

MAX9111/MAX9113

Single/Dual LVDS Line Receivers with Ultra-Low Pulse Skew in SOT23

General Description

The MAX9111/MAX9113 single/dual low-voltage differential signaling (LVDS) receivers are designed for high-speed applications requiring minimum power consumption, space, and noise. Both devices support switching rates exceeding 500Mbps while operating from a single +3.3V supply, and feature ultra-low 300ps (max) pulse skew required for high-resolution imaging applications such as laser printers and digital copiers.

The MAX9111 is a single LVDS receiver, and the MAX9113 is a dual LVDS receiver.

Both devices conform to the EIA/TIA-644 LVDS standard and convert LVDS to LVTTTL/CMOS-compatible outputs. A fail-safe feature sets the outputs high when the inputs are undriven and open, terminated, or shorted. The MAX9111/MAX9113 are available in space-saving 8-pin SOT23 and SO packages. Refer to the MAX9110/MAX9112 data sheet for single/dual LVDS line drivers.

Applications

- Laser Printers
- Digital Copiers
- Cellular Phone Base Stations
- Telecom Switching Equipment
- Network Switches/Routers
- LCD Displays
- Backplane Interconnect
- Clock Distribution
- Automotive

Features

- Low 300ps (max) Pulse Skew for High-Resolution Imaging and High-Speed Interconnect
- Space-Saving 8-Pin SOT23 and SO Packages
- Pin-Compatible Upgrades to DS90LV018A and DS90LV028A (SO Packages Only)
- Guaranteed 500Mbps Data Rate
- Low 29mW Power Dissipation at 3.3V
- Conform to EIA/TIA-644 Standard
- Single +3.3V Supply
- Flow-Through Pinout Simplifies PCB Layout
- Fail-Safe Circuit Sets Output High for Undriven Inputs
- High-Impedance LVDS Inputs when Powered Off
- AEC-Q100 Qualified, Refer to [Ordering Information](#) for the Specific /V Versions

[Typical Operating Circuit](#) appears at end of data sheet.

Detailed Description

LVDS Inputs

The MAX9111/MAX9113 feature LVDS inputs for interfacing high-speed digital circuitry. The LVDS interface standard is a signaling method intended for point-to-point communication over a controlled impedance media, as defined by the ANSI/EIA/TIA-644 standards. The technology uses low-voltage signals to achieve fast transition times, minimize power dissipation, and noise immunity. Receivers such as the MAX9111/MAX9113 convert LVDS signals to CMOS/LVTTL signals at rates in excess of 500Mbps. The devices are capable of detecting differential signals as low as 100mV and as high as 1V within a 0V to 2.4V input voltage range. The LVDS standard specifies an input voltage range of 0 to 2.4V referenced to ground.

Fail-Safe

The fail-safe feature sets the output to a high state when the inputs are undriven and open, terminated, or shorted. When using one channel in the MAX9113, leave the unused channel open. The fail-safe feature is not guaranteed to be operational above +85°C.

ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The receiver inputs of the MAX9111/MAX9113 have extra protection against static electricity. Maxim’s engineers have developed state-of-the-art structures to protect these pins against ESD of ±11kV without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down.

ESD protection can be tested in various ways; the receiver inputs of this product family are characterized for protection to the limit of ±11kV using the Human Body Model.

Human Body Model

Figure 3a shows the Human Body Model, and Figure 3b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

Applications Information

Supply Bypassing

Bypass V_{CC} with high-frequency surface-mount ceramic $0.1\mu\text{F}$ and $0.001\mu\text{F}$ capacitors in parallel, as close to the device as possible, with the $0.001\mu\text{F}$ valued capacitor the closest to the device. For additional supply bypassing, place a $10\mu\text{F}$ tantalum or ceramic capacitor at the point where power enters the circuit board.

Differential Traces

Output trace characteristics affect the performance of the MAX9111/MAX9113. Use controlled impedance traces to match trace impedance to both transmission medium impedance and the termination resistor. Eliminate reflections and ensure that noise couples as common mode by running the differential traces close together. Reduce skew by matching the electrical length of the traces. Excessive skew can result in a degradation of magnetic field cancellation.

Maintain the distance between the differential traces to avoid discontinuities in differential impedance. Avoid 90° turns and minimize the number of vias to further prevent impedance discontinuities.

Cables and Connectors

Transmission media should have a differential characteristic impedance of about 100Ω . Use cables and connectors that have matched impedance to minimize impedance discontinuities.

Avoid the use of unbalanced cables such as ribbon or simple coaxial cable. Balanced cables such as twisted pair offer superior signal quality and tend to generate less EMI due to canceling effects. Balanced cables tend to pick up noise as common mode, which is rejected by the LVDS receiver.

Termination

The MAX9111/MAX9113 input differential voltage depends on the driver current and termination resistance. Refer to the MAX9110/MAX9112 differential driver data sheet for this information.

Minimize the distance between the termination resistor and receiver inputs. Use a single 1% to 2% surface-mount resistor across the receiver inputs.

Board Layout

For LVDS applications, a four-layer PCB that provides separate power, ground, LVDS signals, and input signals is recommended. Isolate the input and LVDS signals from each other to prevent coupling. For best results, separate the input and LVDS signal planes with the power and ground planes.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:
