

## FEATURES

### SPI interface with error detection

Includes CRC, invalid read/write address, and SCLK count error detection

Supports burst mode and daisy-chain mode

Industry-standard SPI Mode 0 and SPI Mode 3 interface compatible

Guaranteed break-before-make switching allowing external wiring of switches to deliver multiplexer configurations

1  $\Omega$  typical on resistance at 25°C

0.23  $\Omega$  typical on resistance flatness at 25°C

$V_{SS}$  to  $V_{DD}$  analog signal range

Fully specified at  $\pm 5$  V, 12 V, 5 V, and 3.3 V

$\pm 3.3$  V to  $\pm 8$  V dual-supply operation

3.3 V to 16 V single-supply operation

1.8 V logic compatibility with  $2.7$  V  $\leq V_L \leq 3.3$  V

4 mm  $\times$  4 mm, 24-lead LFCSP package

## APPLICATIONS

Communication systems

Medical systems

Audio and video signal routing

Automatic test equipment

Data acquisition systems

Battery-powered systems

Sample-and-hold systems

Relay replacements

## GENERAL DESCRIPTION

The ADGS1612 contains four independent single-pole/single-throw (SPST) switches. A serial peripheral interface (SPI) controls the switches. The SPI interface has robust error detection features, including cyclic redundancy check (CRC) error detection, invalid read/write address detection, and serial clock (SCLK) count error detection.

It is possible to daisy-chain multiple ADGS1612 devices together. Daisy-chaining enables the configuration of multiple devices with a minimal amount of digital lines. The ADGS1612 can also operate in burst mode to decrease the time between SPI commands.

Each switch conducts equally well in both directions when on, and each switch has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked.

The ultralow on resistance ( $R_{ON}$ ) of these switches make them ideal solutions for data acquisition and gain switching applications where low  $R_{ON}$  and low distortion are critical. The  $R_{ON}$  profile is very flat over the full analog input range, ensuring excellent linearity and low distortion when switching audio

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

16054-001

signals. The ADGS1612 exhibits break-before-make switching action for use in multiplexer applications. Note that throughout this data sheet, the multifunction pin, RESET/ $V_L$ , is referred to either by the entire pin name or by a single function of the pin, for example,  $V_L$ , when only that function is relevant.

## PRODUCT HIGHLIGHTS

1. The SPI interface removes the need for parallel conversion and logic traces and reduces general-purpose input/output (GPIO) channel count.
2. Daisy-chain mode removes additional logic traces when multiple devices are used.
3. CRC, invalid read/write address, and SCLK count error detection ensure a robust digital interface.
4. CRC error detection capabilities allow the use of the ADGS1612 in safety critical systems.
5. Guaranteed break-before-make switching allows the use of the ADGS1612 in multiplexer configurations with external wiring.
6. Minimum distortion.

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

**Table 8.**

Parameter	Rating
$V_{DD}$ to $V_{SS}$	18 V
$V_{DD}$ to GND	-0.3 V to +18 V
$V_{SS}$ to GND	+0.3 V to -18 V
RESET/ $V_L$ to GND	
$V_{DD} \leq 5.5$ V	-0.3V to $V_{DD} + 0.3$ V
$V_{DD} > 5.5$ V	-0.3 V to +6 V
Analog Inputs <sup>1</sup>	$V_{SS} - 0.3$ V to $V_{DD} + 0.3$ V or 30 mA, whichever occurs first
Digital Inputs <sup>1</sup>	-0.3 V to +6 V
Peak Current, Sx or Dx Pins <sup>2</sup>	546 mA (pulsed at 1 ms, 10% duty cycle maximum)
Continuous Current, Sx or Dx <sup>2,3</sup>	Data + 15%
Temperature Ranges	
Operating	-40°C to +125°C
Storage	-65°C to +150°C
Junction Temperature	150°C
Reflow Soldering Peak Temperature, Pb-Free	260°C

<sup>1</sup> Overvoltages at the digital, Sx, and Dx pins are clamped by internal diodes. Limit current to the maximum ratings given.

