MC9328MXL

1 Introduction

The i.MX Family of applications processors provides a leap in performance with an ARM9™ microprocessor core and highly integrated system functions. The i.MX family specifically addresses the requirements of the personal, portable product market by providing intelligent integrated peripherals, an advanced processor core, and power management capabilities.

The MC9328MXL (i.MXL) processor features the advanced and power-efficient ARM920T™ core that operates at speeds up to 200 MHz. Integrated modules, which include a USB device, an LCD controller, and an MMC/SD host controller, support a suite of peripherals to enhance portable products seeking to provide a rich multimedia experience. It is packaged in either a 256-contact Mold Array Process-Ball Grid Array (MAPBGA) or 225-contact MAPBGA package.

[Figure 1](#) shows the functional block diagram of the i.MXL processor.

1.1 Features

To support a wide variety of applications, the processor offers a robust array of features, including the following:

- ARM920T™ Microprocessor Core
- AHB to IP Bus Interfaces (APIs)
- External Interface Module (EIM)
- SDRAM Controller (SDRAMC)
- DPLL Clock and Power Control Module
- Two Universal Asynchronous Receiver/Transmitters (UART 1 and UART 2)
- Serial Peripheral Interface (SPI)
- Two General-Purpose 32-bit Counters/Timers
- Watchdog Timer
- Real-Time Clock/Sampling Timer (RTC)
- LCD Controller (LCDC)
- Pulse-Width Modulation (PWM) Module
- Universal Serial Bus (USB) Device
- Multimedia Card and Secure Digital (MMC/SD) Host Controller Module
- Memory Stick® Host Controller (MSHC)
- Direct Memory Access Controller (DMAC)
- Synchronous Serial Interface and an Inter-IC Sound (SSI/I²S) Module
- Inter-IC (I²C) Bus Module

- Video Port
- General-Purpose I/O (GPIO) Ports
- Bootstrap Mode
- Multimedia Accelerator (MMA)
- Power Management Features
- Operating Voltage Range: 1.7 V to 1.9 V core, 1.7 V to 3.3 V I/O
- 256-pin MAPBGA Package
- 225-contact MAPBGA Package

1.2 Target Applications

The i.MXL processor is targeted for advanced information appliances, smart phones, Web browsers, digital MP3 audio players, handheld computers, and messaging applications.

1.3 Ordering Information

Table 1 provides ordering information.

1.4 Conventions

This document uses the following conventions:

- $\overline{\text{OVERBAR}}$ is used to indicate a signal that is active when pulled low: for example, $\overline{\text{RESET}}$.
- *Logic level one* is a voltage that corresponds to Boolean true (1) state.
- *Logic level zero* is a voltage that corresponds to Boolean false (0) state.
- To *set* a bit or bits means to establish logic level one.
- To *clear* a bit or bits means to establish logic level zero.
- A *signal* is an electronic construct whose state conveys or changes in state convey information.

- A *pin* is an external physical connection. The same pin can be used to connect a number of signals.
- *Asserted* means that a discrete signal is in active logic state.
 - *Active low* signals change from logic level one to logic level zero.
 - *Active high* signals change from logic level zero to logic level one.
- *Negated* means that an asserted discrete signal changes logic state.
 - *Active low* signals change from logic level zero to logic level one.
 - *Active high* signals change from logic level one to logic level zero.
- LSB means *least significant bit* or *bits*, and MSB means *most significant bit* or *bits*. References to low and high bytes or words are spelled out.
- Numbers preceded by a percent sign (%) are binary. Numbers preceded by a dollar sign (\$) or 0x are hexadecimal.

2 Signals and Connections

Table 2 identifies and describes the i.MXL processor signals that are assigned to package pins. The signals are grouped by the internal module that they are connected to.

Table 2. i.MXL Signal Descriptions

| Signal Name | Function/Notes |
|---------------------------------------|---|
| External Bus/Chip-Select (EIM) | |
| A[24:0] | Address bus signals |
| D[31:0] | Data bus signals |
| $\overline{EB0}$ | MSB Byte Strobe—Active low external enable byte signal that controls D [31:24]. |
| $\overline{EB1}$ | Byte Strobe—Active low external enable byte signal that controls D [23:16]. |
| $\overline{EB2}$ | Byte Strobe—Active low external enable byte signal that controls D [15:8]. |
| $\overline{EB3}$ | LSB Byte Strobe—Active low external enable byte signal that controls D [7:0]. |
| \overline{OE} | Memory Output Enable—Active low output enables external data bus. |
| \overline{CS} [5:0] | Chip-Select—The chip-select signals \overline{CS} [3:2] are multiplexed with \overline{CSD} [1:0] and are selected by the Function Multiplexing Control Register (FMCR). By default \overline{CSD} [1:0] is selected. |
| \overline{ECB} | Active low input signal sent by a flash device to the EIM whenever the flash device must terminate an on-going burst sequence and initiate a new (long first access) burst sequence. |
| \overline{LBA} | Active low signal sent by a flash device causing the external burst device to latch the starting burst address. |
| BCLK (burst clock) | Clock signal sent to external synchronous memories (such as burst flash) during burst mode. |
| \overline{RW} | \overline{RW} signal—Indicates whether external access is a read (high) or write (low) cycle. Used as a \overline{WE} input signal by external DRAM. |
| \overline{DTACK} | \overline{DTACK} signal—The external input data acknowledge signal. When using the external \overline{DTACK} signal as a data acknowledge signal, the bus time-out monitor generates a bus error when a bus cycle is not terminated by the external \overline{DTACK} signal after 1022 clock counts have elapsed. |

Table 2. i.MXL Signal Descriptions (Continued)

| Signal Name | Function/Notes |
|--------------------------------|--|
| Bootstrap | |
| BOOT [3:0] | System Boot Mode Select—The operational system boot mode of the i.MXL processor upon system reset is determined by the settings of these pins. |
| SDRAM Controller | |
| SDBA [4:0] | SDRAM non-interleave mode bank address multiplexed with address signals A [15:11]. These signals are logically equivalent to core address p_addr [25:21] in SDRAM cycles. |
| SDIBA [3:0] | SDRAM interleave addressing mode bank address multiplexed with address signals A [19:16]. These signals are logically equivalent to core address p_addr [12:9] in SDRAM cycles. |
| MA [11:10] | SDRAM address signals |
| MA [9:0] | SDRAM address signals which are multiplexed with address signals A [10:1]. MA [9:0] are selected on SDRAM cycles. |
| DQM [3:0] | SDRAM data enable |
| $\overline{\text{CSD0}}$ | SDRAM Chip-select signal which is multiplexed with the $\overline{\text{CS2}}$ signal. These two signals are selectable by programming the system control register. |
| $\overline{\text{CSD1}}$ | SDRAM Chip-select signal which is multiplexed with $\overline{\text{CS3}}$ signal. These two signals are selectable by programming the system control register. By default, $\overline{\text{CSD1}}$ is selected, so it can be used as boot chip-select by properly configuring BOOT [3:0] input pins. |
| $\overline{\text{RAS}}$ | SDRAM Row Address Select signal |
| $\overline{\text{CAS}}$ | SDRAM Column Address Select signal |
| $\overline{\text{SDWE}}$ | SDRAM Write Enable signal |
| SDCKE0 | SDRAM Clock Enable 0 |
| SDCKE1 | SDRAM Clock Enable 1 |
| SDCLK | SDRAM Clock |
| $\overline{\text{RESET_SF}}$ | Not Used |
| Clocks and Resets | |
| EXTAL16M | Crystal input (4 MHz to 16 MHz), or a 16 MHz oscillator input when the internal oscillator circuit is shut down. |
| XTAL16M | Crystal output |
| EXTAL32K | 32 kHz crystal input |
| XTAL32K | 32 kHz crystal output |
| CLKO | Clock Out signal selected from internal clock signals. |
| $\overline{\text{RESET_IN}}$ | Master Reset—External active low Schmitt trigger input signal. When this signal goes active, all modules (except the reset module and the clock control module) are reset. |
| $\overline{\text{RESET_OUT}}$ | Reset Out—Internal active low output signal from the Watchdog Timer module and is asserted from the following sources: Power-on reset, External reset ($\overline{\text{RESET_IN}}$), and Watchdog time-out. |
| POR | Power On Reset—Internal active high Schmitt trigger input signal. The POR signal is normally generated by an external RC circuit designed to detect a power-up event. |

Table 2. i.MXL Signal Descriptions (Continued)

| Signal Name | Function/Notes |
|------------------------------|--|
| JTAG | |
| $\overline{\text{TRST}}$ | Test Reset Pin—External active low signal used to asynchronously initialize the JTAG controller. |
| $\overline{\text{TDO}}$ | Serial Output for test instructions and data. Changes on the falling edge of TCK. |
| TDI | Serial Input for test instructions and data. Sampled on the rising edge of TCK. |
| TCK | Test Clock to synchronize test logic and control register access through the JTAG port. |
| TMS | Test Mode Select to sequence the JTAG test controller's state machine. Sampled on the rising edge of TCK. |
| DMA | |
| DMA_REQ | DMA Request—external DMA request signal. Multiplexed with SPI1_SPI_RDY. |
| BIG_ENDIAN | Big Endian—Input signal that determines the configuration of the external chip-select space. If it is driven logic-high at reset, the external chip-select space will be configured to big endian. If it is driven logic-low at reset, the external chip-select space will be configured to little endian. This input must not change state after power-on reset negates or during chip operation. |
| ETM | |
| ETMTRACESYNC | ETM sync signal which is multiplexed with A24. ETMTRACESYNC is selected in ETM mode. |
| ETMTRACECLK | ETM clock signal which is multiplexed with A23. ETMTRACECLK is selected in ETM mode. |
| ETMPIESTAT [2:0] | ETM status signals which are multiplexed with A [22:20]. ETMPIESTAT [2:0] are selected in ETM mode. |
| ETMTRACEPKT [7:0] | ETM packet signals which are multiplexed with $\overline{\text{ECB}}$, $\overline{\text{LBA}}$, BCLK (burst clock), PA17, A [19:16]. ETMTRACEPKT [7:0] are selected in ETM mode. |
| CMOS Sensor Interface | |
| CSI_D [7:0] | Sensor port data |
| CSI_MCLK | Sensor port master clock |
| CSI_VSYNC | Sensor port vertical sync |
| CSI_HSYNC | Sensor port horizontal sync |
| CSI_PIXCLK | Sensor port data latch clock |
| LCD Controller | |
| LD [15:0] | LCD Data Bus—All LCD signals are driven low after reset and when LCD is off. |
| FLM/VSYNC | Frame Sync or Vsync—This signal also serves as the clock signal output for the gate driver (dedicated signal SPS for Sharp panel HR-TFT). |
| LP/HSYNC | Line pulse or H sync |
| LSCLK | Shift clock |
| ACD/OE | Alternate crystal direction/output enable. |
| CONTRAST | This signal is used to control the LCD bias voltage as contrast control. |
| SPL_SPR | Program horizontal scan direction (Sharp panel dedicated signal). |
| PS | Control signal output for source driver (Sharp panel dedicated signal). |

Table 2. i.MXL Signal Descriptions (Continued)

| Signal Name | Function/Notes |
|---------------------------------|---|
| CLS | Start signal output for gate driver. This signal is an inverted version of PS (Sharp panel dedicated signal). |
| REV | Signal for common electrode driving signal preparation (Sharp panel dedicated signal). |
| SPI 1 and SPI 2 | |
| SPI1_MOSI | Master Out/Slave In |
| SPI1_MISO | Slave In/Master Out |
| SPI1_ \overline{SS} | Slave Select (Selectable polarity) |
| SPI1_SCLK | Serial Clock |
| SPI1_ $\overline{SPI_RDY}$ | Serial Data Ready |
| SPI2_TXD | SPI2 Master TxData Output—This signal is multiplexed with a GPIO pin yet shows up as a primary or alternative signal in the signal multiplex scheme table. Please refer to the SPI and GPIO chapters in the <i>MC9328MXL Reference Manual</i> for information about how to bring this signal to the assigned pin. |
| SPI2_RXD | SPI2 Master RxData Input—This signal is multiplexed with a GPIO pin yet shows up as a primary or alternative signal in the signal multiplex scheme table. Please refer to the SPI and GPIO chapters in the <i>MC9328MXL Reference Manual</i> for information about how to bring this signal to the assigned pin. |
| SPI2_ \overline{SS} | SPI2 Slave Select—This signal is multiplexed with a GPIO pin yet shows up as a primary or alternative signal in the signal multiplex scheme table. Please refer to the SPI and GPIO chapters in the <i>MC9328MXL Reference Manual</i> for information about how to bring this signal to the assigned pin. |
| SPI2_SCLK | SPI2 Serial Clock—This signal is multiplexed with a GPIO pin yet shows up as a primary or alternative signal in the signal multiplex scheme table. Please refer to the SPI and GPIO chapters in the <i>MC9328MXL Reference Manual</i> for information about how to bring this signal to the assigned pin. |
| General Purpose Timers | |
| TIN | Timer Input Capture or Timer Input Clock—The signal on this input is applied to both timers simultaneously. |
| TMR2OUT | Timer 2 Output |
| USB Device | |
| USBD_VMO | USB Minus Output |
| USBD_VPO | USB Plus Output |
| USBD_VM | USB Minus Input |
| USBD_VP | USB Plus Input |
| USBD_SUSPND | USB Suspend Output |
| USBD_RCV | USB Receive Data |
| $\overline{USBD_ROE}$ | USB \overline{OE} |
| USBD_AFE | USB Analog Front End Enable |
| Secure Digital Interface | |
| SD_CMD | SD Command—If the system designer does not wish to make use of the internal pull-up, via the Pull-up enable register, a 4.7K–69K external pull up resistor must be added. |
| SD_CLK | MMC Output Clock |

Table 2. i.MXL Signal Descriptions (Continued)

| Signal Name | Function/Notes |
|--|--|
| SD_DAT [3:0] | Data—If the system designer does not wish to make use of the internal pull-up, via the Pull-up enable register, a 50K–69K external pull up resistor must be added. |
| Memory Stick Interface | |
| MS_BS | Memory Stick Bus State (Output)—Serial bus control signal |
| MS_SDIO | Memory Stick Serial Data (Input/Output) |
| MS_SCLKO | Memory Stick Serial Clock (Input)—Serial protocol clock source for SCLK Divider |
| MS_SCLKI | Memory Stick External Clock (Output)—Test clock input pin for SCLK divider. This pin is only for test purposes, not for use in application mode. |
| MS_PI0 | General purpose Input0—Can be used for Memory Stick Insertion/Extraction detect |
| MS_PI1 | General purpose Input1—Can be used for Memory Stick Insertion/Extraction detect |
| UARTs – IrDA/Auto-Bauding | |
| UART1_RXD | Receive Data |
| UART1_TXD | Transmit Data |
| $\overline{\text{UART1_RTS}}$ | Request to Send |

| $\overline{\text{UART2_CTS}}$ | Clear to Send |
| $\overline{\text{UART2_DSR}}$ | Data Set Ready |
| $\overline{\text{UART2_RI}}$ | Ring Indicator |
| $\overline{\text{UART2_DCD}}$ | Data Carrier Detect |
| $\overline{\text{UART2_DTR}}$ | Data Terminal Ready |
| Serial Audio Port – SSI (configurable to I²S protocol) | |
| SSI_TXDAT | Transmit Data |
| SSI_RXDAT | Receive Data |
| SSI_TXCLK | Transmit Serial Clock |
| SSI_RXCLK | Receive Serial Clock |
| SSI_TXFS | Transmit Frame Sync |
| SSI_RXFS | Receive Frame Sync |
| I²C | |
| I2C_SCL | I ² C Clock |
| I2C_SDA | I ² C Data |

