

# 16-Bit Digital Signal Controllers (up to 32-Kbyte Flash and 2-Kbyte SRAM)

#### **Operating Conditions**

3.0V to 3.6V, -40°C to +125°C, DC to 16 MIPS

#### Core: 16-bit dsPIC33F CPU

- · Code-Efficient (C and Assembly) Architecture
- · Two 40-Bit Wide Accumulators
- · Single-Cycle (MAC/MPY) with Dual Data Fetch
- · Single-Cycle Mixed-Sign MUL plus Hardware Divide
- · 32-Bit Multiply Support

#### **Clock Management**

- ±0.25% Internal Oscillator
- · Programmable PLLs and Oscillator Clock Sources
- · Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timer (WDT)
- · Fast Wake-up and Start-up

#### **Power Management**

- Low-Power Management modes (Sleep, Idle, Doze)
- · Integrated Power-on Reset and Brown-out Reset
- 1 mA/MHz Dynamic Current (typical)
- 30 µA IPD Current (typical)

#### **PWM**

- · Up to Three PWM Pairs
- · Two Dead-Time Generators
- 31.25 ns PWM Resolution
- · PWM Support for:
  - Inverters, PFC, UPS
  - BLDC, PMSM, ACIM, SRM
- · Class B-Compliant Fault Inputs
- · Possibility of ADC Synchronization with PWM Signal

#### **Advanced Analog Features**

- · ADC module:
  - 10-bit, 1.1 Msps with four S&H
  - Four analog inputs on 18-pin devices and up to 14 analog inputs on 44-pin devices
- · Flexible and Independent ADC Trigger Sources
- · Three Comparator modules
- · Charge Time Measurement Unit (CTMU):
  - Supports mTouch™ capacitive touch sensing
  - Provides high-resolution time measurement (1 ns)
  - On-chip temperature measurement

#### **Timers/Output Compare/Input Capture**

- · Up to Five General Purpose Timers:
  - One 16-bit and up to two 32-bit timers/counters
- · Two Output Compare modules
- · Three Input Capture modules
- · Peripheral Pin Select (PPS) to allow Function Remap

#### **Communication Interfaces**

- · UART module (4 Mbps)
  - With support for LIN/J2602 Protocols and IrDA®
- 4-Wire SPI module (8 MHz maximum speed)
  - Remappable Pins in 32-Kbyte Flash Devices
- I<sup>2</sup>C<sup>™</sup> module (400 kHz)

#### Input/Output

- Sink/Source 10 mA or 6 mA, Pin-Specific for Standard VOH/VOL, up to 16 mA or 12 mA for Non-Standard VOH1
- 5V Tolerant Pins
- Up to 20 Selectable Open-Drain and Pull-ups
- Three External Interrupts (two are remappable)

#### **Qualification and Class B Support**

- AEC-Q100 REVG (Grade 1 -40°C to +125°C) Planned
- · Class B Safety Library, IEC 60730, UDE Certified

#### **Debugger Development Support**

- · In-Circuit and In-Application Programming
- · Up to Three Complex Data Breakpoints
- Trace and Run-Time Watch

#### dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104 PRODUCT FAMILIES

The device names, pin counts, memory sizes, and peripheral availability of each device are listed in Table 1. The following pages show their pinout diagrams.

TABLE 1: dsPIC33FJ16(GP/MC)101/102 DEVICE FEATURES

		/te)	rte)	rte)			appa	ble l	Perip	herals	;	Σ		၁၀						
Device	Pins	Program Flash (Kbyte)	RAM (Kbytes)	Remappable Pins	16-bit Timer <sup>(1,2)</sup>	Input Capture	Output Compare	UART	External Interrupts <sup>(3)</sup>	SPI	Motor Control PWM	PWM Faults	10-Bit, 1.1 Msps ADC	RTCC	I <sup>2</sup> C™	Comparators	СТМU	I/O Pins	Packages	
dsPIC33FJ16GP101	18	16	1	8	3	3	2	1	3	1	_	-	1 ADC, 4-ch	Υ	1	3	Υ	13	PDIP, SOIC	
	20	16	1	8	3	3	2	1	3	1	_	_	1 ADC, 4-ch	Υ	1	3	Υ	15	SSOP	
dsPIC33FJ16GP102	28	16	1	16	3	3	2	1	3	1	_	_	1 ADC, 6-ch	Y	1	3	Y	21	SPDIP, SOIC, SSOP, QFN	
	36	16	1	16	3	3	2	1	3	1	_	ı	1 ADC, 6-ch	Υ	1	3	Υ	21	VTLA	
dsPIC33FJ16MC101	20	16	1	10	3	3	2	1	3	1	6-ch	1	1 ADC, 4-ch	Υ	1	3	Y	15	PDIP, SOIC, SSOP	
dsPIC33FJ16MC102	28	16	1	16	3	3	2	1	3	1	6-ch	2	1 ADC, 6-ch	Y	1	3	Υ	21	SPDIP, SOIC, SSOP, QFN	
	36	16	1	16	3	3	2	1	3	1	6-ch	2	1 ADC, 6-ch	Y	1	3	Y	21	VTLA	

Note 1: Two out of three timers are remappable.

2: One pair can be combined to create one 32-bit timer.

**3:** Two out of three interrupts are remappable.

TABLE 2: dsPIC33FJ32(GP/MC)101/102/104 DEVICE FEATURES

		6		Remappable Peripherals

#### TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com** or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

#### **Most Current Data Sheet**

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

#### http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

#### **Errata**

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- · Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

#### **Customer Notification System**

Register on our web site at www.microchip.com to receive the most current information on all of our products.

#### **Referenced Sources**

This device data sheet is based on the following individual chapters of the "dsPIC33F/PIC24H Family Reference Manual". These documents should be considered as the primary reference for the operation of a particular module or device feature.

Note 1: To access the documents listed below, browse to the documentation section of the dsPIC33FJ16MC102 product page of the Microchip Web site (www.microchip.com).

In addition to parameters, features, and other documentation, the resulting page provides links to the related family reference manual sections.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104
NOTES:

#### 1.0 DEVICE OVERVIEW

Note:

This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the latest family reference sections of the "dsPIC33F/PIC24H Family Reference Manual", which are available from the Microchip web site (www.microchip.com).

This data sheet contains device-specific information for dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 Digital Signal Controller (DSC) Devices. These devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance, 16-bit microcontroller (MCU) architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules in the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family of devices. Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

FIGURE 1-1: dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104 BLOCK DIAGRAM

TABLE 1-1: PINOUT I/O DESCRIPTIONS

Pin Name	Pin Type	Buffer Type	PPS	Description
AN0-AN12, AN15 <sup>(5)</sup>	I	Analog	No	Analog input channels.
CLKO	- 0	ST/CMOS —	No No	External clock source input. Always associated with OSC1 pin function. Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function.
OSC1 OSC2	I I/O	ST/CMOS	No No	Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise. Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes.
SOSCI SOSCO	- 0	ST/CMOS	No No	32.768 kHz low-power oscillator crystal input; CMOS otherwise. 32.768 kHz low-power oscillator crystal output.
CN0-CN30 <sup>(5)</sup>	I	ST	No	Change Notification inputs. Can be software programmed for internal weak pull-ups on all inputs.
IC1-IC3	ı	ST	Yes	Capture Inputs 1/2/3.
OCFA OC1-OC2	I О	ST —	Yes Yes	Compare Fault A input (for Compare Channels 1 and 2). Compare Outputs 1 through 2.
INTO INT1 INT2	         	ST ST ST	No Yes Yes	External Interrupt 0. External Interrupt 1. External Interrupt 2.
RA0-RA4, RA7-RA10 <sup>(5)</sup>		ST	No	PORTA is a bidirectional I/O port.
RB0-RB15 <sup>(5)</sup>	I/O	ST	No	PORTB is a bidirectional I/O port.
RC0-RC9 <sup>(5)</sup>	I/O	ST	No	PORTC is a bidirectional I/O port.
T1CK T2CK T3CK T4CK <sup>(6)</sup> T5CK <sup>(6)</sup>		ST ST ST ST ST	No Yes Yes Yes Yes	Timer1 external clock input. Timer2 external clock input. Timer3 external clock input. Timer4 external clock input. Timer5 external clock input.
U1CTS U1RTS U1RX U1TX	   0   0	ST — ST —	Yes Yes Yes Yes	UART1 Clear-to-Send. UART1 Ready-to-Send. UART1 receive. UART1 transmit.
SCK1 SDI1 SDO1	I/O I O	ST ST —	Yes Yes Yes	Synchronous serial clock input/output for SPI1. SPI1 data in. SPI1 data out.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power ST = Schmitt Trigger input with CMOS levels O = Output I = Input PPS = Peripheral Pin Select

- Note 1: An external pull-down resistor is required for the FLTA1 pin on dsPIC33FJXXMC101 (20-pin) devices.
  - 2: The FLTA1 pin and the PWM1Lx/PWM1Hx pins are available in dsPIC(16/32)MC10X devices only.
  - 3: The FLTB1 pin is available in dsPIC(16/32)MC102/104 devices only.
  - 4: The PWM Fault pins are enabled during any Reset event. Refer to Section 15.2 "PWM Faults" for more information on the PWM Faults.
  - 5: Not all pins are available on all devices. Refer to the specific device in the "Pin Diagrams" section for availability.
  - 6: This pin is available in dsPIC33FJ32(GP/MC)104 (44-pin) devices only.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
SCL1	I/O	ST	No	Synchronous serial clock input/output for I2C1.
SDA1	I/O	ST	No	Synchronous serial data input/output for I2C1.
ASCL1	I/O	ST	No	Alternate synchronous serial clock input/output for I2C1.
ASDA1	I/O	ST	No	Alternate synchronous serial data input/output for I2C1.
FLTA1 <sup>(1,2,4)</sup>	- 1	ST	No	PWM1 Fault A input.
FLTB1 <sup>(3,4)</sup>	- 1	ST	No	PWM1 Fault B input.
PWM1L1	0	_	No	PWM1 Low Output 1
PWM1H1	0	_	No	PWM1 High Output 1
PWM1L2	0	_	No	PWM1 Low Output 2
PWM1H2	0	_	No	PWM1 High Output 2
PWM1L3	0	_	No	PWM1 Low Output 3
PWM1H3	0	_	No	PWM1 High Output 3
RTCC	0	Digital	No	RTCC Alarm output.
CTPLS	0	Digital	Yes	CTMU pulse output.
CTED1	I	Digital	No	CTMU External Edge Input 1.
CTED2	- 1	Digital	No	CTMU External Edge Input 2.
CVREFIN	- 1	Analog	No	Comparator Voltage Positive Reference Input.
CVREFOUT	0	Analog	No	Comparator Voltage Positive Reference Output.
C1INA	I	Analog	No	Comparator 1 Positive Input A.
C1INB	I	Analog	No	Comparator 1 Negative Input B.
C1INC	I	Analog	No	Comparator 1 Negative Input C.
C1IND	I	Analog	No	Comparator 1 Negative Input D.
C1OUT	0	Digital	Yes	Comparator 1 Output.
C2INA	I	Analog	No	Comparator 2 Positive Input A.
C2INB	I	Analog	No	Comparator 2 Negative Input B.
C2INC	I	Analog	No	Comparator 2 Negative Input C.
C2IND	I	Analog	No	Comparator 2 Negative Input D.
C2OUT	0	Digital	Yes	Comparator 2 Output.
C3INA	I	Analog	No	Comparator 3 Positive Input A.
C3INB	- 1	Analog	No	Comparator 3 Negative Input B.
C3INC	I	Analog	No	Comparator 3 Negative Input C.
C3IND	I	Analog	No	Comparator 3 Negative Input D.
C3OUT	0	Digital	Yes	Comparator 3 Output.
PGED1	I/O	ST	No	Data I/O pin for Programming/Debugging Communication Channel 1.
PGEC1	I	ST	No	Clock input pin for Programming/Debugging Communication Channel 1.
PGED2	I/O	ST	No	Data I/O pin for Programming/Debugging Communication Channel 2.
PGEC2	I	ST	No	Clock input pin for Programming/Debugging Communication Channel 2.
PGED3	I/O	ST	No	Data I/O pin for Programming/Debugging Communication Channel 3.
PGEC3	I	ST	No	Clock input pin for Programming/Debugging Communication Channel 3.
MCLR	I/P	ST	No	Master Clear (Reset) input. This pin is an active-low Reset to the device.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power ST = Schmitt Trigger input with CMOS levels O = Output I = Input PPS = Peripheral Pin Select

- Note 1: An external pull-down resistor is required for the FLTA1 pin on dsPIC33FJXXMC101 (20-pin) devices.
  - 2: The FLTA1 pin and the PWM1Lx/PWM1Hx pins are available in dsPIC(16/32)MC10X devices only.
  - 3: The FLTB1 pin is available in dsPIC(16/32)MC102/104 devices only.
  - 4: The PWM Fault pins are enabled during any Reset event. Refer to Section 15.2 "PWM Faults" for more information on the PWM Faults.
  - 5: Not all pins are available on all devices. Refer to the specific device in the "Pin Diagrams" section for availability.
  - 6: This pin is available in dsPIC33FJ32(GP/MC)104 (44-pin) devices only.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
AVDD	P	P	No	Positive supply for analog modules. This pin must be connected at all times. AVDD is connected to VDD in the 18-pin dsPIC33FJXXGP101 and 20-pin dsPIC33FJXXMC101 devices. In all other devices, AVDD is separated from VDD.
AVss	Р	Р	No	Ground reference for analog modules. AVss is connected to Vss in the 18-pin dsPIC33FJXXGP101 and 20-pin dsPIC33FJXXMC101 devices. In all other devices, AVss is separated from Vss.
VDD	Р	_	No	Positive supply for peripheral logic and I/O pins.
VCAP	Р	_	No	CPU logic filter capacitor connection.
Vss	Р	_	No	Ground reference for logic and I/O pins.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power ST = Schmitt Trigger input with CMOS levels O = Output I = Input PPS = Peripheral Pin Select

- Note 1: An external pull-down resistor is required for the FLTA1 pin on dsPIC33FJXXMC101 (20-pin) devices.
  - 2: The FLTA1 pin and the PWM1Lx/PWM1Hx pins are available in dsPIC(16/32)MC10X devices only.
  - 3: The FLTB1 pin is available in dsPIC(16/32)MC102/104 devices only.
  - 4: The PWM Fault pins are enabled during any Reset event. Refer to Section 15.2 "PWM Faults" for more information on the PWM Faults.
  - 5: Not all pins are available on all devices. Refer to the specific device in the "Pin Diagrams" section for availability.
  - 6: This pin is available in dsPIC33FJ32(GP/MC)104 (44-pin) devices only.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104	
NOTES:	

# 2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS

Note 1: This data sheet summarizes the features of the dsPlC33FJ16(GP/MC)101/102 and dsPlC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPlC33F/PlC24H Family Reference Manual". Please see the Microchip web site (www.microchip.com) for the latest "dsPlC33F/PlC24H Family Reference Manual" sections.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

#### 2.1 Basic Connection Requirements

Getting started with the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family of 16-bit Digital Signal Controllers (DSCs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and Vss pins (see Section 2.2 "Decoupling Capacitors")
- All AVDD and AVss pins, if present on the device (regardless if ADC module is not used) (see Section 2.2 "Decoupling Capacitors")
- VCAP (see Section 2.3 "CPU Logic Filter Capacitor Connection (VCAP)")
- MCLR pin (see Section 2.4 "Master Clear (MCLR) Pin")
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see Section 2.5 "ICSP Pins")
- OSC1 and OSC2 pins when external oscillator source is used (see Section 2.6 "External Oscillator Pins")

#### 2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD, and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- Value and type of capacitor: Recommendation of 0.1 µF (100 nF), 10V-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended that ceramic capacitors be used.
- Placement on the printed circuit board: The
  decoupling capacitors should be placed as close
  to the pins as possible. It is recommended to
  place the capacitors on the same side of the
  board as the device. If space is constricted, the
  capacitor can be placed on another layer on the
  PCB using a via; however, ensure that the trace
  length from the pin to the capacitor is within
  one-quarter inch (6 mm) in length.
- Handling high-frequency noise: If the board is experiencing high-frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μF in parallel with 0.001 μF.
- Maximizing performance: On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

## FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION

Note 1: As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between VDD and AVDD to improve ADC noise rejection. The inductor impedance should be less than  $1\Omega$  and the inductor capacity greater than 10 mA.

Where:

$$f = \frac{FCNV}{2} \qquad \text{(i.e., ADC conversion rate/2)}$$
 
$$f = \frac{1}{(2\pi\sqrt{LC})}$$
 
$$L = \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

#### 2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7  $\mu F$  to 47  $\mu F$ .

## 2.3 CPU Logic Filter Capacitor Connection (VCAP)

A low-ESR (< 5 Ohms) capacitor is required on the VCAP pin, which is used to stabilize the voltage regulator output voltage. The VCAP pin must not be connected to VDD, and must have a capacitor between 4.7  $\mu$ F and 10  $\mu$ F, 16V connected to ground. The type can be ceramic or tantalum. Refer to **Section 26.0** "Electrical Characteristics" for additional information.

The placement of this capacitor should be close to the VCAP. It is recommended that the trace length not exceed one-quarter inch (6 mm). Refer to Section 23.2 "On-Chip Voltage Regulator" for details.

#### 2.4 Master Clear (MCLR) Pin

The  $\overline{\text{MCLR}}$  pin provides two specific device functions:

- · Device Reset
- · Device programming and debugging

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the  $\overline{\text{MCLR}}$  pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in Figure 2-2, it is recommended that the capacitor C, be isolated from the MCLR pin during programming and debugging operations.

Place the components shown in Figure 2-2 within one-quarter inch (6 mm) from the MCLR pin.

## FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS

- Note 1:  $R \le 10 \text{ k}\Omega$  is recommended. A suggested starting value is  $10 \text{ k}\Omega$ . Ensure that the MCLR pin VIH and VIL specifications are met.
  - 2:  $\underline{R1} \leq 470\Omega$  will limit any current flowing into  $\underline{MCLR}$  from the external capacitor C, in the event of  $\underline{MCLR}$  pin breakdown, due to Electrostatic Discharge (ESD) or  $\underline{Electrical}$  Overstress (EOS). Ensure that the  $\underline{MCLR}$  pin VIH and VIL specifications are met.

#### 2.5 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes, and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternately, refer to the AC/DC characteristics and timing requirements information in the "dsPIC33F Flash Programming Specification for Devices with Volatile Configuration Bits" (DS70659) for information on capacitive loading limits and pin Input Voltage High (VIH) and Input Voltage Low (VIL) requirements.

Ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 3 or MPLAB REAL ICE $^{\text{TM}}$ .

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip web site.

- "Using MPLAB® ICD 3" (poster) (DS51765)
- "MPLAB<sup>®</sup> ICD 3 Design Advisory" (DS51764)
- "MPLAB<sup>®</sup> REAL ICE™ In-Circuit Debugger User's Guide" (DS51616)
- "Using MPLAB® REAL ICE™" (poster) (DS51749)

#### 2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 8.0 "Oscillator Configuration"** for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in Figure 2-3.

FIGURE 2-3: SUGGESTED PLACEMENT
OF THE OSCILLATOR
CIRCUIT

## 2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to 4 MHz < FIN < 8 MHz (for MSPLL mode) or 3 MHz < FIN < 8 MHz (for ECPLL mode) to comply with device PLL start-up conditions. HSPLL mode is not supported. This means that if the external oscillator frequency is outside this range, the application must start-up in the FRC mode first. The fixed PLL settings of 4x after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can enable the PLL, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

## 2.8 Configuration of Analog and Digital Pins During ICSP Operations

If MPLAB ICD 3 or MPLAB REAL ICE in-circuit emulator is selected as a debugger, it automatically initializes all of the Analog-to-Digital input pins (ANx) as "digital" pins, by setting all bits in the AD1PCFGL register.

The bits in the register that correspond to the Analog-to-Digital pins that are initialized by MPLAB ICD 3 or MPLAB REAL ICE in-circuit emulator, must not be cleared by the user application firmware; otherwise, communication errors will result between the debugger and the device.

If your application needs to use certain Analog-to-Digital pins as analog input pins during the debug session, the user application must clear the corresponding bits in the AD1PCFGL register during initialization of the ADC module.

When MPLAB ICD 3 or MPLAB REAL ICE in-circuit emulator is used as a programmer, the user application firmware must correctly configure the AD1PCFGL register. Automatic initialization of this register is only done during debugger operation. Failure to correctly configure the register(s) will result in all Analog-to-Digital pins being recognized as analog input pins, resulting in the port value being read as a logic '0', which may affect user application functionality.

#### 2.9 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic-low state.

Alternately, connect a 1k to 10k resistor between Vss and unused pins.

### 3.0 CPU

Note 1: This data sheet summarizes the features of the dsPlC33FJ16(GP/MC)101/102 and dsPlC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 2. "CPU" (DS70204) in the "dsPlC33F/PlC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

dsPIC33FJ16(GP/MC)101/102 dsPIC33FJ32(GP/MC)101/102/104 CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for DSP. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies by device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction and the table instructions. Overhead-free program loop constructs are supported using the DO and REPEAT instructions, both of which are interruptible at any point.

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can serve as a data, address, or address offset register. The 16th working register (W15) operates as a software Stack Pointer (SP) for interrupts and calls.

There are two classes of instruction in the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices: MCU and DSP. These two instruction classes are seamlessly integrated into a single CPU. The instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices are capable of executing a data (or program data) memory read, a working register (data) read, a data memory write, and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing A + B = C operations to be executed in a single cycle.

A block diagram of the CPU is shown in Figure 3-1, and the programmer's model for the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 is shown in Figure 3-2.

### 3.1 Data Addressing Overview

The data space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

Overhead-free circular buffers (Modulo Addressing mode) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU circular addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program-to-data-space mapping feature lets any instruction access program space as if it were data space.

### 3.2 DSP Engine Overview

The DSP engine features a high-speed 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators, and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value up to 16 bits right or left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The MAC instruction and other associated instructions can concurrently fetch two data operands from memory, while multiplying two W registers and accumulating and optionally saturating the result in the same cycle. This instruction functionality requires that the RAM data space be split for these instructions and linear for all others. Data space partitioning is achieved in a transparent and flexible manner through dedicating certain working registers to each address space.

