

74ABT3284 18-Bit Synchronous Datapath Multiplexer

General Description

The 74ABT3284 is a synchronous datapath buffer designed to transmit four 9-bit bytes of data onto one or two 9-bit bytes in 2:1 or 4:1 multiplexed configurations. In addition, the non-inverting transceiver supports bidirectional data transfer in transparent or registered modes. A data byte from any one of the six ports can be stored during transparent operation for later recall. Data input to any port may also be read back to itself for byte manipulation or system self-diagnostic purposes.

The 74ABT3284 is useful for interleaving data in memory applications or for use in bus-to-bus communications where variations in data word length or construction are required.

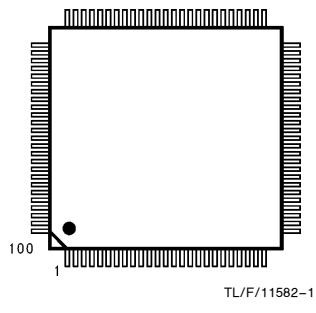

- 18-bit 2:1 or 9-bit 4:1 multiplexed modes
- Registered or transparent datapath operation
- Output enables and select lines have the option of being synchronized for pipelined operation
- Independent input, output register and control synchronizing clocks insure maximum timing flexibility
- Independent control signals insure functional flexibility
- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Guaranteed latchup protection
- High impedance glitch free bus loading during entire power up and power down cycle
- Non-destructive hot insertion capability

Features

- Advanced BiCMOS technology provides high speed at low power consumption

TRI-STATE® is a registered trademark of National Semiconductor Corporation.

Functional Description

The 74ABT3284 is a bi-directional registered data-path routing device which can multiplex/de-multiplex four 9-bit "A-side" data ports (Ports A, B, C, D) onto/from one 9-bit "X-side" port (Port X). Alternatively, it can be configured for mux/demux of two 18-bit data paths (Ports A and C, B and D) onto/from one 18-bit data path (Ports X and Y).

Each of the six 9-bit I/O ports have independent active low TRI-STATE® output enable control logic which can be configured to operate asynchronously or synchronously. With MODE_SO low, direct asynchronous output control is provided. With MODE_SO high, output enable control is asserted synchronously on the positive edge of the CP_IN clock. All I/O port inputs are continuously active allowing output state feedback.

The four A-side ports (A, B, C, D) contain independently enabled input and output data registers for storage of data passing in either direction. The input register (AIR, BIR, CIR, DIR) is loaded/held on the positive edge of CP_AX when the respective Load Control pin (LDAI, LDBI, LDCI, LDDI) is asserted high/low. The Input Registers can be loaded with data from the corresponding A-side port. The output register (AOR, BOR, COR, DOR) is loaded/held on the positive edge of CP_XA when the respective Load Control pin (LDAO, LDBO, LDCO, LDDO) is asserted high/low. The Output Registers can be loaded with data from Port X when MODE_WS is asserted low. When MODE_WS is asserted high, the Output Registers A and C can be loaded with Port X data and the B and D Output Registers can be loaded with data from Port Y.

When routing data from A-side to X-side, Data Path Control is provided for the following options via the SA2X inputs; Transparent mode where Input Register is bypassed but can simultaneously monitor A-side data; Registered Mode where X-side receives data from the selected Input Registers; Readback Mode where X-side receives data from the selected Output Registers. A-side data from Ports A, B, C, or D can be selected to Port X via the XSEL data path select inputs. Ports B or D can be selected to Port Y via the YSEL data path select input.

When routing data from X-side to A-side, Data Path Control is provided for the following options via the ASEL inputs; Transparent mode where Output Register is bypassed but can simultaneously monitor X-side data; Registered Mode where the A-side Port receives data from the corresponding Output Register; Readback Mode where the A-side Port receives data from the corresponding Input Registers. MODE_WS asserted low selects Port X data to be passed to Ports A, B, C, and D. With MODE_WS asserted high, Port X data is passed to Ports A and C with Port Y data passed to Ports B and D.

All Data Path Control Inputs and Input/Output Register Load Enable Inputs are active high and can be asserted asynchronously or synchronously. When MODE_SC is low, these inputs operate asynchronously. When MODE_SC is high, the inputs are asserted synchronously on the positive edge of the CP_IN clock.

When operating the Data Path Control and/or the Output Enable Input groups with MODE_SC and/or MODE_SO "hard wired" high for synchronous mode, a single pre-clock of CP_IN will be required following power-up to insure that all internal synchronous control registers are in the appropriate known state. If the application requires "on the fly" changes from asynchronous to synchronous operation, then the respective control/enable pin data must be pre-clocked via CP_IN and held steady prior to and during any low to high transition of the MODE_SO or MODE_SC to properly initiate the sync control registers for synchronous control mode.

