

FEATURES

- Low cost, compact, current-sense solution
- 3 available gain versions
 - 20 V/V (ADM4073T)
 - 50 V/V (ADM4073F)
 - 100 V/V (ADM4073H)
- Typical $\pm 1.0\%$ full-scale accuracy
- Supply current: 500 μA
- Wide bandwidth: 1.8 MHz
- Operating supply: 3 V to 28 V
- Wide common-mode range: 2 V to 28 V
 - Independent of supply voltage
- Operating temperature range: -40°C to $+125^\circ\text{C}$
- Available in a 6-lead SOT-23 package
- Pin-to-pin compatibility with the MAX4073

APPLICATIONS

- Cell phones
- PDA's
- Notebook computers
- Portable, battery-powered systems
- Smart battery packs and chargers
- Automotive
- Power management systems
- PA bias control
- General system-level, board-level current monitoring
- Precision current sources

GENERAL DESCRIPTION

The ADM4073 is a low cost, high-side, current-sense amplifier ideal for small portable applications, such as cell phones, notebook computers, PDA's, and other systems where current monitoring is required. The device is available in three different gain models, eliminating the need for gain-setting resistors. Because the ground path is not interrupted, the ADM4073 is particularly useful in rechargeable battery-powered systems, while its wide 1.8 MHz bandwidth makes it suitable for use inside battery-charger control loops. The input common-mode range of 2 V to 28 V is independent of the supply voltage.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

05131-003

APPLICATION DIAGRAM

Figure 2.

05131-001

The voltage on the output pin is determined by the current flowing through the selectable external sense resistor and the gain of the version selected. The operating range is 3 V to 28 V with a typical supply current of 500 μA .

The ADM4073 is available in a 6-lead SOT-23 package and is specified over the automotive operating temperature range (-40°C to $+125^\circ\text{C}$).

¹ 100% production tested at $T_A = 25^\circ\text{C}$. Specifications over temperature limit are guaranteed by design.

² The sum of the gain and offset errors is the total OUT voltage error.

³ $6.25\text{ mV} = 1/16^{\text{th}}$ of 100 mV full-scale sense voltage.

⁴ Output settles to within 1% of final value.

⁵ When overdriven, this device does not experience phase reversal.

ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter | Rating |
|---|-------------------------------------|
| V _{CC} to GND | −0.3 V to +30 V |
| RS+, RS− to GND | −0.3 V to +30 V |
| OUT to GND | −0.3 V to (V _{CC} + 0.3 V) |
| OUT Short-Circuit to GND | Continuous |
| Differential Input Voltage (V _{RS+} − V _{RS−}) | ±5 V |
| Current into Any Pin | ±20 mA |
| Storage Temperature Range | −65°C to +125°C |
| Operating Temperature Range | −40°C to +125°C |
| Lead Temperature, Soldering (10 sec) | 300°C |
| Junction Temperature | 150°C |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL CHARACTERISTICS

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

| Package Type | θ_{JA} | Unit |
|---------------|---------------|------|
| 6-Lead SOT-23 | 169.5 | °C/W |

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. Pin Configuration

Table 4. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
|---------|-----------------|--|
| 1 | GND | Chip Ground Pin. |
| 2 | GND | Chip Ground Pin. |
| 3 | V _{CC} | Chip Power Supply. Requires a 0.1 μ F capacitor to ground. |
| 4 | RS+ | Power-Side Connection to the External Sense Resistor. |
| 5 | RS- | Load-Side Connection to the External Sense Resistor. |
| 6 | OUT | Voltage Output. V _{OUT} is proportional to V _{SENSE} . Output impedance is approximately 12 k Ω . |

THEORY OF OPERATION

The current from the source flows through R_{SENSE} , which generates a voltage drop, V_{SENSE} , across the $RS+$ and $RS-$ terminals of the sense amplifier. The Input Stage Amplifier A1 regulates its inputs to be equal, thereby shunting a current proportional to V_{SENSE}/R_{G1} to the output current mirror. This current is then multiplied by a gain factor of b in the output stage current mirror and flows through R_{GD} to generate V_{OUT} . Therefore, V_{OUT} is related to V_{SENSE} by the ratio of R_{G1} to R_{GD} and the current gain of b .

$$V_{OUT} = A_V \times V_{SENSE}$$

where:

$$A_V = R_{GD}/R_{G1} \times b$$

A_V is equal to different voltages depending upon the model of the device.

- 20 V/V for ADM4073T.
- 50 V/V for ADM4073F.
- 100 V/V for ADM4073H.

Figure 25. Functional Block Diagram

R_{SENSE}

The ADM4073 has the ability to sense a wide variety of currents by selecting a particular sense resistor. Select a suitable output voltage for full-scale current, such as 10 V for 10 A. Then, select a gain model that gives the most efficient use of the sense voltage range (150 mV max).

In the example above, using the ADM4073H (gain of 100) gives an output voltage of 10 V when the sense voltage is 100 mV. Use the following equation to determine what value of sense resistor gives 100 mV with 10 A flowing through it:

$$R_{SENSE} = 100 \text{ mV}/10 \text{ A}$$

$$R_{SENSE} = 10 \text{ m}\Omega$$

$$V_{OUT} = (I_{LOAD} \times R_{SENSE}) \times A_V$$

To measure lower currents accurately, use as large a sense resistor as possible to utilize the higher end of the sense voltage range. This reduces the effects of the offset voltage errors in the internal amplifier.

When currents are very large, it is important to take the I^2R power losses across the sense resistor into account. If the sense resistor's rated power dissipation is not sufficient, its value can drift, giving an inaccurate output voltage or it could fail altogether. This, in turn, causes the voltage across the $RS+$ and $RS-$ pins to exceed the absolute maximum ratings.

If the monitored supply rail has a large amplitude high frequency component, choose a sense resistor with low inductance.

Figure 26. Using PCB Trace for Current Sensing

OUTPUT (OUT)

The output stage of the ADM4073 is a current source driving a pull-down resistance. To ensure optimum accuracy, care must be taken not to load this output externally. To minimize output errors, ensure OUT is connected to a high impedance input stage. If this is not possible, output buffering is recommended.

The percent error introduced by output loading is determined with the following formula:

$$\% \text{ Error} = 100 \left(1 - R_{LOAD} / (R_{OUT_INT} + R_{LOAD}) \right)$$

where:

R_{LOAD} is the external load applied to OUT .

R_{OUT_INT} is the internal output resistance (12 k Ω).

NOTES

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