## 3.3 Special MCU Features

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 features a 17-bit by 17-bit single-cycle multiplier that is shared by both the MCU ALU and DSP engine. The multiplier can perform signed, unsigned and mixed-sign multiplication. Using a 17-bit by 17-bit multiplier for 16-bit by 16-bit multiplication not only allows you to perform mixed-sign multiplication, it also achieves accurate results for special operations, such as (-1.0) x (-1.0).

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 supports 16/16 and 32/16 divide operations, both fractional and integer. All divide instructions are iterative operations. They must be executed within a REPEAT loop, resulting in a total execution time of 19 instruction cycles. The divide operation can be interrupted during any of those 19 cycles without loss of data.

A 40-bit barrel shifter is used to perform up to a 16-bit left or right shift in a single cycle. The barrel shifter can be used by both MCU and DSP instructions.

## 3.4 CPU Control Registers

### **REGISTER 3-1:** SR: CPU STATUS REGISTER

R-0	R-0	R/C-0	R/C-0	R-0	R/C-0	R-0	R/W-0
OA	ОВ	OB SA <sup>(1)</sup>		OAB	SAB	DA	DC
bit 15							bit 8

R/W-0 <sup>(3)</sup>	R/W-0 <sup>(3)</sup>	R/W-0 <sup>(3)</sup>	R-0	R/W-0	R/W-0	R/W-0	R/W-0
	IPL<2:0> <sup>(2)</sup>		RA	N	OV	Z	С
bit 7							bit 0

Legend:	C = Clearable bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read	d as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 OA: Accumulator A Overflow Status bit

1 = Accumulator A overflowed

0 = Accumulator A has not overflowed

bit 14 **OB:** Accumulator B Overflow Status bit

1 = Accumulator B overflowed

0 = Accumulator B has not overflowed

bit 13 SA: Accumulator A Saturation 'Sticky' Status bit (1)

1 = Accumulator A is saturated or has been saturated at some time

0 = Accumulator A is not saturated

bit 12 SB: Accumulator B Saturation 'Sticky' Status bit (1)

1 = Accumulator B is saturated or has been saturated at some time

0 = Accumulator B is not saturated

bit 11 OAB: OA || OB Combined Accumulator Overflow Status bit

1 = Accumulators A or B have overflowed

0 = Neither Accumulators A or B have overflowed

bit 10 SAB: SA || SB Combined Accumulator 'Sticky' Status bit

1 = Accumulators A or B are saturated or have been saturated at some time in the past

0 = Neither Accumulator A or B are saturated

This bit may be read or cleared (not set). Clearing this bit will clear SA and SB.

bit 9 DA: DO Loop Active bit

1 = DO loop in progress

0 = DO loop not in progress

bit 8 **DC:** MCU ALU Half Carry/Borrow bit

1 = A carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred

0 = No carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred

**Note 1:** This bit can be read or cleared (not set).

2: The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.

3: The IPL<2:0> Status bits are read-only when NSTDIS = 1 (INTCON1<15>).

### REGISTER 3-1: SR: CPU STATUS REGISTER (CONTINUED)

1 = Accumulator B saturation is enabled

0 = Accumulator B saturation is disabled

bit 5 SATDW: Data Space Write from DSP Engine Saturation Enable bit

1 = Data space write saturation is enabled

0 = Data space write saturation is disabled

bit 4 ACCSAT: Accumulator Saturation Mode Select bit

1 = 9.31 saturation (super saturation)

0 = 1.31 saturation (normal saturation)

bit 3 **IPL3:** CPU Interrupt Priority Level Status bit 3<sup>(2)</sup>

1 = CPU Interrupt Priority Level is greater than 70 = CPU Interrupt Priority Level is 7 or less

bit 2 PSV: Program Space Visibility in Data Space Enable bit

1 = Program space is visible in data space

0 = Program space is not visible in data space

bit 1 RND: Rounding Mode Select bit

1 = Biased (conventional) rounding is enabled

0 = Unbiased (convergent) rounding is enabled

bit 0 IF: Integer or Fractional Multiplier Mode Select bit

1 = Integer mode is enabled for DSP multiply ops

0 = Fractional mode is enabled for DSP multiply ops

**Note 1:** This bit will always read as '0'.

2: The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU Interrupt Priority Level.

### 3.5 Arithmetic Logic Unit (ALU)

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 ALU is 16 bits wide and is capable of addition, subtraction, bit shifts, and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV), and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the "16-Bit MCU and DSC Programmer's Reference Manual" (DS70157) for information on the SR bits affected by each instruction.

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit-divisor division.

## 3.5.1 MULTIPLIER

Using the high-speed 17-bit x 17-bit multiplier of the DSP engine, the ALU supports unsigned, signed or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- · 16-bit unsigned x 16-bit signed
- · 8-bit unsigned x 8-bit unsigned

### 3.5.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- · 32-bit signed/16-bit signed divide
- · 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. The 16-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend.

The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

### 3.6 DSP Engine

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a barrel shifter and a 40-bit adder/subtracter (with two target accumulators, round and saturation logic).

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 is a single-cycle instruction flow architecture; therefore, concurrent operation of the DSP engine with MCU instruction flow is not possible. However, some MCU ALU and DSP engine resources can be used concurrently by the same instruction (e.g., ED, EDAC).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are ADD, SUB, and NEG.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- · Fractional or Integer DSP Multiply (IF)
- · Signed or Unsigned DSP Multiply (US)
- Conventional or Convergent Rounding (RND)
- Automatic Saturation On/Off for ACCA (SATA)
- Automatic Saturation On/Off for ACCB (SATB)
- Automatic Saturation On/Off for Writes to Data Memory (SATDW)
- Accumulator Saturation mode Selection (ACCSAT)

A block diagram of the DSP engine is shown in Figure 3-3.

TABLE 3-1: DSP INSTRUCTIONS SUMMARY

Instruction	Algebraic Operation	ACC Write Back
CLR	A = 0	Yes
ED	$A = (x - y)^2$	No
EDAC	$A = A + (x - y)^2$	No
MAC	A = A + (x * y)	Yes
MAC	$A = A + x^2$	No
MOVSAC	No change in $A$	Yes
MPY	A = x * y	No
MPY	$A = x^2$	No
MPY.N	A = -x * y	No
MSC	A = A - x * y	Yes

### 3.6.1 MULTIPLIER

The 17-bit x 17-bit multiplier is capable of signed or unsigned operation and can multiplex its output using a scaler to support either 1.31 fractional (Q31) or 32-bit integer results. Unsigned operands are zero-extended into the 17th bit of the multiplier input value. Signed operands are sign-extended into the 17th bit of the multiplier input value. The output of the 17-bit x 17-bit multiplier/scaler is a 33-bit value that is sign-extended to 40 bits. Integer data is inherently represented as a signed 2's complement value, where the Most Significant bit (MSb) is defined as a sign bit. The range of an N-bit 2's complement integer is  $-2^{N-1}$  to  $2^{N-1}-1$ .

- For a 16-bit integer, the data range is -32768 (0x8000) to 32767 (0x7FFF) including 0.
- For a 32-bit integer, the data range is
   -2,147,483,648 (0x8000 0000) to 2,147,483,647 (0x7FFF FFFF).

When the multiplier is configured for fractional multiplication, the data is represented as a 2's complement fraction, where the MSb is defined as a sign bit and the radix point is implied to lie just after the sign bit (QX format). The range of an N-bit 2's complement fraction with this implied radix point is -1.0 to  $(1-2^{1-N})$ . For a 16-bit fraction, the Q15 data range is -1.0 (0x8000) to 0.999969482 (0x7FFF) including 0 and has a precision of 3.01518x10<sup>-5</sup>. In Fractional mode, the 16 x 16 multiply operation generates a 1.31 product that has a precision of 4.65661 x  $10^{-10}$ .

The same multiplier is used to support the MCU multiply instructions, which include integer 16-bit signed, unsigned and mixed sign multiply operations.

The MUL instruction can be directed to use byte or word-sized operands. Byte operands will direct a 16-bit result, and word operands will direct a 32-bit result to the specified register(s) in the W array.

# 3.6.2 DATA ACCUMULATORS AND ADDER/SUBTRACTER

The data accumulator consists of a 40-bit adder/subtracter with automatic sign extension logic. It can select one of two accumulators (A or B) as its preaccumulation source and post-accumulation destination. For the  ${\tt ADD}$  and  ${\tt LAC}$  instructions, the data to be accumulated or loaded can be optionally scaled using the barrel shifter prior to accumulation.

# 3.6.2.1 Adder/Subtracter, Overflow and Saturation

The adder/subtracter is a 40-bit adder with an optional zero input into one side, and either true or complement data into the other input.

- In the case of addition, the Carry/Borrow input is active-high and the other input is true data (not complemented).
- In the case of subtraction, the Carry/Borrow input is active-low and the other input is complemented.

The adder/subtracter generates Overflow Status bits, SA/SB and OA/OB, which are latched and reflected in the STATUS register:

- Overflow from bit 39: this is a catastrophic overflow in which the sign of the accumulator is destroyed.
- Overflow into guard bits 32 through 39: this is a recoverable overflow. This bit is set whenever all the guard bits are not identical to each other.

The adder has an additional saturation block that controls accumulator data saturation, if selected. It uses the result of the adder, the Overflow Status bits described previously, and the SAT<A:B> (CORCON<7:6>) and ACCSAT (CORCON<4>) mode control bits to determine when and to what value, to saturate.

Six STATUS register bits support saturation and overflow:

- · OA: ACCA overflowed into guard bits
- · OB: ACCB overflowed into guard bits
- SA: ACCA saturated (bit 31 overflow and saturation)

or

ACCA overflowed into guard bits and saturated (bit 39 overflow and saturation)

• SB: ACCB saturated (bit 31 overflow and saturation)

or

ACCB overflowed into guard bits and saturated (bit 39 overflow and saturation)

- · OAB: Logical OR of OA and OB
- SAB: Logical OR of SA and SB

The OA and OB bits are modified each time data passes through the adder/subtracter. When set, they indicate that the most recent operation has overflowed into the accumulator guard bits (bits 32 through 39). The OA and OB bits can also optionally generate an arithmetic warning trap when OA and OB are set and the corresponding Overflow Trap Flag Enable bits (OVATE, OVBTE) in the INTCON1 register are set (refer to Section 7.0 "Interrupt Controller"). This allows the user application to take immediate action; for example, to correct system gain.

The SA and SB bits are modified each time data passes through the adder/subtracter, but can only be cleared by the user application. When set, they indicate that the accumulator has overflowed its maximum range (bit 31 for 32-bit saturation or bit 39 for 40-bit saturation) and will be saturated (if saturation is enabled). When saturation is not enabled, SA and SB default to bit 39 overflow, and therefore, indicate that a catastrophic overflow has occurred. If the COVTE bit in the INTCON1 register is set, the SA and SB bits will generate an arithmetic warning trap when saturation is disabled.

The Overflow and Saturation Status bits can optionally be viewed in the STATUS Register (SR) as the logical OR of OA and OB (in bit OAB) and the logical OR of SA and SB (in bit SAB). Programmers can check one bit in the STATUS register to determine whether either accumulator has overflowed, or one bit to determine whether either accumulator has saturated. This is useful for complex number arithmetic, which typically uses both accumulators.

The device supports three Saturation and Overflow modes:

- Bit 39 Overflow and Saturation:
   When bit 39 overflow and saturation occurs, the
   saturation logic loads the maximally positive 9.31
   value (0x7FFFFFFFFF) or maximally negative 9.31
   value (0x8000000000) into the target accumulator.
   The SA or SB bit is set and remains set until
   cleared by the user application. This condition is
   referred to as 'super saturation' and provides protection against erroneous data or unexpected
   algorithm problems (such as gain calculations).
- Bit 31 Overflow and Saturation: When bit 31 overflow and saturation occurs, the saturation logic then loads the maximally positive 1.31 value (0x007FFFFFFFF) or maximally negative 1.31 value (0x0080000000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. When this Saturation mode is in effect, the guard bits are not used, so the OA, OB or OAB bits are never set.
- Bit 39 Catastrophic Overflow:
   The bit 39 Overflow Status bit from the adder is used to set the SA or SB bit, which remains set until cleared by the user application. No saturation operation is performed, and the accumulator is allowed to overflow, destroying its sign. If the COVTE bit in the INTCON1 register is set, a catastrophic overflow can initiate a trap exception.

### 3.6.3 ACCUMULATOR 'WRITE BACK'

The MAC class of instructions (with the exception of MPY, MPY.N, ED, and EDAC) can optionally write a rounded version of the high word (bits 31 through 16) of the accumulator which is not targeted by the instruction into data space memory. The write is performed across the X bus into combined X and Y address space. The following addressing modes are supported:

- W13, Register Direct:
   The rounded contents of the non-target accumulator are written into W13 as a 1.15 fraction.
- [W13] + = 2, Register Indirect with Post-Increment: The rounded contents of the non-target accumulator are written into the address pointed to by W13 as a 1.15 fraction. W13 is then incremented by 2 (for a word write).

### 3.6.3.1 Round Logic

The round logic is a combinational block that performs a conventional (biased) or convergent (unbiased) round function during an accumulator write (store). The Round mode is determined by the state of the RND bit in the CORCON register. It generates a 16-bit, 1.15 data value that is passed to the data space write saturation logic. If rounding is not indicated by the instruction, a truncated 1.15 data value is stored and the least significant word (lsw) is simply discarded.

Conventional rounding will zero-extend bit 15 of the accumulator and will add it to the ACCxH word (bits 16 through 31 of the accumulator).

- If the ACCxL word (bits 0 through 15 of the accumulator) is between 0x8000 and 0xFFFF (0x8000 included), ACCxH is incremented.
- If ACCxL is between 0x0000 and 0x7FFF, ACCxH is left unchanged.

A consequence of this algorithm is that over a succession of random rounding operations, the value tends to be biased slightly positive.

Convergent (or unbiased) rounding operates in the same manner as conventional rounding, except when ACCxL equals 0x8000. In this case, the Least Significant bit (LSb), bit 16 of the accumulator, of ACCxH is examined:

- If it is '1', ACCxH is incremented.
- If it is '0'. ACCxH is not modified.

Assuming that bit 16 is effectively random in nature, this scheme removes any rounding bias that may accumulate.

The SAC and SAC.R instructions store either a truncated (SAC), or rounded (SAC.R) version of the contents of the target accumulator to data memory via the X bus, subject to data saturation (see Section 3.6.3.2 "Data Space Write Saturation"). For the MAC class of instructions, the accumulator write-back operation functions in the same manner, addressing combined MCU (X and Y) data space though the X bus. For this class of instructions, the data is always subject to rounding.

### 3.6.3.2 Data Space Write Saturation

In addition to adder/subtracter saturation, writes to data space can also be saturated, but without affecting the contents of the source accumulator. The data space write saturation logic block accepts a 16-bit, 1.15 fractional value from the round logic block as its input, together with overflow status from the original source (accumulator) and the 16-bit round adder. These inputs are combined and used to select the appropriate 1.15 fractional value as output to write to data space memory.

If the SATDW bit in the CORCON register is set, data (after rounding or truncation) is tested for overflow and adjusted accordingly:

- For input data greater than 0x007FFF, data written to memory is forced to the maximum positive 1.15 value, 0x7FFF.
- For input data less than 0xFF8000, data written to memory is forced to the maximum negative 1.15 value, 0x8000.

The MSb of the source (bit 39) is used to determine the sign of the operand being tested.

If the SATDW bit in the CORCON register is not set, the input data is always passed through unmodified under all conditions.

### 3.6.4 BARREL SHIFTER

The barrel shifter can perform up to 16-bit arithmetic or logic right shifts, or up to 16-bit left shifts, in a single cycle. The source can be either of the two DSP accumulators or the X bus (to support multi-bit shifts of register or memory data).

The shifter requires a signed binary value to determine both the magnitude (number of bits) and direction of the shift operation. A positive value shifts the operand right. A negative value shifts the operand left. A value of '0' does not modify the operand.

The barrel shifter is 40 bits wide, thereby obtaining a 40-bit result for DSP shift operations and a 16-bit result for MCU shift operations. Data from the X bus is presented to the barrel shifter between Bit Positions 16 and 31 for right shifts, and between Bit Positions 0 and 16 for left shifts.

OTES:		

### 4.0 MEMORY ORGANIZATION

Note:

This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 3. "Data Memory"** (DS70202) and **Section 4. "Program Memory"** (DS70203) in the "dsPIC33F/PIC24H Family Reference Manual", which are available from the Microchip web site (www.microchip.com).

The device architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the data space during code execution.

### 4.1 Program Address Space

The program address memory space of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in Section 4.6 "Interfacing Program and Data Memory Spaces".

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

The memory maps for the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family of devices re shown in Figure 4-1 and Figure 4-2.

FIGURE 4-1: PROGRAM MEMORY MAP FOR dsPIC33FJ16(GP/MC)101/102 DEVICES

DS70652E-page 50

# 4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-3).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

### 4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices reserve the addresses between 0x00000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at 0x000000, with the actual address for the start of code at 0x0000002.

dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices also have two Interrupt Vector Tables (IVTs), located from 0x000004 to 0x0000FF and 0x000100 to 0x0001FF. These vector tables allow each of the device interrupt sources to be handled by separate Interrupt Service Routines (ISRs). A more detailed discussion of the Interrupt Vector Tables is provided in Section 7.1 "Interrupt Vector Table".

most significant word (msw) least significant word (lsw) PC Address msw Address (Isw Address) 23 16 8 0 0x000001 0000000 0x000000 0x000003 0x000002 0000000 0000000 0x000005 0x000004 0x000007 0000000 0x000006 **Program Memory** Instruction Width 'Phantom' Byte (read as '0')

FIGURE 4-3: PROGRAM MEMORY ORGANIZATION

### 4.2 Data Address Space

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 CPU has a separate 16-bit-wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps is shown in Figure 4-4.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when EA<15> = 0) is used for implemented memory addresses, while the upper half (EA<15> = 1) is reserved for the Program Space Visibility area (see Section 4.6.3 "Reading Data from Program Memory Using Program Space Visibility").

Microchip dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices implement up to 2 Kbytes of data memory. Should an EA point to a location outside of this area, an all-zero word or byte will be returned.

### 4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

### 4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCU devices and improve data space memory usage efficiency, the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word that contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decoding but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction in progress is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB. The MSB is not modified.

A sign-extend instruction (SE) is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternately, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

### 4.2.3 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0x0000 to 0x07FF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control, and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.

## 4.2.4 NEAR DATA SPACE

The 8-Kbyte area between 0x0000 and 0x1FFF is referred to as the near data space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MOV class of instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode with a working register as an Address Pointer.

FIGURE 4-4: DATA MEMORY MAP FOR dsPIC33FJ16(GP/MC)101/102 DEVICES WITH 1-KBYTE RAM

FIGURE 4-5: DATA MEMORY MAP FOR dsPIC33FJ32(GP/MC)101/102/104 DEVICES WITH 2-KBYTE RAM

### 4.2.5 X AND Y DATA SPACES

The core has two data spaces, X and Y. These data spaces can be considered either separate (for some DSP instructions), or as one unified linear address range (for MCU instructions). The data spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms such as Finite Impulse Response (FIR) filtering and Fast Fourier transform (FFT).

The X data space is used by all instructions and supports all addressing modes. X data space has separate read and write data buses. The X read data bus is the read data path for all instructions that view data space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y data space is used in concert with the X data space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY . N, and MSC) to provide two concurrent data read paths.

Both the X and Y data spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X data space.

All data memory writes, including in DSP instructions, view data space as combined X and Y address space. The boundary between the X and Y data spaces is device-dependent and is not user-programmable.

All Effective Addresses are 16 bits wide and point to bytes within the data space. Therefore, the data space address range is 64 Kbytes, or 32K words, although the implemented memory locations vary by device.

Note 1: This bit is available in dsPIC33FJXXMC10X devices only.

2: This bit is available in dsPIC33FJ32(GP/MC)10X devices only.

#### 4.2.6 SOFTWARE STACK

In addition to its use as a working register, the W15 register in the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices is also used as a software Stack Pointer. The Stack Pointer always points to the first available free word and grows from lower to higher addresses. It pre-decrements for stack pops and post-increments for stack pushes, as shown in Figure 4-6. For a PC push during any CALL instruction, the MSb of the PC is zero-extended before the push, ensuring that the MSb is always clear.

**Note:** A PC push during exception processing concatenates the SRL register to the MSb of the PC prior to the push.

The Stack Pointer Limit register (SPLIM) associated with the Stack Pointer sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' because all stack operations must be word-aligned.

Whenever an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal and a push operation is performed, a stack error trap will not occur. However, the stack error trap will occur on a subsequent push operation. For example, to cause a stack error trap when the stack grows beyond address 0x0C00 in RAM, initialize the SPLIM with the value 0x0BFE.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0x0800. This prevents the stack from interfering with the SFR space.

A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 4-6: CALL STACK FRAME

#### 4.2.7 DATA RAM PROTECTION FEATURE

The dsPIC33F product family supports Data RAM protection features that enable segments of RAM to be protected when used in conjunction with Boot and Secure Code Segment Security. BSRAM (Secure RAM Segment for BS) is accessible only from the Boot Segment Flash code when enabled. SSRAM (Secure RAM Segment for RAM) is accessible only from the Secure Segment Flash code when enabled. See Table 4-1 for an overview of the BSRAM and SSRAM SFRs.

#### 4.3 Instruction Addressing Modes

The addressing modes shown in Table 4-40 form the basis of the addressing modes that are optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those provided in other instruction types.

#### 4.3.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (near data space). Most file register instructions employ a working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire data space.

#### 4.3.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 < function > Operand 2

where Operand 1 is always a working register (that is, the addressing mode can only be register direct), which is referred to as Wb. Operand 2 can be a W register, fetched from data memory, or a 5-bit literal. The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- · Register Direct
- Register Indirect
- · Register Indirect Post-Modified
- · Register Indirect Pre-Modified
- · 5-Bit or 10-Bit Literal

Note: Not all instructions support all of the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

TABLE 4-40: FUNDAMENTAL ADDRESSING MODES SUPPORTED

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of Wn forms the Effective Address (EA).
Register Indirect Post-Modified	The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of Wn and Wb forms the EA.
Register Indirect with Literal Offset	The sum of Wn and a literal forms the EA.

