FM28V102A

## Features

■ 1-Mbit ferroelectric random access memory (F-RAM) logically organized as $64 \mathrm{~K} \times 16$
a Configurable as $128 \mathrm{~K} \times 8$ using $\overline{\mathrm{UB}}$ and $\overline{\mathrm{LB}}$
a High-endurance 100 trillion $\left(10^{14}\right)$ read/writes
a 151-year data retention (see the Data Retention and Endurance table)
$\square$ NoDelay ${ }^{\text {TM }}$ writes
$\square$ Page mode operation to 30-ns cycle time

- Advanced high-reliability ferroelectric process
- SRAM compatible
a Industry-standard $64 \mathrm{~K} \times 16$ SRAM pinout
a 60-ns access time, 90-ns cycle time
■ Superior to battery-backed SRAM modules
$\square$ No battery concerns
$\square$ Monolithic reliability
$\square$ True surface mount solution, no rework steps
$\square$ Superior for moisture, shock, and vibration
■ Low power consumption
$\square$ Active current 7 mA (typ)
$\square$ Standby current $120 \mu \mathrm{~A}$ (typ)
a Sleep mode current $3 \mu \mathrm{~A}$ (typ)
Low-voltage operation: $\mathrm{V}_{\mathrm{DD}}=2.0 \mathrm{~V}$ to 3.6 V

■ Industrial temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
■ 44-pin thin small outline package (TSOP) Type II
■ Restriction of hazardous substances (RoHS) compliant

## Functional Overview

The FM28V102A is a $64 \mathrm{~K} \times 16$ nonvolatile memory that reads and writes similar to a standard SRAM. A ferroelectric random access memory or F-RAM is nonvolatile, which means that data is retained after power is removed. It provides data retention for over 151 years while eliminating the reliability concerns, functional disadvantages, and system design complexities of battery-backed SRAM (BBSRAM). Fast write timing and high write endurance make the F-RAM superior to other types of memory.
The FM28V102A operation is similar to that of other RAM devices and therefore, it can be used as a drop-in replacement for a standard SRAM in a system. Read cycles may be triggered by $\overline{\mathrm{CE}}$ or simply by changing the address and write cycles may be triggered by $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$. The F-RAM memory is nonvolatile due to its unique ferroelectric memory process. These features make the FM28V102A ideal for nonvolatile memory applications requiring frequent or rapid writes.
The device is available in a 400-mil 44-pin TSOP-II surface mount package. Device specifications are guaranteed over the industrial temperature range $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Pinout

