# 1 Application Description

The MWCT1x23 is a wireless power transmitter controller that integrates all required functions for 65 W consumer wireless power transfer system using the induction principle and in premium version also for WPC PC0 “Qi” compliant wireless power transmitter design. It is an intelligent device which uses periodically analog PING to detect a device for charging while gaining super low standby power. Once the device is detected, the MWCT1x23 controls the power transfer by adjusting the current and voltage of the power stage according to required operating point of power receiver.

The key characteristics and features of the system are:

- Enables single or multi-coil power transmitter topology
- Variable Z-gap range (vertical movement) from 4 mm to 35 mm – depends on coils setup. This range is limited by the 65-W power transfer programable thresholds
- Modularity in design of power transmitter unit to extend the number of transmitter coils to form a larger active area, which requires:
  - Minor reconfiguration of software
  - Extension of the multiplexer hardware (coil switches and control signal multiplexer).
  - No major impact on the system topology
- Fast wireless power transfer start-up time below 2.5 s (applicable for up to seven transmitter coils).
- No power from powered device is needed for the power receiver unit to start-up.
- Support of one Power Class 1 (PC1) device with up to 65 W of PRU output. Premium version support also one Qi-certified Power Class 0 (PC0) device with support for 5-W and 15-W receivers.
- Peak power transfer efficiency (input of power transmitter unit to output of power receiver unit) of over 86 % at the best coil placement and 65 W of power receiver unit output.
- Power receiver unit output-integrated protections for over-power and over-current scenarios.
- SRun-time system resonant frequency tracking ranging from 100 kHz to 145 kHz to improve the power-transfer efficiency.
- The power receiver unit power output acts as a constant 19.5-V source, forming an alternative to standard 65-W (or lower) AC power adapters, and thus simplifying its integration into the target system. Output voltage is adjustable.
- Foreign Object Detection during and prior to the power transfer.

## Ratings

- Interface for Bluetooth Low Energy (BLE) out-band communication between the power receiver unit and power transmitter unit for secured data and firmware update transfer towards the power transmitter unit.
- The power receiver unit is enabled with authentication devices to ensure that only safe and authentic devices initiate the power transfer in premium version.
- Compliance with the EMC regulation for commercial electronic devices.

1. This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEI clock mode).
2. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=0.
3. The resulting system clock frequencies should not exceed their maximum specified values. The DCO frequency deviation ( $\Delta f_{\text{dco}_t}$ ) over voltage and temperature should be considered.
4. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=1.
5. The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
6. This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bits are changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
7. Excludes any oscillator currents that are also consuming power while PLL is in operation.
8. This specification was obtained using a NXP developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary.
9. This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

#### NOTE

The 32 kHz oscillator works in low power mode by default and cannot be moved into high power/gain mode.

#### 4.6.1.1 Equivalent circuit for ADC inputs

The following figure shows the ADC input circuit during sample and hold. S1 and S2 are always opened/closed at non-overlapping phases, and both S1 and S2 operate at the ADC clock frequency. The following equation gives equivalent input impedance when the input is selected.

## 4.9.2 SPI (DSPI) switching specifications (full voltage range)

The DMA Serial Peripheral Interface (DSPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The tables below provides DSPI timing characteristics for classic SPI timing modes. Refer to the DSPI chapter of the Reference Manual for information on the modified transfer formats used for communicating with slower peripheral devices.

# 9 Terminology and guidelines

## 9.1 Definition: Operating requirement

An *operating requirement* is a specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip.

### 9.1.1 Example

This is an example of an operating requirement:

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	0.9	1.1	V

## 9.2 Definition: Operating behavior

Unless otherwise specified, an *operating behavior* is a specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions.

### 9.2.1 Example

This is an example of an operating behavior:

Symbol	Description	Min.	Max.	Unit
$I_{WP}$	Digital I/O weak pullup/pulldown current	10	130	$\mu\text{A}$

### 9.3 Definition: Attribute

An *attribute* is a specified value or range of values for a technical characteristic that are guaranteed, regardless of whether you meet the operating requirements.

#### 9.3.1 Example

This is an example of an attribute:

Symbol	Description	Min.	Max.	Unit
CIN_D	Input capacitance: digital pins	—	7	pF

### 9.4 Definition: Rating

A *rating* is a minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:

- *Operating ratings* apply during operation of the chip.
- *Handling ratings* apply when the chip is not powered.

#### 9.4.1 Example

This is an example of an operating rating:

Symbol	Description	Min.	Max.	Unit
$V_{DD}$	1.0 V core supply voltage	-0.3	1.2	V

## 9.5 Result of exceeding a rating

## 9.6 Relationship between ratings and operating requirements

## 9.7 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip's ratings.
- During normal operation, don't exceed any of the chip's operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.

## 9.8 Definition: Typical value

A *typical value* is a specified value for a technical characteristic that:

- Lies within the range of values specified by the operating behavior
- Given the typical manufacturing process, is representative of that characteristic during operation when you meet the typical-value conditions or other specified conditions

Typical values are provided as design guidelines and are neither tested nor guaranteed.

### 9.8.1 Example 1

This is an example of an operating behavior that includes a typical value:

Symbol	Description	Min.	Typ.	Max.	Unit
$I_{WP}$	Digital I/O weak pullup/pulldown current	10	70	130	$\mu A$

### 9.8.2 Example 2

This is an example of a chart that shows typical values for various voltage and temperature conditions:

## 9.9 Typical Value Conditions

Typical values assume you meet the following conditions (or other conditions as specified):

Symbol	Description	Value	Unit
T <sub>A</sub>	Ambient temperature	25	°C
V <sub>DD</sub>	3.3 V supply voltage	3.3	V
