

Features

- 2A Maximum Output Current
- Tiny 1.0uH Chip Inductor
- Excellent Transient Response
- Input Voltage: 2.7V to 5.5V
- Ultra-small, Low Profile 8-pin 2mm x 2mm TDFN Package
- Fixed or Adjustable Output Voltage
- Adjustable Output Voltage: 1.0V to 3.3V
- High Efficiency with 2.5MHz Switching Frequency
- 55uA No Load Quiescent Current
- 100% Duty Cycle Low-Dropout Operation
- Internal Soft Start
- Over-Temperature and Current Limit Protection
- <1uA Shutdown Current
- -40°C to 85°C Temperature Range
- Pb-Free/Halogen Free Package
- RoHS/REACH Compliant

Applications

- Cellular Phone
- Digital Cameras
- Hard Disk Drives
- MP3 Players
- PDAs and Handheld Computers
- Portable Media Players
- USB Devices
- Wireless Network Cards

General Description

The PAM2316 is a 2A step-down sync converter. The 2.5MHz switching frequency enables the use of small external components. The ultra-small 2mm x 2mm footprint and high efficiency make the PAM2316 an ideal choice for portable applications.

The PAM2316 delivers 2A maximum output current while consuming only 55uA no-load quiescent current. Low RDS(ON) integrated MOSFETs and 100% duty cycle operation make the PAM2316 the ideal choice for high output voltage, high current applications which require a low dropout threshold.

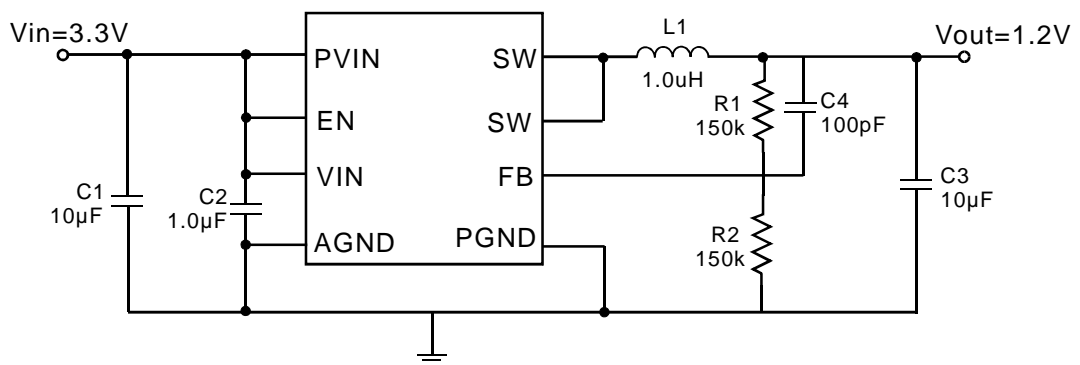

The PAM2316 provides excellent transient response and output accuracy across the operating range.

The PAM2316 maintains high efficiency throughout the load range. The PAM2316 automatically optimizes efficiency during light load mode (PSM) and maintains constant frequency and low output ripple during PWM mode.

Over-temperature and short circuit protection safeguard the PAM2316 and system components from damage.