Table 2. i.MXL Signal Descriptions (Continued)

| Signal Name | Function/Notes |
|-------------------------------------|---|
| PWM | |
| PWMO | PWM Output |
| Test Function | |
| TRISTATE | Forces all I/O signals to high impedance for test purposes. For normal operation, terminate this input with a 1 k ohm resistor to ground. (TRI-STATE® is a registered trademark of National Semiconductor.) |
| Digital Supply Pins | |
| NVDD | Digital Supply for the I/O pins |
| NVSS | Digital Ground for the I/O pins |
| Supply Pins – Analog Modules | |
| AVDD | Supply for analog blocks |
| Internal Power Supply | |
| QVDD | Power supply pins for silicon internal circuitry |
| QVSS | Ground pins for silicon internal circuitry |

2.1 I/O Pads Power Supply and Signal Multiplexing Scheme

This section describes detailed information about both the power supply for each I/O pin and its function multiplexing scheme. The user can reference information provided in [Table 6 on page 18](#) to configure the power supply scheme for each device in the system (memory and external peripherals). The function multiplexing information also shown in [Table 6](#) allows the user to select the function of each pin by configuring the appropriate GPIO registers when those pins are multiplexed to provide different functions.

- ¹ Pull down this input with 1KΩ resistor to GND.
- ² External circuit required to drive this input.
- ³ Tie this input high (to AVDD) or pull down with 1KΩ resistor to GND.
- ⁴ Pull up this output with a resistor to NVDD2.

3 Electrical Characteristics

This section contains the electrical specifications and timing diagrams for the i.MXL processor.

3.1 Maximum Ratings

Table 4 provides information on maximum ratings which are those values beyond which damage to the device may occur. Functional operation should be restricted to the limits listed in Recommended Operating Range Table 5 on page 18 or the DC Characteristics table.

Table 4. Maximum Ratings

| Symbol | Rating | Minimum | Maximum | Unit |
|---------------------|---|------------------|-------------------|------|
| NV _{DD} | DC I/O Supply Voltage | -0.3 | 3.3 | V |
| QV _{DD} | DC Internal (core = 150 MHz) Supply Voltage | -0.3 | 1.9 | V |
| QV _{DD} | DC Internal (core = 200 MHz) Supply Voltage | -0.3 | 2.0 | V |
| AV _{DD} | DC Analog Supply Voltage | -0.3 | 3.3 | V |
| BTRFV _{DD} | DC Bluetooth Supply Voltage | -0.3 | 3.3 | V |
| VESD_HBM | ESD immunity with HBM (human body model) | – | 2000 | V |
| VESD_MM | ESD immunity with MM (machine model) | – | 100 | V |
| ILatchup | Latch-up immunity | – | 200 | mA |
| Test | Storage temperature | -55 | 150 | °C |
| Pmax | Power Consumption | 800 ¹ | 1300 ² | mW |

¹ A typical application with 30 pads simultaneously switching assumes the GPIO toggling and instruction fetches from the ARM® core—that is, 7x GPIO, 15x Data bus, and 8x Address bus.

² A worst-case application with 70 pads simultaneously switching assumes the GPIO toggling and instruction fetches from the ARM core—that is, 32x GPIO, 30x Data bus, 8x Address bus. These calculations are based on the core running its heaviest OS application at 200MHz, and where the whole image is running out of SDRAM. QVDD at 2.0V, NVDD and AVDD at 3.3V, therefore, 180mA is the worst measurement recorded in the factory environment, max 5mA is consumed for OSC pads, with each toggle GPIO consuming 4mA.

3.2 Recommended Operating Range

Table 5 provides the recommended operating ranges for the supply voltages and temperatures. The i.MXL processor has multiple pairs of VDD and VSS power supply and return pins. QVDD and QVSS pins are used for internal logic. All other VDD and VSS pins are for the I/O pads voltage supply, and each pair of VDD and VSS provides power to the enclosed I/O pads. This design allows different peripheral supply voltage levels in a system.

Because AVDD pins are supply voltages to the analog pads, it is recommended to isolate and noise-filter the AVDD pins from other VDD pins.

For more information about I/O pads grouping per VDD, please refer to Table 2 on page 4.

Table 5. Recommended Operating Range

| Symbol | Rating | Minimum | Maximum | Unit |
|----------------|---|---------|---------|------|
| T _A | Operating temperature range MC9328MXLVM20/MC9328MXLVM15 MC9328MXLVP20/MC9328MXLVP15 | 0 | 70 | °C |

| T _A | Operating temperature range MC9328MXLCVM15/ MC9328MXLCP15 | -40 | 85 | °C |
| NVDD | I/O supply voltage (if using MSHC, CSI, SPI, LCD, and USBd which are only 3 V interfaces) | 2.70 | 3.30 | V |
| NVDD | I/O supply voltage (if not using the peripherals listed above) | 1.70 | 3.30 | V |
| QVDD | Internal supply voltage (Core = 150 MHz) | 1.70 | 1.90 | V |
| QVDD | Internal supply voltage (Core = 200 MHz) | 1.80 | 2.00 | V |
| AVDD | Analog supply voltage | 1.70 | 3.30 | V |

3.3 Power Sequence Requirements

For required power-up and power-down sequencing, please refer to the “Power-Up Sequence” section of application note AN2537 on the i.MX applications processor website.

