) and setting ‘00’ is 1000x base current.

Section 29.0 “Electrical Characteristics” was revised to change the following typical IPD specifications:

- DC20h/i/j/k from 204 μA to 200 μA
- DC60h/i/j/k from 0.15 μA to 0.025 μA
- DC60l/m/n/o from 0.25 μA to 0.040 μA
- DC72h/i/j/k from 0.80 μA to 0.70 μA

Revision C (April 2012)

Updated the Pin Diagrams on Pages 3 through 7, to change “LVDIN” to “HLVDIN” in all occurrences, and correct the placement of certain functions.

Updated **Table 1-3** to remove references to unimplemented package types, corrected several erroneous pin assignments and removed other alternate but unimplemented assignments.

For **Section 5.0 “Flash Program Memory”**, updated **Example 5-2**, **Example 5-3** and **Example 5-4** with new table offset functions.

Updated **Figure 12-1** to correctly show the implemented Timer1 input options.

For **Section 22.0 “12-Bit A/D Converter with Threshold Detect”**:

- Updated **Register 22-1** to add the MODE12 bit
- Updated the descriptions of the PVCFGx and CSCNA bits in **Register 22-2**
- Updated **Register 22-4** to change the VRSREQ bit to a reserved bit position
- Modified footnote text in **Register 22-5**
- Corrected CHOLD in **Figure 22-2**

For **Section 25.0 “Charge Time Measurement Unit (CTMU)”**:

- Updated the text in **Section 25.1 “Measuring Capacitance”** and **Section 25.3 “Pulse Generation and Delay”** to better reflect the module’s implementation
- Updated **Figure 25-3** to show additional detail in pulse generation

Added the following timing diagrams and timing requirement tables to **Section 29.0 “Electrical Characteristics”**:

- **Figure 29-6 (Reset, Watchdog Timer, Oscillator Start-up Timer and Power-up Timer Timing Characteristics)**
- **Figure 29-7 (Brown-out Reset Characteristics)**
- **Figure 29-9 (Input Capture x Timings)** through **Figure 29-21 (SPIx Module Slave Mode Timing Characteristics (CKE = 1))**
- **Table 29-28 (Input Capture x Requirements)** through **Table 29-39 (SPIx Module Slave Mode Timing Requirements (CKE = 1))**
- **Figure 29-22 (A/D Conversion Timing)**

Updated **Table 29-5** to add specification, DC15.

Replaced **Table 29-6**, **Table 29-7** and **Table 29-8** with new, shorter versions that remove unimplemented temperature options. (No existing specification values have been changed in this process.)

Updated **Table 29-16** with correct values for CTMUICON bit settings.

Combined previous **Table 29-21** and **Table 29-22** to create a new **Table 29-21 (AC Characteristics: Internal RC Accuracy)**. All existing subsequent tables are renumbered accordingly.

Updated **Table 29-26** to add specifications, SY35 and SY55.

Updated **Table 29-40**:

- Split AD01 into separate entries for “F” and “FV” device families
- Added specifications, AD08 (IVREF) and AD09 (ZVREF)
- Changed AD17 (2.5 k Ω max. to 1 k Ω max.)

Updated **Table 29-41**:

- Changed AD50 (75 ns min. to 600 ns min.)
- Changed AD51 (250 ns typ. to 1.67 μs typ.)
- Changed AD60 (0.5 TAD min. to 2 TAD min.)
- Split AD55 into separate entries for 10-bit and 12-bit conversions

Added **Section 30.0 “DC and AC Characteristics Graphs and Tables”**, with **Figure 30-1** through **Figure 30-39**.

Replaced some of the packaging diagrams in **Section 31.0 “Packaging Information”** with the newly revised diagrams.

Other minor typographic corrections throughout.

PIC24FV32KA304 FAMILY

Revision D (March 2013)

Throughout the data sheet: corrected the name of RCON register bit 12 as RETEN, to maintain consistency with other PIC24F devices (was previously LVREN). In addition, changed the description of the bit in the RCON register ([Register 7-1](#)) to clarify its function in controlling the Retention Regulator.

Throughout the data sheet: corrected the name of FPOR Configuration register bit 2 as RETCFG, to maintain consistency with other PIC24F devices (was previously LVRCFG). In addition, changed the description of the bit in the FPOR Configuration register ([Register 26-6](#)) to clarify its function in enabling the Retention Regulator.

For [Section 10.4 “Voltage Regulator-Based Power-Saving Features”](#):

- Removed all references to Fast Wake-up Sleep mode, not implemented in this device
- Changed all references of the High-Voltage Regulator to On-Chip Voltage Regulator
- Removed all references to the Low-Voltage Regulator, which was replaced in most cases with Retention Regulator
- Clarified the Retention Regulator’s operation in [Section 10.4.3 “Retention Sleep Mode”](#) (formerly “Low-Voltage Sleep Mode”)
- Modified [Table 10-1](#) for consistency with the above changes

Corrects [Section 26.2 “On-Chip Voltage Regulator”](#) to clarify the operation of the on-chip regulator in “F” and “FV” families, and include DC parameters and specifications.

For [Section 29.0 “Electrical Characteristics”](#):

- Updated captioning on all specification tables to include extended temperature data
- Amended [Table 29-8](#) to include +125°C data for all existing specifications
- Added new [Table 29-27](#) and [Figure 29-8](#) to characterize external clock input specifications for general purpose timers (all subsequent tables and figures are renumbered accordingly)
- Added parameter numbers to several existing but previous unnumbered parameters in multiple tables

Updated [Section 30.0 “DC and AC Characteristics Graphs and Tables”](#):

- Added additional graphs for Extended temperature devices ([Section 30.2 “Characteristics for Extended Temperature Devices \(-40°C to +125°C\)”](#), [Figure 30-40](#) through [Figure 30-56](#))
- Replaced [Figure 30-32](#) with an updated graph

Replaced some of the packaging diagrams in [Section 31.0 “Packaging Information”](#) with the newly revised diagrams.

Updates Product Information System to include extended temperature devices in the information key.

Other minor typographic corrections throughout.

Revision E (October 2017)

Changed the PGEC2/PGED2 44-Pin value to 9 in [Table 1-3](#).

Removed the OFFCAL bit from [Table 4-16](#) and [Register 22-2](#).

Updated [Register 6-1](#) to include the correct Programming Operations for NVMP<5:0>.

Updated [Figure 22-1](#).

Updated footnotes in [Register 25-2](#).

Updated ambient temperature under bias range in [Section 29.0 “Electrical Characteristics”](#), updated the DC16 electrical specs in [Table 29-21](#), updated the F20 FRC electrical specs in [Table 29-3](#) and changed the Minimum Input Capture x requirement for IC15 TccP.

Other minor typographic and formatting corrections throughout.

NOTES:

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

PIC24FV32KA304 FAMILY

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:
