

## External CAN FD Controller with SPI Interface

### Features

#### General

- External CAN FD Controller with SPI Interface
- Arbitration Bit Rate up to 1 Mbps
- Data Bit Rate up to 8 Mbps
- CAN FD Controller modes
  - Mixed CAN 2.0B and CAN FD mode
  - CAN 2.0B mode
- Conforms to ISO 11898-1:2015

#### Message FIFOs

- 31 FIFOs, configurable as transmit or receive FIFOs
- One Transmit Queue (TXQ)
- Transmit Event FIFO (TEF) with 32 bit time stamp

#### Message Transmission

- Message transmission prioritization:
  - Based on priority bit field, and/or
  - Message with lowest ID gets transmitted first using the Transmit Queue (TXQ)
- Programmable automatic retransmission attempts: unlimited, 3 attempts or disabled

#### Message Reception

- 32 Flexible Filter and Mask Objects
- Each object can be configured to filter either:
  - Standard ID + first 18 data bits, or
  - Extended ID
- 32-bit Time Stamp

#### Special Features

- VDD: 2.7 to 5.5V
- Active current: max. 20 mA at 5.5 V, 40 MHz CAN clock
- Sleep current: 10  $\mu$ A, typical
- Message objects are located in RAM: 2 KB
- Up to 3 configurable interrupt pins
- Bus Health Diagnostics and Error counters
- Transceiver standby control
- Start of frame pin for indicating the beginning of messages on the bus
- Temperature ranges:
  - High (H):  $-40^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

#### Oscillator Options

- 40, 20 or 4 MHz crystal, or ceramic resonator; or external clock input
- Clock output with prescaler

#### SPI Interface

- Up to 20 MHz SPI clock speed
- Supports SPI modes 0,0 and 1,1
- Registers and bit fields are arranged in a way to enable efficient access via SPI

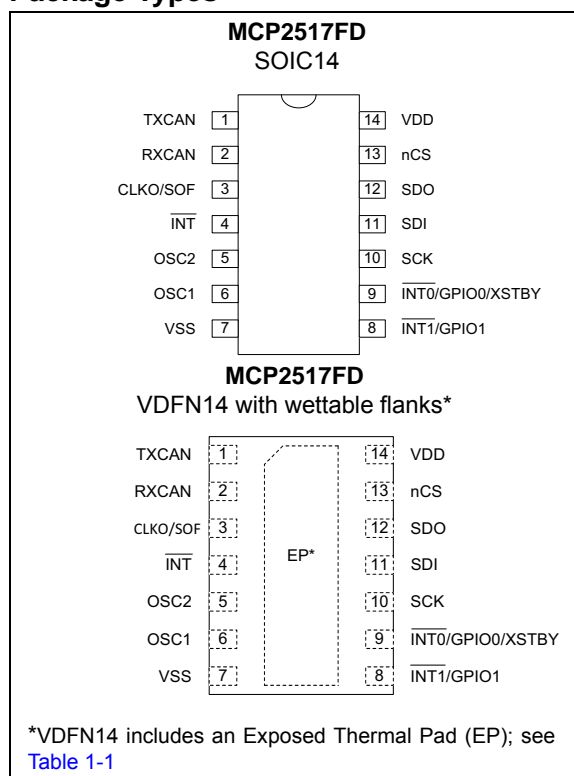

#### Safety Critical Systems

- SPI commands with CRC to detect noise on SPI interface
- Error Correction Code (ECC) protected RAM

#### Additional Features

- GPIO pins:  $\overline{\text{INT0}}$  and  $\overline{\text{INT1}}$  can be configured as general purpose I/O
- Open drain outputs: TXCAN,  $\overline{\text{INT}}$ ,  $\overline{\text{INT0}}$ , and  $\overline{\text{INT1}}$  pins can be configured as push/pull or open drain outputs

#### Package Types

# MCP2517FD

## 1.0 DEVICE OVERVIEW

The MCP2517FD is a cost-effective and small-footprint CAN FD controller that can be easily added to a microcontroller with an available SPI interface. Therefore, a CAN FD channel can be easily added to a microcontroller that is either lacking a CAN FD peripheral, or that doesn't have enough CAN FD channels.

The MCP2517FD supports both, CAN frames in the Classical format (CAN2.0B) and CAN Flexible Data Rate (CAN FD) format, as specified in ISO 11898-1:2015.

## 1.1 Block Diagram

Figure 1.1 shows the block diagram of the MCP2517FD. The MCP2517FD contains the following main blocks:

- The CAN FD Controller module implements the CAN FD protocol and contains the FIFOs, and Filters.
- The SPI interface is used to control the device by accessing SFRs and RAM.
- The RAM controller arbitrates the RAM accesses between the SPI and CAN FD Controller module.
- The Message RAM is used to store the data of the Message Objects.
- The oscillator generates the CAN clock.
- The Internal LDO and POR circuit.
- The I/O control.

**Note 1:** This data sheet summarizes the features of the MCP2517FD. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the "MCP25xxFD Family Reference Manual".

FIGURE 1-1: MCP2517FD BLOCK DIAGRAM

## 1.2 Pin Out Description

Table 1-1 describes the functions of the pins.

**TABLE 1-1: MCP2517FD STANDARD PINOUT VERSION**

Pin Name	SOIC	VDFN	Pin Type	Description
TXCAN	1	1	O	Transmit output to CAN FD transceiver
RXCAN	2	2	I	Receive input from CAN FD transceiver
CLKO/SOF	3	3	O	Clock output/Start of Frame output
$\overline{\text{INT}}$	4	4	O	Interrupt output (active low)
OSC2	5	5	O	External oscillator output
OSC1	6	6	I	External oscillator input
VSS	7	7	P	Ground
$\overline{\text{INT1}}$ /GPIO1	8	8	I/O	RX Interrupt output (active low)/GPIO
$\overline{\text{INT0}}$ /GPIO0/ XSTBY	9	9	I/O	TX Interrupt output (active low)/GPIO/ Transceiver Standby output
SCK	10	10	I	SPI clock input
SDI	11	11	I	SPI data input
SDO	12	12	O	SPI data output
nCS	13	13	I	SPI chip select input
VDD	14	14	P	Positive Supply
EP	-	15	P	Exposed Pad; connect to VSS

**Legend:** P = Power, I = Input, O = Output

# MCP2517FD

## 1.3 Typical Application

Figure 1-2 shows an example of a typical application of the MCP2517FD. In this example, the microcontroller operates at 3.3V.

The MCP2517FD interfaces directly with microcontrollers operating at 2.7V to 5.5V. In addition, the MCP2517FD connects directly to high-speed CAN FD transceivers. There are no external level shifters required when connecting VDD of the MCP2517FD and the microcontroller to VIO of the transceiver.

The VDD of the CAN FD transceiver is connected to 5V.

The SPI interface is used to configure and control the CAN FD controller.

The MCP2517FD signals interrupts to the microcontroller using  $\overline{\text{INT}}$ , INT0 and INT1. Interrupts need to be cleared by the microcontroller through SPI.

The CLKO pin provides the clock to the microcontroller.

**FIGURE 1-2: MCP2517FD INTERFACING WITH A 3.3V MICROCONTROLLER**

## 2.0 CAN FD CONTROLLER MODULE

Figure 2-1 shows the main blocks of the CAN FD Controller module:

- The CAN FD Controller module has multiple modes:
  - Configuration
  - Normal CAN FD
  - Normal CAN 2.0
  - Sleep
  - Listen Only
  - Restricted Operation
  - Internal and External Loop back modes
- The CAN FD Bit Stream Processor (BSP) implements the Medium Access Control of the CAN FD protocol described in ISO 11898-1:2015. It serializes and de-serializes the bit stream, encodes and decodes the CAN FD frames, manages the medium access, acknowledges frames, and detects and signals errors.
- The TX Handler prioritizes the messages that are requested for transmission by the Transmit FIFOs. It uses the RAM Interface to fetch the transmit data from RAM and provides it to the BSP for transmission.
- The BSP provides received messages to the RX Handler. The RX Handler uses the Acceptance Filter to filter out messages that shall be stored into Receive FIFOs. It uses the RAM Interface to store received data into RAM.

- Each FIFO can be configured either as a Transmit or Receive FIFO. The FIFO Control keeps track of the FIFO Head and Tail, and calculates the User Address. For a TX FIFO, the User Address points to the address in RAM where the data for the next transmit message shall be stored. For a RX FIFO, the User Address points to the address in RAM where the data of the next receive message shall be read. The User notifies the FIFO that a message was written to or read from RAM by incrementing the Head/Tail of the FIFO.
- The Transmit Queue (TXQ) is a special transmit FIFO that transmits the messages based on the ID of the messages stored in the queue.
- The Transmit Event FIFO (TEF) stores the message IDs of the transmitted messages.
- A free-running Time Base Counter is used to time stamp received messages. Messages in the TEF can also be time stamped.
- The CAN FD Controller module generates interrupts when new messages are received or when messages were transmitted successfully.
- The Special Function Registers (SFR) are used to control and to read the status of the CAN FD Controller module.

**Note 1:** This data sheet summarizes the features of the CAN FD Controller module. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “MCP25xxFD Family Reference Manual”.

**FIGURE 2-1: CAN FD CONTROLLER MODULE BLOCK DIAGRAM**

# MCP2517FD

---

NOTES:

## 3.0 MEMORY ORGANIZATION

Figure 3-1 illustrates the main sections of the memory and its address ranges:

- MCP2517FD Special Function Registers (SFR)
- CAN FD Controller Module SFR
- Message Memory (RAM)

The SFR are 32 bit wide. The LSB is located at the lower address, e.g., the LSB of C1CON is located at address 0x000, while its MSB is located at address 0x003.

