**Table 1 Pinning Table**

Pin	Name	Function
1	$V_{CC}$	Supply voltage
2	$V_{Bias}$	Bias reference voltage
3	$RF_{in}$	RF input
4	$RF_{out}$	RF output

## 6.3 AC Characteristics

AC characteristics are described in two sub-chapters, first for 100 MHz FM Radio applications, then for higher frequencies in a 50  $\Omega$  environment.

### 6.3.1 AC Characteristics in FM Radio Applications

Two BGB707L7ESD FM radio application notes are available on our website [www.infineon.com/BGB707](http://www.infineon.com/BGB707). Depending on the impedance of the used antenna, please consult AN177 for high-ohmic antennas and AN181 for 50  $\Omega$  antennas. In this chapter you find a summary of the electrical performance as described in these application notes in table form.

#### 6.3.1.1 High-Ohmic FM Radio Antenna

### 6.3.3 AC Characteristics in Test Fixture

For frequencies from 150 MHz to 10 GHz the measurement setup is a test fixture with Bias-T's in a 50 Ω system according to **Figure 8** at  $V_C = 3V$ ,  $T_A = 25\text{ °C}$ . The collector current  $I_C$  is controlled by an external base voltage  $V_B$  applied at  $RF_{in}$  pin and not by the integrated biasing's reference voltage  $V_{Bias}$ .  $V_C$  controls the collector voltage at  $RF_{out}$  pin. This allows direct measurement of the amplifier performance as a function of bias conditions without passive components.
