

### FEATURES

- 2-channel, 256-position potentiometer
- End-to-end resistance: 2.5 k $\Omega$ , 10 k $\Omega$ , 50 k $\Omega$ , and 100 k $\Omega$
- Compact 10-lead MSOP (3 mm  $\times$  4.9 mm) package
- Fast settling time:  $t_s = 5 \mu\text{s}$  typical on power-up
- Full read/write of wiper register
- Power-on preset to midscale
- Computer software replaces microcontroller in factory programming applications
- Single supply: 2.7 V to 5.5 V
- Low temperature coefficient: 35 ppm/ $^{\circ}\text{C}$
- Low power:  $I_{DD} = 6 \mu\text{A}$  maximum
- Wide operating temperature:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Evaluation board available
- Qualified for automotive applications

### APPLICATIONS

- Systems calibrations
- Electronics level settings
- Mechanical trimmers replacement in new designs
- Permanent factory PCB setting
- Transducer adjustment of pressure, temperature, position, chemical, and optical sensors
- RF amplifier biasing
- Automotive electronics adjustment
- Gain control and offset adjustment

### GENERAL DESCRIPTION

The AD5162 provides a compact 3 mm  $\times$  4.9 mm packaged solution for dual, 256-position adjustment applications. This device performs the same electronic adjustment function as a 3-terminal mechanical potentiometer. Available in four end-to-end resistance values (2.5 k $\Omega$ , 10 k $\Omega$ , 50 k $\Omega$ , 100 k $\Omega$ ), this low temperature coefficient device is ideal for high accuracy and stability-variable resistance adjustments. The wiper settings are controllable through an SPI digital interface. The resistance between the wiper and either endpoint of the fixed resistor varies linearly with respect to the digital code transferred into the RDAC latch.<sup>1</sup>

<sup>1</sup> The terms *digital potentiometer*, *VR*, and *RDAC* are used interchangeably.

### FUNCTIONAL BLOCK DIAGRAM

Figure 1.

Operating from a 2.7 V to 5.5 V power supply and consuming less than 6  $\mu\text{A}$  allows the AD5162 to be used in portable battery-operated applications.

For applications that program the AD5162 at the factory, Analog Devices offers device programming software running on Windows<sup>®</sup> NT/2000/XP operating systems. This software effectively replaces the need for external SPI controllers, which in turn enhances the time to market of systems. An AD5162 evaluation kit and software are available. The kit includes a cable and instruction manual.

Total Harmonic Distortion	THD <sub>W</sub>	$V_A = 1\text{ V rms}$ , $V_B = 0\text{ V}$ , f = 1 kHz		0.1		%
$V_W$ Settling Time	$t_s$	$V_A = 5\text{ V}$ , $V_B = 0\text{ V}$ , ±1 LSB error band		1		μs
Resistor Noise Voltage Density	$e_{N\_WB}$	$R_{WB} = 1.25\text{ k}\Omega$ , $R_s = 0$		3.2		nV/√Hz

<sup>1</sup> Typical specifications represent average readings at 25°C and  $V_{DD} = 5\text{ V}$ .

<sup>2</sup> Resistor position nonlinearity error, R-INL, is the deviation from an ideal value measured between the maximum resistance and the minimum resistance wiper positions. R-DNL measures the relative step change from the ideal between successive tap positions. Parts are guaranteed monotonic.

<sup>3</sup>  $V_A = V_{DD}$ ,  $V_B = 0\text{ V}$ , wiper ( $V_W$ ) = no connect.

<sup>4</sup> Specifications apply to all VRs.

<sup>5</sup> INL and DNL are measured at  $V_W$  with the RDAC configured as a potentiometer divider similar to a voltage output DAC.  $V_A = V_{DD}$  and  $V_B = 0\text{ V}$ . DNL specification limits of ±1 LSB maximum are guaranteed monotonic operating conditions.

<sup>6</sup> Resistor Terminal A, Resistor Terminal B, and Resistor Terminal W have no limitations on polarity with respect to each other.

<sup>7</sup> Guaranteed by design, but not subject to production test.

<sup>8</sup>  $P_{DISS}$  is calculated from  $(I_{DD} \times V_{DD})$ . CMOS logic level inputs result in minimum power dissipation.

<sup>9</sup> All dynamic characteristics use  $V_{DD} = 5\text{ V}$ .

<sup>7</sup> Guaranteed by design, but not subject to production test.