Table 3-1 lists the MCP2517FD specific registers. The first column contains the address of the SFR.

Table 3-2 lists the registers of the CAN FD Controller Module. The first column contains the address of the SFR.

## 3.1 MCP2517FD Specific Registers

- [Register 3-1](#): OSC
- [Register 3-2](#): IOCON
- [Register 3-3](#): CRC
- [Register 3-4](#): ECCCON
- [Register 3-5](#): ECCSTAT

**TABLE 3-3: REGISTER LEGEND**

Symbol	Description	Symbol	Description
R	Readable bit	HC	Cleared by Hardware only
W	Writable bit	HS	Set by Hardware only
U	Unimplemented bit, read as '0'	1	Bit is set at Reset
S	Settable bit	0	Bit is cleared at Reset
C	Clearable bit	x	Bit is unknown at Reset

**EXAMPLE 3-1:**

R/W - 0 indicates the bit is both readable and writable, and reads '0' after a Reset.

- Register 3-21: CiBDIAG1

### Fifo Control and Status Registers

- Register 3-22: CiTEFCON
- Register 3-23: CiTEFSTA
- Register 3-24: CiTEFUA
- Register 3-25: CiTXQCON
- Register 3-26: CiTXQSTA
- Register 3-27: CiTXQUA
- Register 3-28: CiFIFOCONm – m = 1 to 31
- Register 3-29: CiFIFOSTAm – m = 1 to 31
- Register 3-30: CiFIFOUAm – m = 1 to 31

### Filter Configuration and Control Registers

- Register 3-31: CiFLTCONm – m = 0 to 7
- Register 3-32: CiFLTOBJm – m = 0 to 31
- Register 3-33: CiMASKm – m = 0 to 31

**Note:** The 'i' shown in the register identifier denotes CANi, e.g., C1CON. The MCP2517FD contains one CAN FD Controller Module.

**TABLE 3-4: REGISTER LEGEND**

Sym	Description	Sym	Description
R	Readable bit	HC	Cleared by Hardware only
W	Writable bit	HS	Set by Hardware only
U	Unimplemented bit, read as '0'	1	Bit is set at Reset
S	Settable bit	0	Bit is cleared at Reset
C	Clearable bit	x	Bit is unknown at Reset

### EXAMPLE 3-2:

R/W - 0 indicates the bit is both readable and writable, and reads '0' after a Reset.

 1010 = 1024  
 1011 = 2048  
 1111-1100 = 4096
- bit 27      **ABAT**: Abort All Pending Transmissions bit  
 1 = Signal all transmit FIFOs to abort transmission  
 0 = Module will clear this bit when all transmissions were aborted
- bit 26-24      **REQOP<2:0>**: Request Operation Mode bits  
 000 = Set Normal CAN FD mode; supports mixing of CAN FD and Classic CAN 2.0 frames  
 001 = Set Sleep mode  
 010 = Set Internal Loopback mode  
 011 = Set Listen Only mode  
 100 = Set Configuration mode  
 101 = Set External Loopback mode  
 110 = Set Normal CAN 2.0 mode; possible error frames on CAN FD frames  
 111 = Set Restricted Operation mode

