## 1A VOLTAGE REGULATOR (Operating Voltage up to 16V)

---

NO.EA-183-111116

### OUTLINE

The R1190x series are a low supply current voltage regulator with high output voltage accuracy. The maximum operating voltage is 16V and the output current is 1A. Each of these ICs consists of a voltage reference unit, an error amplifier, a resistor-net for voltage setting, as a short current protection, a peak current protection, a thermal shutdown, an inrush current limit and a chip enable circuit. The wide input voltage range (Max. 16V). Additionally, the output voltage is fixed internally, in the range from 2.0V to 12.0V by the 0.1V steps. The supply current of R1190x series is excellent (Typ. 150 $\mu$ A) moreover R1190x series has the standby mode (Typ. 0.1 $\mu$ A) by the chip enable function.

Since the package for these ICs are TO-252-5-P2, SOT-89-5 and HSOP-6J with high power dissipation, high density mounting of the ICs on boards is possible.

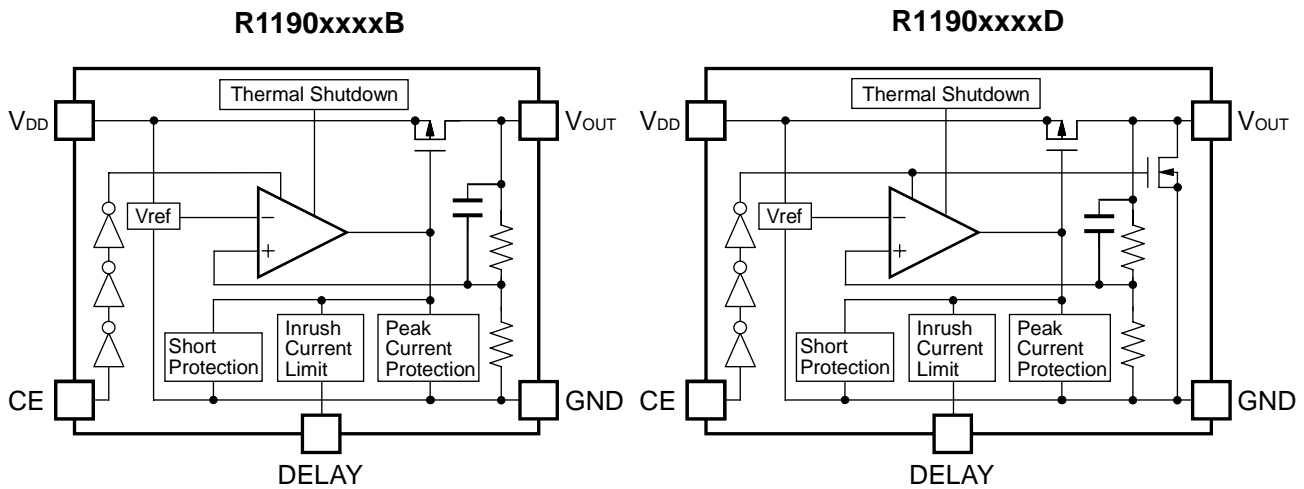

### FEATURES

- Input Voltage Range ..... 3.5V to 16V
- Supply Current ..... Typ. 150 $\mu$ A
- Standby Current ..... Typ. 0.1 $\mu$ A
- Output Voltage Range ..... 2.0V to 12.0V (0.1V steps)  
(For other voltages, please refer to MARK INFORMATION.)
- Output Voltage Accuracy .....  $\pm 1.5\%$
- Temperature-Drift Coefficient of Output Voltage ... Typ.  $\pm 100$ ppm/ $^{\circ}$ C
- Dropout Voltage ..... Typ. 1.1V ( $I_{OUT}=1A$ ,  $V_{OUT}=5V$ )
- Output Current ..... Min. 1A ( $3.3V \leq V_{OUT} \leq 12.0V$ )
- Line Regulation ..... Typ. 0.02%/V
- Packages ..... SOT-89-5, HSOP-6J, TO-252-5-P2
- Built-in Fold Back Protection Circuit ..... Typ. 300mA (Current at short mode)
- Built-in Thermal Shutdown Circuit
- Built-in Inrush Current Limit Circuit ..... The Delay Pin for setting Inrush Current Limit Time

### APPLICATIONS

- Power source for digital home appliances.
- Power source for audio visual equipments.

## SELECTION GUIDE

The output voltage, auto discharge function, package for the ICs can be selected at the user's request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R1190Hxxx*-T1-FE	SOT-89-5	1,000 pcs	Yes	Yes
R1190Sxxx*-E2-FE	HSOP-6J	1,000 pcs	Yes	Yes
R1190Jxxx*-T1-FE	TO-252-5-P2	3,000 pcs	Yes	Yes

xxx : The output voltage can be designated in the range of 2.0V(020) to 12.0V(120) in 0.1V steps.  
(For other voltages, please refer to MARK INFORMATIONS.)

\* : The auto discharge function at off state are options as follows.  
(B) without auto discharge function at off state  
(D) with auto discharge function at off state

### ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field.

The functional operation at or over these absolute maximum ratings is not assured.

### RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

## TYPICAL APPLICATION

(External Components)

$C_1, C_2$ : Ceramic Capacitor 4.7 $\mu$ F Nippon Chemi-con Corporation KTD500B475M43A0T00

## TECHNICAL NOTES

When using these ICs, consider the following points:

### Phase Compensation

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, use a capacitor  $C_{OUT}$  with good frequency characteristics and ESR (Equivalent Series Resistance). (Note: If additional ceramic capacitors are connected with parallel to the output pin with an output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

### PCB Layout

Make  $V_{DD}$  and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect a capacitor with a capacitance value as much as 4.7 $\mu$ F or more between  $V_{DD}$  and GND pin, and as close as possible to the pins.

Set external components, especially the output capacitor, as close as possible to the ICs, and make wiring as short as possible. (Refer to the TYPICAL APPLICATION diagram above.)

### Thermal Shutdown

There is the built-in thermal-shutdown function in R1190x series. It discontinues operation of the IC when the junction temperature becomes over 150°C (Typ.) and IC re-operates when the junction temperature under 130°C. If the temperature increasing keeps the IC repeats ON and OFF operating. The output becomes the pulse condition.

### Chip Enable Circuit

For the output voltage stability, please do not use the intermediate electric potential (the voltage value between  $V_{CEH}$  and  $V_{CEL}$ ) that causes the supply current increasing and the unstable of output voltage.

### **Inrush-Current Limit Function**

R1190x Series has the function to limit the inrush-current, it limited approximately 0.3A when the voltage regulator is turn ON. It is also possible to set time of the rush-current limitation by connecting capacitor with DELAY pin. The rush-current time ( $t_D$ ) and the value of capacitor ( $C_D$ (F)) is calculatable by the following formula;

$$t_D=(0.000198+(3.79\times 10^7\times C_D))\times V_{IN}$$

The inrush-current is limited even if the capacitor is not connected with the DELAY pin. In this case, the time is calculated as  $C_D=0$  by the formula above.

Though, if the value of time is insufficient for controlling the inrush-current, please connect the capacitor with DELAY pin. The DELAY pin is used as OPEN when the capacitor is not used. Please use the DELAY pin as OPEN when the capacitor is not used.

### **Auto-Discharge Function**

R1190xxxxD series has the auto-discharge function. When "L" signal is put into the Chip-enable pin (CE), the switch between  $V_{OUT}$  and GND is turned ON and the charge at capacitor is discharge rapidly by the auto-discharge function.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