Figure 1. 44-pin TSOP II pinout

## Pin Definitions

| Pin Name | I/O Type | Description |
| :---: | :---: | :---: |
| $\mathrm{A}_{15}-\mathrm{A}_{0}$ | Input | Address inputs: The 16 address lines select one of 64 K words in the F-RAM array. The lowest two address lines $A_{1}-A_{0}$ may be used for page mode read and write operations. |
| $\mathrm{DQ}_{15}-\mathrm{DQ}_{0}$ | Input/Output | Data I/O Lines: 16-bit bidirectional data bus for accessing the F-RAM array. |
| $\overline{\mathrm{WE}}$ | Input | Write Enable: A write cycle begins when $\overline{\mathrm{WE}}$ is asserted. The rising edge causes the FM28V102A to write the data on the DQ bus to the F-RAM array. The falling edge of WE latches a new column address for page mode write cycles. |
| $\overline{\mathrm{CE}}$ | Input | Chip Enable: The device is selected and a new memory access begins on the falling edge of $\overline{\mathrm{CE}}$. The entire address is latched internally at this point. Subsequent changes to the $A_{1}-A_{0}$ address inputs allow page mode operation. |
| $\overline{\mathrm{OE}}$ | Input | Output Enable: When $\overline{\mathrm{OE}}$ is LOW, the FM28V102A drives the data bus when the valid read data is available. Deasserting OE HIGH tristates the DQ pins. |
| $\overline{\text { UB }}$ | Input | Upper Byte Select: Enables $\mathrm{DQ}_{15}-\mathrm{DQ}_{8}$ pins during reads and writes. These pins are $\mathrm{HI}-\mathrm{Z}$ if $\overline{\overline{U B}}$ is HIGH . If the user does not perform byte writes and the device is not configured as a $128 \mathrm{~K} \times 8$, the $\overline{\mathrm{UB}}$ and $\overline{\mathrm{LB}}$ pins may be tied to ground. |
| $\overline{\mathrm{LB}}$ | Input | Lower Byte Select: Enables $\mathrm{DQ}_{7}-\mathrm{DQ}_{0}$ pins during reads and writes. These pins are $\mathrm{HI}-\mathrm{Z}$ if $\overline{\overline{\mathrm{LB}}}$ is HIGH . If the user does not perform byte writes and the device is not configured as a $128 \mathrm{~K} \times 8$, the $\overline{\mathrm{UB}}$ and $\overline{\mathrm{LB}}$ pins may be tied to ground. |
| $\overline{Z Z}$ | Input | Sleep: When $\overline{\mathrm{ZZ}}$ is LOW, the device enters a low-power sleep mode for the lowest supply current condition. $\overline{\mathrm{ZZ}}$ must be HIGH for a normal read/write operation. This pin must be tied to $\mathrm{V}_{\mathrm{DD}}$ if not used. |
| $V_{S S}$ | Ground | Ground for the device. Must be connected to the ground of the system. |
| $V_{\text {DD }}$ | Power supply | Power supply input to the device. |
| NC | No connect | No connect. This pin is not connected to the die. |

## Device Operation

The FM28V102A is a word wide F-RAM memory logically organized as $65,536 \times 16$ and accessed using an industry-standard parallel interface. All data written to the part is immediately nonvolatile with no delay. The device offers page mode operation, which provides high-speed access to addresses within a page (row). Access to a different page requires that either $\overline{\mathrm{CE}}$ transitions LOW or the upper address $\left(\mathrm{A}_{15}-\mathrm{A}_{2}\right)$ changes. See the Functional Truth Table on page 15 for a complete description of read and write modes.

## Memory Operation

Users access 65,536 memory locations, each with 16 data bits through a parallel interface. The F-RAM array is organized as 16,384 rows each having 64 bits. Each row has four column locations, which allow fast access in page mode operation. When an initial address is latched by the falling edge of $\overline{C E}$, subsequent column locations may be accessed without the need to toggle $\overline{\mathrm{CE}}$. When $\overline{\mathrm{CE}}$ is deasserted HIGH, a pre-charge operation begins. Writes occur immediately at the end of the access with no delay. The $\overline{\mathrm{WE}}$ pin must be toggled for each write operation. The write data is stored in the nonvolatile memory array immediately, which is a feature unique to F-RAM called NoDelay writes.

## Read Operation

A read operation begins on the falling edge of $\overline{\mathrm{CE}}$. The falling edge of $\overline{\mathrm{CE}}$ causes the address to be latched and starts a memory read cycle if $\overline{\mathrm{WE}}$ is HIGH. Data becomes available on the bus after the access time is met. When the address is latched and the access completed, a new access to a random location (different row) may begin while $\overline{\mathrm{CE}}$ is still LOW. The minimum cycle time for random addresses is $t_{R C}$. Note that unlike SRAMs, the FM28V102A's $\overline{\mathrm{CE}}$-initiated access time is faster than the address access time.
The FM28V102A will drive the data bus when $\overline{\mathrm{OE}}$ and at least one of the byte enables $(\overline{\mathrm{UB}}, \overline{\mathrm{LB}})$ is asserted LOW. The upper data byte is driven when UB is LOW, and the lower data byte is driven when $\overline{\mathrm{LB}}$ is LOW. If $\overline{\mathrm{OE}}$ is asserted after the memory access time is met, the data bus will be driven with valid data. If $\overline{\mathrm{OE}}$ is asserted before completing the memory access, the data bus will not be driven until valid data is available. This feature minimizes supply current in the system by eliminating transients caused by invalid data being driven to the bus. When $\overline{\mathrm{OE}}$ is deasserted HIGH, the data bus will remain in a HI-Z state.