# 4.3.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- · Register Direct
- · Register Indirect
- · Register Indirect Post-modified
- · Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- · Register Indirect with Literal Offset
- · 8-Bit Literal
- 16-Bit Literal

**Note:** Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

#### 4.3.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOVSAC, and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

Note:	Register	Indirect	with	Register	Offset
	Addressi	ng mode i	is avai	ilable only	for W9
	(in X spa	ce) and W	/11 (in	Y space).	

In summary, the following addressing modes are supported by the  ${\tt MAC}$  class of instructions:

- · Register Indirect
- · Register Indirect Post-Modified by 2
- · Register Indirect Post-Modified by 4
- · Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

#### 4.3.5 OTHER INSTRUCTIONS

In addition to the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ADD Acc, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

#### 4.4 Modulo Addressing

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either data or program space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into program space) and Y data spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction as there are certain restrictions on the buffer start address (for incrementing buffers), or end address (for decrementing buffers), based upon the direction of the circular buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

#### 4.4.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT, and YMODEND (see Table 4-1).

Note: Y space Modulo Addressing EA calculations assume word-sized data (LSb of

every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

# 4.4.2 W ADDRESS REGISTER SELECTION

- The Modulo and Bit-Reversed Addressing Control register, MODCON<15:0>, contains enable flags as well as a W register field to specify the W Address registers. The XWM and YWM fields select which registers will operate with Modulo Addressing.
- If XWM = 15, X RAGU and X WAGU Modulo Addressing is disabled.
- If YWM = 15, Y AGU Modulo Addressing is disabled.

The X Address Space Pointer W register (XWM), to which Modulo Addressing is to be applied, is stored in MODCON<3:0> (see Table 4-1). Modulo Addressing is enabled for X data space when XWM is set to any value other than '15' and the XMODEN bit is set at MODCON<15>.

The Y Address Space Pointer W register (YWM) to which Modulo Addressing is to be applied is stored in MODCON<7:4>. Modulo Addressing is enabled for Y data space when YWM is set to any value other than '15' and the YMODEN bit is set at MODCON<14>.

#### FIGURE 4-7: MODULO ADDRESSING OPERATION EXAMPLE

# 4.4.3 MODULO ADDRESSING APPLICABILITY

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries check for addresses less than or greater than the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

Note: The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset (such as [W7 + W2]) is used, Modulo Address

correction is performed, but the contents of the register remain unchanged.

#### 4.5 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

# 4.5.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWM bits (W register selection) in the MODCON register are any value other than '15' (the stack cannot be accessed using Bit-Reversed Addressing)
- · The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is  $M = 2^N$  bytes, the last 'N' bits of the data buffer start address must be zeros.

XB<14:0> is the Bit-Reversed Address modifier, or 'pivot point,' which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note:

All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It will not function for any other addressing mode or for byte-sized data and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data is a requirement, the LSb of the EA is ignored (and always clear).

Note:

Modulo Addressing and Bit-Reversed Addressing should not be enabled together. If an application attempts to do so, Bit-Reversed Addressing will assume priority, when active, for the X WAGU, and X WAGU, Modulo Addressing will be disabled. However, Modulo Addressing will continue to function in the X RAGU.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV<15>) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

FIGURE 4-8: BIT-REVERSED ADDRESS EXAMPLE

# 4.6 Interfacing Program and Data Memory Spaces

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 architecture uses a 24-bit-wide program space and a 16-bit-wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 architecture provides two methods by which program space can be accessed during operation:

- Using table instructions to access individual bytes, or words, anywhere in the program space
- Remapping a portion of the program space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for lookups from a large table of static data. The application can only access the lsw of the program word.

#### 4.6.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Page register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the MSb of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

For remapping operations, the 8-bit Program Space Visibility register (PSVPAG) is used to define a 16K word page in the program space. When the MSb of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike table operations, this limits remapping operations strictly to the user memory area.

Table 4-42 and Figure 4-9 show how the program EA is created for table operations and remapping accesses from the data EA.

TABLE 4-42:	PROGRAM SPACE ADDRESS CONSTRUCTION
-------------	------------------------------------

Access Type	Access	Program Space Address					
Access Type	Space	<23>	<22:16>	<15>	<14:1>	<0>	
Instruction Access	User	0 PC<22:1>				0	
(Code Execution)			0xx xxxx x	xxx xxx	x xxxx xxx0		
TBLRD/TBLWT	User	ТВ	LPAG<7:0>	Data EA<15:0>			
(Byte/Word Read/Write)		0xxx xxxx xxxx xxxx xxxx					
	Configuration	ТВ	LPAG<7:0>		Data EA<15:0>		
		1	xxx xxxx	XXXX X	xxx xxxx xxxx		
Program Space Visibility	User	0 1		PSVPAG<7:0>		0> <sup>(1)</sup>	
(Block Remap/Read)		0	XXXX XXXX		XXX XXXX XXXX XXXX		

**Note 1:** Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

FIGURE 4-9: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

# 4.6.2 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program space without going through data space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper 8 bits of a program space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit-wide word address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space that contains the least significant data word. TBLRDH and TBLWTH access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

- TBLRDL (Table Read Low):
  - In Word mode, this instruction maps the lower word of the program space location (P<15:0>) to a data address (D<15:0>).
  - In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.

- TBLRDH (Table Read High):
  - In Word mode, this instruction maps the entire upper word of a program address (P<23:16>) to a data address. Note that D<15:8>, the 'phantom byte', will always be '0'.
  - In Byte mode, this instruction maps the upper or lower byte of the program word to D<7:0> of the data address, in the TBLRDL instruction. The data is always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in Section 5.0 "Flash Program Memory".

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When TBLPAG<7> = 0, the table page is located in the user memory space. When TBLPAG<7> = 1, the page is located in configuration space.

FIGURE 4-10: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

# 4.6.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access to stored constant data from the data space without the need to use special instructions (such as  ${\tt TBLRDL}$  and  ${\tt TBLRDH}$ ).

Program space access through the data space occurs if the MSb of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (CORCON<2>). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add a cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address, 0x8000 and higher, maps directly into a corresponding program memory address (see Figure 4-11), only the lower 16 bits of the

24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

**Note:** PSV access is temporarily disabled during table reads/writes.

For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV, and are executed inside a REPEAT loop, these instances require two instruction cycles in addition to the specified execution time of the instruction:

- · Execution in the first iteration
- · Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction using PSV to access data, to execute in a single cycle.

#### 5.0 FLASH PROGRAM MEMORY

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 5. "Flash Programming" (DS70191) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable, and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Run-Time Self-Programming (RTSP)

ICSP allows a device to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (one of the alternate programming pin pairs: PGECx/PGEDx), and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows users to manufacture boards with unprogrammed devices, and then program the Digital Signal Controller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (table read) and TBLWT (table write) instructions. With RTSP, the user application can write program memory data in a single program memory word, and erase program memory in blocks or 'pages' of 512 instructions (1536 bytes).

# 5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the table read and table write instructions. These allow direct read and write access to the program memory space, from the data memory, while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits <7:0> of the TBLPAG register and the Effective Address (EA) from a W register specified in the table instruction, as shown in Figure 5-1.

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits <23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

#### 5.2 RTSP Operation

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of memory, which consists of eight rows (512 instructions); and to program one word. Table 26-12 shows typical erase and programming times. The 8-row erase pages are edge-aligned from the beginning of program memory, on boundaries of 1536 bytes.

#### 5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the operation is finished.

The programming time depends on the FRC accuracy (see Table 26-18) and the value of the FRC Oscillator Tuning register (see Register 8-3). Use the following formula to calculate the minimum and maximum values for the Word Write Time and Page Erase Time (see Table 26-12).

#### **EQUATION 5-1: PROGRAMMING TIME**

$$\frac{T}{7.37~MHz \times (FRC~Accuracy)\% \times (FRC~Tuning)\%}$$

For example, if the device is operating at +125°C, the FRC accuracy will be ±2%. If the TUN<5:0> bits (see Register 8-3) are set to `b000000, the minimum row write time is equal to Equation 5-2.

# EQUATION 5-2: MINIMUM ROW WRITE TIME

$$T_{RW} = \frac{355 \ Cycles}{7.37 \ MHz \times (1 + 0.02) \times (1 - 0.00375)} = 47.4 \mu s$$

The maximum row write time is equal to Equation 5-3.

# EQUATION 5-3: MAXIMUM ROW WRITE TIME

$$T_{RW} = \frac{355 \ Cycles}{7.37 \ MHz \times (1 - 0.02) \times (1 - 0.00375)} = 49.3 \,\mu s$$

Setting the WR bit (NVMCON<15>) starts the operation, and the WR bit is automatically cleared when the operation is finished.

# 5.3.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program one word (24 bits) of program Flash memory at a time. To do this, it is necessary to erase the 8-row erase page that contains the desired address of the location the user wants to change.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPS.

Performing a page erase operation on the last page of program memory will clear the Flash Configuration Words, thereby enabling code protection as a result. Therefore, users should avoid performing page erase operations on the last page of program memory.

Refer to **Section 5. "Flash Programming"** (DS70191) in the "dsPIC33F/PIC24H Family Reference Manual" for details and codes examples on programming using RTSP.

#### 5.4 Control Registers

Note:

Two SFRs are used to read and write the program Flash memory: NVMCON and NVMKEY.

The NVMCON register (Register 5-1) controls which blocks are to be erased, which memory type is to be programmed, and the start of the programming cycle.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register. Refer to **Section 5.3** "**Programming Operations**" for further details.

### REGISTER 5-1: NVMCON: FLASH MEMORY CONTROL REGISTER

R/SO-0 <sup>(1)</sup>	R/W-0 <sup>(1)</sup>	R/W-0 <sup>(1)</sup>	U-0	U-0	U-0	U-0	U-0
WR	WREN	WRERR	_	_	_	_	
bit 15							bit 8

U-0	R/W-0 <sup>(1)</sup>	U-0	U-0	R/W-0 <sup>(1)</sup>	R/W-0 <sup>(1)</sup>	R/W-0 <sup>(1)</sup>	R/W-0 <sup>(1)</sup>
_	ERASE	_	_		NVMOP	<3:0> <sup>(2)</sup>	
bit 7							bit 0

Legend:	SO = Settable Only bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, rea	d as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 WR: Write Control bit<sup>(1)</sup>

- 1 = Initiates a Flash memory program or erase operation. The operation is self-timed and the bit is cleared by hardware once operation is complete
- 0 = Program or erase operation is complete and inactive
- bit 14 WREN: Write Enable bit<sup>(1)</sup>
  - 1 = Enables Flash program/erase operations
  - 0 = Inhibits Flash program/erase operations
- bit 13 WRERR: Write Sequence Error Flag bit<sup>(1)</sup>
  - 1 = An improper program or erase sequence attempt or termination has occurred (bit is set automatically on any set attempt of the WR bit)
  - 0 = The program or erase operation completed normally
- bit 12-7 **Unimplemented:** Read as '0'
- bit 6 **ERASE:** Erase/Program Enable bit<sup>(1)</sup>
  - 1 = Performs the erase operation specified by NVMOP<3:0> on the next WR command
  - 0 = Performs the program operation specified by NVMOP<3:0> on the next WR command
- bit 5-4 **Unimplemented:** Read as '0'
- bit 3-0 **NVMOP<3:0>:** NVM Operation Select bits<sup>(1,2)</sup>

#### If ERASE = 1:

- 1111 = No operation
- 1101 = Erase General Segment
- 1100 = No operation
- 0011 = No operation
- 0010 = Memory page erase operation
- 0001 = No operation
- 0000 = No operation

#### If ERASE = 0:

- 1111 = No operation
- 1101 = No operation
- 1100 = No operation
- 0011 = Memory word program operation
- 0010 = No operation
- 0001 = No operation
- 0000 = No operation
- Note 1: These bits can only be reset on a POR.
  - 2: All other combinations of NVMOP<3:0> are unimplemented.

#### REGISTER 5-2: NVMKEY: NONVOLATILE MEMORY KEY REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
_	_	_	_	_	_	_	_
bit 15							bit 8

W-0	W-0	W-0	W-0	W-0	W-0	W-0	W-0				
NVMKEY<7:0>											
bit 7											

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'

-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15-8 **Unimplemented:** Read as '0'

bit 7-0 **NVMKEY<7:0>:** Key Register bits (write-only)

#### 6.0 RESETS

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 8. "Reset" (DS70192) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Reset module combines all Reset sources and controls the device Master Reset Signal, SYSRST. The following is a list of device Reset sources:

· POR: Power-on Reset

· BOR: Brown-out Reset

• MCLR: Master Clear Pin Reset

• SWR: RESET Instruction

· WDTO: Watchdog Timer Reset

CM: Configuration Mismatch Reset

• TRAPR: Trap Conflict Reset

· IOPUWR: Illegal Condition Device Reset

- Illegal Opcode Reset

- Uninitialized W Register Reset

- Security Reset

A simplified block diagram of the Reset module is shown in Figure 6-1.

Any active source of Reset will make the SYSRST signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state, and some are unaffected.

**Note:** Refer to the specific peripheral section or Section 3.0 "CPU" of this data sheet for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 6-1).

All bits that are set, with the exception of the POR bit (RCON<0>), are cleared during a POR event. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this data sheet.

The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

#### FIGURE 6-1: RESET SYSTEM BLOCK DIAGRAM

Note:

#### 6.1 Reset Control Register

### REGISTER 6-1: RCON: RESET CONTROL REGISTER<sup>(1)</sup>

R/W-0	R/W-0	U-0	U-0	U-0	U-0	R/W-0	R/W-0
TRAPR	IOPUWR	_	_	_	_	CM	VREGS
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-1	R/W-1
EXTR	SWR	SWDTEN <sup>(2)</sup>	WDTO	SLEEP	IDLE	BOR	POR
bit 7							bit 0

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'

-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15 TRAPR: Trap Reset Flag bit

1 = A Trap Conflict Reset has occurred0 = A Trap Conflict Reset has not occurred

bit 14 IOPUWR: Illegal Opcode or Uninitialized W Access Reset Flag bit

1 = An illegal opcode detection, an illegal address mode or uninitialized W register used as an Address Pointer caused a Reset

0 = An Illegal Opcode or Uninitialized W Reset has not occurred

bit 13-10 **Unimplemented:** Read as '0'

bit 9 **CM:** Configuration Mismatch Flag bit

 ${\tt 1}$  = A Configuration Mismatch Reset has occurred 0 = A Configuration Mismatch Reset has not occurred

bit 8 **VREGS:** Voltage Regulator Stand-by During Sleep bit

1 = Voltage regulator is active during Sleep

0 = Voltage regulator goes into Stand-by mode during Sleep

bit 7 **EXTR:** External Reset (MCLR) Pin bit

1 = A Master Clear (pin) Reset has occurred 0 = A Master Clear (pin) Reset has not occurred

bit 6 SWR: Software Reset (Instruction) Flag bit

1 = A RESET instruction has been executed

0 = A RESET instruction has not been executed **SWDTEN**: Software Enable/Disable of WDT bit<sup>(2)</sup>

1 = WDT is enabled 0 = WDT is disabled

bit 4 WDTO: Watchdog Timer Time-out Flag bit

1 = WDT time-out has occurred0 = WDT time-out has not occurred

bit 3 SLEEP: Wake-up from Sleep Flag bit

1 = Device has been in Sleep mode

0 = Device has not been in Sleep mode

**Note 1:** All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

bit 5

### REGISTER 6-1: RCON: RESET CONTROL REGISTER<sup>(1)</sup> (CONTINUED)

bit 2 **IDLE:** Wake-up from Idle Flag bit

1 = Device has been in Idle mode0 = Device has not been in Idle mode

bit 1 BOR: Brown-out Reset Flag bit

1 = A Brown-out Reset has occurred0 = A Brown-out Reset has not occurred

bit 0 **POR:** Power-on Reset Flag bit

1 = A Power-on Reset has occurred0 = A Power-on Reset has not occurred

- **Note 1:** All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.
  - **2:** If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

#### 6.2 System Reset

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family of devices have two types of Reset:

- · Cold Reset
- · Warm Reset

A Cold Reset is the result of a POR or a BOR. On a Cold Reset, the FNOSC Configuration bits in the FOSC Configuration register selects the device clock source.

A Warm Reset is the result of all other Reset sources, including the RESET instruction. On Warm Reset, the device will continue to operate from the current clock source as indicated by the Current Oscillator Selection (COSC<2:0>) bits in the Oscillator Control (OSCCON<14:12>) register.

The device is kept in a Reset state until the system power supplies have stabilized at appropriate levels and the oscillator clock is ready. The sequence in which this occurs is shown in Figure 6-2.

TABLE 6-1: OSCILLATOR DELAY

Oscillator Mode	Oscillator Start-up Delay	Oscillator Start-up Timer	PLL Lock Time	Total Delay
FRC, FRCDIV16, FRCDIVN	Toscd <sup>(1)</sup>	_	_	Toscd
FRCPLL	Tosco <sup>(1)</sup>	_	Tlock <sup>(3)</sup>	Toscd <sup>(1)</sup> + Tlock <sup>(3)</sup>
MS	Tosco <sup>(1)</sup>	Tost <sup>(2)</sup>	_	Toscd <sup>(1)</sup> + Tost <sup>(2)</sup>
HS	Tosco <sup>(1)</sup>	Tost <sup>(2)</sup>	_	Tosco <sup>(1)</sup> + Tost <sup>(2)</sup>
EC	_	_	_	_
MSPLL	Tosco <sup>(1)</sup>	Tost <sup>(2)</sup>	Tlock <sup>(3)</sup>	$TOSCD^{(1)} + TOST^{(2)} + TLOCK^{(3)}$
ECPLL	_	_	Tlock <sup>(3)</sup>	TLOCK <sup>(3)</sup>
SOSC	Tosco <sup>(1)</sup>	Tost <sup>(2)</sup>	_	Toscd <sup>(1)</sup> + Tost <sup>(2)</sup>
LPRC	Toscd <sup>(1)</sup>	_	_	Tosco <sup>(1)</sup>

- Note 1: Toscd = Oscillator Start-up Delay (1.1  $\mu$ s max. for FRC, 70  $\mu$ s max. for LPRC). Crystal oscillator start-up times vary with crystal characteristics, load capacitance, etc.
  - 2: Tost = Oscillator Start-up Timer Delay (1024 oscillator clock period). For example, Tost = 102.4  $\mu$ s for a 10 MHz crystal and Tost = 32 ms for a 32 kHz crystal.
  - 3: TLOCK = PLL Lock time (1.5 ms nominal) if PLL is enabled.

FIGURE 6-2: SYSTEM RESET TIMING

- POR: A POR circuit holds the device in Reset when the power supply is turned on. The POR circuit is active until VDD crosses the VPOR threshold and the delay, TPOR, has elapsed.
- BOR: The on-chip voltage regulator has a BOR circuit that keeps the device in Reset until VDD crosses the VBOR threshold and the delay, TBOR, has elapsed. The delay, TBOR, ensures the voltage regulator output becomes stable.
- 3. PWRT Timer: The Power-up Timer continues to hold the processor in Reset for a specific period of time (TPWRT) after a BOR. The delay, TPWRT, ensures that the system power supplies have stabilized at the appropriate level for full-speed operation. After the delay, TPWRT, has elapsed, the SYSRST becomes inactive, which in turn, enables the selected oscillator to start generating clock cycles.
- Oscillator Delay: The total delay for the clock to be ready for various clock source selections is given in Table 6-1. Refer to Section 8.0 "Oscillator Configuration" for more information.
- 5. When the oscillator clock is ready, the processor begins execution from location, 0x000000. The user application programs a GOTO instruction at the Reset address, which redirects program execution to the appropriate start-up routine.
- The Fail-Safe Clock Monitor (FSCM), if enabled, begins to monitor the system clock when the system clock is ready and the delay, TFSCM, has elapsed.

Note:

TABLE 6-2: OSCILLATOR PARAMETERS

Symbol	Parameter	Value
VPOR	POR Threshold	1.8V nominal
TPOR	POR Extension Time	30 μs maximum
VBOR	BOR Threshold	2.5V nominal
TBOR	BOR Extension Time	100 μs maximum
TPWRT	Power-up Time Delay	64 ms nominal
TFSCM	Fail-Safe Clock Monitor Delay	900 μs maximum

When the device exits the Reset condition (begins normal operation), the device operating parameters (voltage, frequency, temperature, etc.) must be within their operating ranges; otherwise, the device may not function correctly. The user application must ensure that the delay between the time power is first applied, and the time SYSRST becomes inactive, is long enough to get all operating parameters within specification.

#### 6.3 POR

A POR circuit ensures the device is reset from poweron. The POR circuit is active until VDD crosses the VPOR threshold and the delay, TPOR, has elapsed. The delay, TPOR, ensures that the internal device bias circuits become stable.

The device supply voltage characteristics must meet the specified starting voltage and rise rate requirements to generate the POR. Refer to **Section 26.0** "**Electrical Characteristics**" for details.

The POR status (POR) bit in the Reset Control (RCON<0>) register is set to indicate the Power-on Reset.

#### 6.4 BOR and PWRT

The on-chip regulator has a BOR circuit that resets the device when the VDD is too low (VDD < VBOR) for proper device operation. The BOR circuit keeps the device in Reset until VDD crosses the VBOR threshold and the delay, TBOR, has elapsed. The delay, TBOR, ensures the voltage regulator output becomes stable.

The BOR status (BOR) bit in the Reset Control (RCON<1>) register is set to indicate the Brown-out Reset.

The device will not run at full speed after a BOR as the VDD should rise to acceptable levels for full-speed operation. The Power-up Timer (PWRT) provides power-up time delay (TPWRT) to ensure that the system power supplies have stabilized at the appropriate levels for full-speed operation before the SYSRST is released.

Refer to **Section 23.0 "Special Features"** for further details.

Figure 6-3 shows the typical brown-out scenarios. The Reset delay (TBOR + TPWRT) is initiated each time VDD rises above the VBOR trip point.