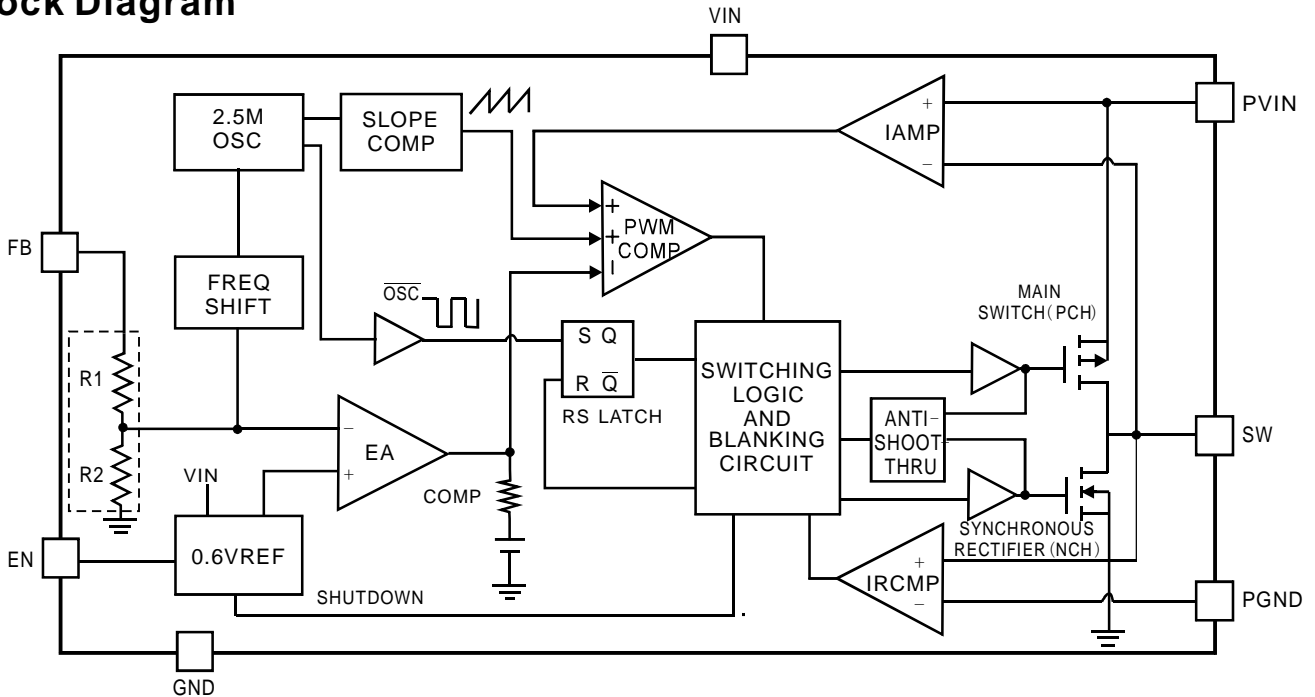

The PAM2316 is available in a Pb-free, ultra-small, low profile, 8-pin 2mm x 2mm TDFN package. The product is rated over a temperature range of -40°C to 85°C.

Typical Application

$$V_{out} = 0.6 * (1 + R1/R2)$$

Block Diagram

Pin Configuration & Marking Information

Pin Description

Pin NO.	Name	Function
1	PGND	Main power ground return pin. Connect to the output and input capacitor return.
2	PVIN	Input power supply tied to the source of the high side P-channel MOSFET.
3	VIN	Power supply; supplies power for the internal circuitry.
4	FB	Feedback input pin. Feedback voltage to internal error amplifier, the threshold voltage is 0.6V.
5	AGND	Analog ground. This pin is internally connected to the analog ground of the control circuitry.
6	EN	Enable pin. A logic low disables the converter and it consumes less than 1µA of current. When connected high, it resumes normal operation.
7,8	SW	Switching node. Connect the inductor to this pin. It is internally connected to the drain of both high and low side MOSFETs.

Absolute Maximum Ratings

These are stress ratings only and functional operation is not implied. Exposure to absolute maximum ratings for prolonged time periods may affect device reliability. All voltages are with respect to ground.

Input Voltage.....	-0.3V to 6.5V	Junction Temperature.....	150°C
EN, FB Pin Voltage.....	-0.3V to V_{IN}	Storage Temperature Range.....	-65°C to 150°C
SW Pin Voltage.....	-0.3V to ($V_{IN}+0.3V$)	Soldering Temperature.....	300°C, 5sec

Recommended Operating Conditions

Supply Voltage.....	2.7V to 5.5V	Junction Temperature Range.....	-40°C to 125°C
Operation Temperature Range.....	-40°C to 85°C		

Thermal Information

Parameter	Package	Symbol	Maximum	Unit
Thermal Resistance (Junction to Case)	TDFN22-8	θ_{JC}	23.4	°C/W
Thermal Resistance (Junction to Ambient)	TDFN22-8	θ_{JA}	70	
Internal Power Dissipation	TDFN22-8	P_D	1.4	W

Electrical Characteristic

$T_A=25^{\circ}\text{C}$, $V_{IN}=3.3\text{V}$, $V_{out}=1.2\text{V}$, $C_{IN}=10\mu\text{F}$, $C_o=10\mu\text{F}$, $L=1.0\mu\text{H}$, unless otherwise noted.