## Write Operation

In the FM28V102A, writes occur in the same interval as reads. The FM28V102A supports both $\overline{\mathrm{CE}}$ and $\overline{\mathrm{WE}}$ controlled write cycles. In both cases, the address $\mathrm{A}_{15}-\mathrm{A}_{2}$ is latched on the falling edge of $\overline{\mathrm{CE}}$.
In a $\overline{\mathrm{CE}}$-controlled write, the $\overline{\mathrm{WE}}$ signal is asserted before beginning the memory cycle. That is, $\overline{W E}$ is LOW when $\overline{C E}$ falls. In this case, the device begins the memory cycle as a write. The FM28V102A will not drive the data bus regardless of the state of $\overline{\mathrm{OE}}$ as long as $\overline{\mathrm{WE}}$ is LOW. Input data must be valid when $\overline{\mathrm{CE}}$ is
deasserted HIGH. In a $\overline{\text { WE-controlled write, the memory cycle }}$ begins on the falling edge of $\overline{\mathrm{CE}}$. The $\overline{\mathrm{WE}}$ signal falls some time later. Therefore, the memory cycle begins as a read. The data bus will be driven if $\overline{\mathrm{OE}}$ is LOW ; however, it will be $\mathrm{HI}-\mathrm{Z}$ when $\overline{\mathrm{WE}}$ is asserted LOW. The $\overline{\mathrm{CE}}$ - and $\overline{\mathrm{WE}}$-controlled write timing cases are shown in the Switching Waveforms on page 13.
Write access to the array begins on the falling edge of $\overline{\mathrm{WE}}$ after the memory cycle is initiated. The write access terminates on the rising edge of $\overline{\mathrm{WE}}$ or $\overline{\mathrm{CE}}$, whichever comes first. A valid write operation requires the user to meet the access time specification before deasserting $\overline{\mathrm{WE}}$ or $\overline{\mathrm{CE}}$. The data setup time indicates the interval during which data cannot change before the end of the write access (rising edge of $\overline{\mathrm{WE}}$ or $\overline{\mathrm{CE}}$ ).
Unlike other nonvolatile memory technologies, there is no write delay with F-RAM. Because the read and write access times of the underlying memory are the same, the user experiences no delay through the bus. The entire memory operation occurs in a single bus cycle. Data polling, a technique used with EEPROMs to determine if a write is complete, is unnecessary.

## Page Mode Operation

The F-RAM array is organized as 16,384 rows each having 64 bits. Each row has four column-address locations. Address inputs $A_{1}-A_{0}$ define the column address to be accessed. An access can start on any column address, and other column locations may be accessed without the need to toggle the $\overline{\mathrm{CE}} \mathrm{pin}$. For fast access reads, after the first data byte is driven to the bus, the column address inputs $A_{1}-A_{0}$ may be changed to a new value. A new data byte is then driven to the DQ pins no later than $t_{\text {AAP, }}$ which is less than half the initial read access time. For fast access writes, the first write pulse defines the first write access. While $\overline{\mathrm{CE}}$ is LOW, a subsequent write pulse along with a new column address provides a page mode write access.