FIGURE 6-3: BROWN-OUT RESET SITUATIONS

#### 6.5 External Reset (EXTR)

The External Reset is generated by driving the MCLR pin low. The MCLR pin is a Schmitt trigger input with an additional glitch filter. Reset pulses that are longer than the minimum pulse width will generate a Reset. Refer to Section 26.0 "Electrical Characteristics" for minimum pulse-width specifications. The External Reset (MCLR) Pin (EXTR) bit in the Reset Control (RCON) register is set to indicate the MCLR Reset.

# 6.5.1 EXTERNAL SUPERVISORY CIRCUIT

Many systems have external supervisory circuits that generate Reset signals to reset multiple devices in the system. This External Reset signal can be directly connected to the MCLR pin to reset the device when the rest of the system is reset.

#### 6.5.2 INTERNAL SUPERVISORY CIRCUIT

When using the internal power supervisory circuit to reset the device, the External Reset pin (MCLR) should be tied directly or resistively to VDD. In this case, the MCLR pin will not be used to generate a Reset. The External Reset pin (MCLR) does not have an internal pull-up and must not be left unconnected.

#### 6.6 Software RESET Instruction (SWR)

Whenever the RESET instruction is executed, the device will assert SYSRST, placing the device in a special Reset state. This Reset state will not re-initialize the clock. The clock source in effect prior to the RESET instruction will remain as the source. SYSRST is released at the next instruction cycle and the Reset vector fetch will commence.

The Software Reset (Instruction) Flag (SWR) bit in the Reset Control (RCON<6>) register is set to indicate the Software Reset.

# 6.7 Watchdog Timer Time-out Reset (WDTO)

Whenever a Watchdog Timer Time-out Reset occurs, the device will asynchronously assert SYSRST. The clock source will remain unchanged. A WDT time-out during Sleep or Idle mode will wake-up the processor, but will not reset the processor.

The Watchdog Timer Time-out Flag (WDTO) bit in the Reset Control (RCON<4>) register is set to indicate the Watchdog Reset. Refer to **Section 23.4 "Watchdog Timer (WDT)"** for more information on Watchdog Reset.

#### 6.8 Trap Conflict Reset

If a lower priority hard trap occurs while a higher priority trap is being processed, a hard Trap Conflict Reset occurs. The hard traps include exceptions of Priority Level 13 through Level 15, inclusive. The address error (Level 13) and oscillator error (Level 14) traps fall into this category.

The Trap Reset Flag (TRAPR) bit in the Reset Control (RCON<15>) register is set to indicate the Trap Conflict Reset. Refer to **Section 7.0 "Interrupt Controller"** for more information on Trap Conflict Resets.

#### 6.9 Configuration Mismatch Reset

To maintain the integrity of the Peripheral Pin Select Control registers, they are constantly monitored with shadow registers in hardware. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a Configuration Mismatch Reset occurs.

The Configuration Mismatch Flag (CM) bit in the Reset Control (RCON<9>) register is set to indicate the Configuration Mismatch Reset. Refer to **Section 10.0 "I/O Ports"** for more information on the Configuration Mismatch Reset.

**Note:** The Configuration Mismatch feature and associated Reset flag is not available on all devices.

#### 6.10 Illegal Condition Device Reset

An Illegal Condition Device Reset occurs due to the following sources:

- · Illegal Opcode Reset
- · Uninitialized W Register Reset
- · Security Reset

The Illegal Opcode or Uninitialized W Access Reset Flag (IOPUWR) bit in the Reset Control (RCON<14>) register is set to indicate the Illegal Condition Device Reset.

#### 6.10.1 ILLEGAL OPCODE RESET

A device Reset is generated if the device attempts to execute an illegal opcode value that is fetched from program memory.

The Illegal Opcode Reset function can prevent the device from executing program memory sections that are used to store constant data. To take advantage of the Illegal Opcode Reset, use only the lower 16 bits of each program memory section to store the data values. The upper 8 bits should be programmed with 0x3F, which is an illegal opcode value.

# 6.10.2 UNINITIALIZED W REGISTER RESET

Any attempts to use the uninitialized W register as an Address Pointer will reset the device. The W register array (with the exception of W15) is cleared during all Resets and is considered uninitialized until written to.

#### 6.10.3 SECURITY RESET

If a Program Flow Change (PFC) or Vector Flow Change (VFC) targets a restricted location in a protected segment (Boot and Secure Segment), that operation will cause a Security Reset.

The PFC occurs when the Program Counter is reloaded as a result of a Call, Jump, Computed Jump, Return, Return from Subroutine or other form of branch instruction.

The VFC occurs when the Program Counter is reloaded with an interrupt or trap vector.

#### 6.11 Using the RCON Status Bits

The user application can read the Reset Control (RCON) register after any device Reset to determine the cause of the Reset.

Note:	The status bits in the RCON register									
	should be cleared after they are read so									
	that the next RCON register value after a									
	device Reset will be meaningful.									

Table 6-3 provides a summary of Reset flag bit operation.

TABLE 6-3: RESET FLAG BIT OPERATION

Flag Bit	Set by:	Cleared by:
TRAPR (RCON<15>)	Trap conflict event	POR, BOR
IOPWR (RCON<14>)	Illegal opcode or uninitialized W register access or Security Reset	POR, BOR
CM (RCON<9>)	Configuration Mismatch	POR, BOR
EXTR (RCON<7>)	MCLR Reset	POR
SWR (RCON<6>)	RESET instruction	POR, BOR
WDTO (RCON<4>)	WDT Time-out	PWRSAV instruction, CLRWDT instruction, POR, BOR
SLEEP (RCON<3>)	PWRSAV #SLEEP instruction	POR, BOR
IDLE (RCON<2>)	PWRSAV #IDLE instruction	POR, BOR
BOR (RCON<1>)	POR, BOR	_
POR (RCON<0>)	POR	_

Note: All Reset flag bits can be set or cleared by user software.

#### 7.0 INTERRUPT CONTROLLER

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 41. "Interrupts (Part IV)" (DS70300) in the "dsPIC33F/PIC24H Family Reference Manual", which is available on the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 CPU. It has the following features:

- · Up to eight processor exceptions and software traps
- · Seven user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- · Fixed interrupt entry and return latencies

#### 7.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in Figure 7-1. The IVT resides in program memory, starting at location, 000004h. The IVT contains 126 vectors consisting of eight non-maskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit-wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices implement up to 26 unique interrupts and 4 nonmaskable traps. These are summarized in Table 7-1 and Table 7-2.

# 7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 7-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a way to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications to facilitate evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

#### 7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices clear their registers in response to a Reset, forcing the PC to zero. The Digital Signal Controller then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

**Note:** Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

FIGURE 7-1: dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104 INTERRUPT VECTOR TABLE

TABLE 7-1: INTERRUPT VECTORS

Vector Number	Interrupt Request (IRQ) Number	IVT Address	AIVT Address	Interrupt Source

# 7.3 Interrupt Control and Status Registers

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices implement a total of 22 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFSx
- IECx
- IPCx
- INTTREG

#### 7.3.1 INTCON1 AND INTCON2

Global interrupt functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table.

#### 7.3.2 IFSx Registers

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

#### 7.3.3 IECx Registers

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

#### 7.3.4 IPCx Registers

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

#### 7.3.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into Vector Number (VECNUM<6:0>) and Interrupt Level (ILR<3:0>) bit fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence that they are listed in Table 7-1. For example, the INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0<0>, the INT0IE bit in IECO<0> and the INT0IPx bits in the first positions of IPC0 (IPCO<2:0>).

#### 7.3.6 STATUS/CONTROL REGISTERS

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality.

- The CPU STATUS Register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU Interrupt Priority Level. The user application can change the current CPU Interrupt Priority Level by writing to the IPLx bits.
- The CORCON register contains the IPL3 bit which, together with IPL<2:0>, also indicates the current CPU Interrupt Priority Level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in Register 7-1 through Register 7-28 in the following pages.

#### REGISTER 7-1: SR: CPU STATUS REGISTER(1)

R-0	R-0	R/C-0	R/C-0	R-0	R/C-0	R-0	R/W-0
OA	ОВ	SA	SB	OAB	SAB	DA	DC
bit 15							bit 8

R/W-0 <sup>(3)</sup>	R/W-0 <sup>(3)</sup>	R/W-0 <sup>(3)</sup>	R-0	R/W-0	R/W-0	R/W-0	R/W-0
IPL2 <sup>(2)</sup>	IPL1 <sup>(2)</sup>	IPL0 <sup>(2)</sup>	RA	N	OV	Z	С
bit 7							bit 0

Legend:C = Clearable bitR = Readable bitW = Writable bitU = Unimplemented bit, read as '0'-n = Value at POR'1' = Bit is set'0' = Bit is clearedx = Bit is unknown

bit 7-5 IPL<2:0>: CPU Interrupt Priority Level Status bits<sup>(2,3)</sup>

111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled

110 = CPU Interrupt Priority Level is 6 (14)

101 = CPU Interrupt Priority Level is 5 (13)

100 = CPU Interrupt Priority Level is 4 (12)

011 = CPU Interrupt Priority Level is 3 (11)

010 = CPU Interrupt Priority Level is 2 (10)

001 = CPU Interrupt Priority Level is 1 (9)

000 = CPU Interrupt Priority Level is 0 (8)

Note 1: For complete register details, see Register 3-1.

2: The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.

3: The IPL<2:0> Status bits are read-only when NSTDIS (INTCON1<15>) = 1.

#### REGISTER 7-2: CORCON: CORE CONTROL REGISTER(1)

#### 7.4 Interrupt Setup Procedures

#### 7.4.1 INITIALIZATION

To configure an interrupt source at initialization:

- Set the NSTDIS bit (INTCON1<15>) if nested interrupts are not desired.
- Select the user-assigned priority level for the interrupt source by writing the control bits into the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources can be programmed to the same non-zero value.

**Note:** At a device Reset, the IPCx registers are initialized such that all user interrupt sources are assigned to Priority Level 4.

- Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
- Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

#### 7.4.2 INTERRUPT SERVICE ROUTINE

The method used to declare an ISR and initialize the IVT with the correct vector address depends on the programming language (C or assembler) and the language development toolsuite used to develop the application.

In general, the user application must clear the interrupt flag in the appropriate IFSx register for the source of interrupt that the ISR handles. Otherwise, program will re-enter the ISR immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a RETFIE instruction to unstack the saved PC value, SRL value and old CPU priority level.

#### 7.4.3 TRAP SERVICE ROUTINE

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

#### 7.4.4 INTERRUPT DISABLE

All user interrupts can be disabled using this procedure:

- 1. Push the current SR value onto the software stack using the PUSH instruction.
- Force the CPU to Priority Level 7 by inclusive ORing the value OEh with SRL.

To enable user interrupts, the  ${\tt POP}$  instruction can be used to restore the previous SR value.

Note: Only user interrupts with a priority level of 7 or lower can be disabled. Trap sources (Level 8-Level 15) cannot be disabled.

The DISI instruction provides a convenient way to disable interrupts of Priority Levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the DISI instruction.

# 8.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 52. "Oscillator (Part VI)" (DS70644) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information. The oscillator system for dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices provides:

- External and internal oscillator options as clock sources
- An on-chip, 4x Phase Lock Loop (PLL) to scale the internal operating frequency to the required system clock frequency
- An internal FRC oscillator that can also be used with the PLL, thereby allowing full-speed operation without any external clock generation hardware
- Clock switching between various clock sources
- Programmable clock postscaler for system power savings
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and takes fail-safe measures
- A Clock Control register (OSCCON)
- Nonvolatile Configuration bits for main oscillator selection

A simplified diagram of the oscillator system is shown in Figure 8-1.

#### FIGURE 8-1: OSCILLATOR SYSTEM DIAGRAM

Note 1: If the oscillator is used with MS or HS modes, an extended parallel resistor with the value of 1 M $\Omega$  must be connected.

2: The term, FP, refers to the clock source for all peripherals, while FCY refers to the clock source for the CPU. Throughout this document, FCY and FP are used interchangeably, except in the case of Doze mode. FP and FCY will be different when Doze mode is used with a Doze ratio of 1:2 or lower.

#### 8.1 CPU Clocking System

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices provide seven system clock options:

- · Fast RC (FRC) Oscillator
- · FRC Oscillator with 4x PLL
- · Primary (MS, HS or EC) Oscillator
- · Primary Oscillator with 4x PLL
- · Secondary (LP) Oscillator
- · Low-Power RC (LPRC) Oscillator
- · FRC Oscillator with postscaler

#### 8.1.1 SYSTEM CLOCK SOURCES

#### 8.1.1.1 Fast RC

The Fast RC (FRC) internal oscillator runs at a nominal frequency of 7.37 MHz. User software can tune the FRC frequency. User software can optionally specify a factor (ranging from 1:2 to 1:256) by which the FRC clock frequency is divided. This factor is selected using the FRCDIV<2:0> (CLKDIV<10:8>) bits.

The FRC frequency depends on the FRC accuracy (see Table 26-18) and the value of the FRC Oscillator Tuning register (see Register 8-3).

#### 8.1.1.2 Primary

The primary oscillator can use one of the following as its clock source:

- MS (Crystal): Crystals and ceramic resonators in the range of 4 MHz to 10 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- HS (High-Speed Crystal): Crystals in the range of 10 MHz to 32 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- EC (External Clock): The external clock signal is directly applied to the OSC1 pin.

#### 8.1.1.3 Secondary

The secondary (LP) oscillator is designed for low power and uses a 32.768 kHz crystal or ceramic resonator. The LP oscillator uses the SOSCI and SOSCO pins.

#### 8.1.1.4 Low-Power RC

The Low-Power RC (LPRC) internal oscillator runs at a nominal frequency of 32.768 kHz. It is also used as a reference clock by the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

#### 8.1.1.5 PLL

The clock signals generated by the FRC and primary oscillators can be optionally applied to an on-chip, 4x Phase Lock Loop (PLL) to provide faster output frequencies for device operation. PLL configuration is described in **Section 8.1.3** "PLL Configuration".

#### 8.1.2 SYSTEM CLOCK SELECTION

The oscillator source used at a device Power-on Reset event is selected using Configuration bit settings. The Oscillator Configuration bit settings are located in the Configuration registers in the program memory. (Refer to Section 23.1 "Configuration Bits" for further details.) The initial Oscillator Selection Configuration bits. FNOSC<2:0> (FOSCSEL<2:0>), and the Primary Oscillator Mode Configuration Select bits, POSCMD<1:0> (FOSC<1:0>), select the oscillator source that is used at a Power-on Reset. The FRC primary oscillator is the default (unprogrammed) selection.

The Configuration bits allow users to choose among 12 different clock modes, shown in Table 8-1.

The output of the oscillator (or the output of the PLL if a PLL mode has been selected) Fosc is divided by 2 to generate the device instruction clock (FCY) and the peripheral clock time base (FP). FCY defines the operating speed of the device, and speeds up to 16 MHz are supported by the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 architecture.

Instruction execution speed or device operating frequency, Fcy, is given by:

# EQUATION 8-1: DEVICE OPERATING FREQUENCY

$$FCY = \frac{FOSC}{2}$$

#### 8.1.3 PLL CONFIGURATION

The primary oscillator and internal FRC oscillator can optionally use an on-chip, 4x PLL to obtain higher speeds of operation.

For example, suppose an 8 MHz crystal is being used with the selected oscillator mode of MS with PLL. This provides a Fosc of 8 MHz \* 4 = 32 MHz. The resultant device operating speed is 32/2 = 16 MIPS.

# EQUATION 8-2: MS WITH PLL MODE EXAMPLE

$$FCY = \frac{FOSC}{2} = \frac{1}{2} (80000004) = 16 \text{ MIPS}$$

TABLE 8-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

•

100001 = Center frequency -11.625% (6.52 MHz)

100000 = Center frequency -12% (6.49 MHz)

**Note 1:** OSCTUN functionality has been provided to help customers compensate for temperature effects on the FRC frequency over a wide range of temperatures. The tuning step size is an approximation and is neither characterized nor tested.

## 8.3 Clock Switching Operation

Applications are free to switch among any of the four clock sources (Primary, LP, FRC and LPRC) under software control at any time. To limit the possible side effects of this flexibility, dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices have a safeguard lock built into the switch process.

Note: Primary Oscillator mode has three different submodes (MS, HS, and EC), which are determined by the POSCMD<1:0> Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch among the different primary submodes without reprogramming the device.

#### 8.3.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the FOSC Configuration register must be programmed to '0'. (Refer to **Section 23.1 "Configuration Bits"** for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and Fail-Safe Clock Monitor function are disabled. This is the default setting.

The NOSCx control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSCx bits (OSCCON<14:12>) reflect the clock source selected by the FNOSCx Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled; it is held at '0' at all times.

## 8.3.2 OSCILLATOR SWITCHING SEQUENCE

Performing a clock switch requires this basic sequence:

- If desired, read the COSC bits (OSCCON<14:12>) to determine the current oscillator source.
- 2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
- Write the appropriate value to the NOSCx control bits (OSCCON<10:8>) for the new oscillator source.
- 4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
- Set the OSWEN bit (OSCCON<0>) to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically as follows:

 The clock switching hardware compares the COSCx status bits with the new value of the NOSCx control bits. If they are the same, the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.

- If a valid clock switch has been initiated, the LOCK and CF (OSCCON<5,3>) status bits are cleared.
- The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware waits until the Oscillator Start-up Timer (OST) expires. If the new source is using the PLL, the hardware waits until a PLL lock is detected (LOCK = 1).
- The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
- The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSCx bit values are transferred to the COSCx status bits.
- The old clock source is turned off at this time, with the exception of LPRC (if WDT or FSCM is enabled) or LP (if LPOSCEN remains set).
  - Note 1: The processor continues to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.
    - 2: Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.
    - 3: Refer to Section 52. "Oscillator (Part VI)" (DS70644) in the "dsPIC33F/PIC24H Family Reference Manual" for details.

#### 8.4 Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor (FSCM) allows the device to continue to operate even in the event of an oscillator failure. The FSCM function is enabled by programming. If the FSCM function is enabled, the LPRC internal oscillator runs at all times (except during Sleep mode) and is not subject to control by the Watchdog Timer.

In the event of an oscillator failure, the FSCM generates a clock failure trap event and switches the system clock over to the FRC oscillator. Then, the application program can either attempt to restart the oscillator or execute a controlled shutdown. The trap can be treated as a Warm Reset by simply loading the Reset address into the oscillator fail trap vector.

If the PLL multiplier is used to scale the system clock, the internal FRC is also multiplied by the same factor on clock failure. Essentially, the device switches to FRC with PLL on a clock failure.

#### 9.0 POWER-SAVING FEATURES

# Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 9. "Watchdog Timer and Power-Saving Modes" (DS70196) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. Devices can manage power consumption in four different ways:

- · Clock Frequency
- · Instruction-Based Sleep and Idle modes
- · Software-Controlled Doze mode
- · Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

# 9.1 Clock Frequency and Clock Switching

dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 8.0 "Oscillator Configuration"**.

# 9.2 Instruction-Based Power-Saving Modes

dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in Example 9-1.

Note: SLEEP\_MODE and IDLE\_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to wake-up.

#### 9.2.1 SLEEP MODE

The following occur in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled
- The LPRC clock continues to run in Sleep mode if the WDT is enabled
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode
- Some device features or peripherals may continue to operate. This includes items such as the Input Change Notification (ICN) on the I/O ports, or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled

The device will wake-up from Sleep mode on any of the these events:

- · Any interrupt source that is individually enabled
- · Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

#### EXAMPLE 9-1: PWRSAV INSTRUCTION SYNTAX

PWRSAV #SLEEP\_MODE ; Put the device into SLEEP mode PWRSAV #IDLE MODE ; Put the device into IDLE mode

#### 9.2.2 IDLE MODE

The following occur in Idle mode:

- · The CPU stops executing instructions.
- · The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see Section 9.4 "Peripheral Module Disable").
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device will wake from Idle mode on any of these events:

- · Any interrupt that is individually enabled
- · Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the PWRSAV instruction, or the first instruction in the ISR.

# 9.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a PWRSAV instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

#### 9.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this may not be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU Idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the UART module has been configured for 500 kbps based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the UART module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

#### 9.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers will have no effect and read values will be invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note:

If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104
NOTES:

#### 10.0 I/O PORTS

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 10. "I/O Ports" (DS70193) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

All of the device pins (except VDD, VSS, MCLR, and OSC1/CLKI) are shared among the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

## 10.1 Parallel I/O (PIO) Ports

Generally a parallel I/O port that shares a pin with a peripheral is subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents "loop through," in which a port's digital output can drive the input of a peripheral that shares the same pin. Figure 10-1 shows how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', the pin is an input. All port pins are defined as inputs after a Reset. Reads from the Output Latch (LATx) register read the latch. Writes to the Output Latch register write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

Any bit and its associated data and control registers that is not valid for a particular device will be disabled. This means the corresponding LATx and TRISx registers and the port pin will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

FIGURE 10-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

#### 10.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORT, LAT and TRIS registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

See "Pin Diagrams" for the available pins and their functionality.

#### 10.2 Configuring Analog Port Pins

The AD1PCFGL and TRIS registers control the operation of the Analog-to-Digital port pins. The port pins that are to function as analog inputs must have their corresponding TRIS bit set (input). If the TRIS bit is cleared (output), the digital output level (VOH or VOL) will be converted.

The AD1PCFGL register has a default value of 0x0000; therefore, all pins that share ANx functions are analog (not digital) by default.

When the PORT register is read, all pins configured as analog input channels will read as cleared (a low level).

Pins configured as digital inputs will not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

#### 10.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP. An demonstration is shown in Example 10-1.

#### 10.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States even in Sleep mode when the clocks are disabled. Depending on the device pin count, up to 21 external signals (CNx pin) can be selected (enabled) for generating an interrupt request on a Change-of-State.

Four control registers are associated with the CN module. The CNEN1 and CNEN2 registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

Note

Pull-ups on Input Change Notification pins should always be disabled when the port pin is configured as a digital output.

#### **EXAMPLE 10-1: PORT WRITE/READ EXAMPLE**

```
MOV 0xFF00, W0 ; Configure PORTB<15:8> as inputs
MOV W0, TRISBB ; and PORTB<7:0> as outputs
NOP ; Delay 1 cycle
btss PORTB, #13 ; Next Instruction
```

#### 10.4 Peripheral Pin Select (PPS)

Peripheral Pin Select configuration enables peripheral set selection and placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, programmers can better tailor the microcontroller to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select configuration feature operates over a fixed subset of digital I/O pins. Programmers can independently map the input and/or output of most digital peripherals to any one of these I/O pins. Peripheral Pin Select is performed in software, and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping, once it has been established.