**Note 1:** These bits can only be modified in Configuration mode.

## REGISTER 3-6: CiCON – CAN CONTROL REGISTER (CONTINUED)

bit 23-21	<p><b>OPMOD&lt;2:0&gt;</b>: Operation Mode Status bits</p> <p>000 = Module is in Normal CAN FD mode; supports mixing of CAN FD and Classic CAN 2.0 frames</p> <p>001 = Module is in Sleep mode</p> <p>010 = Module is in Internal Loopback mode</p> <p>011 = Module is in Listen Only mode</p> <p>100 = Module is in Configuration mode</p> <p>101 = Module is in External Loopback mode</p> <p>110 = Module is Normal CAN 2.0 mode; possible error frames on CAN FD frames</p> <p>111 = Module is Restricted Operation mode</p>
bit 20	<p><b>TXQEN</b>: Enable Transmit Queue bit<sup>(1)</sup></p> <p>1 = Enables TXQ and reserves space in RAM</p> <p>0 = Don't reserve space in RAM for TXQ</p>
bit 19	<p><b>STEF</b>: Store in Transmit Event FIFO bit<sup>(1)</sup></p> <p>1 = Saves transmitted messages in TEF and reserves space in RAM</p> <p>0 = Don't save transmitted messages in TEF</p>
bit 18	<p><b>SERR2LOM</b>: Transition to Listen Only Mode on System Error bit<sup>(1)</sup></p> <p>1 = Transition to Listen Only Mode</p> <p>0 = Transition to Restricted Operation Mode</p>
bit 17	<p><b>ESIGM</b>: Transmit ESI in Gateway Mode bit<sup>(1)</sup></p> <p>1 = ESI is transmitted recessive when ESI of message is high or CAN controller error passive</p> <p>0 = ESI reflects error status of CAN controller</p>
bit 16	<p><b>RTXAT</b>: Restrict Retransmission Attempts bit<sup>(1)</sup></p> <p>1 = Restricted retransmission attempts, CiFIFOCONm.TXAT is used</p> <p>0 = Unlimited number of retransmission attempts, CiFIFOCONm.TXAT will be ignored</p>
bit 15-13	<p><b>Unimplemented</b>: Read as '0'</p>
bit 12	<p><b>BRSDIS</b>: Bit Rate Switching Disable bit</p> <p>1 = Bit Rate Switching is Disabled, regardless of BRS in the Transmit Message Object</p> <p>0 = Bit Rate Switching depends on BRS in the Transmit Message Object</p>
bit 11	<p><b>BUSY</b>: CAN Module is Busy bit</p> <p>1 = The CAN module is transmitting or receiving a message</p> <p>0 = The CAN module is inactive</p>
bit 10-9	<p><b>WFT&lt;1:0&gt;</b>: Selectable Wake-up Filter Time bits</p> <p>00 = T00FILTER</p> <p>01 = T01FILTER</p> <p>10 = T10FILTER</p> <p>11 = T11FILTER</p>
	<p><b>Note:</b> Please refer to <a href="#">Table 7-5</a>.</p>
bit 8	<p><b>WAKFIL</b>: Enable CAN Bus Line Wake-up Filter bit<sup>(1)</sup></p> <p>1 = Use CAN bus line filter for wake-up</p> <p>0 = CAN bus line filter is not used for wake-up</p>
bit 7	<p><b>Unimplemented</b>: Read as '0'</p>
bit 6	<p><b>PXEDIS</b>: Protocol Exception Event Detection Disabled bit<sup>(1)</sup></p> <p>A recessive "res bit" following a recessive FDF bit is called a Protocol Exception.</p> <p>1 = Protocol Exception is treated as a Form Error.</p> <p>0 = If a Protocol Exception is detected, the CAN FD Controller Module will enter Bus Integrating state.</p>
bit 5	<p><b>ISOCRCEN</b>: Enable ISO CRC in CAN FD Frames bit<sup>(1)</sup></p> <p>1 = Include Stuff Bit Count in CRC Field and use Non-Zero CRC Initialization Vector according to ISO 11898-1:2015</p> <p>0 = Do NOT include Stuff Bit Count in CRC Field and use CRC Initialization Vector with all zeros</p>

**Note 1:** These bits can only be modified in Configuration mode.

# MCP2517FD

---

NOTES:

## 3.3 Message Memory

The MCP2517FD contains a 2 KB RAM that is used to store message objects. There are three different kinds of message objects:

- [Table 3-5](#): Transmit Message Objects used by the TXQ and by TX FIFOs.
- [Table 3-6](#): Receive Message Objects used by RX FIFOs.
- [Table 3-7](#): TEF objects.

[Figure 3-2](#) illustrates how message objects are mapped into RAM. The number of message objects for the TEF, the TXQ, and for each FIFO is configurable. Only the message objects for FIFO2 are shown in detail. The number of data bytes per message object (payload) is individually configurable for the TXQ and each FIFO.

FIFOs and message objects can only be configured in Configuration mode.

The TEF objects are allocated first. Space in RAM will only be reserved if `CiCON.STEF = 1`.

Next the TXQ objects are allocated. Space in RAM will only be reserved if `CiCON.TXQEN = 1`.

Next the message objects for FIFO1 through FIFO31 are allocated.

This highly flexible configuration results in an efficient usage of the RAM.

The addresses of the message objects depend on the selected configuration. The application doesn't have to calculate the addresses. The User Address field provides the address of the next message object to read from or write to.

### 3.3.1 RAM ECC

The RAM is protected with an Error Correction Code (ECC). The ECC logic supports Single Error Correction (SEC), and Double Error Detection (DED).

SEC/DED requires seven parity bits in addition to the 32 data bits.

[Figure 3-3](#) shows the block diagram of the ECC logic.

#### 3.3.1.1 ECC Enable and Disable

The ECC logic can be enabled by setting `ECCCON.ECCEN`. When ECC is enabled, the data written to the RAM is encoded, and the data read from RAM is decoded.

When the ECC logic is disabled, the data is written to RAM, the parity bits are taken from `ECCCON.PARITY`. This enables the testing of the ECC logic by the user. During a read the parity bits are stripped out and the data is read back unchanged.

#### 3.3.1.2 RAM Write

During a RAM write, the Encoder calculates the parity bits and adds the parity bits to the input data.

#### 3.3.1.3 RAM READ

During a RAM read, the Decoder checks the output data from RAM for consistency and removes the parity bits. It corrects single bit errors and detects double bit errors.

## 4.0 SPI INTERFACE

The MCP2517FD is designed to interface directly with an Serial Peripheral Interface (SPI) port available on most microcontrollers. The SPI in the microcontroller must be configured in mode 0,0 or 1,1 in 8-bit operating mode.