## Pre-charge Operation

The pre-charge operation is an internal condition in which the memory state is prepared for a new access. Pre-charge is user-initiated by driving the $\overline{\mathrm{CE}}$ signal HIGH. It must remain HIGH for at least the minimum pre-charge time, $\mathrm{t}_{\mathrm{PC}}$.
Pre-charge is also activated by changing the upper addresses, $\mathrm{A}_{15}-\mathrm{A}_{2}$. The current row is first closed before accessing the new row. The device automatically detects an upper order address change, which starts a pre-charge operation. The new address is latched and the new read data is valid within the $t_{A A}$ address access time; see Figure 6 on page 11. A similar sequence occurs for write cycles; see Figure 11 on page 12. The rate at which random addresses can be issued is $t_{R C}$ and $t_{W C}$, respectively.

## Sleep Mode

The device incorporates a sleep mode of operation, which allows the user to achieve the lowest power supply current condition. It enters a low-power sleep mode by asserting the $\overline{\mathrm{ZZ}}$ pin LOW. Read and write operations must complete before the $\overline{Z Z}$ pin going LOW. When $\overline{Z Z}$ is LOW, all pins are ignored except the $\overline{\mathrm{ZZ}}$ pin. When $\overline{\mathrm{ZZ}}$ is deasserted HIGH, there is some time delay ( $\mathrm{t}_{\text {ZZEX }}$ ) before the user can access the device. If sleep mode is not used, the $\overline{Z Z}$ pin must be tied to $V_{D D}$

Figure 2. Sleep/Standby State Diagram

## SRAM Drop-In Replacement

The FM28V102A is designed to be a drop-in replacement for standard asynchronous SRAMs. The device does not require $\overline{\mathrm{CE}}$ to toggle for each new address. CE may remain LOW indefinitely. While $\overline{\mathrm{CE}}$ is LOW, the device automatically detects address changes and a new access begins. This functionality allows $\overline{\mathrm{CE}}$ to be grounded, similar to an SRAM. It also allows page mode operation at speeds up to 33 MHz .
Figure 3 shows a pull-up resistor on $\overline{\mathrm{CE}}$, which will keep the pin HIGH during power cycles, assuming the MCU / MPU pin tristates during the reset condition. The pull-up resistor value should be chosen to ensure the $\overline{\mathrm{CE}}$ pin tracks $\mathrm{V}_{\mathrm{DD}}$ to a high enough value, so that the current drawn when $\overline{C E}$ is LOW is not an issue. A $10-\mathrm{k} \Omega$ resistor draws $330 \mu \mathrm{~A}$ when $\overline{\mathrm{CE}}$ is LOW and $V_{D D}=3.3 \mathrm{~V}$
Figure 3. Use of Pull-up Resistor on $\overline{\mathbf{C E}}$

Note that if $\overline{\mathrm{CE}}$ is tied to ground, the user must be sure $\overline{\mathrm{WE}}$ is not LOW at power-up or power-down events. If $\overline{\mathrm{CE}}$ and $\overline{\mathrm{WE}}$ are both LOW during power cycles, data will be corrupted. Figure 4 shows a pull-up resistor on WE, which will keep the pin HIGH during power cycles, assuming the MCU/MPU pin tristates during the reset condition. The pull-up resistor value should be chosen to ensure the $\overline{\mathrm{WE}}$ pin tracks $\mathrm{V}_{\mathrm{DD}}$ to a high enough value, so that the current drawn when $\overline{W E}$ is LOW is not an issue. A $10-\mathrm{k} \Omega$ resistor draws $330 \mu \mathrm{~A}$ when $\overline{\mathrm{WE}}$ is LOW and $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$.
Figure 4. Use of Pull-up Resistor on $\overline{\mathrm{WE}}$

For applications that require the lowest power consumption, the $\overline{\mathrm{CE}}$ signal should be active (LOW) only during memory accesses. The FM28V102A draws supply current while $\overline{\mathrm{CE}}$ is LOW, even if addresses and control signals are static. While CE is HIGH, the device draws no more than the maximum standby current, $\mathrm{I}_{\mathrm{SB}}$. The $\overline{U B}$ and $\overline{\mathrm{LB}}$ byte select pins are active for both read and write cycles. They may be used to allow the device to be wired as a $128 \mathrm{~K} \times 8$ memory. The upper and lower data bytes can be tied together and controlled with the byte selects. Individual byte enables or the next higher address line $\mathrm{A}_{16}$ may be available from the system processor.