#### **AVAILABLE PINS** 10.4.1

The Peripheral Pin Select feature is used with a range of up to 16 pins. The number of available pins depends on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the designation "RPn" in their full pin designation, where "RP" designates a remappable peripheral and "n" is the remappable pin number.

#### 10.4.2 CONTROLLING PERIPHERAL PIN SELECT

Peripheral Pin Select features are controlled through two sets of Special Function Registers: one to map peripheral inputs and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

#### 10.4.2.1 Input Mapping

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral. A control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers are used to configure peripheral input mapping (see Register 10-1 through Register 10-10). Each register contains sets of 5-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 5-bit value maps the RPn pin with that value to that peripheral. For any given device, the valid range of values for any bit field corresponds to the maximum number of Peripheral Pin Selections supported by the device.

Figure 10-2 Illustrates remappable pin selection for U1RX input.

Note:

For input mapping only, the Peripheral Pin Select (PPS) functionality does not have priority over the TRISx settings. Therefore, when configuring the RPx pin for input, the corresponding bit in the TRISx register must also be configured for input (i.e., set to '1').

**FIGURE 10-2:** REMAPPABLE MUX **INPUT FOR U1RX** 

TABLE 10-1: SELECTABLE INPUT SOURCES (MAPS INPUT TO FUNCTION)(1)

Input Name	Function Name	Register	Configuration Bits
External Interrupt 1	INT1	RPINR0	INT1R<4:0>
External Interrupt 2	INT2	RPINR1	INT2R<4:0>
Timer2 External Clock	T2CK	RPINR3	T2CKR<4:0>
Timer3 External Clock	T3CK	RPINR3	T3CKR<4:0>
Timer4 External Clock	T4CK	RPINR4	T4CKR<4:0>(2)
Timer5 External Clock	T5CK	RPINR4	T5CKR<4:0>(2)
Input Capture 1	IC1	RPINR7	IC1R<4:0>
Input Capture 2	IC2	RPINR7	IC2R<4:0>
Input Capture 3	IC3	RPINR8	IC3R<4:0>
Output Compare Fault A	OCFA	RPINR11	OCFAR<4:0>
UART1 Receive	U1RX	RPINR18	U1RXR<4:0>
UART1 Clear-to-Send	U1CTS	RPINR18	U1CTSR<4:0>
SDI1 SPI Data Input 1	SDI1	RPINR20	SDI1R<4:0> <sup>(2)</sup>
SCK1 SPI Clock Input 1	SCK1	RPINR20	SCK1R<4:0>(2)
SPI1 Slave Select Input	SS1	RPINR21	SS1R<4:0> <sup>(2)</sup>

Note 1: Unless otherwise noted, all inputs use the Schmitt input buffers.

2: These bits are available in dsPIC33FJ32(GP/MC)10X devices only.

#### 10.4.2.2 Output Mapping

In contrast to the inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Like the RPINRx registers, each register contains sets of 5-bit fields, with each set associated with one RPn pin (see Register 10-11 through Register 10-18). The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 10-2 and Figure 10-3).

The list of peripherals for output mapping also includes a null value of '00000' because of the mapping technique. This permits any given pin to remain unconnected from the output of any of the pin selectable peripherals.

FIGURE 10-3: MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPn

TABLE 10-2: OUTPUT SELECTION FOR REMAPPABLE PIN (RPn)

Function	RPnR<4:0>	Output Name
NULL	00000	RPn tied to Default Port Pin
C1OUT	00001	RPn tied to Comparator 1 Output
C2OUT	00010	RPn tied to Comparator 2 Output
U1TX	00011	RPn tied to UART1 Transmit
U1RTS	00100	RPn tied to UART1 Ready-to-Send
SCK1	01000	RPn tied to SPI Clock <sup>(1)</sup>
SDO1	00111	RPn tied to SPI Data Output <sup>(1)</sup>
SS1	01001	RPn tied to SPI1 Slave Select Output <sup>(1)</sup>

CTPLS	11101	RPn tied to CTMU Pulse Output
C3OUT	11110	RPn tied to Comparator 3 Output

Note 1: This function is available in dsPIC33FJ32(GP/MC)10X devices only.

# 10.4.3 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices include three features to prevent alterations to the peripheral map:

- · Control register lock sequence
- · Continuous state monitoring
- · Configuration bit pin select lock

#### 10.4.3.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (OSCCON<6>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, a specific command sequence must be executed:

- 1. Write 0x46 to OSCCON<7:0>.
- 2. Write 0x57 to OSCCON<7:0>.
- 3. Clear (or set) IOLOCK as a single operation.

Note: MPLAB® C30 provides built-in C language functions for unlocking the OSCCON register:

\_\_builtin\_write\_OSCCONL(value)
\_\_builtin\_write\_OSCCONH(value)

See MPLAB IDE Help for more information.

Unlike the similar sequence with the oscillator's LOCK bit, IOLOCK remains in one state until changed. This allows all of the Peripheral Pin Selects to be configured with a single unlock sequence followed by an update to all control registers, then locked with a second lock sequence.

#### 10.4.3.2 Continuous State Monitoring

In addition to being protected from direct writes, the contents of the RPINRx and RPORx registers are constantly monitored in hardware by shadow registers. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a Configuration Mismatch Reset will be triggered.

#### 10.4.3.3 Configuration Bit Pin Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPINRx and RPORx registers. The IOL1WAY (FOSC<5>) Configuration bit blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure will not execute, and the Peripheral Pin Select Control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session. Programming IOL1WAY allows user applications unlimited access (with the proper use of the unlock sequence) to the Peripheral Pin Select registers.

#### 10.5 I/O Helpful Tips

- 1. In some cases, certain pins, as defined in Section 26.0 "Electrical Characteristics". Table 26-11 under "Injection Current", have internal protection diodes to VDD and Vss. The term, "Injection Current", is also referred to as "Clamp Current". On designated pins, with sufficient external current limiting precautions by the user, I/O pin input voltages are allowed to be greater or less than the data sheet absolute maximum ratings with nominal VDD, with respect to the Vss and VDD supplies. Note that when the user application forward biases either of the high or low side internal input clamp diodes, that the resulting current being injected into the device, that is clamped internally by the VDD and VSS power rails, may affect the ADC accuracy by four to six counts.
- I/O pins that are shared with any analog input pin. (i.e., ANx), are always analog pins by default after any Reset. Consequently, any pin(s) configured as an analog input pin, automatically disables the digital input pin buffer. As such, any attempt to read a digital input pin will always return a '0' regardless of the digital logic level on the pin if the analog pin is configured. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the Analog Pin Configuration register in the ADC module (AD1PCFGL), by setting the appropriate bit that corresponds to that I/O port pin, to a '1'. On devices with more than one ADC, both analog pin configurations for both ADC modules must be configured as a digital I/O pin for that pin to function as a digital I/O pin.

Note: Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in the data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name from left-toright. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1. This indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.

- 4. Each CN pin has a configurable internal weak pull-up resistor. The pull-ups act as a current source connected to the pin, and eliminates the need for external resistors in certain applications. The internal pull-up is to ~(VDD-0.8), not VDD. This is still above the minimum VIH of CMOS and TTI devices.
- 5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the VOH/IOH and VOL/IOL DC characteristic specification. The respective IOH and IOL current rating only applies to maintaining the corresponding output at or above the VOH and at or below the VOL levels. However, for LEDs unlike digital inputs of an externally connected device, they are not governed by the same minimum VIH/VIL levels. An I/O pin output can safely sink or source any current less than that listed in the absolute maximum rating section of the data sheet. For example:

VOH = 2.4v @ IOH = -6 mA and VDD = 3.3V

The maximum output current sourced by any 6 mA I/O pin = 15 mA.

LED source current < 15 mA is technically permitted. Refer to the VoH/IOH specifications in **Section 26.0 "Electrical Characteristics"** for additional information.

#### 10.6 I/O Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Note:

In the event you are not able to access the product page using the link above, enter this URL in your browser:

http://www.microchip.com/wwwproducts/ Devices.aspx?dDocName=en554109

#### 10.7 Peripheral Pin Select Registers

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family of devices implements up to 23 registers for remappable peripheral configuration.

Note:

Input and Output Register values can only be changed if IOLOCK (OSCCON<6>) = 0. See **Section 10.4.3.1 "Control Register Lock"** for a specific command sequence.

#### 11.0 TIMER1

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 11. "Timers" (DS70205) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer, which can serve as the time counter for the Real-Time Clock (RTC) or operate as a free-running interval timer/counter. Timer1 can operate in three modes:

- · 16-bit Timer
- · 16-bit Synchronous Counter
- 16-bit Asynchronous Counter

Timer1 also supports these features:

- · Timer gate operation
- · Selectable prescaler settings
- · Timer operation during CPU Idle and Sleep modes
- Interrupt on 16-bit Period register match or falling edge of external gate signal

Figure 11-1 presents a block diagram of the 16-bit timer module.

To configure Timer1 for operation:

- 1. Load the timer value into the TMR1 register.
- Load the timer period value into the PR1 register.
- Select the timer prescaler ratio using the TCKPS<1:0> bits in the T1CON register.
- 4. Set the Clock and Gating modes using the TCS and TGATE bits in the T1CON register.
- 5. Set or clear the TSYNC bit in T1CON to select synchronous or asynchronous operation.
- 6. If interrupts are required, set the Timer1 Interrupt Enable bit, T1IE. Use the Timer1 Interrupt Priority bits, T1IP<2:0>, to set the interrupt priority.
- 7. Set the TON bit (= 1) in the T1CON register.

**Note 1:** When TCS = 1 and TON = 1, writes to the TMR1 register are inhibited from the CPU.

Note:

#### 12.0 TIMER2/3 AND TIMER4/5

Note 1: This data sheet summarizes the features of the dsPlC33FJ16(GP/MC)101/102 and dsPlC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 11. "Timers" (DS70205) in the "dsPlC33F/PlC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

Timer2/3 and Timer4/5 have three 2-bit timers that can also be configured as two independent 16-bit timers with selectable operating modes.

**Note 1:** Timer4 and Timer5 are available in dsPIC33FJ32(GP/MC10X) devices only.

As a 32-bit timer, Timer2/3 and Timer4/5 permit operation in three modes:

- Two independent 16-bit timers (e.g., Timer2 and Timer3 or Timer4 and Timer5) with all 16-bit operating modes (except Asynchronous Counter mode)
- Single 32-bit timer (Timer2/3 and Timer4/5)
- Single 32-bit synchronous counter (Timer2/3 and Timer4/5)

Timer2/3 and Timer4/5 also support:

- · Timer gate operation
- · Selectable prescaler settings
- · Timer operation during Idle and Sleep modes
- · Interrupt on a 32-bit Period register match
- Time base for input capture and output compare modules (Timer2 and Timer3 only)
- ADC1 event trigger (Timer2/3 only)

Individually, all eight of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed above, except for the event trigger. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, T4CON and T5CON registers (see Register 12-1 through Register 12-2).

For 32-bit timer/counter operation, Timer2/4 is the least significant word (lsw) and Timer3/5 is the most significant word (msw) of the 32-bit timers.

For 32-bit operation, T3CON and T5CON control bits are ignored. Only T2CON and T4CON control bits are used for setup and control. Timer2 and Timer4 clock and gate inputs are used for the 32-bit timer modules, but an interrupt is generated with the Timer3 and Timer5 interrupt flags.

#### 12.1 32-Bit Operation

To configure Timer2/3 and Timer4/5 for 32-bit operation:

- 1. Set the T32 control bit.
- 2. Select the prescaler ratio for Timer2 or Timer4 using the TCKPS<1:0> bits.
- 3. Set the Clock and Gating modes using the corresponding TCS and TGATE bits.
- 4. Load the timer period value. PR3/PR5 contains the msw of the value, while PR2/PR4 contains the least significant word (lsw).
- 5. If interrupts are required, set the interrupt enable bit, T3IE or T5IE. Use the priority bits, T3IP<2:0> or T5IP<2:0>, to set the interrupt priority. While Timer2/Timer4 controls the timer, the interrupt appears as a Timer3/Timer5 interrupt.
- 6. Set the corresponding TON bit.

The timer value at any point is stored in the register pair, TMR3:TMR2 or TMR5:TMR4, which always contains the msw of the count, while TMR2 or TMR4 contains the lsw.

#### 12.2 16-Bit Operation

To configure any of the timers for individual 16-bit operation:

- 1. Clear the T32 bit corresponding to that timer.
- 2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
- Set the Clock and Gating modes using the TCS and TGATE bits.
- 4. Load the timer period value into the PRx register.
- 5. If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP<2:0>, to set the interrupt priority.
- 6. Set the TON bit.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104	
NOTES:	_

### 13.0 INPUT CAPTURE

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 12. "Input Capture" (DS70198) in the "dsPIC33F/ PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

> 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The input capture module is useful in applications pulse reauirina frequency (period) and measurement. The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices support up to three input capture channels.

The input capture module captures the 16-bit value of the selected Time Base register when an event occurs at the ICx pin. The events that cause a capture event are listed below in three categories:

- 1. Simple Capture Event modes:
  - · Capture timer value on every falling edge of input at ICx pin
  - · Capture timer value on every rising edge of input at ICx pin
- 2. Capture timer value on every edge (rising and falling)
- 3. Prescaler Capture Event modes:
  - · Capture timer value on every 4th rising edge of input at ICx pin
  - · Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select one of two 16-bit timers (Timer2 or Timer3) for the time base. The selected timer can use either an internal or external clock.

Other operational features include:

- · Device wake-up from capture pin during CPU Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values:
  - Interrupt optionally generated after 1, 2, 3 or 4 buffer locations are filled
- · Use of input capture to provide additional sources of external interrupts

#### 14.0 OUTPUT COMPARE

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 13. "Output Compare" (DS70209) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The output compare module can select either Timer2 or Timer3 for its time base. The module compares the value of the timer with the value of one or two compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the Compare register value. The output compare module generates either a single output pulse, or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events.

The output compare module has multiple operating modes:

- · Active-Low One-Shot mode
- · Active-High One-Shot mode
- · Toggle mode
- · Delayed One-Shot mode
- · Continuous Pulse mode
- · PWM mode without Fault protection
- · PWM mode with Fault protection

FIGURE 14-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM

#### 14.1 Output Compare Modes

Configure the Output Compare modes by setting the appropriate Output Compare Mode (OCM<2:0>) bits in the Output Compare x Control (OCxCON<2:0>) register. Table 14-1 lists the different bit settings for the Output Compare modes. Figure 14-2 illustrates the output compare operation for various modes. The user

application must disable the associated timer when writing to the Output Compare Control registers to avoid malfunctions.

Note: See Section 13. "Output Compare" in the "dsPIC33F/PIC24H Family Reference Manual" (DS70209) for OCxR and OCxRS register restrictions.

TABLE 14-1: OUTPUT COMPARE MODES

OCM<2:0>	Mode	OCx Pin Initial State	OCx Interrupt Generation
000	Module Disabled	Controlled by GPIO register	_
001	Active-Low One-Shot	0	OCx Rising Edge
010	Active-High One-Shot	1	OCx Falling Edge

## 15.0 MOTOR CONTROL PWM MODULE

- Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 14. "Motor Control PWM" (DS70187), in the "dsPIC33F/PIC24H Family Reference Manual", which is available on the Microchip web site (www.microchip.com).
  - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ16MC10X devices have a 6-channel Pulse-Width Modulation (PWM) module.

The PWM module has the following features:

- Up to 16-bit resolution
- · On-the-fly PWM frequency changes
- · Edge-Aligned and Center-Aligned Output modes
- · Single Pulse Generation mode
- Interrupt support for asymmetrical updates in Center-Aligned mode
- Output override control for Electrically Commutative Motor (ECM) operation or BLDC
- Special Event comparator for scheduling other peripheral events
- Fault pins to optionally drive each of the PWM output pins to a defined state
- Duty cycle updates configurable to be immediate or synchronized to the PWM time base

#### 15.1 PWM1: 6-Channel PWM Module

This module simplifies the task of generating multiple synchronized PWM outputs. The following power and motion control applications are supported by the PWM module:

- · 3-Phase AC Induction Motor
- · Switched Reluctance (SR) Motor
- · Brushless DC (BLDC) Motor
- Uninterruptible Power Supply (UPS)

This module contains three duty cycle generators, numbered 1 through 3. The module has six PWM output pins, numbered PWM1H1/PWM1L1 through PWM1H3/PWM1L3. The six I/O pins are grouped into high/low numbered pairs, denoted by the suffix H or L, respectively. For complementary loads, the low PWM pins are always the complement of the corresponding high I/O pin.

On dsPIC33FJ16MC102 (28-pin) devices, the FLTA1 and FLTB1 pins are supported and do not require an external

**FIGURE 15-1:** 6-CHANNEL PWM MODULE BLOCK DIAGRAM (PWM1)

correct functionality.

pull-down resistor.

Note:

#### 15.2 PWM Faults

The Motor Control PWM module incorporates up to two Fault inputs, FLTA1 and FLTB1. These Fault inputs are implemented with Class B safety features. These features ensure that the PWM outputs enter a safe state when either of the Fault inputs is asserted.

The FLTA1 and FLTB1 pins, when enabled and having ownership of a pin, also enable a soft internal pull-down resistor. The soft pull-down provides a safety feature by automatically asserting the Fault should a break occur in the Fault signal connection.

The implementation of internal pull-down resistors is dependent on the device variant. Table 15-1 describes which devices and pins implement the internal pull-down resistors.

TABLE 15-1: INTERNAL PULL-DOWN RESISTORS ON PWM FAULT PINS

Device	Fault Pin	Internal Pull-Down Implemented?
dsPIC33FJXXMC101	FLTA1	No
dsPIC33FJXXMC102	FLTA1	Yes
	FLTB1	Yes
dsPIC33FJ32MC104	FLTA1	Yes
	FLTB1	Yes

On devices without internal pull-downs on the Fault pin, it is recommended to connect an external pull-down resistor for Class B safety features.

## 15.2.1 PWM FAULTS AT RESET

During any Reset event, the PWM module maintains ownership of both PWM Fault pins. At Reset, both Faults are enabled in latched mode to guarantee the fail-safe power-up of the application. The application software must clear both of the PWM Faults before enabling the Motor Control PWM module.

The Fault condition must be cleared by the external circuitry driving the Fault input pin high and clearing the Fault interrupt flag. After the Fault pin condition has been cleared, the PWM module restores the PWM output signals on the next PWM period or half-period boundary.

Refer to **Section 14. "Motor Control PWM"** (DS70187), in the "dsPIC33F/PIC24H Family Reference Manual" for more information on the PWM Faults.

The number of PWM Faults mapped to the device pins depend on the specific variant. Regardless of the variant, both Faults will be enabled during any Reset event. The application must clear both FLTA1 and FLTB1 before enabling the Motor Control PWM module. Refer to the specific device pin diagrams to see which Fault pins are mapped to the device pins.

# 15.3 Write-Protected Registers

On dsPIC33FJ(16/32)MC10X devices, write protection is implemented for the PWMxCON1, PxFLTACON and PxFLTBCON registers. The write protection feature prevents any inadvertent writes to these registers. The write protection feature can be controlled by the PWMLOCK Configuration bit in the FOSCSEL Configuration register. The default state of the write protection feature is enabled (PWMLOCK = 1). The write protection feature can be disabled by configuring PWMLOCK (FOSCSEL<6>) = 0.

The user application can gain access to these locked registers either by configuring the PWMLOCK bit (FOSCSEL<6>) = 0 or by performing the unlock sequence. To perform the unlock sequence, the user application must write two consecutive values (0xABCD and 0x4321) to the PWMxKEY register to perform the unlock operation. The write access to the PWMxCON1, PxFLTACON or PxFLTBCON registers must be the next SFR access following the unlock process. There can be no other SFR accesses during the unlock process and subsequent write access.

To write to all registers, the PWMxCON1, PxFLTACON and PxFLTBCON registers require three unlock operations.

The correct unlocking sequence is described in Example 15-1 and Example 15-2.