PARAMETER	SYMBOL	Test Conditions	MIN	TYP	MAX	UNITS

$I_o=0\sim 2\text{A}$, $V_o=1.2\text{V}$, $V_{in}=3.3\text{V}$

Load Transient

$I_o=0\sim 2\text{A}$, $V_o=3.3\text{V}$, $V_{in}=5\text{V}$

Application Information

The basic PAM2316 application circuit is shown on Page 1. External component selection is determined by the load requirement, selecting L first and then Cin and Cout.

Inductor Selection

For most applications, the value of the inductor will fall in the range of 0.47µH to 2µH. Its value is chosen based on the desired ripple current. Large value inductors lower ripple current and small value inductors result in higher ripple currents. Higher V_{IN} or V_{OUT} also increases the ripple current as shown in equation 2.0A reasonable starting point for setting ripple current is $\Delta I_L = 800\text{mA}$ (40% of 2A).

$$\Delta I_L = \frac{1}{(f)(L)} V_{OUT} \left(1 - \frac{V_{OUT}}{V_{IN}} \right) \quad (1)$$

The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation. Thus, a 2.8A rated inductor should be enough for most applications (2A + 800mA). For better efficiency, choose a low DC-resistance inductor.

C_{IN} and C_{OUT} Selection

In continuous mode, the source current of the top MOSFET is a square wave of duty cycle V_{OUT}/V_{IN} . To prevent large voltage transients, a low ESR input capacitor sized for the maximum RMS current must be used. The maximum RMS capacitor current is given by:

$$C_{IN} \text{ required } I_{RMS} \cong I_{OMAX} \frac{[V_{OUT}(V_{IN}-V_{OUT})]^{1/2}}{V_{IN}}$$

This formula has a maximum at $V_{IN} = 2V_{OUT}$, where $I_{RMS} = I_{OUT}/2$. This simple worst-case condition is commonly used for design because even significant deviations do not offer much relief. Note that the capacitor manufacturer's ripple current ratings are often based on 2000 hours of life. This makes it advisable to further derate the capacitor, or choose a capacitor rated at a higher temperature than required. Consult the manufacturer if there is any question.

The selection of C_{OUT} is driven by the required effective series resistance (ESR).

Typically, once the ESR requirement for C_{OUT} has been met, the RMS current rating generally far exceeds the $I_{RIPPLE}(P-P)$ requirement. The

output ripple ΔV_{OUT} is determined by:

$$\Delta V_{OUT} = \Delta I_L (ESR + 1/8fC_{OUT})$$

Where f = operating frequency, C_{OUT} = output capacitance and ΔI_L = ripple current in the inductor. For a fixed output voltage, the output ripple is highest at maximum input voltage since ΔI_L increases with input voltage.

Using Ceramic Input and Output Capacitors

Higher values, lower cost ceramic capacitors are now becoming available in smaller case sizes. Their high ripple current, high voltage rating and low ESR make them ideal for switching regulator applications. Using ceramic capacitors can achieve very low output ripple and small circuit size.

When choosing the input and output ceramic capacitors, choose the X5R or X7R dielectric formulations. These dielectrics have the best temperature and voltage characteristics of all the ceramics for a given value and size.

Thermal consideration

Thermal protection limits power dissipation in the PAM2316. When the junction temperature exceeds 150°C, the OTP (Over Temperature Protection) starts the thermal shutdown and turns the pass transistor off. The pass transistor resumes operation after the junction temperature drops below 120°C.

For continuous operation, the junction temperature should be maintained below 125°C. The power dissipation is defined as:

$$P_D = I_O^2 \frac{V_O R_{DS(ON)H} + (V_{IN} - V_O) R_{DS(ON)L}}{V_{IN}} + (t_{SW} F_{SW} I_O + I_Q) V_{IN}$$

I_Q is the step-down converter quiescent current. The term t_{SW} is used to estimate the full load step-down converter switching losses.