SFR and Message Memory (RAM) are accessed using SPI instructions. Figure 4-1 illustrates the generic format of the SPI instructions (SPI mode 0,0). Each instruction starts with driving nCS low (falling edge on nCS). The 4-bit command and the 12-bit address are shifted into SDI on the rising edge of SCK. During a write instruction, data bits are shifted into SDI on the rising edge of SCK. During a read instruction, data bits are shifted out of SDO on the falling edge of SCK. One or more data bytes are transferred with one instruction. Data bits are updated on the falling edge of SCK and must be valid on the rising edge of SCK. Each instruction ends with driving nCS high (rising edge on nCS).

Refer to Figure 7-1 for detailed input and output timing for both mode 0,0 and mode 1,1.

Table 4-1 lists the SPI instructions and their format.

- Note 1:** The frequency of SCK has to be less than or equal to half the frequency of SYSCLK. This ensures that the synchronization between SCK and SYSCLK works correctly.
- 2:** In order to minimize the Sleep current, the SDO pin of the MCP2517FD must not be left floating while the device is in Sleep mode. This can be achieved by enabling a pull-up or pull-down resistor inside the MCU on the pin that is connected to the SDO pin of the MCP2517FD, while the MCP2517FD is in Sleep mode.

**FIGURE 4-1: SPI INSTRUCTION FORMAT**

**TABLE 4-1: SPI INSTRUCTIONS**

Name	Format	Description
RESET	C = 0b0000; A = 0x000	Resets internal registers to default state; selects Configuration mode.
READ	C = 0b0011; A; D = SDO	Read SFR/RAM from address A.
WRITE	C = 0b0010; A; D = SDI	Write SFR/RAM to address A.
READ_CRC	C = 0b1011; A; N; D = SDO; CRC = SDO	Read SFR/RAM from address A. N data bytes. Two bytes CRC. CRC is calculated on C, A, N and D.
WRITE_CRC	C = 0b1010; A; N; D = SDI; CRC = SDI	Write SFR/RAM to address A. N data bytes. Two bytes CRC. CRC is calculated on C, A, N and D.
WRITE_SAFE	C = 0b1100; A; D = SDI; CRC = SDI	Write SFR/RAM to address A. Check CRC before write. CRC is calculated on C, A and D.

**Legend:** C = Command (4 bit), A = Address (12 bit), D = Data (1 to n bytes), N = Number of Bytes (1 byte), CRC (2 bytes)

# MCP2517FD

## 4.1 SFR Access

The SFR access is byte-oriented. Any number of data bytes can be read or written with one instruction. The address is incremented by one automatically after every data byte. The address rolls over from 0x3FF to 0x000 and from 0xFFF to 0xE00.

The following SPI instructions only show the different fields and their values. Every instruction follows the generic format illustrated in Figure 4-1.

### 4.1.1 RESET

Figure 4-2 illustrates the RESET instruction. The instruction starts with nCS going low. The Command (C<3:0> = 0b0000) is followed by the Address (A<11:0> = 0x000). The instruction ends when nCS goes high.

The RESET instruction should only be issued after the device has entered Configuration mode. All SFR and State Machines are reset just like during a Power-on Reset (POR), and the device transitions immediately to Configuration mode.

The Message Memory is not changed.

The actual reset happens at the end of the instruction when nCS goes high.

**FIGURE 4-3: SFR READ INSTRUCTION**

**FIGURE 4-4: SFR WRITE INSTRUCTION**

### 4.1.2 SFR READ - READ

Figure 4-3 illustrates the READ instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C<3:0> = 0b0011), is followed by the Address (A<11:0>). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). Any number of data bytes can be read. The instruction ends when nCS goes high.

### 4.1.3 SFR WRITE - WRITE

Figure 4-4 illustrates the WRITE instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C<3:0> = 0b0010), is followed by the Address (A<11:0>). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Any number of data bytes can be written. The instruction ends when nCS goes high.

Data bytes are written to the register with the falling edge on SCK following the 8th data bit.

**FIGURE 4-2: RESET INSTRUCTION**

## 4.2 Message Memory Access

The Message Memory (RAM) access is Word-oriented (4 bytes at a time). Any multiple of 4 data bytes can be read or written with one instruction. The address is incremented by one automatically after every data byte. The address rolls over from 0xBFF to 0x400.

The following SPI instructions only show the different fields and their values. Every instruction follows the generic format illustrated in [Figure 4-1](#).

### 4.2.1 MESSAGE MEMORY READ - READ

[Figure 4-5](#) illustrates the READ instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C<3:0> = 0b0011), is followed by the Address (A<11:0>). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). The instruction ends when nCS goes high.

Read commands from RAM must always read a multiple of 4 data bytes. A word is internally read from RAM after the address field, and after every fourth data byte read on the SPI. In case nCS goes high before a multiple of 4 data bytes is read on SDO, the incomplete read should be discarded by the microcontroller.