# EXAMPLE 15-1: ASSEMBLY CODE FOR WRITE-PROTECTED REGISTER UNLOCK AND FAULT CLEARING SEQUENCE

```
; FLTA1 pin must be pulled high externally in order to clear and disable the Fault
; Writing to P1FLTBCON register requires unlock sequence
mov #0xabcd,w10 ; Load first unlock key to w10 register
mov #0x4321,w11 ; Load second unlock key to w11 register
mov #0x0000,w0 ; Load desired value of B13777
                       ; Load desired value of P1FLTACON register in w0
; Write first unlock key to PWM1KEY register

Note 1: The PWMxCON1 register is a write-protected register. Refer to Section 15.3 "Write-Protected Registers" for more information on the unlock sequence.

- 2: The Reset status for this bit depends on the setting of the PWMPIN Configuration bit (FPOR<7>):
  - If PWMPIN = 1 (default), the PWM pins are controlled by the PORT register at Reset, meaning they are initially programmed as inputs (i.e., tri-stated).
  - If PWMPIN = 0, the PWM pins are controlled by the PWM module at Reset and are therefore, initially programmed as output pins.

### bit 15-0 PWMKEY<15:0>: PWMx Unlock bits

If the PWMLOCK Configuration bit is asserted (PWMLOCK = 1), the PWMxCON1, PxFLTACON and PxFLTBCON registers are writable only after the proper sequence is written to the PWMxKEY register. If the PWMLOCK Configuration bit is deasserted (PWMLOCK = 0), the PWMxCON1, PxFLTACON and PxFLTBCON registers are writable at all times. Refer to **Section 14.** "Motor Control PWM" (DS70187) in the "dsPlC33F/PlC24H Family Reference Manual" for details on the unlock sequence.

# 16.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 18. "Serial Peripheral Interface (SPI)" (DS70206) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, Analog-to-Digital Converters, etc. The SPI module is compatible with SPI and SIOP from Motorola<sup>®</sup>.

Each SPI module consists of a 16-bit shift register, SPIxSR (where x = 1 or 2), used for shifting data in and out, and a buffer register, SPIxBUF. A control register, SPIxCON, configures the module. Additionally, a status register, SPIxSTAT, indicates status conditions.

The serial interface consists of four pins:

- · SDIx (serial data input)
- · SDOx (serial data output)
- · SCKx (shift clock input or output)
- SSx (active-low slave select).

In Master mode operation, SCKx is a clock output. In Slave mode, it is a clock input.

FIGURE 16-1: SPIX MODULE BLOCK DIAGRAM

## 16.1 SPI Helpful Tips

- In Frame mode, if there is a possibility that the master may not be initialized before the slave:
  - a) If FRMPOL (SPIxCON2<13>) = 1, use a pull-down resistor on SSx.
  - b) If FRMPOL = 0, use a pull-up resistor on  $\overline{SSx}$ .

**Note:** This insures that the first frame transmission after initialization is not shifted or corrupted.

- 2. <u>In N</u>on-Framed 3-Wire mode, (i.e., not using SSx from a master):
  - a) If CKP (SPIxCON1
     6>) = 1, always place a pull-up resistor on SSx.
  - b) If CKP = 0, always place a pull-down resistor on SSx.

Note: This will insure that during power-up and initialization, the master/slave will not lose sync due to an errant SCK transition that would cause the slave to accumulate data shift errors for both transmit and receive, appearing as corrupted data.

FRMEN (SPIxCON2<15>) = 1 and SSEN (SPIxCON1<7>) = 1 are exclusive and invalid.
 In Frame mode, SCKx is continuous and the Frame Sync pulse is active on the SSx pin, which indicates the start of a data frame.

**Note:** Not all third-party devices support Frame mode timing. Refer to the SPI electrical characteristics for details.

- In Master mode only, set the SMP bit (SPIxCON1<9>) to a '1' for the fastest SPI data rate possible. The SMP bit can only be set at the same time or after the MSTEN bit (SPIxCON1<5>) is set
- 5. To avoid invalid slave read data to the master, the user's master software must ensure enough time for slave software to fill its write buffer before the user application initiates a master write/read cycle. It is always advisable to preload the SPIxBUF Transmit register in advance of the next master transaction cycle. SPIxBUF is transferred to the SPIx Shift register and is empty once the data transmission begins.
- The SPI related pins (SDI1, SDO1, SCK1) are located at fixed positions in the dsPIC33FJ16(GP/ MC)10X devices. The same pins are remappable in the dsPIC33FJ32(GP/MC)10X devices.

### 16.2 SPI Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

http://www.microchip.com/wwwproducts/ Devices.aspx?dDocName=en554109

# 17.0 INTER-INTEGRATED CIRCUIT™ (I<sup>2</sup>C™)

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 19. "Inter-Integrated Circuit™ (I²C™)" (DS70195) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit<sup>TM</sup> ( $I^2C^{TM}$ ) module provides complete hardware support for both Slave and Multi-Master modes of the  $I^2C$  serial communication standard, with a 16-bit interface.

The I<sup>2</sup>C module has a 2-pin interface:

- · The SCLx pin is clock
- · The SDAx pin is data

The I<sup>2</sup>C module offers the following key features:

- I<sup>2</sup>C interface supporting both Master and Slave modes of operation.
- I<sup>2</sup>C Slave mode supports 7-bit and 10-bit addresses
- I<sup>2</sup>C Master mode supports 7-bit and 10-bit addresses
- I<sup>2</sup>C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for I<sup>2</sup>C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I<sup>2</sup>C supports multi-master operation, detects bus collision and arbitrates accordingly

# 17.1 Operating Modes

The hardware fully implements all the master and slave functions of the I<sup>2</sup>C Standard and Fast mode specifications, as well as 7-bit and 10-bit addressing.

The I<sup>2</sup>C module can operate either as a slave or a master on an I<sup>2</sup>C bus.

The following types of I<sup>2</sup>C operation are supported:

- I<sup>2</sup>C slave operation with 7-bit address
- I<sup>2</sup>C slave operation with 10-bit address
- I<sup>2</sup>C master operation with 7-bit or 10-bit address

For details about the communication sequence in each of these modes, refer to the Microchip web site (www.microchip.com) for the latest "dsPIC33F/PIC24H Family Reference Manual" sections.

# 17.2 I<sup>2</sup>C Registers

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CxSTAT are read/write:

- · I2CxRSR is the shift register used for shifting data
- I2CxRCV is the receive buffer and the register to which data bytes are written or from which data bytes are read
- I2CxTRN is the transmit register to which bytes are written during a transmit operation
- · I2CxADD register holds the slave address
- ADD10 status bit indicates 10-Bit Addressing mode
- I2CxBRG acts as the Baud Rate Generator (BRG) reload value

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV and an interrupt pulse is generated.

-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15 I2CEN: I2Cx Enable bit

1 = Enables the I2Cx module and configures the SDAx and SCLx pins as serial port pins

0 = Disables the I2Cx module; all I<sup>2</sup>C pins are controlled by port functions

bit 14 Unimplemented: Read as '0'

bit 13 I2CSIDL: I2Cx Stop in Idle Mode bit

1 = Discontinues module operation when device enters an Idle mode

0 = Continues module operation in Idle mode

bit 12 **SCLREL:** SCLx Release Control bit (when operating as I<sup>2</sup>C slave)

1 = Releases SCLx clock

0 = Holds SCLx clock low (clock stretch)

#### If STREN = 1:

Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clears at beginning of every slave data byte transmission. Hardware clears at end of every slave address byte reception. Hardware clears at every slave data byte reception.

### If STREN = 0:

Bit is R/S (i.e., software can only write '1' to release clock). Hardware clears at beginning of every slave data byte transmission. Hardware clears at end of every slave address byte reception.

bit 11 IPMIEN: Intelligent Peripheral Management Interface (IPMI) Enable bit

1 = IPMI mode is enabled; all addresses Acknowledged

0 = IPMI mode is disabled

bit 10 A10M: I2Cx 10-Bit Slave Address bit

1 = I2CxADD is a 10-bit slave address

0 = I2CxADD is a 7-bit slave address

bit 9 DISSLW: Disable Slew Rate Control bit

1 = Slew rate control is disabled

0 = Slew rate control is enabled

bit 8 SMEN: SMBus Input Levels bit

1 = Enables I/O pin thresholds compliant with SMBus specification

0 = Disables SMBus input thresholds

bit 7 **GCEN:** General Call Enable bit (when operating as I<sup>2</sup>C slave)

1 = Enables interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)

0 = General call address is disabled

# REGISTER 17-1: I2CxCON: I2Cx CONTROL REGISTER (CONTINUED)

bit 6 STREN: SCLx Clock Stretch Enable bit (when operating as I<sup>2</sup>C slave)

Used in conjunction with the SCLREL bit.

- 1 = Enables software or receives clock stretching
- 0 = Disables software or receives clock stretching
- bit 5 **ACKDT:** Acknowledge Data bit (when operating as I<sup>2</sup>C master, applicable during master receive)

Value that will be transmitted when the software initiates an Acknowledge sequence.

- 1 = Sends NACK during Acknowledge
- 0 = Sends ACK during Acknowledge
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit (when operating as I<sup>2</sup>C master, applicable during master receive)
  - 1 = Initiates Acknowledge sequence on SDAx and SCLx pins and transmits ACKDT data bit; hardware clears at end of master Acknowledge sequence
  - 0 = Acknowledge sequence is not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Enables Receive mode for I<sup>2</sup>C; hardware clears at end of eighth bit of the master receive data byte.
  - 0 = Receive sequence is not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Initiates Stop condition on SDAx and SCLx pins; hardware clears at end of the master Stop sequence
  - 0 = Stop condition not in progress
- bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Initiates Repeated Start condition on SDAx and SCLx pins; hardware clears at end of the master Repeated Start sequence
  - 0 = Repeated Start condition is not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Initiates Start condition on SDAx and SCLx pins; hardware clears at end of master Start sequence
  - 0 = Start condition is not in progress

bit 15 ACKSTAT: Acknowledge Status bit

(when operating as I<sup>2</sup>C master, applicable to master transmit operation)

1 = NACK received from slave

0 = ACK received from slave

Hardware sets or clears at end of slave Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I<sup>2</sup>C master, applicable to master transmit operation)

1 = Master transmit is in progress (8 bits + ACK)

0 = Master transmit is not in progress

Hardware sets at beginning of master transmission. Hardware clears at end of slave Acknowledge.

bit 13-11 **Unimplemented:** Read as '0'

bit 10 BCL: Master Bus Collision Detect bit

1 = A bus collision has been detected during a master operation

0 = No collision

Hardware sets at detection of bus collision.

bit 9 GCSTAT: General Call Status bit

1 = General call address was received

0 = General call address was not received

Hardware sets when address matches general call address. Hardware clears at Stop detection.

bit 8 ADD10: 10-Bit Address Status bit

1 = 10-bit address was matched

0 = 10-bit address was not matched

Hardware sets at match of 2nd byte of matched 10-bit address. Hardware clears at Stop detection.

bit 7 IWCOL: Write Collision Detect bit

1 = An attempt to write to the I2CxTRN register failed because the I<sup>2</sup>C module is busy

0 = No collision

Hardware sets at occurrence of a write to I2CxTRN while busy (cleared by software).

bit 6 **I2COV:** Receive Overflow Flag bit

1 = A byte was received while the I2CxRCV register is still holding the previous byte

0 = No overflow

Hardware sets at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

bit 5 **D\_A:** Data/Address bit (when operating as I<sup>2</sup>C slave)

1 = Indicates that the last byte received was data

0 = Indicates that the last byte received was device address

Hardware clears at device address match. Hardware sets by reception of a slave byte.

bit 4 **P:** Stop bit

1 = Indicates that a Stop bit has been detected last

0 = Stop bit was not detected last

Hardware sets or clears when Start, Repeated Start or Stop is detected.

# REGISTER 17-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

bit 3 **S:** Start bit

1 = Indicates that a Start (or Repeated Start) bit has been detected last

0 = Start bit was not detected last

Hardware sets or clears when Start, Repeated Start or Stop is detected.

bit 2 **R\_W**: Read/Write Information bit (when operating as I<sup>2</sup>C slave)

1 = Read – indicates data transfer is output from slave

0 = Write - indicates data transfer is input to slave

Hardware sets or clears after reception of an I<sup>2</sup>C device address byte.

bit 1 RBF: Receive Buffer Full Status bit

1 = Receive is complete, I2CxRCV is full

0 = Receive is not complete, I2CxRCV is empty

Hardware sets when I2CxRCV is written with received byte. Hardware clears when software reads

I2CxRCV.

bit 0 TBF: Transmit Buffer Full Status bit

1 = Transmit in progress, I2CxTRN is full

0 = Transmit complete, I2CxTRN is empty

Hardware sets when software writes to I2CxTRN. Hardware clears at completion of data transmission.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104
NOTES:

# 18.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 17. "UART" (DS70188) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 device family. The UART is a full-duplex asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the UxCTS and UxRTS pins, and also includes an IrDA® encoder and decoder.

The primary features of the UART module are:

- Full-Duplex, 8-Bit or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity options (for 8-bit data)
- · One or Two Stop bits
- Hardware Flow Control Option with UxCTS and UxRTS Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 1 Mbps to 6 bps at 16x mode at 16 MIPS
- Baud Rates Ranging from 4 Mbps to 24.4 bps at 4x mode at 16 MIPS
- 4-Deep First-In First-Out (FIFO) Transmit Data Buffer
- · 4-Deep FIFO Receive Data Buffer
- · Parity, Framing and Buffer Overrun Error Detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- · Transmit and Receive Interrupts
- A Separate Interrupt for all UART Error Conditions
- · Loopback mode for Diagnostic Support
- · Support for Sync and Break Characters
- · Support for Automatic Baud Rate Detection
- IrDA<sup>®</sup> Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA® Support

A simplified block diagram of the UART module is shown in Figure 18-1. The UART module consists of these key hardware elements:

- · Baud Rate Generator
- Asynchronous Transmitter
- · Asynchronous Receiver

FIGURE 18-1: UART SIMPLIFIED BLOCK DIAGRAM

# 18.1 UART Helpful Tips

- 1. In multi-node direct connect UART networks, UART receive inputs react to the complementary logic level, defined by the URXINV bit (UxMODE<4>) which defines the Idle state, the default of which is logic high (i.e., URXINV = 0). Because remote devices do not initialize at the same time, it is likely that one of the devices, because the RX line is floating, will trigger a Start bit detection and will cause the first byte received after the device has been initialized to be invalid. To avoid this situation, the user should use a pull-up or pull-down resistor on the RX pin depending on the value of the URXINV bit.
  - a) If URXINV = 0, use a pull-up resistor on the RX pin.
  - b) If URXINV = 1, use a pull-down resistor on the RX pin.
- 2. The first character received on a wake-up from Sleep mode, caused by activity on the UxRX pin of the UART module, will be invalid. In Sleep mode, peripheral clocks are disabled. By the time the oscillator system has restarted and stabilized from Sleep mode, the baud rate bit sampling clock, relative to the incoming UxRX bit timing, is no longer synchronized, resulting in the first character being invalid. This is to be expected.

### 18.2 UART Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Note:

In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/

bit 15 **UARTEN:** UARTx Enable bit<sup>(1)</sup>

1 = UARTx is enabled; all UARTx pins are controlled by UARTx as defined by the UEN<1:0> bits

0 = UARTx is disabled; all UARTx pins are controlled by port latches; UARTx power consumption is minimal

bit 14 Unimplemented: Read as '0'

bit 13 USIDL: UARTx Stop in Idle Mode bit

1 = Discontinues module operation when device enters Idle mode

0 = Continues module operation in Idle mode

bit 12 IREN: IrDA® Encoder and Decoder Enable bit<sup>(2)</sup>

1 = IrDA encoder and decoder are enabled

0 = IrDA encoder and decoder are disabled

bit 11 RTSMD: UARTx Mode Selection for UxRTS Pin bit

1 = UxRTS pin in Simplex mode

 $0 = \overline{\text{UxRTS}}$  pin in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UARTx Pin Enable bits

11 = UxTX, UxRX and BCLK pins are enabled and used; UxCTS pin is controlled by port latches

10 = UxTX, UxRX,  $\overline{\text{UxCTS}}$  and  $\overline{\text{UxRTS}}$  pins are enabled and used

01 = UxTX, UxRX and UxRTS pins are enabled and used; UxCTS pin is controlled by port latches

00 = UxTX and UxRX pins are enabled and used; UxCTS and UxRTS/BCLK pins are controlled by port latches

bit 7 WAKE: Wake-up on Start bit Detect During Sleep Mode Enable bit

1 = UARTx will continue to sample the UxRX pin; interrupt is generated on falling edge; bit is cleared in hardware on following rising edge

0 = No wake-up is enabled

bit 6 LPBACK: UARTx Loopback Mode Select bit

1 = Enables Loopback mode

0 = Loopback mode is disabled

bit 5 ABAUD: Auto-Baud Enable bit

1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h) before other data; cleared in hardware upon completion

0 = Baud rate measurement is disabled or completed

**Note 1:** Refer to **Section 17. "UART"** (DS70188) in the "dsPIC33F/PIC24H Family Reference Manual" for information on enabling the UART module for receive or transmit operation.

2: This feature is available for 16x BRG mode (BRGH = 0) only.

# REGISTER 18-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

bit 4 URXINV: UARTx Receive Polarity Inversion bit

1 = UxRX Idle state is '0' 0 = UxRX Idle state is '1'

bit 3 BRGH: High Baud Rate Enable bit

1 = BRG generates 4 clocks per bit period (4x baud clock, High-Speed mode)
 0 = BRG generates 16 clocks per bit period (16x baud clock, Standard mode)

bit 2-1 PDSEL<1:0>: Parity and Data Selection bits

11 = 9-bit data, no parity 10 = 8-bit data, odd parity 01 = 8-bit data, even parity 00 = 8-bit data, no parity

bit 0 STSEL: Stop Bit Selection bit

1 = Two Stop bits
0 = One Stop bit

**Note 1:** Refer to **Section 17. "UART"** (DS70188) in the "dsPIC33F/PIC24H Family Reference Manual" for information on enabling the UART module for receive or transmit operation.

2: This feature is available for 16x BRG mode (BRGH = 0) only.

- bit 11 UTXBRK: UARTx Transmit Break bit
  - 1 = Sends Sync Break on next transmission Start bit, followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
  - 0 = Sync Break transmission is disabled or completed
- bit 10 UTXEN: UARTx Transmit Enable bit(1)
  - 1 = Transmit is enabled, UxTX pin is controlled by UARTx
  - 0 = Transmit is disabled, any pending transmission is aborted and the buffer is reset; UxTX pin is controlled by port
- bit 9 **UTXBF:** UARTx Transmit Buffer Full Status bit (read-only)
  - 1 = Transmit buffer is full
  - 0 = Transmit buffer is not full, at least one more character can be written
- bit 8 **TRMT:** Transmit Shift Register Empty bit (read-only)
  - 1 = Transmit Shift Register is empty and transmit buffer is empty (the last transmission has completed)
  - 0 = Transmit Shift Register is not empty, a transmission is in progress or queued
- bit 7-6 URXISEL<1:0>: UARTx Receive Interrupt Mode Selection bits
  - 11 = Interrupt is set on UxRSR transfer, making the receive buffer full (i.e., has 4 data characters)
  - 10 = Interrupt is set on UxRSR transfer, making the receive buffer 3/4 full (i.e., has 3 data characters)
  - 0x = Interrupt is set when any character is received and transferred from the UxRSR to the receive buffer; receive buffer has one or more characters
- **Note 1:** Refer to **Section 17. "UART"** (DS70188) in the "dsPIC33F/PIC24H Family Reference Manual" for information on enabling the UART module for transmit operation.

# REGISTER 18-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 5 **ADDEN:** Address Character Detect bit (Bit 8 of received data = 1)
  - 1 = Address Detect mode is enabled; if 9-bit mode is not selected, this does not take effect
  - 0 = Address Detect mode is disabled
- bit 4 **RIDLE:** Receiver Idle bit (read-only)
  - 1 = Receiver is Idle
  - 0 = Receiver is active
- bit 3 **PERR:** Parity Error Status bit (read-only)
  - 1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
  - 0 = Parity error has not been detected
- bit 2 FERR: Framing Error Status bit (read-only)
  - 1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
  - 0 = Framing error has not been detected
- bit 1 **OERR:** Receive Buffer Overrun Error Status bit (read-only/clear only)
  - 1 = Receive buffer has overflowed
  - 0 = Receive buffer has not overflowed; clearing a previously set OERR bit (1  $\rightarrow$  0 transition) will reset the receiver buffer and the UxRSR to the empty state
- bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
  - 1 = Receive buffer has data, at least one more character can be read
  - 0 = Receive buffer is empty
- **Note 1:** Refer to **Section 17. "UART"** (DS70188) in the "dsPIC33F/PIC24H Family Reference Manual" for information on enabling the UART module for transmit operation.

# 19.0 10-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 16. "Analog-to-Digital Converter (ADC)" (DS70183) in the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices have up to 14 ADC module input channels.

# 19.1 Key Features

The 10-bit ADC configuration has the following key features:

- · Successive Approximation (SAR) conversion
- · Conversion speeds of up to 1.1 Msps
- · Up to 14 analog input pins
- Four Sample-and-Hold (S&H) circuits for simultaneous sampling of up to four analog input pins
- · Automatic Channel Scan mode
- · Selectable conversion trigger source
- · Selectable Buffer Fill modes
- Four result alignment options (signed/unsigned, fractional/integer)
- · Operation during CPU Sleep and Idle modes
- · 16-word conversion result buffer

Depending on the particular device pinout, the ADC can have up to 14 analog input pins.

Block diagrams of the ADC module are shown in Figure 19-1 through Figure 19-3.

#### 19.2 ADC Initialization

To configure the ADC module:

- Select port pins as analog inputs (AD1PCFGL<15:0>).
- 2. Select the analog conversion clock to match the desired data rate with the processor clock (ADxCON3<7:0>).
- 3. Determine how many Sample-and-Hold channels will be used (ADxCON2<9:8>).
- Select the appropriate sample/conversion sequence (ADxCON1<7:5> and ADxCON3<12:8>).
- 5. Select the way conversion results are presented in the buffer (ADxCON1<9:8>).
- Turn on the ADC module (ADxCON1<15>).
- 7. Configure ADC interrupt (if required):
  - a) Clear the ADxIF bit.
  - b) Select the ADC interrupt priority.

DS70652E-page 218

#### FIGURE 19-4: ADC CONVERSION CLOCK PERIOD BLOCK DIAGRAM

## 19.3 ADC Helpful Tips

- 1. The SMPI<3:0> (AD1CON2<5:2>) control bits:
  - a) Determine when the ADC interrupt flag is set and an interrupt is generated if enabled.
  - b) When the CSCNA bit (AD1CON2<10>) is set to '1', determine when the ADC analog scan channel list, defined in the AD1CSSL register, starts over from the beginning.