**TIMING CHARACTERISTICS: ALL VERSIONS**

$V_{DD} = 5\text{ V} \pm 10\%$ , or  $3\text{ V} \pm 10\%$ ;  $V_A = V_{DD}$ ;  $V_B = 0\text{ V}$ ;  $-40^\circ\text{C} < T_A < +125^\circ\text{C}$ ; unless otherwise noted.

**Table 3.**

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
SPI INTERFACE TIMING CHARACTERISTICS <sup>1</sup>						
Clock Frequency	$f_{\text{CLK}}$				25	MHz
Input Clock Pulse Width	$t_{\text{CH}}, t_{\text{CL}}$	Clock level high or low	20			ns
Data Setup Time	$t_{\text{DS}}$		5			ns
Data Hold Time	$t_{\text{DH}}$		5			ns
$\overline{\text{CS}}$ Setup Time	$t_{\text{CSS}}$		15			ns
$\overline{\text{CS}}$ High Pulse Width	$t_{\text{CSW}}$		40			ns
CLK Fall to $\overline{\text{CS}}$ Fall Hold Time	$t_{\text{CSH0}}$		0			ns
CLK Fall to $\overline{\text{CS}}$ Rise Hold Time	$t_{\text{CSH1}}$		0			ns
$\overline{\text{CS}}$ Rise to Clock Rise Setup	$t_{\text{CS1}}$		10			ns

<sup>1</sup> See the timing diagrams for the locations of measured values (that is, see Figure 42 and Figure 43).

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 4.

Parameter	Rating
$V_{DD}$ to GND	-0.3 V to +7 V
$V_A$ , $V_B$ , $V_W$ to GND	$V_{DD}$
Terminal Current, Ax to Bx, Ax to Wx, Bx to Wx <sup>1</sup>	
Pulsed	$\pm 20$ mA
Continuous	$\pm 5$ mA
Digital Inputs and Output Voltage to GND	0 V to 7 V
Operating Temperature Range	$-40^\circ\text{C}$ to $+125^\circ\text{C}$
Maximum Junction Temperature ( $T_{JMAX}$ )	$150^\circ\text{C}$
Storage Temperature	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Lead Temperature (Soldering, 10 sec)	$300^\circ\text{C}$
Thermal Resistance, $\theta_{JA}$ for 10-Lead MSOP <sup>2</sup>	$230^\circ\text{C}/\text{W}$

<sup>1</sup> The maximum terminal current is bound by the maximum current handling of the switches, the maximum power dissipation of the package, and the maximum applied voltage across any two of the A, B, and W terminals at a given resistance.

<sup>2</sup> The package power dissipation is  $(T_{JMAX} - T_A)/\theta_{JA}$ .

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2.

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	B1	B1 Terminal.
2	A1	A1 Terminal.
3	W2	W2 Terminal.
4	GND	Digital Ground.
5	V <sub>DD</sub>	Positive Power Supply.
6	CLK	Serial Clock Input. Positive-edge triggered.
7	SDI	Serial Data Input.
8	$\overline{CS}$	Chip Select Input, Active Low. When $\overline{CS}$ returns high, data is loaded into the DAC register.
9	B2	B2 Terminal.
10	W1	W1 Terminal.

## THEORY OF OPERATION

The AD5162 is a 256-position, digitally controlled variable resistor (VR) device.

An internal power-on preset places the wiper at midscale during power-on, which simplifies the fault condition recovery at power-up.

### PROGRAMMING THE VARIABLE RESISTOR AND VOLTAGE

#### Rheostat Operation

The nominal resistance of the RDAC between Terminal A and Terminal B is available in 2.5 kΩ, 10 kΩ, 50 kΩ, and 100 kΩ. The nominal resistance ( $R_{AB}$ ) of the VR has 256 contact points accessed by the wiper terminal and the B terminal contact. The 8-bit data in the RDAC latch is decoded to select one of the 256 possible settings.

Figure 33. Rheostat Mode Configuration

Assuming that a 10 kΩ part is used, the first connection of the wiper starts at the B terminal for Data 0x00. Because there is a 50 Ω wiper contact resistance, such a connection yields a minimum of 100 Ω ( $2 \times 50 \Omega$ ) resistance between Terminal W and Terminal B. The second connection is the first tap point, which corresponds to 139 Ω ( $R_{WB} = R_{AB}/256 + 2 \times R_W = 39 \Omega + 2 \times 50 \Omega$ ) for Data 0x01. The third connection is the next tap point, representing 178 Ω ( $2 \times 39 \Omega + 2 \times 50 \Omega$ ) for Data 0x02, and so on. Each LSB data value increase moves the wiper up the resistor ladder until the last tap point is reached at 10,100 Ω ( $R_{AB} + 2 \times R_W$ ).