<sup>2</sup> Sx refers to the S1 to S4 pins, and Dx refers to the D1 to D4 pins.

<sup>3</sup> See Table 5 and Table 6.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

## THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

$\theta_{JA}$  is the natural convection junction to ambient thermal resistance measured in a one cubic foot sealed enclosure.  $\theta_{JC}$  is the junction to case thermal resistance.

**Table 9. Thermal Resistance**

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
CP-24-17 <sup>1</sup>	60	13	°C/W

<sup>1</sup> Thermal impedance simulated values are based on a JEDEC 252P thermal test board. See JEDEC JESD51.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

## NOTES

1. THE EXPOSED PAD IS CONNECTED INTERNALLY, FOR INCREASED RELIABILITY OF THE SOLDER JOINTS AND MAXIMUM THERMAL CAPABILITY, IT IS RECOMMENDED THAT THE EXPOSED PAD BE SOLDERED TO THE SUBSTRATE,  $V_{SS}$ .
2. NIC = NOT INTERNALLY CONNECTED.

16054-005

Figure 5. Pin Configuration

Table 10. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	D1	Drain Terminal 1. This pin can be an input or an output.
2	S1	Source Terminal 1. This pin can be an input or an output.
3	$V_{SS}$	Most Negative Power Supply Potential. In single-supply applications, tie this pin to ground.
4, 11	GND	Ground (0 V) Reference.
5	S4	Source Terminal 4. This pin can be an input or an output.
6	D4	Drain Terminal 4. This pin can be an input or an output.
7, 8, 10, 12, 16, 19, 24	NIC	Not Internally Connected. These pins are not internally connected.
9	$\overline{\text{RESET}}/V_L$	Reset/Logic Power Supply Input. Under normal operation, drive the $\overline{\text{RESET}}/V_L$ pin with a 2.7 V to 5.5 V supply. Pull the pin low to complete a hardware reset. All switches are opened, and the appropriate registers are set to their default settings.
13	D3	Drain Terminal 3. This pin can be an input or an output.
14	S3	Source Terminal 3. This pin can be an input or an output.
15	$V_{DD}$	Most Positive Power Supply Potential.
17	S2	Source Terminal 2. This pin can be an input or an output.
18	D2	Drain Terminal 2. This pin can be an input or an output.
20	SDO	Serial Data Output. This pin can be used for daisy-chaining a number of these devices together or for reading back the data stored in a register for diagnostic purposes. The serial data is propagated on the falling edge of SCLK. Pull this open-drain output to $V_L$ with an external resistor.
21	$\overline{\text{CS}}$	Active Low Control Input. $\overline{\text{CS}}$ is the frame synchronization signal for the input data. When $\overline{\text{CS}}$ goes low, it powers on the SCLK buffers and enables the input shift register. Data is transferred in on the falling edges of the following clocks. Taking $\overline{\text{CS}}$ high updates the switch condition.
22	SCLK	Serial Clock Input. Data is captured on the positive edge of SCLK. Data is transferred at rates of up to 50 MHz.
23	SDI	Serial Data Input. Data is captured on the positive edge of the serial clock input.
	EPAD	Exposed Pad. The exposed pad is connected internally. For increased reliability of the solder joints and maximum thermal capability, it is recommended that the exposed pad be soldered to the substrate, $V_{SS}$ .

Figure 38. AC PSRR

## TERMINOLOGY

### $I_{DD}$

$I_{DD}$  is the positive supply current.

### $I_{SS}$

$I_{SS}$  is the negative supply current.

### $V_D, V_S$

$V_D$  and  $V_S$  are the analog voltages on Terminal D and Terminal S, respectively.

### $R_{ON}$

$R_{ON}$  is the ohmic resistance between Terminal D and Terminal S.