3.4 DC Electrical Characteristics

Table 6 contains both maximum and minimum DC characteristics of the i.MXL processor.

Table 6. Maximum and Minimum DC Characteristics

| Number or Symbol | Parameter | Min | Typical | Max | Unit |
|-------------------|---|-----|---|-----|------|
| I _{op} | Full running operating current at 1.8V for QVDD, 3.3V for NVDD/AVDD (Core = 96 MHz, System = 96 MHz, MPEG4 decoding playback from external memory card to both external SSI audio decoder and driving TFT display panel, and OS with MMU enabled memory system is running on external SDRAM). | – | QVDD at 1.8V = 120mA; NVDD+AVDD at 3.0V = 30mA | – | mA |
| Sidd ₁ | Standby current (Core = 150 MHz, QVDD = 1.8V, temp = 25°C) | – | 25 | – | μA |
| Sidd ₂ | Standby current (Core = 150 MHz, QVDD = 1.8V, temp = 55°C) | – | 45 | – | μA |
| Sidd ₃ | Standby current (Core = 150 MHz, QVDD = 2.0V, temp = 25°C) | – | 35 | – | μA |
| Sidd ₄ | Standby current (Core = 150 MHz, QVDD = 2.0V, temp = 55°C) | – | 60 | – | μA |

3.5 AC Electrical Characteristics

The AC characteristics consist of output delays, input setup and hold times, and signal skew times. All signals are specified relative to an appropriate edge of other signals. All timing specifications are specified at a system operating frequency from 0 MHz to 96 MHz (core operating frequency 150 MHz) with an operating supply voltage from V_{DD min} to V_{DD max} under an operating temperature from T_L to T_H. All timing is measured at 30 pF loading.

4 Functional Description and Application Information

This section provides the electrical information including and timing diagrams for the individual modules of the i.MXL.

4.1 Embedded Trace Macrocell

All registers in the ETM9 are programmed through a JTAG interface. The interface is an extension of the ARM920T processor’s TAP controller, and is assigned scan chain 6. The scan chain consists of a 40-bit shift register comprised of the following:

- 32-bit data field
- 7-bit address field
- A read/write bit

The data to be written is scanned into the 32-bit data field, the address of the register into the 7-bit address field, and a 1 into the read/write bit.

A register is read by scanning its address into the address field and a 0 into the read/write bit. The 32-bit data field is ignored. A read or a write takes place when the TAP controller enters the UPDATE-DR state. The timing diagram for the ETM9 is shown in Figure 2. See Table 9 for the ETM9 timing parameters used in Figure 2.

4.3 Reset Module

The timing relationships of the Reset module with the POR and RESET_IN are shown in Figure 3 and Figure 4.

NOTE

Be aware that NVDD must ramp up to at least 1.8V before QVDD is powered up to prevent forward biasing.