### 4.2.2 MESSAGE MEMORY WRITE - WRITE

[Figure 4-6](#) illustrates the WRITE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C<3:0> = 0b0010), is followed by the Address (A<11:0>). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). The instruction ends when nCS goes high.

Write commands must always write a multiple of 4 data bytes. After every fourth data byte, with the falling edge on SCK, the RAM Word gets written. In case nCS goes high before a multiple of 4 data bytes is received on SDI, the data of the incomplete Word will not be written to RAM.

**FIGURE 4-5: MESSAGE MEMORY READ INSTRUCTION**

**FIGURE 4-6: MESSAGE MEMORY WRITE INSTRUCTION**

# MCP2517FD

## 4.3 SPI Commands with CRC

In order to detect or avoid bit errors during SPI communication, SPI commands with CRC are available.

### 4.3.1 CRC CALCULATION

In parallel with the SPI shift register, the CRC is calculated, see Figure 4-7.

When nCS is asserted, the CRC calculator is reset to 0xFFFF.

The result of the CRC calculation is available after the Data section of a CRC command. The result of the CRC calculation is written to the CRC register in case a CRC mismatch is detected. In case of a CRC mismatch, CRC.CRCERRIF is set.

The MCP2517FD uses the following generator polynomial: CRC-16/USB (0x8005). CRC-16 detects all single and double-bit errors, all errors with an odd number of bits, all burst errors of length 16 or less, and most errors for longer bursts. This allows an excellent detection of SPI communication errors that can happen in the system, and heavily reduces the risk of miscommunication, even under noisy environments.

The maximum number of data bits is used while reading and writing TX or RX Message Objects. A RX Message Object with 64 Bytes of data + 12 Bytes ID and Time Stamp contains 76 Bytes or 608 bits. In comparison, USB data packets contain up to 1024 bits. CRC-16 has a Hamming Distance of 4 up to 1024 bits.

FIGURE 4-7: CRC CALCULATION

## 4.3.2 SFR READ WITH CRC - READ\_CRC

Figure 4-8 illustrates the READ\_CRC instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C<3:0> = 0b1011), is followed by the Address (A<11:0>), and the number of data bytes (N<7:0>). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by the data byte from address A+1 (DB[A+1]). Any number of data bytes can be read. Next the CRC is shifted out (CRC<15:0>). The instruction ends when nCS goes high.

The CRC is provided to the microcontroller. The microcontroller checks the CRC. No interrupt is generated on CRC mismatch during a READ\_CRC command inside the MCP2517FD.

If nCS goes high before the last byte of the CRC is shifted out, a CRC Form Error interrupt is generated: CRC.FERRIF.

## 4.3.3 SFR WRITE WITH CRC - WRITE\_CRC

Figure 4-9 illustrates the WRITE\_CRC instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C<3:0> = 0b1010), is followed by the Address (A<11:0>), and the number of data bytes (N<7:0>). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Any number of data bytes can be written. Next the CRC is shifted in (CRC<15:0>). The instruction ends when nCS goes high.

The SFR is written to the register after the data byte was shifted in on SDI, with the falling edge on SCK. Data bytes are written to the register before the CRC is checked.

The CRC is checked at the end of the write access. In case of a CRC mismatch, a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC Form Error interrupt is generated: CRC.FERRIF.

**FIGURE 4-8: SFR READ WITH CRC INSTRUCTION**

**FIGURE 4-9: SFR WRITE WITH CRC INSTRUCTION**

## 4.3.4 SFR WRITE SAFE WITH CRC - WRITE\_SAFE

This instruction ensures that only correct data is written to the SFR.

Figure 4-10 illustrates the WRITE\_SAFE instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C<3:0> = 0b1100), is followed by the Address (A<11:0>). Afterwards, one data byte is shifted into address A (DB[A]). Next the CRC (CRC<15:0>) is shifted in. The instruction ends when nCS goes high.

The data byte is only written to the SFR after the CRC is checked and if it matches.

If the CRC mismatches, the data byte is not written to the SFR and a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC Form Error interrupt is generated: CRC.FERRIF.

**FIGURE 4-10: SFR WRITE SAFE WITH CRC INSTRUCTION**

# MCP2517FD

## 4.3.5 MESSAGE MEMORY READ WITH CRC- READ\_CRC

Figure 4-11 illustrates the READ\_CRC instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C<3:0> = 0b1011), is followed by the Address (A<11:0>), and the number of data Words (N<7:0>). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). Next the CRC (CRC<15:0>) is shifted out. The instruction ends when nCS goes high.

Read commands should always read a multiple of 4 data bytes. A word is internally read from RAM after the “N” field, and after every fourth data byte read on the SPI. In case nCS goes high before a multiple of 4 data bytes are read on SDO, the incomplete read should be discarded by the microcontroller.

The CRC is provided to the microcontroller. The microcontroller checks the CRC. No interrupt is generated on CRC mismatch during a READ\_CRC command inside the MCP2517FD.