Figure 5. FM28V102A Wired as $128 \mathrm{~K} \times 8$

FM28V102A

## Endurance

The FM28V102A is capable of being accessed at least $10^{14}$ times - reads or writes. An F-RAM memory operates with a read and restore mechanism. Therefore, an endurance cycle is applied on a row basis. The F-RAM architecture is based on an array of rows and columns. Rows are defined by $\mathrm{A}_{15-2}$ and column addresses by $A_{1-0}$. The array is organized as 16 K rows of four words each. The entire row is internally accessed once whether a single 16-bit word or all four words are read or written. Each word in the row is counted only once in an endurance calculation.
The user may choose to write CPU instructions and run them from a certain address space. Table 1 shows endurance calculations for a 256-byte repeating loop, which includes a starting address, three-page mode accesses, and a $\overline{\mathrm{CE}}$ pre-charge. The number of bus clock cycles needed to complete a four-word transaction is $4+1$ at lower bus speeds, but $5+2$ at 33 MHz due to initial read latency and an extra clock cycle to
satisfy the device's pre-charge timing constraint $t_{\mathrm{PC}}$. The entire loop causes each byte to experience only one endurance cycle. The F-RAM read and write endurance is virtually unlimited even at a $33-\mathrm{MHz}$ system bus clock rate.

Table 1. Time to Reach 100 Trillion Cycles for Repeating 256-byte Loop

| Bus <br> Freq <br> $(\mathbf{M H z})$ | Bus <br> Cycle <br> Time <br> $(\mathrm{ns})$ | 256-byte <br> Transaction <br> Time $(\mu \mathrm{s})$ | Endurance <br> Cycles/sec | Endurance <br> Cycles/year | Rears to <br> $\mathbf{1 0}^{\mathbf{1 4}}$ <br> Cycles |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 33 | 30 | 10.56 | 94,690 | $2.98 \times 10^{\mathbf{1 2}}$ | 33.5 |
| 25 | 40 | 12.8 | 78,125 | $2.46 \times 10^{12}$ | 40.6 |
| 10 | 100 | 28.8 | 34,720 | $1.09 \times 10^{12}$ | 91.7 |
| 5 | 200 | 57.6 | 17,360 | $5.47 \times 10^{11}$ | 182.8 |

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.
Storage temperature $\qquad$ $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$

Maximum accumulated storage time
At $125^{\circ} \mathrm{C}$ ambient temperature
1000 h
At $85^{\circ} \mathrm{C}$ ambient temperature 10 Years
Ambient temperature
with power applied $\qquad$ $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Supply voltage on $\mathrm{V}_{\mathrm{DD}}$ relative to $\mathrm{V}_{\mathrm{SS}} \ldots . . . .-1.0 \mathrm{~V}$ to +4.5 V Voltage applied to outputs in High Z state $\qquad$ -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$ Input voltage $\qquad$ -1.0 V to +4.5 V and $\mathrm{V}_{\mathrm{IN}}<\mathrm{V}_{\mathrm{DD}}+1.0 \mathrm{~V}$

Transient voltage (<20 ns) on any pin to ground potential $\qquad$ -2.0 V to $\mathrm{V}_{\mathrm{CC}}+2.0 \mathrm{~V}$ Package power dissipation capability ( $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ ) $\qquad$ 1.0 W