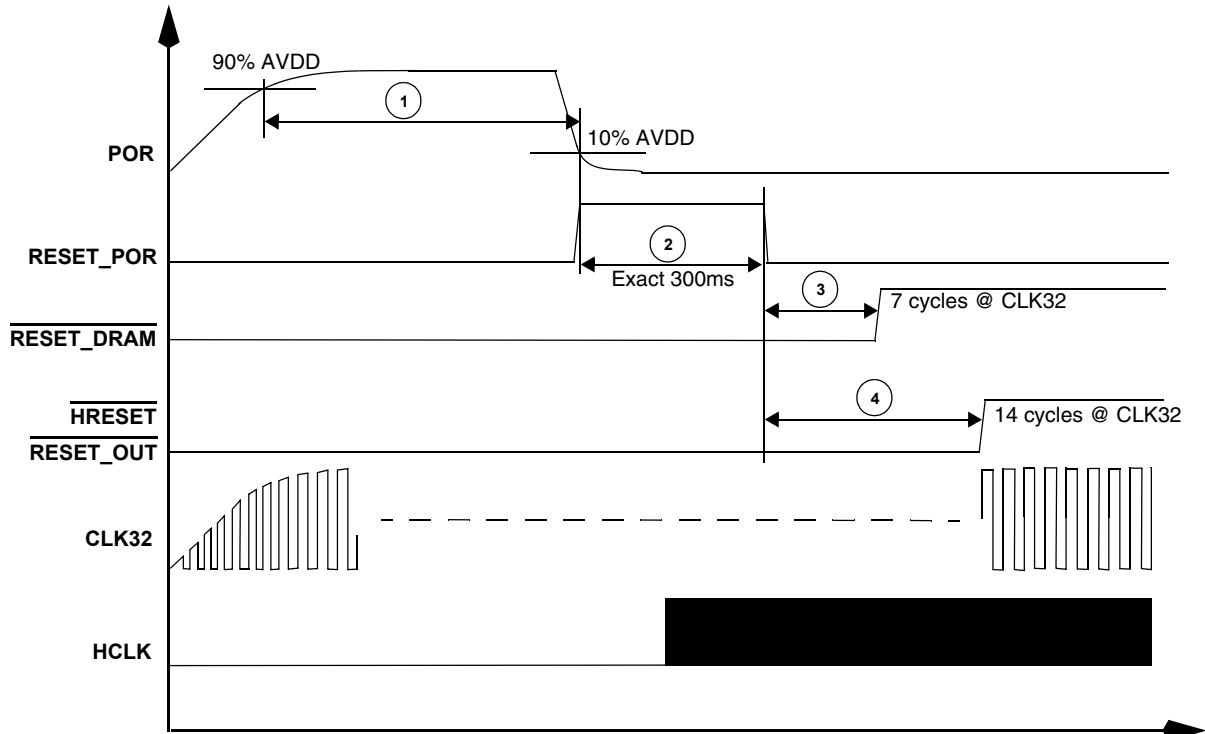

Figure 3. Timing Relationship with POR

Figure 4. Timing Relationship with RESET_IN

Table 11. Reset Module Timing Parameter Table

| Ref No. | Parameter | 1.8 ± 0.1 V | | 3.0 ± 0.3 V | | Unit |
|---------|--|-------------------|-----|-------------------|-----|-----------------|
| | | Min | Max | Min | Max | |
| 1 | Width of input POWER_ON_RESET | note ¹ | – | note ¹ | – | – |

| 6 | 4K to 32K-cycle qualifier | 4 | 4 | 4 | 4 | Cycles of CLK32 |

¹ POR width is dependent on the 32 or 32.768 kHz crystal oscillator start-up time. Design margin should allow for crystal tolerance, i.MX chip variations, temperature impact, and supply voltage influence. Through the process of supplying crystals for use with CMOS oscillators, crystal manufacturers have developed a working knowledge of start-up time of their crystals. Typically, start-up times range from 400 ms to 1.2 seconds for this type of crystal. If an external stable clock source (already running) is used instead of a crystal, the width of POR should be ignored in calculating timing for the start-up process.

4.4 External Interface Module

The External Interface Module (EIM) handles the interface to devices external to the i.MXL processor, including the generation of chip-selects for external peripherals and memory. The timing diagram for the EIM is shown in [Figure 5](#), and [Table 12](#) defines the parameters of signals.

4.4.1 $\overline{\text{DTACK}}$ Signal Description

The $\overline{\text{DTACK}}$ signal is the external input data acknowledge signal. When using the external $\overline{\text{DTACK}}$ signal as a data acknowledge signal, the bus time-out monitor generates a bus error when a bus cycle is not terminated by the external $\overline{\text{DTACK}}$ signal after 1022 HCLK counts have elapsed. Only the CS5 group supports DTACK signal function when the external DTACK signal is used for data acknowledgement.

4.4.2 $\overline{\text{DTACK}}$ Signal Timing

Figure 6 through Figure 9 show the access cycle timing used by chip-select 5. The signal values and units of measure for this figure are found in the associated tables.

| T3 | VSYN to SCLK | – | $0 \leq T3 \leq Ts^5$ | – |
| T4 | SCLK to HSYN | 0 | HWAIT1+1 | Tpix |

¹ Maximum frequency of LCDC_CLK is 48 MHz, which is controlled by Peripheral Clock Divider Register.

² Maximum frequency of SCLK is HCLK / 5, otherwise LD output will be wrong.

³ VSYN, HSYN and SCLK can be programmed as active high or active low. In the above timing diagram, all these 3 signals are active high.

⁴ Tpix is the pixel clock period which equals LCDC_CLK period * (PCD + 1).

⁵ Ts is the shift clock period. Ts = Tpix * (panel data bus width).

4.5 SPI Timing Diagrams

To use the internal transmit (TX) and receive (RX) data FIFOs when the SPI 1 module is configured as a master, two control signals are used for data transfer rate control: the \overline{SS} signal (output) and the $\overline{SPI_RDY}$ signal (input). The SPI1 Sample Period Control Register (PERIODREG1) and the SPI2 Sample Period Control Register (PERIODREG2) can also be programmed to a fixed data transfer rate for either SPI 1 or SPI 2. When the SPI 1 module is configured as a slave, the user can configure the SPI1 Control Register (CONTROLREG1) to match the external SPI master's timing. In this configuration, \overline{SS} becomes an input signal, and is used to latch data into or load data out to the internal data shift registers, as well as to increment the data FIFO. Figure 34 through Figure 38 show the timing relationship of the master SPI using different triggering mechanisms.

Note:

- Ts is the SCLK period which equals $LCDC_CLK / (PCD + 1)$. Normally $LCDC_CLK = 15ns$.
- VSYN, HSYN and OE can be programmed as active high or active low. In [Figure 41](#), all 3 signals are active low.
- The polarity of SCLK and LD[15:0] can also be programmed.
- SCLK can be programmed to be deactivated during the VSYN pulse or the OE deasserted period. In [Figure 41](#), SCLK is always active.
- For T9 non-display region, VSYN is non-active. It is used as an reference.
- XMAX is defined in pixels.