### $\Delta R_{ON}$

$\Delta R_{ON}$  is the difference between the  $R_{ON}$  of any two channels.

### $R_{FLAT(ON)}$

$R_{FLAT(ON)}$  is the difference between the maximum and minimum values of on resistance, measured over the specified analog signal range.

### $I_S$ (Off)

$I_S$  (Off) is the source leakage current with the switch off.

### $I_D$ (Off)

$I_D$  (Off) is the drain leakage current with the switch off.

### $I_D$ (On), $I_S$ (On)

$I_D$  (On) and  $I_S$  (On) are the channel leakage currents with the switch on.

### $I_{DS}$

$I_{DS}$  is the drain to source current.

### V1

V1 is the voltage drop across the switch,  $S_x$ , to  $D_x$ .

### $V_{INL}$

$V_{INL}$  is the maximum input voltage for Logic 0.

### $V_{INH}$

$V_{INH}$  is the minimum input voltage for Logic 1.

### $I_{INL}, I_{INH}$

$I_{INL}$  and  $I_{INH}$  is the low and high input currents of the digital inputs.

### $C_D$ (Off)

$C_D$  (Off) is the off switch drain capacitance, which is measured with reference to ground.

### $C_S$ (Off)

$C_S$  (Off) is the off switch source capacitance, which is measured with reference to ground.

### $C_D$ (On), $C_S$ (On)

$C_D$  (On) and  $C_S$  (On) are the on switch capacitances, measured with reference to ground.

### $C_{IN}$

$C_{IN}$  is the digital input capacitance.

### $t_{ON}$

$t_{ON}$  is the delay between applying the digital control input and the output switching on.

### $t_{OFF}$

$t_{OFF}$  is the delay between applying the digital control input and the output switching off.

### $t_D$

$t_D$  is the off time measured between the 80% point of both switches when switching from one address state to another.

### Off Isolation

Off isolation is a measure of unwanted signal coupling through an off switch.

### Charge Injection

Charge injection is a measure of the glitch impulse transferred from the digital input to the analog output during switching.

### Crosstalk

Crosstalk is a measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

### Bandwidth

Bandwidth is the frequency at which the output is attenuated by 3 dB.

### On Response

On response is the frequency response of the on switch.

### Insertion Loss

Insertion loss is the loss due to the on resistance of the switch.

### Total Harmonic Distortion Plus Noise (THD + N)

THD + N is the ratio of the harmonic amplitude plus noise of the signal to the fundamental.

### AC Power Supply Rejection Ratio (AC PSRR)

AC PSRR is the ratio of the amplitude of signal on the output to the amplitude of the modulation. AC PSRR is a measure of the ability of the device to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p.

## THEORY OF OPERATION

The ADGS1612 is a set of serially controlled, quad SPST switches with error detection features. SPI Mode 0 and SPI Mode 3 can be used with the device, and it operates with SCLK frequencies of up to 50 MHz. The default mode for the ADGS1612 is address mode, in which the registers of the device are accessed by a 16-bit SPI command bounded by  $\overline{CS}$ . The SPI command becomes 24-bit if the user enables CRC error detection. Other error detection features include SCLK count error and invalid read/write error. If any of these SPI interface errors occur, they are detectable by reading the error flags register. The ADGS1612 can also operate in two other modes, namely burst mode and daisy-chain mode.

The interface pins of the ADGS1612 are  $\overline{CS}$ , SCLK, SDI, and SDO. Hold  $\overline{CS}$  low when using the SPI interface. Data is captured on the SDI pin on the rising edge of SCLK, and data is propagated out on the SDO pin on the falling edge of SCLK. SDO has an open-drain output; thus, connect a pull-up resistor to this output. When not pulled low by the ADGS1612, SDO is in a high impedance state.

