## 2 Product Description

The BGSA11GN10 is a Dual Single Pole Single Throw (SPST) RF antenna aperture switch optimized for low  $R_{on}$  enabling applications up to 5.0 GHz. This single supply chip integrates on-chip CMOS logic driven by a simple, single-pin CMOS or TTL compatible control input signal. The 0.1 dB compression point exceeds the switch maximum input power level, resulting in linear performance at all signal levels. Unlike GaAs technology, the 0.1 dB compression point exceeds the switch maximum input power level, resulting in linear performance at all signal levels and external DC blocking capacitors at the RF ports are only required if DC voltage is applied externally. Due to its very high RF voltage ruggedness it is suited for switching any reactive devices such as inductors and capacitors in RF matching circuits without significant losses in quality factors.

## 9 Application Examples

The BGSA11GN10 is a dual single pole single throw (SPST) RF switch in a 1.05 mm x 1.55 mm TSNP-10-1 package. Both SPST can be controlled individually by the control placed next to each other. This solution allows the use of the device for several applications shown in Fig. 7:

- Low  $R_{ON} = 0.79\Omega$  SPST (a) or ultra low  $R_{ON} = 0.38\Omega$  SPST (b)
- Tuning with 2 reactive devices such as capacitors or inductors. (c)
- Combinations of above.

**Figure 7:** BGSA11GN10 realizable circuit configurations

### 9.1 Single SPST shunt operation

The configuration (a) is used to obtain an  $R_{ON} = 0.79\Omega$  and  $C_{OFF} = 250fF$ . It can be used for series and shunt configurations. Note, that for single SPST shunt configuration, it is better to connect RFC to GND to avoid additional capacitance contribution of the unused part RF2 to GND as shown in Fig. 8. For simplicity, connecting the unused RF and Control Pin can be connected to ground.

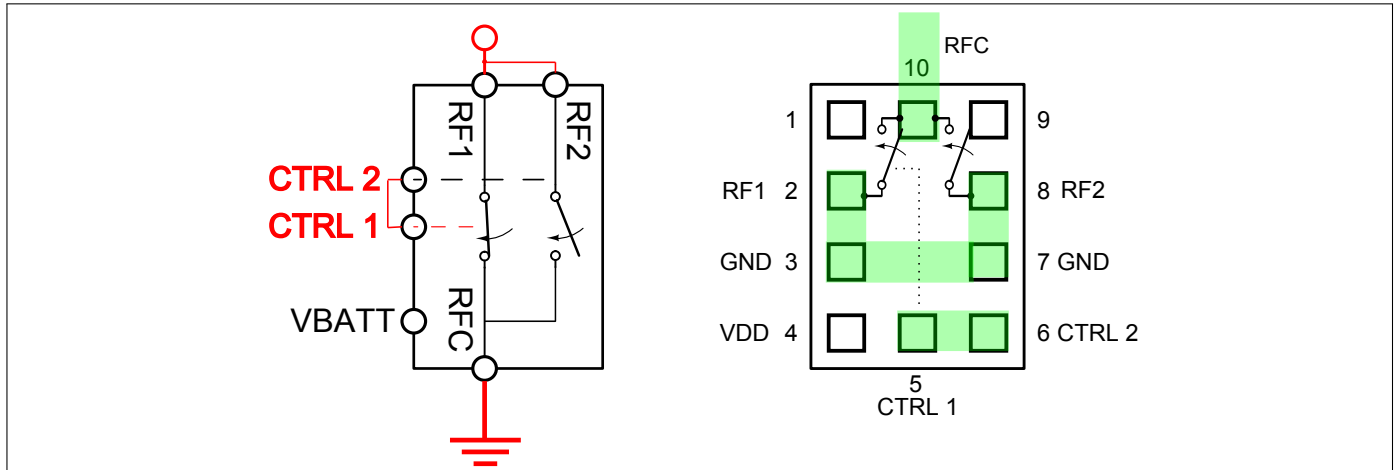

**Figure 8:** BGSA11GN10 single SPST shunt configuration

**9.2 Low  $R_{ON}$  SPST shunt operation**

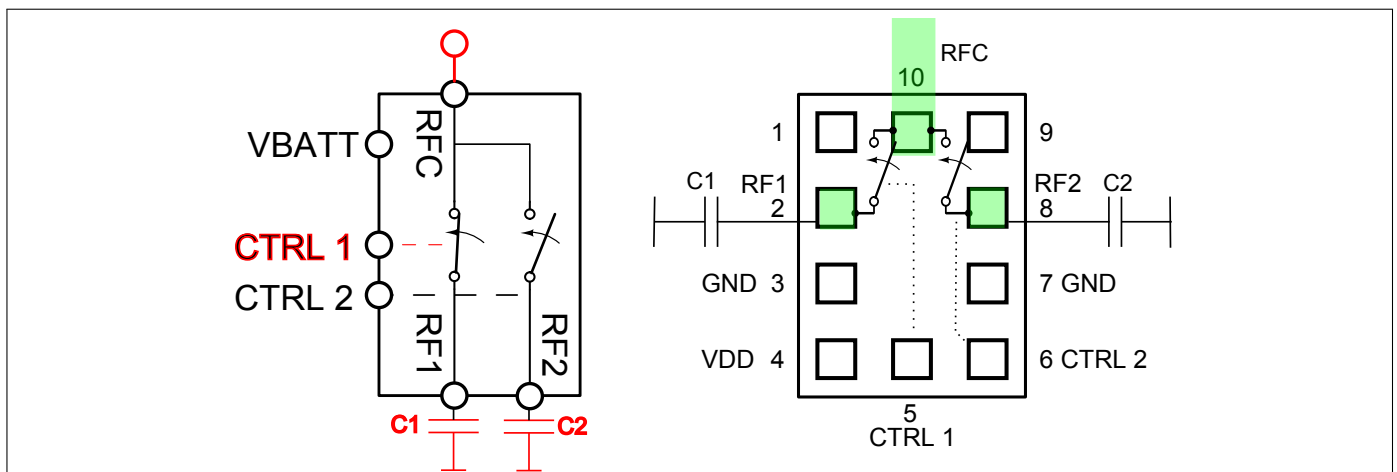

For lowest possible  $R_{ON} = 0.38\Omega$  operation, it is required to connect the logic inputs CTRL 1 with CTRL 2 together and same for RF1 and RF2 as shown in Fig. 9

**Figure 9:** BGSA11GN10 low  $R_{ON}$  SPST shunt configuration

**9.3 Dual SPST for RF tuning**

The dual SPST can also be used for tuning applications, for example to tune capacitance or inductance. Fig. 10 shows as example a tunable capacitance with 4 steps by using 2 external MLCC capacitors. Note that the RF voltage should not exceed the specified 36 V over the switch device and also not for the used capacitor.

**Figure 10:** BGSA11GN10 as shunt capacitance tuning device

For example, resulting capacitances using C1 and C2 can be controlled as shown in table 15. Resulting Q factors can be calculated using the  $R_{ON}$  values using the equation  $Q = \frac{1}{\omega R_{ON} C}$  with  $\omega = 2\pi f$ . Same function can be realized also with inductors (Fig. 11) with  $Q = \frac{\omega L}{R_{ON}}$  in table 16.