Surface mount Pb soldering temperature (3 seconds) $+260^{\circ} \mathrm{C}$ DC output current ( 1 output at a time, 1 s duration) .... 15 mA Static discharge voltage Human Body Model (AEC-Q100-002 Rev. E) ............... 2 kV Charged Device Model (AEC-Q100-011 Rev. B) ......... 500 V Latch-up current > 140 mA

| $\mathrm{t}_{\mathrm{AH}}$ | $\mathrm{t}_{\mathrm{HA}}$ | Address hold time ( $\overline{\mathrm{CE}}$ Controlled) | 70 | - | 60 | - | ns |
| $\mathrm{t}_{\mathrm{OE}}$ | $t_{\text {doe }}$ | Output enable access time | - | 25 | - | 15 | ns |
| $\mathrm{t}_{\mathrm{Hz}}{ }^{[3,4]}$ | $\mathrm{t}_{\text {HZCE }}$ | Chip Enable to output HI-Z | - | 15 | - | 10 | ns |
| $\mathrm{t}_{\mathrm{OHz}}{ }^{[3,4]}$ | $\mathrm{t}_{\text {HZOE }}$ | Output enable HIGH to output HI-Z | - | 15 | - | 10 | ns |
| $\mathrm{t}_{\mathrm{BHZ}}{ }^{[3,4]}$ | $t_{\text {HZBE }}$ | $\overline{\text { UB, }}$, LB HIGHHIGH to output HI-Z | - | 15 | - | 10 | ns |

## Notes

2. Test conditions assume a signal transition time of 3 ns or less, timing reference levels of $0.5 \times \mathrm{V}_{\mathrm{DD}}$, input pulse levels of 0 to 3 V , output loading of the specified $\mathrm{I}_{\mathrm{OL}} / \mathrm{I}_{\mathrm{OH}}$ and load capacitance shown in AC Test Conditions on page 8.
3. $t_{\mathrm{HZ}}, \mathrm{t}_{\mathrm{OHZ}}$ and $\mathrm{t}_{\mathrm{BHZ}}$ are specified with a load capacitance of 5 pF . Transition is measured when the outputs enter a high impedance state.
4. This parameter is characterized but not $100 \%$ tested.

## AC Switching Characteristics (continued)

Over the Operating Range

| Parameters ${ }^{[2]}$ |  | Description | $\mathrm{V}_{\mathrm{DD}}=2.0 \mathrm{~V}$ to 2.7 V |  | $\mathrm{V}_{\mathrm{DD}}=2.7 \mathrm{~V}$ to 3.6 V |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Power Cycle and Sleep Mode Timing

## Over the Operating Range

| Parameter | Description | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: |
| $t_{\text {PU }}$ | Power-up (after $\mathrm{V}_{\mathrm{DD}} \mathrm{min}$. is reached) to first access time | 1 | - | ms |
| $\mathrm{t}_{\text {PD }}$ | Last write ( $\overline{\mathrm{WE}}$ HIGH) to power down time | 0 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{VR}}{ }^{[10]}$ | $V_{\text {DD }}$ power-up ramp rate | 50 | - | $\mu \mathrm{s} / \mathrm{V}$ |
| $\mathrm{t}_{\mathrm{VF}}{ }^{[10]}$ | $V_{\text {DD }}$ power-down ramp rate | 100 | - | $\mu \mathrm{s} / \mathrm{V}$ |
| $\mathrm{t}_{\text {zzH }}$ | $\overline{Z Z}$ active to DQ HI-Z time | - | 20 | ns |
| twezz | Last write to sleep mode entry time | 0 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {zzL }}$ | $\overline{\text { ZZ }}$ active LOW time | 1 | - | $\mu \mathrm{s}$ |
| tzzen | Sleep mode entry time ( $\overline{\mathrm{ZZ}}$ LOW to $\overline{\mathrm{CE}}$ don't care) | - | 0 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {zzex }}$ | Sleep mode exit time ( $\overline{\mathrm{ZZ}} \mathrm{HIGH}$ to $1^{\text {st }}$ access after wakeup) | - | 450 | $\mu \mathrm{s}$ |

Figure 14. Power Cycle and Sleep Mode Timing

Note
10. Slope measured at any point on the $\mathrm{V}_{\mathrm{DD}}$ waveform.