### ADDRESS MODE

Address mode is the default mode for the ADGS1612 on power-up. A single SPI frame in address mode is bounded by a  $\overline{CS}$  falling edge and the succeeding  $\overline{CS}$  rising edge. The SPI frame is composed of 16 SCLK cycles. The timing diagram for address mode is shown in Figure 39. The first SDI bit indicates whether the SPI command is a read or write command. When the first bit is set to 0, a write command is issued, and if the first bit is set to 1, a read command is issued. The next seven bits determine the target register address. The remaining eight bits provide the data to the addressed register. The last eight bits are ignored during a read command, because during these clock cycles, SDO propagates out the data contained in the addressed register.

The target register address of an SPI command is determined on the eighth SCLK rising edge. Data from this register propagates out on SDO from the ninth to the 16<sup>th</sup> SCLK falling edge during SPI

reads. A register write occurs on the 16<sup>th</sup> SCLK rising edge during SPI writes.

During any SPI command, SDO sends out eight alignment bits on the first eight SCLK falling edges. The alignment bits observed at SDO are 0x25.

### ERROR DETECTION FEATURES

Protocol and communication errors on the SPI interface are detectable. There are three detectable errors: incorrect SCLK error detection, invalid read and write address error detection, and CRC error detection. Each of these errors has a corresponding enable bit in the error configuration register. In addition, there is an error flag bit for each of these errors in the error flags register.

#### Cyclic Redundancy Check (CRC) Error Detection

The CRC error detection feature extends a valid SPI frame by eight SCLK cycles. These eight extra cycles are needed to send the CRC byte for that SPI frame. The CRC byte is calculated by the SPI block using the 16-bit payload: the R/W bit, Address Bits[6:0], and Data Bits[7:0]. The CRC polynomial used in the SPI block is  $x^8 + x^2 + x^1 + 1$  with a seed value of 0. For a timing diagram with CRC enabled, see Figure 40. Register writes occur at the 24<sup>th</sup> SCLK rising edge with CRC error checking enabled.

During an SPI write, the microcontroller/CPU provides the CRC byte through SDI. The SPI block checks the CRC byte just before the 24<sup>th</sup> SCLK rising edge. On this same edge, the register write is prevented if an incorrect CRC byte is received by the SPI interface. The CRC error flag is asserted in the error flags register in the case of the incorrect CRC byte being detected.

During an SPI read, the CRC byte is provided to the microcontroller through SDO.

The CRC error detection feature is disabled by default and can be configured by the user through the error configuration register.

Figure 39. Address Mode Timing Diagram

Figure 40. Timing Diagram with CRC Enabled

**SCLK Count Error Detection**

SCLK count error detection allows the user to detect if an incorrect number of SCLK cycles are sent by the microcontroller or CPU. When in address mode, with CRC disabled, 16 SCLK cycles are expected. If 16 SCLK cycles are not detected, the SCLK count error flag asserts in the error flags register. When less than 16 SCLK cycles are received by the device, a write to the register map never occurs. When the ADGS1612 receives more than 16 SCLK cycles, a write to the memory map still occurs at the 16<sup>th</sup> SCLK rising edge, and the flag asserts in the error flags register. With CRC enabled, the expected number of SCLK cycles is 24. SCLK count error detection is enabled by default and can be configured by the user through the error configuration register.

**Invalid Read/Write Address Error**

An invalid read/write address error detects when a nonexistent register address is a target for a read or write. In addition, this error asserts when a write to a read only register is attempted. The invalid read/write address error flag asserts in the error flags register when an invalid read/write address error occurs. The invalid read/write address error is detected on the ninth SCLK rising edge, which means a write to the register never occurs when an invalid address is targeted. Invalid read/write address error detection is enabled by default and can be disabled by the user through the error configuration register.

**CLEARING THE ERROR FLAGS REGISTER**

To clear the error flags register, write the special 16-bit SPI frame, 0x6CA9, to the device. This SPI command does not trigger the invalid R/W address error. When CRC is enabled, the user must also send the correct CRC byte to complete an error clear command. At the 16<sup>th</sup> or 24<sup>th</sup> SCLK rising edge, the error flags register resets to zero.