Figure 34. AD5162 Equivalent RDAC Circuit

The general equation determining the digitally programmed output resistance between W and B is

$$R_{WB}(D) = \frac{D}{256} \times R_{AB} + 2 \times R_W \quad (1)$$

where:

$D$  is the decimal equivalent of the binary code loaded in the 8-bit RDAC register.

$R_{AB}$  is the end-to-end resistance.

$R_W$  is the wiper resistance contributed by the on resistance of the internal switch.

In summary, if  $R_{AB}$  is 10 kΩ and the A terminal is open circuited, the output resistance,  $R_{WB}$ , is set according to the RDAC latch codes, as listed in Table 6.

Table 6. Codes and Corresponding  $R_{WB}$  Resistance

D (Dec)	$R_{WB}$ (Ω)	Output State
255	9961	Full scale ( $R_{AB} - 1 \text{ LSB} + R_W$ )
128	5060	Midscale
1	139	1 LSB
0	100	Zero scale (wiper contact resistance)

Note that in the zero-scale condition, a finite wiper resistance of 100 Ω is present. Care should be taken to limit the current flow between W and B in this state to a maximum pulse current of no more than 20 mA. Otherwise, degradation or possible destruction of the internal switch contact may occur.

Similar to the mechanical potentiometer, the resistance of the RDAC between Wiper W and Terminal A also produces a digitally controlled complementary resistance,  $R_{WA}$ . When these terminals are used, the B terminal can be opened. Setting the resistance value for  $R_{WA}$  starts at a maximum value of resistance and decreases as the data loaded in the latch increases in value. The general equation for this operation is

$$R_{WA}(D) = \frac{256 - D}{256} \times R_{AB} + 2 \times R_W \quad (2)$$

When  $R_{AB}$  is 10 kΩ and the B terminal is open circuited, the output resistance,  $R_{WA}$ , is set according to the RDAC latch codes, as listed in Table 7.

Table 7. Codes and Corresponding  $R_{WA}$  Resistance

D (Dec)	$R_{WA}$ (Ω)	Output State
255	139	Full scale
128	5060	Midscale
1	9961	1 LSB
0	10,060	Zero scale

Typical device-to-device matching is process-lot dependent and may vary by up to ±30%. Because the resistance element is processed in thin-film technology, the change in  $R_{AB}$  with temperature has a very low temperature coefficient of 35 ppm/°C.

## PROGRAMMING THE POTENTIOMETER DIVIDER

### Voltage Output Operation

The digital potentiometer easily generates a voltage divider at wiper to B and wiper to A, proportional to the input voltage at A to B. Unlike the polarity of  $V_{DD}$  to GND, which must be positive, voltage across A to B, W to A, and W to B can be at either polarity.

Figure 35. Potentiometer Mode Configuration

If ignoring the effect of the wiper resistance for approximation, connecting the A terminal to 5 V and the B terminal to ground produces an output voltage at the wiper to B, starting at 0 V up to 1 LSB less than 5 V. Each LSB of voltage is equal to the voltage applied across the A and B terminals divided by the 256 positions of the potentiometer divider. The general equation defining the output voltage at  $V_W$  with respect to ground for any valid input voltage applied to Terminal A and Terminal B is

$$V_W(D) = \frac{D}{256}V_A + \frac{256-D}{256}V_B \quad (3)$$

A more accurate calculation, which includes the effect of wiper resistance,  $V_W$ , is

$$V_W(D) = \frac{R_{WB}(D)}{R_{AB}}V_A + \frac{R_{WA}(D)}{R_{AB}}V_B \quad (4)$$

Operation of the digital potentiometer in the divider mode results in more accurate operation over temperature. Unlike in the rheostat mode, the output voltage is dependent mainly on the ratio of the internal resistors  $R_{WA}$  and  $R_{WB}$ , not on the absolute values. Therefore, the temperature drift reduces to 15 ppm/°C.

## ESD PROTECTION

All digital inputs are protected with a series of input resistors and parallel Zener ESD structures, as shown in Figure 36 and Figure 37. This applies to the SDI, CLK, and  $\overline{CS}$  digital input pins.

Figure 36. ESD Protection of Digital Pins

Figure 37. ESD Protection of Resistor Terminals

## TERMINAL VOLTAGE OPERATING RANGE

The AD5162  $V_{DD}$  and GND power supply defines the boundary conditions for proper 3-terminal digital potentiometer operation. Supply signals present on the A, B, and W terminals that exceed  $V_{DD}$  or GND are clamped by the internal forward-biased diodes (see Figure 38).