If nCS goes high before the last byte of the CRC is shifted out, a CRC Form Error interrupt is generated: CRC.FERRIF.

## 4.3.6 MESSAGE MEMORY WRITE WITH CRC - WRITE\_CRC

Figure 4-12 illustrates the WRITE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C<3:0> = 0b1010), is followed by the Address (A<11:0>), and the number of data Words (N<7:0>). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Next the CRC (CRC<15:0>) is shifted in. The instruction ends when nCS goes high.

Write commands must always write a multiple of 4 data bytes. After every fourth data byte, with the falling edge on SCK, the RAM gets written. In case nCS goes high before a multiple of 4 data bytes is received on SDI, the data of the incomplete Word will not be written to RAM.

The CRC is checked at the end of the write access. In case of a CRC mismatch, a CRC interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC interrupt is generated: CRC.FERRIF.

**FIGURE 4-11: MESSAGE MEMORY READ WITH CRC INSTRUCTION**

**FIGURE 4-12: MESSAGE MEMORY WRITE WITH CRC INSTRUCTION**

## 4.3.7 MESSAGE MEMORY WRITE SAFE WITH CRC - WRITE\_SAFE

This instruction ensures that only correct data is written to RAM.

Figure 4-10 illustrates the WRITE\_SAFE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C<3:0> = 0b1100), is followed by the Address (A<11:0>). Afterwards, the data byte is shifted into address A (DB[A]), next into

address A+1 (DB[A+1]), A+2 (DB[A+2]), and A+3 (DB[A+3]). Next the CRC (CRC<15:0>) is shifted in. The instruction ends when nCS goes high.

The data word is only written to RAM after the CRC is checked and if it matches.

If the CRC mismatches, the data word is not written to RAM and a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC interrupt is generated: CRC.FERRIF.

**FIGURE 4-13: MESSAGE MEMORY WRITE SAFE WITH CRC INSTRUCTION**

## 5.0 OSCILLATOR

Figure 5-1 shows the block diagram of the oscillator in the MCP2517FD. The oscillator system generates the SYSCLK, which is used in the CAN FD Controller Module and for RAM accesses. It is recommended by the CAN FD community to use either a 40 or 20 MHz SYSCLK.

The time reference for clock generation can be an external 40, 20 or 4 MHz crystal, ceramic resonator or external clock.

The OSC register controls the oscillator. The PLL can be enabled to multiply the 4 MHz clock by 10.

The internal 40/20 MHz can be divided by two.

The internally generated clock can be divided and provided on the CLKO pin.

**FIGURE 5-1: MCP2517FD OSCILLATOR BLOCK DIAGRAM**

# MCP2517FD

## 6.0 I/O CONFIGURATION

The IOCON register is used to configure the I/O pins:

- CLKO/SOF: select Clock Output or Start of Frame.
- TXCANOD: TXCAN can be configured as Push-Pull or as Open Drain output. Open Drain outputs allows the user to connect multiple controllers together to build a CAN network without using a transceiver.
- $\overline{\text{INT0}}$  and  $\overline{\text{INT1}}$  can be configured as GPIO with similar registers as in the PIC microcontrollers or as Transmit and Receive interrupts.
- $\overline{\text{INT0}}$ /GPIO0/XSTBY can also be used to automatically control the standby pin of the transceiver.

- INTOD: The interrupt pins can be configured as open-drain or push/pull outputs.

## 6.1 Interrupt Pins

The MCP2517FD contains three different interrupt pins, see [Figure 6-1](#):

- $\overline{\text{INT}}$  is asserted on any interrupt in the CiINT register (xIF & xIE), including the RX and TX interrupts.
- $\overline{\text{INT1}}$ /GPIO1 can be configured as GPIO or RX interrupt pin (CiINT.RXIF & RXIE).
- $\overline{\text{INT0}}$ /GPIO0 can be configured as GPIO or TX interrupt pin (CiINT.TXIF & TXIE).

All interrupt pins are active low.

**FIGURE 6-1: INTERRUPT PINS**

## 7.0 ELECTRICAL SPECIFICATIONS

### 7.1 Absolute Maximum Ratings†

V <sub>DD</sub> .....	-0.3V to 6.0V
DC Voltage at all I/O w.r.t GND .....	-0.3V to V <sub>DD</sub> + 0.3V
Virtual Junction Temperature, T <sub>VJ</sub> (IEC60747-1) .....	-40°C to +165°C
Soldering temperature of leads (10 seconds) .....	+300°C
ESD protection on all pins (IEC 801; Human Body Model).....	±4 kV
ESD protection on all pins (IEC 801; Machine Model).....	±400V
ESD protection on all pins (IEC 801; Charge Device Model).....	±750V

† **NOTICE:** Stresses above those listed under “Maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