- The ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF regardless of which analog inputs are being used, subject to the SMPI<3:0> bits (AD1CON2<5:2>). There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
- 3. The DONE bit (AD1CON1<0>) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely, even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in Manual Sample mode, particularly where the user's code is setting the SAMP bit (AD1CON1<1>), the DONE bit should also be cleared by the user application just before setting the SAMP bit.

### 19.4 ADC Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554109

### 19.5 ADC Control Registers

### REGISTER 19-1: AD1CON1: ADC1 CONTROL REGISTER 1

R/W-0	U-0	R/W-0	U-0	U-0	U-0	R/W-0	R/W-0
ADON	_	ADSIDL	_	_	_	FORM	1<1:0>
bit 15							bit 8

R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-0	R/W-0, HC, HS	R/C-0, HC, HS
	SSRC<2:0>		_	SIMSAM	ASAM	SAMP	DONE
bit 7							bit 0

Legend:	HC = Hardware Clearable bit	HS = Hardware Settable bit	C = Clearable bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'			
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown		

bit 15 **ADON:** ADC Operating Mode bit

1 = ADC module is operating

0 = ADC is off

bit 14 **Unimplemented:** Read as '0'

bit 13 ADSIDL: ADC Stop in Idle Mode bit

1 = Discontinues module operation when device enters Idle mode

0 = Continues module operation in Idle mode

bit 12-10 **Unimplemented:** Read as '0'

bit 9-8 **FORM<1:0>:** Data Output Format bits

11 = Signed fractional (Dout = sddd dddd dd00 0000, where s = .NoT.d<9>)

10 = Fractional (Dout = dddd dddd dd00 0000)

01 = Signed integer (Dout = ssss sssd dddd dddd, where s = .NoT.d<9>)

00 = Integer (Dout = 0000 00dd dddd dddd)

bit 7-5 SSRC<2:0>: Sample Clock Source Select bits

111 = Internal counter ends sampling and starts conversion (auto-convert)

110 = CTMU

101 = Reserved

100 = Reserved

011 = Motor control PWM interval ends sampling and starts conversion<sup>(1)</sup>

010 = GP Timer3 compare ends sampling and starts conversion

001 = Active transition on INT0 pin ends sampling and starts conversion

000 = Clearing SAMP bit ends sampling and starts conversion

bit 4 Unimplemented: Read as '0'

bit 3 SIMSAM: Simultaneous Sample Select bit (applicable only when CHPS<1:0> = 01 or 1x)

1 = Samples CH0, CH1, CH2, CH3 simultaneously (when CHPS<1:0> = 1x); or samples CH0 and CH1 simultaneously (when CHPS<1:0> = 01)

0 = Samples multiple channels individually in sequence

bit 2 ASAM: ADC Sample Auto-Start bit

1 = Sampling begins immediately after last conversion; SAMP bit is auto-set

0 = Sampling begins when the SAMP bit is set

Note 1: This feature is available in dsPIC33FJ(16/32)MC10X devices only.

### REGISTER 19-1: AD1CON1: ADC1 CONTROL REGISTER 1 (CONTINUED)

bit 1 SAMP: ADC Sample Enable bit

1 = ADC Sample-and-Hold amplifiers are sampling0 = ADC Sample-and-Hold amplifiers are holding

If ASAM = 0, software can write '1' to begin sampling; automatically set by hardware if ASAM = 1. If SSRC<2:0> = 000, software can write '0' to end sampling and start conversion. If SSRC<2:0>  $\neq$  000, automatically cleared by hardware to end sampling and start conversion.

bit 0 **DONE:** ADC Conversion Status bit

1 = ADC conversion cycle is completed

0 = ADC conversion has not started or is in progress

Automatically set by hardware when ADC conversion is complete. Software can write '0' to clear the DONE bit status (software not allowed to write '1'). Clearing this bit will NOT affect any operation in progress. Automatically cleared by hardware at start of a new conversion.

Note 1: This feature is available in dsPIC33FJ(16/32)MC10X devices only.

#### 20.0 COMPARATOR MODULE

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 device families. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 54. "Comparator with Blanking" (DS70647) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The comparator module provides three comparators that can be configured in different ways. As shown in Figure 20-1, individual comparator options are specified by the comparator module's Special Function Register (SFR) control bits.

These options allow users to:

- Select the edge for trigger and interrupt generation
- · Select low-power control
- Configure the comparator voltage reference and band gap
- · Configure output blanking and masking

The comparator operating mode is determined by the input selections (i.e., whether the input voltage is compared to a second input voltage) to an internal voltage reference.

2: This reference voltage is generated internally on the device. Refer to Section 26.0 "Electrical Characteristics" for the specified voltage range.

## 21.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 device families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 37. "Real-Time Clock and Calendar (RTCC)" (DS70310) in the "dsPIC33F/PIC24H Family Reference Manual", which is available on the Microchip web site (www.microchip.com).

> 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

This chapter discusses the Real-Time Clock and Calendar (RTCC) module, available on dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices, and its operation.

Some of the key features of the RTCC module are:

- · Time: hours, minutes and seconds
- · 24-hour format (military time)
- · Calendar: weekday, date, month and year
- · Alarm configurable
- Year range: 2000 to 2099
- · Leap year correction
- · BCD format for compact firmware
- Optimized for low-power operation
- · User calibration with auto-adjust
- · Calibration range: ±2.64 seconds error per month
- · Requirements: external 32.768 kHz clock crystal
- · Alarm pulse or seconds clock output on RTCC pin

The RTCC module is intended for applications where accurate time must be maintained for extended periods of time with minimum to no intervention from the CPU. The RTCC module is optimized for low-power usage to provide extended battery lifetime while keeping track of time.

The RTCC module is a 100-year clock and calendar with automatic leap year detection. The range of the clock is from 00:00:00 (midnight) on January 1, 2000 to 23:59:59 on December 31, 2099.

The hours are available in 24-hour (military time) format. The clock provides a granularity of one second with half-second visibility to the user.

FIGURE 21-1: RTCC BLOCK DIAGRAM

### 21.1 RTCC Module Registers

The RTCC module registers are organized into three categories:

- · RTCC Control Registers
- · RTCC Value Registers
- · Alarm Value Registers

#### 21.1.1 REGISTER MAPPING

To limit the register interface, the RTCC Timer and Alarm Time registers are accessed through corresponding register pointers. The RTCC Value register window (RTCVALH and RTCVALL) uses the RTCPTR bits (RCFGCAL<9:8>) to select the desired Timer register pair (see Table 21-1).

By writing the RTCVALH byte, the RTCC Pointer value (RTCPTR<1:0> bits) decrements by one until it reaches '00'. Once it reaches '00', the MINUTES and SECONDS value will be accessible through RTCVALH and RTCVALL until the pointer value is manually changed.

TABLE 21-1: RTCVAL REGISTER MAPPING

RTCPTR	RTCC Value Register Window					
<1:0>	RTCVAL<15:8>	RTCVAL<7:0>				
0.0	MINUTES	SECONDS				
01	WEEKDAY	HOURS				
10	MONTH	DAY				
11	_	YEAR				

The Alarm Value register window (ALRMVALH and ALRMVALL) uses the ALRMPTR bits (ALCFGRPT<9:8>) to select the desired Alarm register pair (see Table 21-2).

By writing the ALRMVALH byte, the Alarm Pointer value (ALRMPTR<1:0> bits) decrements by one until it reaches '00'. Once it reaches '00', the ALRMMIN and ALRMSEC value will be accessible through ALRMVALH and ALRMVALL until the pointer value is manually changed.

TABLE 21-2: ALRMVAL REGISTER MAPPING

ALRMPTR	Alarm Value Register Window				
<1:0>	ALRMVAL<15:8>	ALRMVAL<7:0>			
00	ALRMMIN	ALRMSEC			
01	ALRMWD	ALRMHR			
10	ALRMMNTH	ALRMDAY			
11	_	_			

Considering that the 16-bit core does not distinguish between 8-bit and 16-bit read operations, the user must be aware that when reading either the ALRMVALH or ALRMVALL, bytes will decrement the ALRMPTR<1:0> value. The same applies to the RTCVALH or RTCVALL bytes with the RTCPTR<1:0> being decremented.

Note:	This only applies to read operations and
	not write operations.

#### 21.1.2 WRITE LOCK

In order to perform a write to any of the RTCC Timer registers, the RTCWREN bit (RCFGCAL<13>) must be set (refer to Example 21-1).

Note: To avoid accidental writes to the timer, it is recommended that the RTCWREN bit (RCFGCAL<13>) is kept clear at any other time. For the RTCWREN bit to be set, there is only 1 instruction cycle time window allowed between the 55h/AA sequence and the setting of RTCWREN; therefore, it is recommended that code follow the procedure in Example 21-1.

#### **EXAMPLE 21-1: SETTING THE RTCWREN BIT**

MOV	#NVMKEY, W1	;move the address of NVMKEY into W1
MOV	#0x55, W2	
VOM	#0xAA, W3	
MOV	W2, [W1]	;start 55/AA sequence
VOM	W3, [W1]	
BSET	RCFGCAL, #13	;set the RTCWREN bit

## 21.2 RTCC Control Registers

## REGISTER 21-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER<sup>(1)</sup>

bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0		
CAL<7:0>									
bit 7							bit 0		

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read	l as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **RTCEN**: RTCC Enable bit<sup>(2)</sup>

1 = RTCC module is enabled0 = RTCC module is disabled

bit 14 Unimplemented: Read as '0'

bit 13 RTCWREN: RTCC Value Registers Write Enable bit

1 = RTCVALH and RTCVALL registers can be written to by the user

0 = RTCVALH and RTCVALL registers are locked out from being written to by the user

bit 12 RTCSYNC: RTCC Value Registers Read Synchronization bit

1 = RTCVALH, RTCVALL and ALCFGRPT registers can change while reading, due to a rollover ripple, resulting in an invalid data read. If the register is read twice and the results are the same data, the data can be assumed to be valid.

0 = RTCVALH, RTCVALL or ALCFGRPT registers can be read without concern over a rollover ripple

bit 11 HALFSEC: Half-Second Status bit (3)

1 = Second half period of a second

0 = First half period of a second

bit 10 RTCOE: RTCC Output Enable bit

1 = RTCC output is enabled

0 = RTCC output is disabled

bit 9-8 RTCPTR<1:0>: RTCC Value Register Window Pointer bits

Points to the corresponding RTCC Value registers when reading RTCVALH and RTCVALL registers; the RTCPTR<1:0> value decrements on every read or write of RTCVALH until it reaches '00'.

RTCVAL<15:8>:

00 = MINUTES

01 = WEEKDAY

10 = MONTH

11 = Reserved

RTCVAL<7:0>:

00 = SECONDS

01 = HOURS

10 = DAY

11 **= YEAR** 

Note 1: The RCFGCAL register is only affected by a POR.

2: A write to the RTCEN bit is only allowed when RTCWREN = 1.

3: This bit is read-only; it is cleared to '0' on a write to the lower half of the MINSEC register.

## REGISTER 21-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER<sup>(1)</sup> (CONTINUED)

bit 7-0 CAL<7:0>: RTC Drift Calibration bits

01111111 = Maximum positive adjustment; adds 508 RTC clock pulses every one minute

•

00000001 = Minimum positive adjustment; adds 4 RTC clock pulses every one minute

00000000 **= No adjustment** 

11111111 = Minimum negative adjustment; subtracts 4 RTC clock pulses every one minute

•

•

10000000 = Maximum negative adjustment; subtracts 512 RTC clock pulses every one minute

**Note 1:** The RCFGCAL register is only affected by a POR.

2: A write to the RTCEN bit is only allowed when RTCWREN = 1.

**3:** This bit is read-only; it is cleared to '0' on a write to the lower half of the MINSEC register.

0111 = Once a week

1000 = Once a month

1001 = Once a year (except when configured for February 29th, once every 4 years)

101x = Reserved - do not use

11xx = Reserved – do not use

bit 9-8 ALRMPTR<1:0>: Alarm Value Register Window Pointer bits

Points to the corresponding Alarm Value registers when reading ALRMVALH and ALRMVALL registers; the ALRMPTR<1:0> value decrements on every read or write of ALRMVALH until it reaches '00'.

#### ALRMVAL<15:8>:

00 = ALRMMIN

01 = ALRMWD

10 = ALRMMNTH

11 = Unimplemented

### ALRMVAL<7:0>:

00 = ALRMSEC

01 = ALRMHR

10 = ALRMDAY

11 = Unimplemented

bit 7-0 ARPT<7:0>: Alarm Repeat Counter Value bits

11111111 = Alarm will repeat 255 more times

•

00000000 = Alarm will not repeat

The counter decrements on any alarm event. The counter is prevented from rolling over from 0x00 to 0xFF unless CHIME = 1.

# 22.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 device families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 55. "Charge Time Measurement Unit (CTMU)" (DS70635) in the "dsPIC33F/PIC24H Family Reference Manual", which is available on the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Charge Time Measurement Unit (CTMU) is a flexible analog module that provides accurate differential time measurement between pulse sources, as well as asynchronous pulse generation. Its key features include:

- · Four edge input trigger sources
- · Polarity control for each edge source
- · Control of edge sequence
- · Control of response to edges
- · Precise time measurement resolution of 200 ps
- Accurate current source suitable for capacitive measurement
- On-chip temperature measurement using a built-in diode

Together with other on-chip analog modules, the CTMU can be used to precisely measure time, measure capacitance, measure relative changes in capacitance or generate output pulses that are independent of the system clock.

The CTMU module is ideal for interfacing with capacitive-based sensors. The CTMU is controlled through three registers: CTMUCON1, CTMUCON2 and CTMUICON. CTMUCON1 enables the module, the edge delay generation, sequencing of edges, and controls the current source and the output trigger. CTMUCON2 controls the edge source selection, edge source polarity selection and edge sampling mode. The CTMUICON register controls the selection and trim of the current source.

Figure 22-1 shows the CTMU block diagram.

### FIGURE 22-1: CTMU BLOCK DIAGRAM

### 22.1 CTMU Control Registers

### REGISTER 22-1: CTMUCON1: CTMU CONTROL REGISTER 1

R/W-0	U-0	U-0 R/W-0		R/W-0	R/W-0	R/W-0	R/W-0

bit 15							bit 8

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
_	_	_	_	_	_	_	_
bit 7	bit 7						bit 0

Legend:							
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'					
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown				

bit 15 CTMUEN: CTMU Enable bit

1 = Module is enabled0 = Module is disabled

bit 14 Unimplemented: Read as '0'

bit 13 CTMUSIDL: CTMU Stop in Idle Mode bit

1 = Discontinues module operation when device enters Idle mode

0 = Continues module operation in Idle mode

bit 12 **TGEN:** Time Generation Enable bit<sup>(1)</sup>

1 = Enables edge delay generation

0 = Disables edge delay generation

bit 11 **EDGEN:** Edge Enable bit

1 = Edges are not blocked

0 = Edges are blocked

bit 10 EDGSEQEN: Edge Sequence Enable bit

1 = Edge 1 event must occur before Edge 2 event can occur

0 = No edge sequence is needed

bit 9 IDISSEN: Analog Current Source Control bit<sup>(2)</sup>

1 = Analog current source output is grounded

0 = Analog current source output is not grounded

bit 8 CTTRIG: Trigger Control bit

1 = Trigger output is enabled

0 = Trigger output is disabled

bit 7-0 **Unimplemented:** Read as '0'

Note 1: If TGEN = 1, the peripheral inputs and outputs must be configured to an available RPn pin. For more information, see Section 10.4 "Peripheral Pin Select (PPS)".

2: The ADC module S&H capacitor is not automatically discharged between sample/conversion cycles. Software using the ADC as part of a capacitance measurement must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104
NOTES:

### 23.0 SPECIAL FEATURES

Note 1: This data sheet summarizes features of the dsPIC33FJ16(GP/ MC)101/102 and dsPIC33FJ32(GP/ MC)101/102/104 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 24. "Programming and Diagnostics" (DS70207) and Section 25. "Device Configuration" (DS70194) in the "dsPIC33F/PIC24H Family Reference Manual", which are available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- · Flexible Configuration
- Watchdog Timer (WDT)
- · Code Protection
- In-Circuit Serial Programming™ (ICSP™)
- · In-Circuit Emulation

### 23.1 Configuration Bits

The Configuration Shadow register bits can be configured (read as '0') or left unprogrammed (read as '1') to select various device configurations. These read-only bits are mapped starting at program memory location, 0xF80000. A detailed explanation of the various bit functions is provided in Table 23-4.

Note that address 0xF80000 is beyond the user program memory space and belongs to the configuration memory space (0x800000-0xFFFFFF), which can only be accessed using table reads.

dsPIC33FJ16(GP/MC)101/102 In and dsPIC33FJ32(GP/MC)101/102/104 devices, configuration bytes are implemented as volatile memory. This means that configuration data must be programmed each time the device is powered up. Configuration data is stored in the two words at the top of the on-chip program memory space, known as the Flash Configuration Words. Their specific locations are shown in Table 23-2. These are packed representations of the actual device Configuration bits, whose actual locations are distributed among several locations in configuration space. The configuration data is automatically loaded from the Flash Configuration Words to the proper Configuration registers during device Resets.

**Note:** Configuration data is reloaded on all types of device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration Word for configuration data. This is to make certain that program code is not stored in this address when the code is compiled.

The upper byte of all Flash Configuration Words in program memory should always be '1111 1111'. This makes them appear to be NOP instructions in the remote event that their locations are ever executed by accident. Since Configuration bits are not implemented in the corresponding locations, writing '1's to these locations has no effect on device operation.

Note: Performing a page erase operation on the last page of program memory clears the Flash Configuration Words, enabling code protection as a result. Therefore, users should avoid performing page erase operations on the last page of program memory.

The Configuration Shadow register map is shown in Table 23-1.

IECO	0 = User program memory is write-protected					
IESO	Two-Speed Oscillator Start-up Enable bit					
	1 = Starts up device with FRC, then automatically switches to the user-selected oscillator source when ready					
	0 = Starts up device with user-selected oscillator source					
PWMLOCK	PWM Lock Enable bit					
	1 = Certain PWM registers may only be written after key sequence					
	0 = PWM registers may be written without a key sequence					
WDTWIN<1:0>	Watchdog Timer Window Select bits					
	11 = WDT window is 24% of WDT period					
	10 = WDT window is 37.5% of WDT period					
	01 = WDT window is 50% of WDT period 00 = WDT window is 75% of WDT period					
FNOSC<2:0>	Oscillator Selection bits					
FN030<2.0>	111 = Fast RC Oscillator with Divide-by-N (FRCDIVN)					
	110 = Reserved; do not use					
	101 = Low-Power RC Oscillator (LPRC)					
	100 = Secondary Oscillator (SOSC)					
	011 = Primary Oscillator with PLL module (MS + PLL, EC + PLL)					
	010 = Primary Oscillator (MS, HS, EC)					
	001 = Fast RC Oscillator with Divide-by-N and PLL module (FRCDIVN + PLL)					
FOXOM 41:05	000 = Fast RC Oscillator (FRC)					
FCKSM<1:0>	Clock Switching Mode bits					
	1x = Clock switching is disabled, Fail-Safe Clock Monitor is disabled 01 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled					
	00 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled					
IOL1WAY	Peripheral Pin Select Configuration bit					
102111111	1 = Allow only one reconfiguration					
	0 = Allow multiple reconfigurations					
OSCIOFNC	OSC2 Pin Function bit (except in MS and HS modes)					
	1 = OSC2 is clock output					
	0 = OSC2 is general purpose digital I/O pin					
POSCMD<1:0>	Primary Oscillator Mode Select bits					
	11 = Primary Oscillator is disabled					
	10 = HS Crystal Oscillator mode (10 MHz-32 MHz)					
	01 = MS Crystal Oscillator mode (3 MHz-10 MHz)					
	00 = EC (External Clock) mode (DC-32 MHz)					
FWDTEN	Watchdog Timer Enable bit					
	1 = Watchdog Timer is always enabled (LPRC oscillator cannot be disabled; clearing the SWDTEN					
	bit in the RCON register will have no effect)					
	0 = Watchdog Timer is enabled/disabled by user software (LPRC can be disabled by clearing the SWDTEN bit in the RCON register)					
WINDIS	Watchdog Timer Window Enable bit					
VVIIVDIO	1 = Watchdog Timer in Non-Window mode					
	0 = Watchdog Timer in Window mode					
	o receiving time in trinder mode					

TABLE 23-4: dsPIC33F CONFIGURATION BITS DESCRIPTION (CONTINUED)

Bit Field	Description
WDTPRE	Watchdog Timer Prescaler bit
	1 = 1:128
	0 = 1:32
WDTPOST<3:0>	Watchdog Timer Postscaler bits
	1111 = 1:32,768
	1110 = 1:16,384
	•
	0001 = 1:2
	0000 = 1:1
PLLKEN	PLL Lock Enable bit
	1 = Clock switch to PLL will wait until the PLL lock signal is valid
	0 = Clock switch will not wait for the PLL lock signal
ALTI2C	Alternate I <sup>2</sup> C™ Pins bit
	$1 = I^2C$ is mapped to SDA1/SCL1 pins
	0 = I <sup>2</sup> C is mapped to ASDA1/ASCL1 pins
ICS<1:0>	ICD Communication Channel Select bits
	11 = Communicate on PGEC1 and PGED1
	10 = Communicate on PGEC2 and PGED2
	01 = Communicate on PGEC3 and PGED3 00 = Reserved, do not use
PWMPIN	Motor Control PWM Module Pin Mode bit
VVIVII IIV	1 = PWM module pins controlled by PORT register at device Reset (tri-stated)
	0 = PWM module pins controlled by PWM module at device Reset (in-stated)
HPOL	Motor Control PWM High Side Polarity bit
	1 = PWM module high side output pins have active-high output polarity
	0 = PWM module high side output pins have active-low output polarity
LPOL	Motor Control PWM Low Side Polarity bit
	1 = PWM module low side output pins have active-high output polarity
	0 = PWM module low side output pins have active-low output polarity

### 23.2 On-Chip Voltage Regulator

All of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices power their core digital logic at a nominal 2.5V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. When the regulator is enabled, a low-ESR (less than 5 ohms) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (Figure 23-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 26-14 located in Section 26.1 "DC Characteristics".

**Note:** It is important for low-ESR capacitors to be placed as close as possible to the VCAP pin.

On a POR, it takes approximately 20  $\mu s$  for the on-chip voltage regulator to generate an output voltage. During this time, designated as TSTARTUP, code execution is disabled. TSTARTUP is applied every time the device resumes operation after any power-down.

FIGURE 23-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR<sup>(1,2,3)</sup>

- Note 1: These are typical operating voltages. Refer to Table 26-14 located in Section 26.1 "DC Characteristics" for the full operating ranges of VDD and VCAP.
  - 2: It is important for low-ESR capacitors to be placed as close as possible to the VCAP pin.
  - 3: Typical VCAP pin voltage = 2.5V when VDD ≥ VDDMIN.

### 23.3 BOR: Brown-out Reset

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage, VCAP. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source, based on the device Configuration bit values (FNOSC<2:0> and POSCMD<1:0>).

If an Oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON<5>) is '1'.

Concurrently, the PWRT Time-out (TPWRT) is applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, then a nominal delay of TFSCM = 100 is applied. The total delay in this case is TFSCM.