Figure 38. Maximum Terminal Voltages Set by  $V_{DD}$  and GND

## POWER-UP SEQUENCE

Because the ESD protection diodes limit the voltage compliance at the A, B, and W terminals (see Figure 38), it is important to power  $V_{DD}/GND$  before applying voltage to the A, B, and W terminals; otherwise, the diode is forward-biased such that  $V_{DD}$  is powered unintentionally and may affect the rest of the user's circuit. The ideal power-up sequence is in the following order: GND,  $V_{DD}$ , digital inputs, and then  $V_A$ ,  $V_B$ ,  $V_W$ . The relative order of powering  $V_A$ ,  $V_B$ ,  $V_W$ , and the digital inputs is not important, as long as they are powered after  $V_{DD}/GND$ .

## LAYOUT AND POWER SUPPLY BYPASSING

It is good practice to employ compact, minimum lead length layout design. The leads to the inputs should be as direct as possible with a minimum conductor length. Ground paths should have low resistance and low inductance.

Similarly, it is also good practice to bypass the power supplies with quality capacitors for optimum stability. Supply leads to the device should be bypassed with disc or chip ceramic capacitors of 0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$ . Low ESR 1  $\mu\text{F}$  to 10  $\mu\text{F}$  tantalum or electrolytic capacitors should also be applied at the supplies to minimize any transient disturbance and low frequency ripple (see Figure 39). In addition, note that the digital ground should be joined remotely to the analog ground at one point to minimize the ground bounce.

Figure 39. Power Supply Bypassing

## CONSTANT BIAS TO RETAIN RESISTANCE SETTING

For users who desire nonvolatility but cannot justify the additional cost of the EEMEM, the AD5162 can be considered a low cost alternative by maintaining a constant bias to retain the wiper setting. The AD5162 is designed specifically for low power applications, allowing low power consumption even in battery-operated systems. The graph in Figure 40 demonstrates the power consumption from a 3.4 V, 450 mAh Li-Ion cell phone battery connected to the AD5162. The measurement over time shows that the device draws approximately 1.3  $\mu\text{A}$  and consumes negligible power. Over a course of 30 days, the battery is depleted by less than 2%, the majority of which is due to the intrinsic leakage current of the battery itself.

This demonstrates that constantly biasing the potentiometer can be a practical approach. Most portable devices do not require the removal of batteries for the purpose of charging. Although the resistance setting of the AD5162 is lost when the battery needs replacement, such events occur rather infrequently such that this inconvenience is justified by the lower cost and smaller size offered by the AD5162. If total power is lost, the user should be provided with a means to adjust the setting accordingly.

## EVALUATION BOARD

An evaluation board, along with all necessary software, is available to program the AD5162 from any PC running Windows® 98/2000/XP. The graphical user interface, as shown in Figure 41, is straightforward and easy to use. More detailed information is available in the user manual, which is supplied with the board.

Figure 41. AD5162 Evaluation Board Software

The AD5162 starts at midscale upon power-up. To increment or decrement the resistance, simply move the scrollbars in the left of the software window (see Figure 41). To write a specific value, use the bit pattern in the upper part of the **SDI Write Bit Control (Hit Run)** box and then click **Run**. The format of writing data to the device is shown in Table 8.

## SPI INTERFACE

### SPI-COMPATIBLE, 3-WIRE SERIAL BUS

The AD5162 contains a 3-wire, SPI-compatible digital interface (SDI,  $\overline{CS}$ , and CLK). The 9-bit serial word must be loaded MSB first. The format of the word is shown in Table 8.

The positive-edge sensitive CLK input requires clean transitions to avoid clocking incorrect data into the serial input register. Standard logic families work well. If mechanical switches are used for product evaluation, they should be debounced by a flip-flop or another suitable means. When  $\overline{CS}$  is low, the clock loads data into the serial register on each positive clock edge (see Figure 42).

The data setup and data hold times in Table 3 determine the valid timing requirements. The AD5162 uses a 9-bit serial input data register word that is transferred to the internal RDAC register when the  $\overline{CS}$  line returns to logic high. Extra MSB bits are ignored.

Table 8. Serial Data-Word Format<sup>1</sup>

MSB							LSB	
B8	B7	B6	B5	B4	B3	B2	B1	B0
A0 (2 <sup>8</sup> )	D7 (2 <sup>7</sup> )	D6	D5	D4	D3	D2	D1	D0 (2 <sup>0</sup> )

<sup>1</sup> The values of bits are shown in parentheses.

**NOTES**

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

## JONHON

«**JONHON**» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
