

NCP45560

ecoSWITCH™ Advanced Load Management

Controlled Load Switch with Low R_{ON}

The NCP45560 load switch provides a component and area-reducing solution for efficient power domain switching with inrush current limit via soft-start. In addition to integrated control functionality with ultra low on-resistance, this device offers system safeguards and monitoring via fault protection and power good signaling. This cost effective solution is ideal for power management and hot-swap applications requiring low power consumption in a small footprint.

Features

- Advanced Controller with Charge Pump
- Integrated N-Channel MOSFET with Ultra Low R_{ON}
- Input Voltage Range 0.5 V to 13.5 V
- Soft-Start via Controlled Slew Rate
- Adjustable Slew Rate Control
- Power Good Signal
- Thermal Shutdown
- Undervoltage Lockout
- Short-Circuit Protection
- Extremely Low Standby Current
- Load Bleed (Quick Discharge)
- This is a Pb-Free Device

Typical Applications

- Portable Electronics and Systems
- Notebook and Tablet Computers
- Telecom, Networking, Medical, and Industrial Equipment
- Set-Top Boxes, Servers, and Gateways
- Hot-Swap Devices and Peripheral Ports

ORDERING INFORMATION

See detailed ordering and shipping information on page 12 of this data sheet.

NCP45560

Table 1. PIN DESCRIPTION

Pin	Name	Function
1, 13	V _{IN}	Drain of MOSFET (0.5 V – 13.5 V), Pin 1 must be connected to Pin 13
2	EN	NCP45560–H – Active–high digital input used to turn on the MOSFET, pin has an internal pull down resistor to GND
		NCP45560–L – Active–low digital input used to turn on the MOSFET, pin has an internal pull up resistor to V _{CC}
3	V _{CC}	Supply voltage to controller (3.0 V – 5.5 V)
4	GND	Controller ground
5	SR	Slew rate adjustment; float if not used
6	PG	Active–high, open–drain output that indicates when the gate of the MOSFET is fully charged, external pull up resistor ≥ 1 kΩ to an external voltage source required; tie to GND if not used.
7	BLEED	Load bleed connection, must be tied to V _{OUT} either directly or through a resistor ≤ 1 kΩ
8–12	V _{OUT}	Source of MOSFET connected to load

Table 2. ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Supply Voltage Range	V _{CC}	–0.3 to 6	V
Input Voltage Range	V _{IN}	–0.3 to 18	V
Output Voltage Range	V _{OUT}	–0.3 to 18	V
EN Digital Input Range	V _{EN}	–0.3 to (V _{CC} + 0.3)	V
PG Output Voltage Range (Note 1)	V _{PG}	–0.3 to 6	V
Thermal Resistance, Junction–to–Ambient, Steady State (Note 2)	R _{θJA}	28.6	°C/W
Thermal Resistance, Junction–to–Ambient, Steady State (Note 3)	R _{θJA}	49.7	°C/W
Thermal Resistance, Junction–to–Case (V _{IN} Paddle)	R _{θJC}	1.7	°C/W
Continuous MOSFET Current @ T _A = 25°C (Notes 2 and 4)	I _{MAX}	24	A
Continuous MOSFET Current @ T _A = 25°C (Notes 3 and 4)	I _{MAX}	18.3	A
Total Power Dissipation @ T _A = 25°C (Note 2) Derate above T _A = 25°C	P _D	3.49 34.9	W mW/°C
Total Power Dissipation @ T _A = 25°C (Note 3) Derate above T _A = 25°C	P _D	2.01 20.1	W mW/°C
Storage Temperature Range	T _{STG}	–40 to 150	°C
Lead Temperature, Soldering (10 sec.)	T _{SLD}	260	°C
ESD Capability, Human Body Model (Notes 5 and 6)	ESD _{HBM}	3.0	kV
ESD Capability, Machine Model (Note 5)	ESD _{MM}	200	V
ESD Capability, Charged Device Model (Note 5)	ESD _{CDM}	1.0	kV
Latch–up Current Immunity (Notes 5 and 6)	LU	100	mA

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- PG is an open–drain output that requires an external pull up resistor ≥ 1 kΩ to an external voltage source.
- Surface–mounted on FR4 board using 1 sq–in pad, 1 oz Cu.
- Surface–mounted on FR4 board using the minimum recommended pad size, 1 oz Cu.
- Ensure that the expected operating MOSFET current will not cause the Short–Circuit Protection to turn the MOSFET off undesirably.
- Tested by the following methods @ T_A = 25°C:
 ESD Human Body Model tested per JESD22–A114
 ESD Machine Model tested per JESD22–A115
 ESD Charged Device Model per ESD STM5.3.1
 Latch–up Current tested per JESD78
- Rating is for all pins except for V_{IN} and V_{OUT} which are tied to the internal MOSFET's Drain and Source. Typical MOSFET ESD performance for V_{IN} and V_{OUT} should be expected and these devices should be treated as ESD sensitive.

APPLICATIONS INFORMATION

Enable Control

The NCP45560 has two part numbers, NCP45560–H and NCP45560–L, that only differ in the polarity of the enable control.

The NCP45560–H device allows for enabling the MOSFET in an active–high configuration. When the V_{CC} supply pin has an adequate voltage applied and the EN pin is at a logic high level, the MOSFET will be enabled. Similarly, when the EN pin is at a logic low level, the MOSFET will be disabled. An internal pull down resistor to ground on the EN pin ensures that the MOSFET will be disabled when not being driven.

The NCP45560–L device allows for enabling the MOSFET in an active–low configuration. When the V_{CC} supply pin has an adequate voltage applied and the EN pin is at a logic low level, the MOSFET will be enabled. Similarly, when the EN pin is at a logic high level, the MOSFET will be disabled. An internal pull up resistor to V_{CC} on the EN pin ensures that the MOSFET will be disabled when not being driven.

Power Sequencing

The NCP45560 devices will function with any power sequence, but the output turn–on delay performance may vary from what is specified. To achieve the specified performance, there are two recommended power sequences:

1. $V_{CC} \rightarrow V_{IN} \rightarrow V_{EN}$
2. $V_{IN} \rightarrow V_{CC} \rightarrow V_{EN}$

Load Bleed (Quick Discharge)

The NCP45560 devices have an internal bleed resistor, R_{BLEED} , which is used to bleed the charge off of the load to ground after the MOSFET has been disabled. In series with the bleed resistor is a bleed switch that is enabled whenever the MOSFET is disabled. The MOSFET and the bleed switch are never concurrently active.

It is required that the BLEED pin be connected to V_{OUT} either directly (as shown in Figure 31) or through an external resistor, R_{EXT} (as shown in Figure 30). R_{EXT} should not exceed 1 k Ω and can be used to increase the total bleed resistance.

Care must be taken to ensure that the power dissipated across R_{BLEED} is kept at a safe level. R_{EXT} can be used to decrease the amount of power dissipated across R_{BLEED} .

Power Good

The NCP45560 devices have a power good output (PG) that can be used to indicate when the gate of the MOSFET is fully charged. The PG pin is an active–high, open–drain output that requires an external pull up resistor, R_{PG} , greater than or equal to 1 k Ω to an external voltage source, V_{TERM} , compatible with input levels of other devices connected to this pin (as shown in Figures 30 and 31).

The power good output can be used as the enable signal for other active–high devices in the system (as shown in

Figure 32). This allows for guaranteed by design power sequencing and reduces the number of enable signals needed from the system controller. If the power good feature is not used in the application, the PG pin should be tied to GND.

Slew Rate Control

The NCP45560 devices are equipped with controlled output slew rate which provides soft start functionality. This limits the inrush current caused by capacitor charging and enables these devices to be used in hot swap applications.

The slew rate can be decreased with an external capacitor added between the SR pin and ground (as shown in Figures 30 and 31). With an external capacitor present, the slew rate can be determined by the following equation:

$$\text{Slew Rate} = \frac{K_{SR}}{C_{SR}} \text{ [V/s]} \quad (\text{eq. 1})$$

where K_{SR} is the specified slew rate control constant, found in Table 4, and C_{SR} is the slew rate control capacitor added between the SR pin and ground. The slew rate of the device will always be the lower of the default slew rate and the adjusted slew rate. Therefore, if the C_{SR} is not large enough to decrease the slew rate more than the specified default value, the slew rate of the device will be the default value. The SR pin can be left floating if the slew rate does not need to be decreased.

Short–Circuit Protection

The NCP45560 devices are equipped with short–circuit protection that is used to help protect the part and the system from a sudden high–current event, such as the output, V_{OUT} , being shorted to ground. This circuitry is only active when the gate of the MOSFET is fully charged.

Once active, the circuitry monitors the difference in the voltage on the V_{IN} pin and the voltage on the BLEED pin. In order for the V_{OUT} voltage to be monitored through the BLEED pin, it is required that the BLEED pin be connected to V_{OUT} either directly (as shown in Figure 31) or through a resistor, R_{EXT} (as shown in Figure 30), which should not exceed 1 k Ω . With the BLEED pin connected to V_{OUT} , the short–circuit protection is able to monitor the voltage drop across the MOSFET.

If the voltage drop across the MOSFET is greater than or equal to the short–circuit protection threshold voltage, the MOSFET is immediately turned off and the load bleed is activated. The part remains latched in this off state until EN is toggled or V_{CC} supply voltage is cycled, at which point the MOSFET will be turned on in a controlled fashion with the normal output turn–on delay and slew rate. The current through the MOSFET that will cause a short–circuit event can be calculated by dividing the short–circuit protection threshold by the expected on–resistance of the MOSFET.

NCP45560

Thermal Shutdown

The thermal shutdown of the NCP45560 devices protects the part from internally or externally generated excessive temperatures. This circuitry is disabled when EN is not active to reduce standby current. When an over-temperature condition is detected, the MOSFET is immediately turned off and the load bleed is activated.

The part comes out of thermal shutdown when the junction temperature decreases to a safe operating temperature as dictated by the thermal hysteresis. Upon exiting a thermal shutdown state, and if EN remains active, the MOSFET will be turned on in a controlled fashion with the normal output turn-on delay and slew rate.

Undervoltage Lockout

The undervoltage lockout of the NCP45560 devices turns the MOSFET off and activates the load bleed when the input voltage, V_{IN} , is less than or equal to the undervoltage lockout threshold. This circuitry is disabled when EN is not active to reduce standby current.

If the V_{IN} voltage rises above the undervoltage lockout threshold, and EN remains active, the MOSFET will be turned on in a controlled fashion with the normal output turn-on delay and slew rate.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)