**BURST MODE**

The SPI interface can accept consecutive SPI commands without the need to deassert the CS line, which is called burst mode. Burst mode is enabled through the burst enable register. This mode uses the same 16-bit command to communicate with the device. In addition, the response of the device at SDO is still aligned with the corresponding SPI command. Figure 41 shows an example of SDI and SDO during burst mode.

The invalid read/write address and CRC error checking functions operate similarly during burst mode as they do during address mode. However, SCLK count error detection operates in a slightly different manner. The total number of SCLK cycles within a given CS frame are counted, and if the total is not a multiple of 16 or a multiple of 24 when CRC is enabled, the SCLK count error flag asserts.

Figure 41. Burst Mode Frame

**SOFTWARE RESET**

When in address mode, the user can initiate a software reset. To do so, write two consecutive SPI commands, namely 0xA3 followed by 0x05, targeting Register 0x0B. After a software reset, all register values are set to default.

**DAISY-CHAIN MODE**

The connection of several ADGS1612 devices in a daisy-chain configuration is possible, and Figure 42 shows this setup. All devices share the same CS and SCLK line, whereas the SDO pin of a device forms a connection to the SDI pin of the next device, creating a shift register. In daisy-chain mode, SDO is an eight-cycle delayed version of SDI. When in daisy-chain mode, all commands target the switch data register. Therefore, it is not possible to make configuration changes while in daisy-chain mode.

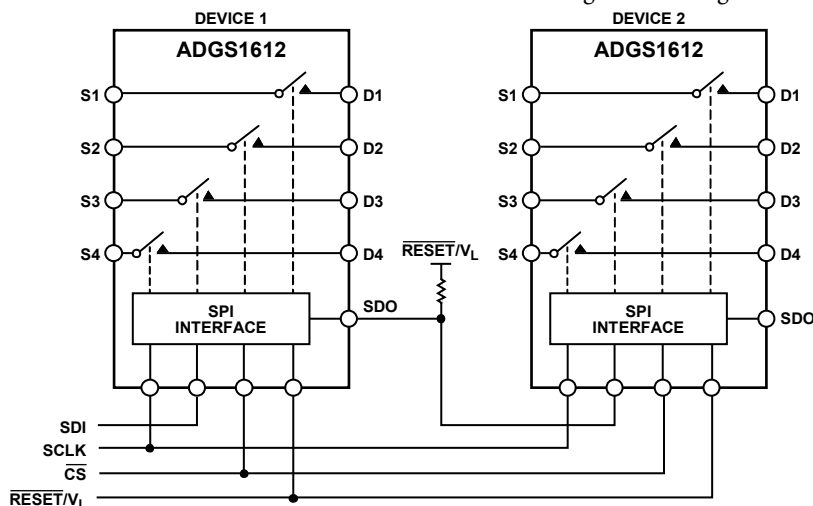

Figure 42. Two SPI Controlled Switches Connected in a Daisy-Chain Configuration

The ADGS1612 can only enter daisy-chain mode when in address mode by sending the 16-bit SPI command, 0x2500 (see Figure 43). When the ADGS1612 receives this command, the SDO of the device sends out the same command because the alignment bits at SDO are 0x25, which allows multiple daisy-connected devices to enter daisy-chain mode in a single SPI frame. A hardware reset is required to exit daisy-chain mode.

For the timing diagram of a typical daisy-chain SPI frame, see Figure 44. When  $\overline{CS}$  goes high, Device 1 writes Command 0, Bits[7:0] to its switch data register, Device 2 writes Command 1, Bits[7:0] to its switches, and so on. The SPI block uses the last eight bits it received through SDI to update the switches. After entering daisy-chain mode, the first eight bits sent out by SDO on each device in the chain are 0x00. When  $\overline{CS}$  goes high, the internal shift register value does not reset back to zero.