4.7 Multimedia Card/Secure Digital Host Controller

The DMA interface block controls all data routing between the external data bus (DMA access), internal MMC/SD module data bus, and internal system FIFO access through a dedicated state machine that monitors the status of FIFO content (empty or full), FIFO address, and byte/block counters for the MMC/SD module (inner system) and the application (user programming).

4.7.1 Command Response Timing on MMC/SD Bus

The card identification and card operation conditions timing are processed in open-drain mode. The card response to the host command starts after exactly N_{ID} clock cycles. For the card address assignment, SET_RCA is also processed in the open-drain mode. The minimum delay between the host command and card response is NCR clock cycles as illustrated in Figure 43. The symbols for Figure 43 through Figure 47 are defined in Table 23.

Table 23. State Signal Parameters for Figure 43 through Figure 47

| Symbol | Definition | Symbol | Definition |
| Z | High impedance state | S | Start bit (0) |
| D | Data bits | T | Transmitter bit (Host = 1, Card = 0) |
| * | Repetition | P | One-cycle pull-up (1) |
| CRC | Cyclic redundancy check bits (7 bits) | E | End bit (1) |

Figure 43. Timing Diagrams at Identification Mode

After a card receives its RCA, it switches to data transfer mode. As shown on the first diagram in [Figure 44](#), SD_CMD lines in this mode are driven with push-pull drivers. The command is followed by a period of two Z bits (allowing time for direction switching on the bus) and then by P bits pushed up by the responding card. The other two diagrams show the separating periods N_{RC} and N_{CC} .

Figure 44. Timing Diagrams at Data Transfer Mode

[Figure 45](#) shows basic read operation timing. In a read operation, the sequence starts with a single block read command (which specifies the start address in the argument field). The response is sent on the SD_CMD lines as usual. Data transmission from the card starts after the access time delay N_{AC} , beginning from the last bit of the read command. If the system is in multiple block read mode, the card sends a continuous flow of data blocks with distance N_{AC} until the card sees a stop transmission command. The data stops two clock cycles after the end bit of the stop command.

Figure 45. Timing Diagrams at Data Read

Figure 46 shows the basic write operation timing. As with the read operation, after the card response, the data transfer starts after N_{WR} cycles. The data is suffixed with CRC check bits to allow the card to check for transmission errors. The card sends back the CRC check result as a CC status token on the data line. If there was a transmission error, the card sends a negative CRC status (101); otherwise, a positive CRC status (010) is returned. The card expects a continuous flow of data blocks if it is configured to multiple block mode, with the flow terminated by a stop transmission command.

4.7.2 SDIO-IRQ and ReadWait Service Handling

In SDIO, there is a 1-bit or 4-bit interrupt response from the SDIO peripheral card. In 1-bit mode, the interrupt response is simply that the SD_DAT[1] line is held low. The SD_DAT[1] line is not used as data in this mode. The memory controller generates an interrupt according to this low and the system interrupt continues until the source is removed (SD_DAT[1] returns to its high level).

In 4-bit mode, the interrupt is less simple. The interrupt triggers at a particular period called the “Interrupt Period” during the data access, and the controller must sample SD_DAT[1] during this short period to determine the IRQ status of the attached card. The interrupt period only happens at the boundary of each block (512 bytes).

Figure 48. SDIO IRQ Timing Diagram

ReadWait is another feature in SDIO that allows the user to submit commands during the data transfer. In this mode, the block temporarily pauses the data transfer operation counter and related status, yet keeps the clock running, and allows the user to submit commands as normal. After all commands are submitted, the user can switch back to the data transfer operation and all counter and status values are resumed as access continues.

¹ Loading capacitor condition is less than or equal to 30pF.

² An external resistor (100 ~ 200 ohm) should be inserted in series to provide current control on the MS_SDIO pin, because of a possibility of signal conflict between the MS_SDIO pin and Memory Stick SDIO pin when the pin direction changes.

³ If the MSC2[RED] bit = 0, MSHC samples MS_SDIO input data at MS_SCLKO rising edge.

⁴ If the MSC2[RED] bit = 1, MSHC samples MS_SDIO input data at MS_SCLKO falling edge.

4.9 Pulse-Width Modulator

The PWM can be programmed to select one of two clock signals as its source frequency. The selected clock signal is passed through a divider and a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin. Its timing diagram is shown in [Figure 51](#) and the parameters are listed in [Table 26](#).

4.11 USB Device Port

Four types of data transfer modes exist for the USB module: control transfers, bulk transfers, isochronous transfers, and interrupt transfers. From the perspective of the USB module, the interrupt transfer type is identical to the bulk data transfer mode, and no additional hardware is supplied to support it. This section covers the transfer modes and how they work from the ground up.

Data moves across the USB in packets. Groups of packets are combined to form data transfers. The same packet transfer mechanism applies to bulk, interrupt, and control transfers. Isochronous data is also moved in the form of packets, however, because isochronous pipes are given a fixed portion of the USB bandwidth at all times, there is no end-of-transfer.

4.13 Synchronous Serial Interface

The transmit and receive sections of the SSI can be synchronous or asynchronous. In synchronous mode, the transmitter and the receiver use a common clock and frame synchronization signal. In asynchronous mode, the transmitter and receiver each have their own clock and frame synchronization signals. Continuous or gated clock mode can be selected. In continuous mode, the clock runs continuously. In gated clock mode, the clock functions only during transmission. The internal and external clock timing diagrams are shown in Figure 60 through Figure 62.