For the condition where the step-down converter is in dropout at 100% duty cycle, the total device dissipation reduces to:

$$P_D = I_O^2 R_{DS(ON)H} + I_Q V_{IN}$$

Since $R_{DS(ON)}$, quiescent current, and switching

losses all vary with input voltage, the total losses should be investigated over the complete input voltage range. The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surrounding airflow and temperature difference between junction and ambient. The maximum power dissipation can be calculated by the following formula:

$$P_D = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

Where $T_{J(max)}$ is the maximum allowable junction temperature $125^{\circ}C$. T_A is the ambient temperature and θ_{JA} is the thermal resistance from the junction to the ambient. Based on the standard JEDEC for a two layers thermal test board, the thermal resistance θ_{JA} of TDFN2X2 $70^{\circ}C/W$, respectively. The maximum power dissipation at $T_A = 25^{\circ}C$ can be calculated by following formula:

$$P_D = (125^{\circ}C - 25^{\circ}C) / 70^{\circ}C/W = 1.42W$$

Setting the Output Voltage

The internal reference is 0.6V (Typical). The output voltage is calculated as below:
The output voltage is given by Table 1.

$$V_o = 0.6 \times \left(1 + \frac{R1}{R2} \right)$$

Table 1: Resistor selection for output voltage setting

V _o	R1	R2
1.2V	150k	150k
1.5V	150k	100k
1.8V	300k	150k
2.5V	380k	120k
3.3V	680k	150k

Pulse Skipping Mode (PSM) Description

When load current decreases, the peak switch current in Power-PMOS will be lower than skip current threshold and the device will enter into Pulse Skipping Mode.

In this mode, the device has two states, working state and idle state. First, the device enters into working state controlled by internal error amplifier. When the feedback voltage gets higher than internal reference voltage, the device will

enter into low I_o idle state with most of internal blocks disabled. The output voltage will be reduced by loading or leakage current. When the feedback voltage gets lower than the internal reference voltage, the converter will start a working state again.

100% Duty Cycle Operation

As the input voltage approaches the output voltage, the converter turns the P-channel transistor continuously on. In this mode the output voltage is equal to the input voltage minus the voltage drop across the P - channel transistor:

$$V_{OUT} = V_{IN} - I_{LOAD} (R_{dson} + R_L)$$

where R_{dson} = P-channel switch ON resistance, I_{LOAD} = Output current, R_L = Inductor DC resistance

UVLO and Soft-Start

The reference and the circuit remain reset until the VIN crosses its UVLO threshold.

The PAM2316 has an internal soft-start circuit that limits the in-rush current during start-up. This prevents possible voltage drops of the input voltage and eliminates the output voltage overshoot.

Short Circuit Protection

When the converter output is shorted or the device is overloaded, each high-side MOSFET current-limit event (3A typ) turns off the high-side MOSFET and turns on the low-side MOSFET. An internal counter is used to count the each current-limit event. The counter is reset after consecutive high-side MOSFETs turn on without reaching current limit. If the current-limit condition persists, the counter fills up. The control logic then stops both high-side and low-side MOSFETs and waits for a hiccup period, before attempting a new soft-start sequence. The counter bits is decided by Vfb voltage. If $V_{fb} \leq 0.2$, the counter is 3-bit counter; if $V_{fb} > 0.2$ the counter is 6-bit counter. The typical hiccup made duty cycle is 1.7%. The hiccup mode is disable during soft-start time.

Thermal Shutdown

When the die temperature exceeds $150^{\circ}C$, a reset occurs and the reset remains until the temperature decrease to $120^{\circ}C$, at which time the circuit can be restarted.

PCB Layout Check List

When laying out the printed circuit board, the following checklist should be used to ensure proper operation of the PAM2316. Check the following in your layout:

1. The input capacitor should be close to IC as close as possible.
2. Must put a small decoupling capacitor between Vin Pin and AGND Pin.
3. Minimize the switching loop area to avoid excessive switching noise.
4. AGND and PGND should connect at input capacitor GND.
5. For the good thermal dissipation, PAM2316 has a heat dissipate pad in the bottom side, it should be soldered to PCB surface. For the copper area can't be large in the component side, so we can use multiple vias connect to other side of the PCB.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