An SCLK rising edge reads in data on SDI while data is propagated out of SDO on an SCLK falling edge. The expected number of SCLK cycles must be a multiple of eight before  $\overline{CS}$  goes high; if this is not the case, the SPI interface sends the last eight bits received to the switch data register.

**POWER-ON RESET**

The digital section of the ADGS1612 enters an initialization phase during  $V_L$  power-up. This initialization also occurs after a hardware or software reset. After  $V_L$  power-up or a reset, ensure that a minimum of 120  $\mu s$  from the time of power-up or reset before any SPI command is issued. Ensure that  $V_L$  does not drop out during the 120  $\mu s$  initialization phase because this may result in incorrect operation of the ADGS1612.

Figure 43. SPI Command to Enter Daisy-Chain Mode

NOTES  
1. SDO2 AND SDO3 ARE THE OUTPUT COMMANDS FROM DEVICE 2 AND DEVICE 3, RESPECTIVELY.

Figure 44. Example of an SPI Frame When Four ADGS1612 Devices Are Connected in Daisy-Chain Mode

## APPLICATIONS INFORMATION

### BREAK-BEFORE-MAKE SWITCHING

The ADGS1612 exhibits break-before-make switching action, which allows the use of the device in multiplexer applications. A multiplexer can be achieved by externally hardwiring the device in the mux configuration that is required, as shown in Figure 45.

<sup>1</sup>ALL Dx PINS ARE CONNECTED AS ONE DRAIN.

Figure 45. SPI Controlled Switch Configured as a 4:1 Mux

### DIGITAL INPUT BUFFERS

There are input buffers present on the digital inputs pins,  $\overline{CS}$ , SCLK, and SDI. These buffers are active at all times. Therefore, there is current draw from the  $V_L$  supply if SCLK or SDI is toggling, regardless of whether  $\overline{CS}$  is active. For typical values of this current draw, refer to the Specifications section and Figure 26.

### POWER SUPPLY RAILS

To guarantee correct operation of the ADGS1612, 0.1  $\mu\text{F}$  decoupling capacitors are required.

The ADGS1612 can operate with bipolar supplies between  $\pm 3.3$  V and  $\pm 8$  V. The supplies on  $V_{DD}$  and  $V_{SS}$  do not have to be symmetrical; however, the  $V_{DD}$  to  $V_{SS}$  range must not exceed 16 V. The ADGS1612 can also operate with single supplies between 3.3 V and 16 V with  $V_{SS}$  connected to GND.

The voltage range that can be supplied to  $V_L$  is from 2.7 V to 5.5 V.

The device is fully specified at  $\pm 5$  V, 12 V, 5 V, and 3.3 V analog supply voltage ranges.

## REGISTER SUMMARY

Table 11. Register Summary

Reg.	Name	Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Default	RW	
0x01	SW_DATA	[7:0]	RESERVED				SW4_EN	SW3_EN	SW2_EN	SW1_EN		0x00	R/W
0x02	ERR_CONFIG	[7:0]	RESERVED					RW_ERR_EN	SCLK_ERR_EN	CRC_ERR_EN		0x06	R/W
0x03	ERR_FLAGS	[7:0]	RESERVED					RW_ERR_FLAG	SCLK_ERR_FLAG	CRC_ERR_FLAG		0x00	R
0x05	BURST_EN	[7:0]	RESERVED							BURST_MODE_EN		0x00	R/W
0x0B	SOFT_RESETB	[7:0]	RESERVED						SOFT_RESETB			0x00	R/W

## REGISTER DETAILS

### SWITCH DATA REGISTER

**Address: 0x01, Reset: 0x00, Name: SW\_DATA**

The switch data register controls the status of the four switches of the ADGS1612.

**Table 12. Bit Descriptions for SW\_DATA**

Bits	Bit Name	Settings	Description	Default	Access
[7:4]	RESERVED		These bits are reserved; set these bits to 0.	0x0	R
3	SW4_EN	0 1	Enable bit for SW4. SW4 open. SW4 closed.	0x0	R/W
2	SW3_EN	0 1	Enable bit for SW3. SW3 open. SW3 closed.	0x0	R/W
1	SW2_EN	0 1	Enable bit for SW2. SW2 open. SW2 closed.	0x0	R/W
0	SW1_EN	0 1	Enable bit for SW1. SW1 open. SW1 closed.	0x0	R/W

### ERROR CONFIGURATION REGISTER

**Address: 0x02, Reset: 0x06, Name: ERR\_CONFIG**

The error configuration register allows the user to enable or disable the relevant error features as required.

**Table 13. Bit Descriptions for ERR\_CONFIG**

Bits	Bit Name	Settings	Description	Default	Access
[7:3]	RESERVED		These bits are reserved; set these bits to 0.	0x0	R
2	RW_ERR_EN	0 1	Enable bit for detecting an invalid read/write address. Disabled. Enabled.	0x1	R/W
1	SCLK_ERR_EN	0 1	Enable bit for detecting the correct number of SCLK cycles in an SPI frame. When CRC is disabled and burst mode is disabled, 16 SCLK cycles are expected. When CRC is enabled and burst mode is disabled, 24 SCLK cycles are expected. A multiple of 16 SCLK cycles is expected when CRC is disabled and burst mode is enabled. A multiple of 24 SCLK cycles is expected when CRC is enabled and burst mode is enabled. Disabled. Enabled.	0x1	R/W
0	CRC_ERR_EN	0 1	Enable bit for CRC error detection. SPI frames must be 24 bits wide when enabled. Disabled. Enabled.	0x0	R/W

**ERROR FLAGS REGISTER****Address: 0x03, Reset: 0x00, Name: ERR\_FLAGS**

The error flags register allows the user to determine if an error occurred. To clear the error flags register, the special 16-bit SPI command, 0x6CA9, must be written to the device. This SPI command does not trigger the invalid R/W address error. When CRC is enabled, then the user must include the correct CRC byte during the SPI write for the clear error flags register command to complete.

**Table 14. Bit Descriptions for ERR\_FLAGS**

Bits	Bit Name	Settings	Description	Default	Access
[7:3]	RESERVED		These bits are reserved and are set to 0.	0x0	R
2	RW_ERR_FLAG	0 1	Error flag for invalid read/write address. The error flag asserts during an SPI read if the target address does not exist. The error flag also asserts when the target address of an SPI write does not exist or is read only. No error. Error.	0x0	R
1	SCLK_ERR_FLAG	0 1	Error flag for the detection of the correct number of SCLK cycles in an SPI frame. No error. Error.	0x0	R
0	CRC_ERR_FLAG	0 1	Error flag that determines if a CRC error occurs during a register write. No error. Error.	0x0	R

**BURST ENABLE REGISTER****Address: 0x05, Reset: 0x00, Name: BURST\_EN**

The burst enable register allows the user to enable or disable burst mode. When enabled, the user can send multiple consecutive SPI commands without deasserting  $\overline{CS}$ .

**Table 15. Bit Descriptions for BURST\_EN**

Bits	Bit Name	Settings	Description	Default	Access
[7:1]	RESERVED		These bits are reserved; set these bits to 0.	0x0	R
0	BURST_MODE_EN	0 1	Burst mode enable bit. Disabled. Enabled.	0x0	R/W

**SOFTWARE RESET REGISTER****Address: 0x0B, Reset: 0x00, Name: SOFT\_RESETB**

This software reset register is used to perform a software reset. Consecutively write 0xA3 and 0x05 to this register, and the device registers reset to their default states.

**Table 16. Bit Descriptions for SOFT\_RESETB**

Bits	Bit Name	Settings	Description	Default	Access
[7:0]	SOFT_RESETB		To perform a software reset, consecutively write 0xA3 followed by 0x05 to this register.	0x0	R/W

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