# MCP2517FD

**TABLE 7-1: DC CHARACTERISTICS**

DC Specifications		Electrical Characteristics: High (H): T <sub>AMB</sub> = -40°C to +150°C; V <sub>DD</sub> = 2.7V to 5.5V				
Sym.	Characteristic	Min.	Typ.	Max.	Units	Conditions/Comments
<b>VDD Pin</b>						
VDD	Voltage Range	2.7		5.5	V	RAM data retention guaranteed
VPORH	Power-on Reset Voltage			2.65	V	Highest voltage on VDD before device releases POR
VPORL	Power-on Reset Voltage	2.2			V	Lowest voltage on VDD before device asserts POR
SVDD	VDD Rise Rate to ensure POR	0.05			V/ms	<a href="#">Note 1</a>
IDD	Supply Current		15	20	mA	40 MHz SYSCLK, 20 MHz SPI activity
IDDS	Sleep Current		10	60	μA	Clock is stopped T <sub>AMB</sub> ≤ +85°C ( <a href="#">Note 1</a> )
				550		Clock is stopped T <sub>AMB</sub> ≤ +150°C
<b>Digital Input Pins:</b>						
V <sub>IH</sub>	High-Level Input Voltage	0.7 V <sub>DD</sub>		V <sub>DD</sub> + 0.3	V	
V <sub>IL</sub>	Low-Level Input Voltage	-0.3		0.3 V <sub>DD</sub>	V	
V <sub>OSCPP</sub>	OSC1 detection Voltage	0.5			V	Minimum peak-to-peak voltage on OSC1 pin ( <a href="#">Note 1</a> )
I <sub>LI</sub>	Input Leakage Current					
	OSC1	-5		+5	μA	
	All other	-1		+1	μA	
<b>Digital Output Pins:</b>						
V <sub>OH</sub>	High-Level Output Voltage	V <sub>DD</sub> - 0.7			V	I <sub>OH</sub> = -2 mA, V <sub>DD</sub> = 2.7V
V <sub>OL</sub>	Low-Level Output Voltage					
	TXCAN			0.6	V	I <sub>OL</sub> = 8 mA, V <sub>DD</sub> = 2.7V
	All other			0.6	V	I <sub>OL</sub> = 2 mA, V <sub>DD</sub> = 2.7V

**Note 1:** Characterized; not 100% tested.

**TABLE 7-2: CLKOUT AND SOF AC CHARACTERISTICS**

AC Specifications		Electrical Characteristics: High (H): T <sub>AMB</sub> = -40°C to +150°C; V <sub>DD</sub> = 2.7V to 5.5V				
Sym.	Characteristic	Min.	Typ.	Max.	Units	Conditions/Comments
TCLKOH	CLKO Output High	8			ns	@ 40 MHz ( <a href="#">Note 1</a> )
TCLKOL	CLKO Output Low	8			ns	<a href="#">Note 1</a>
TCLKOR	CLKO Output Rise			5	ns	<a href="#">Note 1</a>

## 9.0 PACKAGING INFORMATION

### 9.1 Package Marking Information

14-Lead SOIC

Example:

14-Lead VDFN

Example:

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

## APPENDIX A: REVISION HISTORY

### Revision B (May 2018)

The following is the list of modifications:

1. Updated the Active Current value in the [Features](#) section.
2. Updated [Register 3-28](#), [Register 3-29](#) and [Register 3-32](#).
3. Updated [Section 6.1 “Interrupt Pins”](#).
4. Updated [Table 7-4](#).

### Revision A (August 2017)

- Original Release of this Document.

# MCP2517FD

---

NOTES:

## APPENDIX B: CAN FD CONFORMANCE

ISO 11898-1:2015 lists non-mandatory features. [Table B-1](#) clarifies which optional features are implemented.

The MCP2517FD passed the CAN FD conformance tests specified in ISO 16845-1:2016.

**TABLE B-1: ISO OPTIONAL FEATURES**

No.	Optional Feature	Implemented
1	FD frame format	Yes
2	Disabling of frame formats	Yes. Classical CAN frame format.
3	Limited LLC frames	No. Full range of IDs and DLCs implemented.
4	No transmission of frames including padding bytes	N/A. See No. 3.
5	LLC Abort interface	Yes
6	ESI and BRS bit values	Yes
7	Method to provide MAC data consistency	Yes
8	Time and time triggering	Start of Frame output.
9	Time stamping	Yes. 32 bit TBC.
10	Bus monitoring mode	Yes
11	Handle	Yes
12	Restricted operation	Yes
13	Separate prescalers for nominal bits and for data bits	Yes
14	Disabling of automatic retransmission	Yes
15	Maximum number of retransmissions	Yes. One, 3, or unlimited.
16	Disabling of protocol exception event on res bit detected recessive	Yes. Selectable.
17	PCS_Status	No
18	Edge filtering during the bus integration state	Yes. Selectable.
19	Time resolution for SSP placement	Yes. 128 Tq. Measured, manual or disabled.
20	FD_T/R message	TX and RX interrupts.

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC<sup>®</sup> MCUs and dsPIC<sup>®</sup> DSCs, KEELoc<sup>®</sup> code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