## Functional Truth Table

| $\overline{C E}$ | $\overline{\text { WE }}$ | $\mathrm{A}_{15-2}$ | $\mathrm{A}_{1-0}$ | $\overline{\text { ZZ }}$ | Operation ${ }^{[11,12]}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| X | X | X | X | L | Sleep Mode |
| H | X | X | X | H | Standby/Idle |
| $\stackrel{\downarrow}{\llcorner }$ | $\begin{aligned} & \mathrm{H} \\ & \mathrm{H} \end{aligned}$ | $\begin{aligned} & V \\ & V \end{aligned}$ | $\begin{aligned} & V \\ & V \end{aligned}$ | $\begin{aligned} & \mathrm{H} \\ & \mathrm{H} \end{aligned}$ | Read |
| L | H | No Change | Change | H | Page Mode Read |
| L | H | Change | V | H | Random Read |
| $\stackrel{\downarrow}{\mathrm{L}}$ | $\begin{aligned} & \mathrm{L} \\ & \mathrm{~L} \end{aligned}$ | $\begin{aligned} & \mathrm{V} \\ & \mathrm{~V} \end{aligned}$ | $\begin{aligned} & V \\ & V \end{aligned}$ | $\begin{aligned} & \mathrm{H} \\ & \mathrm{H} \end{aligned}$ | $\overline{\mathrm{CE}}$-Controlled Write ${ }^{[12]}$ |
| L | $\downarrow$ | V | V | H | $\overline{\text { WE-Controlled Write }}{ }^{[12,13]}$ |
| L | $\downarrow$ | No Change | V | H | Page Mode Write ${ }^{\text {14] }}$ |
| ¢ | $\begin{aligned} & \mathrm{X} \\ & \mathrm{X} \end{aligned}$ | $\begin{aligned} & X \\ & X \end{aligned}$ | $\begin{aligned} & X \\ & X \end{aligned}$ | $\begin{aligned} & \mathrm{H} \\ & \mathrm{H} \end{aligned}$ | Starts pre-charge |

## Byte Select Truth Table

| WE | OE | LB | UB | Operation ${ }^{[15]}$ |
| :---: | :---: | :---: | :---: | :---: |
| H | H | X | X | Read; Outputs disabled |
|  | X | H | H |  |
| H | L | H | L | Read upper byte; HI-Z lower byte |
|  |  | L | H | Read lower byte; HI-Z upper byte |
|  |  | L | L | Read both bytes |
| L | X | H | L | Write upper byte; Mask lower byte |
|  |  | L | H | Write lower byte; Mask upper byte |
|  |  | L | L | Write both bytes |

## Notes

11. H = Logic HIGH, L = Logic LOW, V = Valid Data, $X=$ Don't Care, $\downarrow=$ toggle LOW, $\uparrow=$ toggle HIGH.
12. For write cycles, data-in is latched on the rising edge of $\overline{C E}$ or $\overline{W E}$, whichever comes first.
13. WE-controlled write cycle begins as a Read cycle and then $\mathrm{A}_{15-2}$ is latched.
14. Addresses $\mathrm{A}_{1-0}$ must remain stable for at least 15 ns during page mode operation.
15. The $\overline{U B}$ and $\overline{\mathrm{LB}}$ pins may be grounded if 1 ) the system does not perform byte writes and 2 ) the device is not configured as a $128 \mathrm{~K} \times 8$.

## Ordering Information

# OCEAN CHIPS <br> Океан Электроники <br> Поставка электронных компонентов 

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR». JONHON
«JONHON» (основан в 1970 г.)
Разъемы специального, военного и аэрокосмического назначения:
(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)
«FORSTAR» (основан в 1998 г.)
ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:
(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