Pin Descriptions

Pin Name	Description	Operation
OEa	Output Enable Inputs (Active Low)	Sync/Async
LDai	Load Enable Inputs for the Input Registers	Sync/Async
LDAO	Load Enable Inputs for the Output Registers	Sync/Async
ASEL(0,1)	A-Side Data Path Select Inputs	Sync/Async
SA2X(0,1)	X-Side Data Path Select Inputs	Sync/Async
XSEL(0,1)	X-Port Data Path Select Inputs	Sync/Async
YSEL	Y-Port Data Path Select Input	Sync/Async
MODE_W	Word Mode Select Input for the X/Y to A-Side Direction	Sync/Async
MODE_SO	Enable Input for Synchronous Output Enable Control	Async
MODE_SC	Enable Input for Synchronous Data Path Control	Async
CP_IN	Clock Input for Synchronous Control (Positive Edge Trigger)	
CP_AX	Clock Input for Input Registers (Positive Edge Trigger)	
CP_XA	Clock Input for Output Registers (Positive Edge Trigger)	

Function Tables

Output Enable Control Table

Inputs		Outputs	Control Mode	Function	
\overline{OE} (A, B, C, D, X, Y)	MODE_SO	CP_IN		Port A, B, C, D, X, Y	
L	L	X	ENABLE	ASYNC	ENABLED OUTPUT, I/O input always active
H	L	X	DISABLE	ASYNC	DISABLED OUTPUT, I/O input always active
(Notes 2, 3)	H (Note 1)	/	(Note 3)	SYNC	(Note 3)

Note 1: Low to High transitions of MODE_SO must be immediately preceded by a low to high transition (clock edge) on CP_IN while holding Synchronous Control Inputs \overline{OE} (A, B, C, D, X, Y) steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

Note 2: \overline{OE} (A, B, C, D, X, Y) levels are synchronously asserted by the positive transition of CP_IN when MODE_SO is high.

Note 3: Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP_IN.

A Side Data Path Select Function Table

Inputs				Data Path		Control Mode	Function
ASEL(1)	ASEL(0)	MODE_SC	CP_IN	From Reg/Port	To Port		
L	L	L	X	(A, B, C, D) IR	A, B, C, D	ASYNC	Readback; Contents of Input Register (A, B, C, D) IR to Port (A, B, C, D)
L	H	L	X	(A, B, C, D) OR	A, B, C, D	ASYNC	Clocked Path; Contents of Output Register (A, B, C, D) OR to Port (A, B, C, D)
H	L	L	X	Port X	A, B, C, & D	ASYNC	Transparent Path; Port X to Port A, B, C, & D
H	H	L	X	Port X Port Y	A & C B & D	ASYNC	Transparent Path; Port X to Port A & C Transparent Path; Port Y to Port B & D
(Notes 2, 3)	(Notes 2, 3)	H (Note 1)	/	(Note 3)	(Note 3)	SYNC	(Note 3)

Note 1: Low to High transitions of MODE_SC must be immediately preceded by a low to high transition (clock edge) on CP_IN while holding Synchronous Control Inputs ASEL(0) and ASEL(1) steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

Note 2: ASEL(0) and ASEL(1) levels are synchronously asserted by the positive transition of CP_IN when MODE_SC is high.

Note 3: Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP_IN.

Input Register Control Table

Inputs					Register	Control Mode	Function
Port (A, B, C, D)	LD(A, B, C, D) I	MODE_SC	CP_IN	CP_XA	(A, B, C, D) IR		
X	L	L	X	/	HOLD	ASYNC	HOLD; Input Register holds previous state.
L (H)	H	L	X	/	L (H)	ASYNC	LOAD; Port A, B, C, D clocked to Input Register (A, B, C, D) IR via CP_AX positive edge
(Note 3)	(Notes 2, 3)	H (Note 1)	/	(Note 3)	(Note 3)	SYNC	(Note 3)

Note 1: Low to High transitions of MODE_SO must be immediately preceded by a low to high transition (clock edge) on CP_IN while holding Synchronous Control Inputs LDAI, LDBI, LDCI, and LDDI steady to preset internal registers and assure predictable operation during the control mode change from asynchronous to synchronous.

Note 2: LDAI, LDBI, LDCI and LDDI levels are synchronously asserted by the positive transition of CP_IN when MODE_SC is high.

Note 3: Synchronous Control Mode Functions are same as Asynchronous at time T + 1 of CP_IN.

Absolute Maximum Ratings (Note 1)

Storage Temperature	−65°C to + 150°C	DC Latchup Source Current	−300 mA
Ambient Temperature under Bias	−55°C to + 125°C	Over Voltage Latchup (I/O)	10V
Junction Temperature under Bias Ceramic	−55°C to + 175°C	Note 1: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.	
Plastic	−55°C to + 150°C	Note 2: Either voltage limit or current limit is sufficient to protect inputs.	
V _{CC} Pin Potential to Ground Pin	−0.5V to + 7.0V		
Input Voltage (Note 2)	−0.5V to + 7.0V		
Input Current (Note 2)	−30 mA to + 5.0 mA		
Voltage Applied to Any Output in the Disabled or Power-off State in the HIGH STATE	−0.5V to + 5.5V −0.5V to V _{CC}		
Current Applied to Output in LOW State (Max)	twice the rated I _{OL} (mA)		

Recommended Operating Conditions

Free Air Ambient Temperature Commercial	−40°C to + 85°C
Supply Voltage Commercial	+ 4.5V to + 5.5V
Minimum Input Edge Rate (ΔV/Δt) Data Input	50 mV/ns
Enable Input	20 mV/ns
Clock Input	100 mV/ns

Symbol	Parameter	Typ	Units	Conditions $T_A = 25^\circ C$
C_{IN}	Input Capacitance	5	pF	$V_{CC} = 0V$ Control Inputs
$C_{I/O}$ (Note 1)	I/O Capacitance	11	pF	$V_{CC} = 5.0V$ ($A_n, B_n, C_n, D_n, X_n, Y_n$)

Note 1: $C_{I/O}$ is measured at frequency $f = 1$ MHz, per MIL-STD-883B, Method 3012.

74ABT3284 18-Bit Synchronous Datapath Multiplexer

Physical Dimensions inches (millimeters)

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

OCEAN CHIPS

Океан Электроники

Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибутором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибутором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
