Description

CPC40055ST is an AC Solid State Switch utilizing dual power SCR outputs. This device includes zero-cross turn-on circuitry and is specified with an 800 V_P blocking voltage.

Tightly controlled zero-cross circuitry ensures low noise switching of AC loads by minimizing the generation of transients. The optically coupled input and output circuits provide exceptional noise immunity and 2500 V_{rms} of isolation. As a result, the CPC40055ST is well suited for industrial environments where electromagnetic interference would disrupt the operation of communications and control systems.

The unique SuperSIP package pioneered by IXYS Integrated Circuits allows Solid State Relays to achieve the highest load current currently available in any similar-sized package. This package features a unique process in which the silicon chips are soft soldered onto the ceramic Direct Copper Bond (DCB) substrate instead of the traditional copper leadframe. The DCB ceramic, the same substrate used in high power modules, not only provides 2500 V_{rms} isolation but also very low junction-to-case thermal impedance (0.35 °C/W).

2 Thermal Characteristics

Parameter	Conditions	Symbol	Rating	Units
Thermal Impedance (Junction to Case)	-	θ_{JC}	0.35	$^{\circ}\text{C/W}$
Thermal Impedance (Junction to Ambient)	Free Air	θ_{JA}	27	$^{\circ}\text{C/W}$

2.1 Heat Sink Calculation

Higher load currents are possible by using lower thermal impedance heat sink combinations.

Heat Sink Rating

$$\theta_{CA} = \frac{(T_J - T_A)}{P_D} - \theta_{JC}$$

T_J = Junction Temperature ($^{\circ}\text{C}$), $T_J \leq 150^{\circ}\text{C}$ *

T_A = Ambient Temperature ($^{\circ}\text{C}$)

θ_{JC} = Thermal Impedance, Junction to Case ($^{\circ}\text{C/W}$) = 0.35°C/W

θ_{CA} = Thermal Impedance of Heat Sink & Thermal Interface Material, Case to Ambient ($^{\circ}\text{C/W}$)

P_D = On-State Voltage (V_{rms}) • Load Current (A_{rms})

* Elevated junction temperature reduces semiconductor lifetime.

NOTE: The exposed surface of the DCB substrate is not to be soldered.

5 Manufacturing Information

5.1 Moisture Sensitivity

All plastic encapsulated semiconductor packages are susceptible to moisture ingress. IXYS Integrated Circuits classifies its plastic encapsulated devices for moisture sensitivity according to the latest version of the joint industry standard, **IPC/JEDEC J-STD-020**, in force at the time of product evaluation. We test all of our products to the maximum conditions set forth in the standard, and guarantee proper operation of our devices when handled according to the limitations and information in that standard as well as to any limitations set forth in the information or standards referenced below.

Failure to adhere to the warnings or limitations as established by the listed specifications could result in reduced product performance, reduction of operable life, and/or reduction of overall reliability.

This product carries a **Moisture Sensitivity Level (MSL)** classification as shown below, and should be handled according to the requirements of the latest version of the joint industry standard **IPC/JEDEC J-STD-033**.

Device	Moisture Sensitivity Level (MSL) Classification
CPC40055ST	MSL 1

5.2 ESD Sensitivity

This product is **ESD Sensitive**, and should be handled according to the industry standard **JESD-625**.

5.3 Soldering Profile

Provided in the table below is the Classification Temperature (T_C) of this product and the maximum dwell time the body temperature of this device may be ($T_C - 5^\circ\text{C}$) or greater. The classification temperature sets the Maximum Body Temperature allowed for this device during lead-free reflow processes. For through-hole devices, and any other processes, the guidelines of **J-STD-020** must be observed.

Device	Classification Temperature (T_C)	Dwell Time (t_p)	Max Reflow Cycles
CPC40055ST	245°C	30 seconds	1

NOTE: The exposed surface of the DCB substrate is not to be soldered.

5.4 Board Wash

IXYS Integrated Circuits recommends the use of no-clean flux formulations. Board washing to reduce or remove flux residue following the solder reflow process is acceptable provided proper precautions are taken to prevent damage to the device. These precautions include but are not limited to: using a low pressure wash and providing a follow up bake cycle sufficient to remove any moisture trapped within the device due to the washing process. Due to the variability of the wash parameters used to clean the board, determination of the bake temperature and duration necessary to remove the moisture trapped within the package is the responsibility of the user (assembler). Cleaning or drying methods that employ ultrasonic energy may damage the device and should not be used. Additionally, the device must not be exposed to flux or solvents that are Chlorine- or Fluorine-based.