Normal or network mode can also be selected. In normal mode, the SSI functions with one data word of I/O per frame. In network mode, a frame can contain between 2 and 32 data words. Network mode is typically used in star or ring-time division multiplex networks with other processors or codecs, allowing interface to time division multiplexed networks without additional logic. Use of the gated clock is not allowed in network mode. These distinctions result in the basic operating modes that allow the SSI to communicate with a wide variety of devices.

Note: SRXD input in synchronous mode only.

¹ All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal STCK/SRCK and/or the frame sync STFS/SRFS shown in the tables and in the figures.

² There are 2 sets of I/O signals for the SSI module. They are from Port C primary function (pad 257 to pad 261) and Port B alternate function (pad 283 to pad 288). When SSI signals are configured as outputs, they can be viewed both at Port C primary function and Port B alternate function. When SSI signals are configured as input, the SSI module selects the input based on status of the FMCR register bits in the Clock controller module (CRM). By default, the input are selected from Port C primary function.

4.14 CMOS Sensor Interface

The CMOS Sensor Interface (CSI) module consists of a control register to configure the interface timing, a control register for statistic data generation, a status register, interface logic, a 32 × 32 image data receive FIFO, and a 16 × 32 statistic data FIFO.

4.14.1 Gated Clock Mode

Figure 63 shows the timing diagram when the CMOS sensor output data is configured for negative edge and the CSI is programmed to received data on the positive edge. Figure 64 shows the timing diagram when the CMOS sensor output data is configured for positive edge and the CSI is programmed to received data in negative edge. The parameters for the timing diagrams are listed in Table 35.

**Figure 63. Sensor Output Data on Pixel Clock Falling Edge

**Figure 64. Sensor Output Data on Pixel Clock Rising Edge

Table 35. Gated Clock Mode Timing Parameters

| Ref No. | Parameter | Min | Max | Unit |
|---------|-------------------------|-------|-----|------|
| 1 | csi_vsync to csi_hsync | 180 | – | ns |
| 2 | csi_hsync to csi_pixclk | 1 | – | ns |
| 3 | csi_d setup time | 1 | – | ns |
| 4 | csi_d hold time | 1 | – | ns |
| 5 | csi_pixclk high time | 10.42 | – | ns |
| 6 | csi_pixclk low time | 10.42 | – | ns |
| 7 | csi_pixclk frequency | 0 | 48 | MHz |

The limitation on pixel clock rise time / fall time are not specified. It should be calculated from the hold time and setup time, according to:

Rising-edge latch data

$$\begin{aligned} \text{max rise time allowed} &= (\text{positive duty cycle} - \text{hold time}) \\ \text{max fall time allowed} &= (\text{negative duty cycle} - \text{setup time}) \end{aligned}$$

In most of case, duty cycle is 50 / 50, therefore

$$\begin{aligned} \text{max rise time} &= (\text{period} / 2 - \text{hold time}) \\ \text{max fall time} &= (\text{period} / 2 - \text{setup time}) \end{aligned}$$

For example: Given pixel clock period = 10ns, duty cycle = 50 / 50, hold time = 1ns, setup time = 1ns.

$$\begin{aligned} \text{positive duty cycle} &= 10 / 2 = 5\text{ns} \\ \Rightarrow \text{max rise time allowed} &= 5 - 1 = 4\text{ns} \\ \text{negative duty cycle} &= 10 / 2 = 5\text{ns} \\ \Rightarrow \text{max fall time allowed} &= 5 - 1 = 4\text{ns} \end{aligned}$$

Falling-edge latch data

$$\begin{aligned} \text{max fall time allowed} &= (\text{negative duty cycle} - \text{hold time}) \\ \text{max rise time allowed} &= (\text{positive duty cycle} - \text{setup time}) \end{aligned}$$

4.14.2 Non-Gated Clock Mode

Figure 65 shows the timing diagram when the CMOS sensor output data is configured for negative edge and the CSI is programmed to received data on the positive edge. Figure 66 shows the timing diagram when the CMOS sensor output data is configured for positive edge and the CSI is programmed to received data in negative edge. The parameters for the timing diagrams are listed in Table 36.

6.2 Reference Documents

The following documents are required for a complete description of the MC9328MXL and are necessary to design properly with the device. Especially for those not familiar with the ARM920T processor or previous i.MX processor products, the following documents are helpful when used in conjunction with this document.

ARM Architecture Reference Manual (ARM Ltd., order number ARM DDI 0100)

ARM9DT1 Data Sheet Manual (ARM Ltd., order number ARM DDI 0029)

ARM Technical Reference Manual (ARM Ltd., order number ARM DDI 0151C)

EMT9 Technical Reference Manual (ARM Ltd., order number DDI O157E)

MC9328MXL Product Brief (order number MC9328MXLP)

MC9328MXL Reference Manual (order number MC9328MXLRM)

The Freescale manuals are available on the Freescale Semiconductors Web site at <http://www.freescale.com/imx>. These documents may be downloaded directly from the Freescale Web site, or printed versions may be ordered. The ARM Ltd. documentation is available from <http://www.arm.com>.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