The BOR Status bit (RCON<1>) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle modes and resets the device should VDD fall below the BOR threshold voltage.

### 23.4 Watchdog Timer (WDT)

For dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

#### 23.4.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler than can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a nominal WDT Time-out (TWDT) period of 1 ms in 5-bit mode or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods, ranging from 1 ms to 131 seconds, can be achieved.

The WDT, prescaler and postscaler are reset:

- · On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

te: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

#### 23.4.2 SLEEP AND IDLE MODES

If the WDT is enabled, it will continue to run during Sleep or Idle modes. When the WDT time-out occurs, the device will wake the device and code execution will continue from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bits (RCON<3:2>) will need to be cleared in software after the device wakes up.

#### 23.4.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disables the WDT during non-critical segments for maximum power savings.

Note: If the WINDIS bit (FWDT<6>) is cleared, the CLRWDT instruction should be executed by the application software only during the last 1/4 of the WDT period. This CLRWDT window can be determined by using a timer. If a CLRWDT instruction is executed before this window, a WDT Reset occurs.

The WDT flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

#### FIGURE 23-2: WDT BLOCK DIAGRAM

## 23.5 In-Circuit Serial Programming™ (ICSP™)

Devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the Digital Signal Controller just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the "dsPIC33F Flash Programming Specification for Devices with Volatile Configuration Bits" (DS70659) for details about In-Circuit Serial Programming (ICSP).

Any of the three pairs of programming clock/data pins can be used:

- · PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

### 23.6 In-Circuit Debugger

When MPLAB® ICD 3 is selected as a debugger, the incircuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- · PGEC1 and PGED1
- PGEC2 and PGED2
- · PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, VSS and the PGECx/PGEDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

### 24.0 INSTRUCTION SET SUMMARY

Note:

This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the latest family reference sections of the "dsPIC33F/PIC24H Family Reference Manual", which are available from the Microchip web site (www.microchip.com).

The dsPIC33F instruction set is identical to that of the dsPIC30F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- · Word or byte-oriented operations
- · Bit-oriented operations
- Literal operations
- · DSP operations
- · Control operations

Table 24-1 shows the general symbols used in describing the instructions.

The dsPIC33F instruction set summary in Table 24-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value 'f'
- The destination, which could be either the file register 'f' or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- · The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- · The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register 'Wn' or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the table read and table write instructions

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSbs are '0's. If this second word is executed as an instruction (by itself), it will execute as a NOP

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the Program Counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles with the additional instruction cycle(s) executed

as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all table reads and writes and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note:

For more details on the instruction set, refer to the "16-Bit MCU and DSC Programmer's Reference Manual" (DS70157).

TABLE 24-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
<n:m></n:m>	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.W	Word mode selection (default)
Acc	One of two accumulators {A, B}
AWB	Accumulator write-back destination address register ∈ {W13, [W13]+ = 2}
bit4	4-bit bit selection field (used in word addressed instructions) ∈ {015}
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0x00000x1FFF}
lit1	1-bit unsigned literal ∈ {0,1}
lit4	4-bit unsigned literal ∈ {015}
lit5	5-bit unsigned literal ∈ {031}
lit8	8-bit unsigned literal ∈ {0255}
lit10	10-bit unsigned literal $\in \{0255\}$ for Byte mode, $\{0:1023\}$ for Word mode
lit14	14-bit unsigned literal ∈ {016384}
lit16	16-bit unsigned literal ∈ {065535}
lit23	23-bit unsigned literal ∈ {08388608}; LSb must be '0'
None	Field does not require an entry, can be blank
OA, OB, SA, SB	DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate
PC	Program Counter
Slit10	10-bit signed literal ∈ {-512511}
Slit16	16-bit signed literal ∈ {-3276832767}
Slit6	6-bit signed literal ∈ {-1616}
Wb	Base W register ∈ {W0W15}
Wd	Destination W register ∈ { Wd, [Wd], [Wd++], [Wd], [++Wd], [Wd] }
Wdo	Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd], [++Wnd], [Wnd], [Wnd+Wb] }
Wm,Wn	Dividend, Divisor working register pair (direct addressing)

### TABLE 24-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)

Field	Description
Wm*Wm	Multiplicand and Multiplier working register pair for Square instructions ∈ {W4 * W4,W5 * W5,W6 * W6,W7 * W7}
Wm*Wn	Multiplicand and Multiplier working register pair for DSP instructions ∈ {W4 * W5,W4 * W6,W4 * W7,W5 * W6,W5 * W7,W6 * W7}
Wn	One of 16 working registers ∈ {W0W15}
Wnd	One of 16 destination working registers ∈ {W0W15}
Wns	One of 16 source working registers ∈ {W0W15}
WREG	W0 (working register used in file register instructions)
Ws	Source W register ∈ { Ws, [Ws], [Ws++], [Ws], [++Ws], [Ws] }
Wso	Source W register ∈ { Wns, [Wns], [Wns++], [Wns], [++Wns], [Wns], [Wns+Wb] }
Wx	X data space prefetch address register for DSP instructions ∈ {[W8] + = 6, [W8] + = 4, [W8] + = 2, [W8], [W8] - = 6, [W8] - = 4, [W8] - = 2, [W9] + = 6, [W9] + = 4, [W9] + = 2, [W9], [W9] - = 6, [W9] - = 4, [W9] - = 2, [W9 + W12], none}
Wxd	X data space prefetch destination register for DSP instructions ∈ {W4W7}
Wy	Y data space prefetch address register for DSP instructions ∈ {[W10] + = 6, [W10] + = 4, [W10] + = 2, [W10], [W10] - = 6, [W10] - = 4, [W10] - = 2, [W11] + = 6, [W11] + = 4, [W11] + = 2, [W11], [W11] - = 6, [W11] - = 4, [W11] - = 2, [W11 + W12], none}
Wyd	Y data space prefetch destination register for DSP instructions ∈ {W4W7}

### 25.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers and dsPIC® Digital Signal Controllers are supported with a full range of software and hardware development tools:

- · Integrated Development Environment
  - MPLAB® IDE Software
- · Compilers/Assemblers/Linkers
  - MPLAB C Compiler for Various Device Families
  - HI-TECH C® for Various Device Families
  - MPASM™ Assembler
  - MPLINK™ Object Linker/ MPLIB™ Object Librarian
  - MPLAB Assembler/Linker/Librarian for Various Device Families
- · Simulators
  - MPLAB SIM Software Simulator
- Emulators
  - MPLAB REAL ICE™ In-Circuit Emulator
- · In-Circuit Debuggers
  - MPLAB ICD 3
  - PICkit™ 3 Debug Express
- · Device Programmers
  - PICkit™ 2 Programmer
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits, and Starter Kits

## 25.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16/32-bit microcontroller market. The MPLAB IDE is a Windows® operating system-based application that contains:

- · A single graphical interface to all debugging tools
  - Simulator
  - Programmer (sold separately)
  - In-Circuit Emulator (sold separately)
  - In-Circuit Debugger (sold separately)
- · A full-featured editor with color-coded context
- A multiple project manager
- Customizable data windows with direct edit of contents
- · High-level source code debugging
- · Mouse over variable inspection
- Drag and drop variables from source to watch windows
- · Extensive on-line help
- Integration of select third party tools, such as IAR C Compilers

The MPLAB IDE allows you to:

- · Edit your source files (either C or assembly)
- One-touch compile or assemble, and download to emulator and simulator tools (automatically updates all project information)
- · Debug using:
  - Source files (C or assembly)
  - Mixed C and assembly
  - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.

## 25.2 MPLAB C Compilers for Various Device Families

The MPLAB C Compiler code development systems are complete ANSI C compilers for Microchip's PIC18, PIC24 and PIC32 families of microcontrollers and the dsPIC30 and dsPIC33 families of Digital Signal Controllers. These compilers provide powerful integration capabilities, superior code optimization and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

## 25.3 HI-TECH C for Various Device Families

The HI-TECH C Compiler code development systems are complete ANSI C compilers for Microchip's PIC family of microcontrollers and the dsPIC family of Digital Signal Controllers. These compilers provide powerful integration capabilities, omniscient code generation and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

The compilers include a macro assembler, linker, preprocessor, and one-step driver, and can run on multiple platforms.

### 25.4 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM Assembler features include:

- · Integration into MPLAB IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

### 25.5 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler and the MPLAB C18 C Compiler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

# 25.6 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC devices. MPLAB C Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- · Support for the entire device instruction set
- · Support for fixed-point and floating-point data
- · Command line interface
- · Rich directive set
- · Flexible macro language
- MPLAB IDE compatibility

### 25.7 MPLAB SIM Software Simulator

The MPLAB SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC® DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB SIM Software Simulator fully supports symbolic debugging using the MPLAB C Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

### 25.8 MPLAB REAL ICE In-Circuit Emulator System

MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs PIC<sup>®</sup> Flash MCUs and dsPIC<sup>®</sup> Flash DSCs with the easy-to-use, powerful graphical user interface of the MPLAB Integrated Development Environment (IDE), included with each kit.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with incircuit debugger systems (RJ11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB IDE. In upcoming releases of MPLAB IDE, new devices will be supported, and new features will be added. MPLAB REAL ICE offers significant advantages over competitive emulators including low-cost, full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, a ruggedized probe interface and long (up to three meters) interconnection cables.

# 25.9 MPLAB ICD 3 In-Circuit Debugger System

MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost effective high-speed hardware debugger/programmer for Microchip Flash Digital Signal Controller (DSC) and microcontroller (MCU) devices. It debugs and programs PIC® Flash microcontrollers and dsPIC® DSCs with the powerful, yet easy-to-use graphical user interface of MPLAB Integrated Development Environment (IDE).

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB REAL ICE systems (RJ-11).

# 25.10 PICkit 3 In-Circuit Debugger/ Programmer and PICkit 3 Debug Express

The MPLAB PICkit 3 allows debugging and programming of PIC<sup>®</sup> and dsPIC<sup>®</sup> Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB Integrated Development Environment (IDE). The MPLAB PICkit 3 is connected to the design engineer's PC using a full speed USB interface and can be connected to the target via an Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™.

The PICkit 3 Debug Express include the PICkit 3, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

# 25.11 PICkit 2 Development Programmer/Debugger and PICkit 2 Debug Express

The PICkit™ 2 Development Programmer/Debugger is a low-cost development tool with an easy to use interface for programming and debugging Microchip's Flash families of microcontrollers. The full featured Windows® programming interface supports baseline (PIC10F, PIC12F5xx, PIC16F5xx), midrange (PIC12F6xx, PIC16F), PIC18F, PIC24, dsPIC30, dsPIC33, and PIC32 families of 8-bit, 16-bit, and 32-bit microcontrollers, and many Microchip Serial EEPROM products. With Microchip's powerful MPLAB Integrated Development Environment (IDE) the PICkit™ 2 enables in-circuit debugging on most PIC® microcontrollers. In-Circuit-Debugging runs, halts and single steps the program while the PIC microcontroller is embedded in the application. When halted at a breakpoint, the file registers can be examined and modified.

The PICkit 2 Debug Express include the PICkit 2, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

### 25.12 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular, detachable socket assembly to support various package types. The ICSP™ cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an MMC card for file storage and data applications.

# 25.13 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, Keeloq® security ICs, CAN, IrDA®, PowerSmart battery management, Seeval® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

### 26.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings<sup>(1)</sup>

Ambient temperature under bias	40°C to +125°C
Storage temperature	65°C to +150°C
Voltage on VDD with respect to Vss	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to Vss <sup>(3)</sup>	0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to Vss when $VDD \ge 3.0V^{(3)}$	-0.3V to +5.6V
Voltage on any 5V tolerant pin with respect to Vss when VDD < 3.0V <sup>(3)</sup>	0.3V to (VDD + 0.3V)
Maximum current out of Vss pin	300 mA
Maximum current into VDD pin <sup>(2)</sup>	250 mA
Maximum output current sourced and sunk by any I/O pin excluding OSCO	15 mA
Maximum output current sourced and sunk by OSCO	25 mA
Maximum current sunk by all ports	200 mA
Maximum current sourced by all ports <sup>(2)</sup>	200 mA

- **Note 1:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
  - 2: Maximum allowable current is a function of the device maximum power dissipation (see Table 26-2).
  - 3: See the "Pin Diagrams" section for 5V tolerant pins.

### 26.1 DC Characteristics

TABLE 26-1: OPERATING MIPS vs. VOLTAGE

	Vpp Bongo	Tomp Banga	Max MIPS	
Characteristic	VDD Range (in Volts)	Temp Range (in °C)	dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104	
DC5	VBOR-3.6V <sup>(1)</sup>	-40°C to +85°C	16	
	VBOR-3.6V <sup>(1)</sup>	-40°C to +125°C	16	

**Note 1:** Overall functional device operation at VBOR < VDD < VDDMIN is ensured but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below VDDMIN.

**TABLE 26-2: THERMAL OPERATING CONDITIONS** 

Rating	Symbol	Min	Тур	Max	Unit
Industrial Temperature Devices					
Operating Junction Temperature Range	TJ	-40	_	+125	°C
Operating Ambient Temperature Range	TA	-40	_	+85	°C
Extended Temperature Devices					
Operating Junction Temperature Range	TJ	-40	_	+140	°C
Operating Ambient Temperature Range	TA	-40	_	+125	°C
Power Dissipation: Internal Chip Power Dissipation: $PINT = VDD \times (IDD - \Sigma IOH)$	PD PINT + PIO			W	
I/O Pin Power Dissipation: I/O = $\Sigma$ ({VDD - VOH} x IOH) + $\Sigma$ (VOL x IOL)					
Maximum Allowed Power Dissipation	PDMAX	(	ΓJ — TA)/θJ	IA	W

TABLE 26-3: THERMAL PACKAGING CHARACTERISTICS

Characteristic	Symbol	Тур	Max	Unit	Notes
Package Thermal Resistance, 18-pin PDIP	θЈА	50	_	°C/W	1
Package Thermal Resistance, 20-pin PDIP	θЈА	50	_	°C/W	1
Package Thermal Resistance, 28-pin SPDIP	θЈА	50	_	°C/W	1
Package Thermal Resistance, 18-pin SOIC	θЈА	63	_	°C/W	1
Package Thermal Resistance, 20-pin SOIC	θЈА	63	_	°C/W	1
Package Thermal Resistance, 28-pin SOIC	θЈА	55	_	°C/W	1
Package Thermal Resistance, 20-pin SSOP	θЈА	90	_	°C/W	1
Package Thermal Resistance, 28-pin SSOP	θЈА	71	_	°C/W	1
Package Thermal Resistance, 28-pin QFN (6x6 mm)	θЈА	37	_	°C/W	1
Package Thermal Resistance, 36-pin VTLA (5x5 mm)	θЈА	31.1	_	°C/W	1
Package Thermal Resistance, 44-pin TQFP	θЈА	45	_	°C/W	1, <b>2</b>
Package Thermal Resistance, 44-pin QFN	θЈА	32	_	°C/W	1, 2
Package Thermal Resistance, 44-pin VTLA	θЈА	30	_	°C/W	1, 2

Note 1: Junction to ambient thermal resistance; Theta-JA (θJA) numbers are achieved by package simulations.

<sup>2:</sup> This package is available in dsPIC33FJ32(GP/MC)104 devices only.

TABLE 26-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

DC CH	ARACTER	Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended				≤ +85°C for Industrial	
Param No.	Symbol	Characteristic	Min	Typ <sup>(1)</sup>	Max	Units	Conditions
Operati	ng Voltag	e					
DC10	Supply \	/oltage <sup>(3)</sup>					
	VDD	_	VBOR	_	3.6	V	Industrial and Extended
DC12	VDR	RAM Data Retention Voltage <sup>(2)</sup>	1.8	_		V	
DC16	VPOR VDD Start Voltage to Ensure Internal Power-on Reset Signal		_	1.75	Vss	V	
DC17	SVDD	VDD Rise Rate to Ensure Internal Power-on Reset Signal	0.024	_	_	V/ms	0-2.4V in 0.1s

- Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.
  - **2:** This is the limit to which VDD may be lowered without losing RAM data.
  - **3:** Overall functional device operation at VBOR < VDD < VDDMIN is ensured but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below VDDMIN.

### TABLE 26-5: ELECTRICAL CHARACTERISTICS: BROWN-OUT RESET (BOR)

DC CHAI	RACTERIST	rics	Standard Oper (unless otherw Operating temp	ise stat	<b>ed)</b> -40°C ≤	≤ Ta ≤ +	85°C for	Industrial r Extended
Param No.	Symbol	Character	istic	Min <sup>(1)</sup>	Тур	Max	Units	Conditions
BO10	VBOR	BOR Event on VDD Tra	ansition	2.40	2.48	2.55	V	See Note 2

- Note 1: Parameters are for design guidance only and are not tested in manufacturing.
  - 2: Overall functional device operation at VBOR < VDD < VDDMIN is ensured but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below VDDMIN.

TABLE 26-6: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC24d	16	21	mA	-40°C				
DC24a	16	21	mA	+25°C	2 2)/	16 MIPS		
DC24b	16	21	mA	+85°C	3.3V	פאוואו סו		
DC24c	16	21	mA	+125°C				

- Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.
  - 2: IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:
    - · Oscillator is configured in EC mode, OSC1 is driven with external square wave from rail-to-rail
    - · CLKO is configured as an I/O input pin in the Configuration Word
    - · All I/O pins are configured as inputs and pulled to Vss
    - MCLR = VDD, WDT and FSCM are disabled
    - · CPU, SRAM, program memory and data memory are operational
    - No peripheral modules are operating; however, every peripheral is being clocked (PMDx bits are all zeroed)
    - CPU executing while (1) statement
  - 3: These parameters are characterized, but not tested in manufacturing.

DC72f	4.7	6.2	1:64	mA	+125°C				
DC72g	4.7	6.2	1:128	mA					

Note 1: Data in the Typical column is at 3.3V, +25°C unless otherwise stated.

- 2: IDOZE is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDOZE measurements are as follows:
  - · Oscillator is configured in EC mode, OSC1 is driven with external square wave from rail-to-rail
  - · CLKO is configured as an I/O input pin in the Configuration Word
  - · All I/O pins are configured as inputs and pulled to Vss
  - MCLR = VDD, WDT and FSCM are disabled
  - · CPU, SRAM, program memory and data memory are operational
  - No peripheral modules are operating; however, every peripheral is being clocked (PMDx bits are all zeroes)
  - CPU executing while (1) statement

TABLE 26-10: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended

- **Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.
  - 2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
  - **3:** Negative current is defined as current sourced by the pin.
  - 4: See "Pin Diagrams" for the 5V tolerant I/O pins.
  - **5:** VIL source < (VSS 0.3). Characterized but not tested.
  - **6:** Non-5V tolerant pins, VIH source > (VDD + 0.3), 5V tolerant pins, VIH source > 5.5V. Characterized but not tested.
  - 7: Digital 5V tolerant pins cannot tolerate any "positive" input injection current from input sources > 5.5V.
  - 8: Injection currents > | 0 | can affect the ADC results by approximately 4-6 counts.
  - **9:** Any number and/or combination of I/O pins, not excluded under IICL or IICH conditions, are permitted provided the mathematical "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

TABLE 26-10: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS (CONTINUED)

DC CH	DC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended

D138a	Tww	Word Write Cycle Time	47.4	_	49.3	μs	Tww = 355 FRC cycles, TA = +85°C, See <b>Note 2</b>		
D138b	Tww	Word Write Cycle Time	47.4	_	49.3	μs	Tww = 355 FRC cycles, TA = +125°C, See <b>Note 2</b>		

- **Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.
  - 2: Other conditions: FRC = 7.37 MHz, TUN<5:0> = b'0111111 (for Min), TUN<5:0> = b'100000 (for Max). This parameter depends on the FRC accuracy (see Table 26-18) and the value of the FRC Oscillator Tuning register (see Register 8-3). For complete details on calculating the Minimum and Maximum time, see Section 5.3 "Programming Operations".
  - 3: These parameters are ensured by design, but are not characterized or tested in manufacturing.

**TABLE 26-13: INTERNAL VOLTAGE REGULATOR SPECIFICATIONS** 

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended					
Param No.	Symbol	Characteristics	Min	Тур	Max	Units	Comments	
_	CEFC	External Filter Capacitor Value <sup>(1)</sup>	4.7	10	_	μF	Capacitor must be low series resistance (< 5 ohms)	

**Note 1:** Typical VCAP voltage = 2.5V when VDD ≥ VDDMIN.

# 26.2 AC Characteristics and Timing Parameters

This section defines dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 AC characteristics and timing parameters.

TABLE 26-14: TEMPERATURE AND VOLTAGE SPECIFICATIONS - AC

	Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)
AC CHARACTERISTICS	Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended Operating voltage VDD range as described in <b>Section 26.1 "DC Characteristics"</b> .

#### FIGURE 26-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

### TABLE 26-15: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

Param No.	Symbol	Characteristic	Min	Тур	Max	Units	Conditions
DO50	Cosc2	OSC2/SOSC2 Pin	_	_	15	pF	In MS and HS modes when external clock is used to drive OSC1
DO56	Сю	All I/O Pins and OSC2	_	_	50	pF	EC mode
DO58	Св	SCLx, SDAx	_	_	400	pF	In I <sup>2</sup> C™ mode

FIGURE 26-2: EXTERNAL CLOCK TIMING

**TABLE 26-16: EXTERNAL CLOCK TIMING REQUIREMENTS** 

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended						
Param No.	Symb	Characteristic	Min	Typ <sup>(1)</sup>	Max	Units	Conditions		
OS10	FIN	External CLKI Frequency (External clocks allowed only in EC and ECPLL modes)	DC	_	32	MHz	EC		
		Oscillator Crystal Frequency	3.0 10 31	_	10 32 33	MHz MHz kHz	MS HS SOSC		
OS20	Tosc	Tosc = 1/Fosc	31.25	_	DC	ns			
OS25	TCY	Instruction Cycle Time(2,4)	62.5	_	DC	ns			
OS30	TosL, TosH	External Clock in (OSC1) <sup>(5)</sup> High or Low Time	0.45 x Tosc	_	_	ns	EC		
OS31	TosR, TosF	External Clock in (OSC1) <sup>(5)</sup> Rise or Fall Time	_	_	20	ns	EC		
OS40	TckR	CLKO Rise Time <sup>(3,5)</sup>	_	6	10	ns			
OS41	TckF	CLKO Fall Time <sup>(3,5)</sup>		6	10	ns			
OS42	Gм	External Oscillator Transconductance <sup>(4)</sup>	14	16	18	mA/V	VDD = 3.3V, TA = +25°C		

Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.

- 2: Instruction cycle period (TcY) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the "max." cycle time limit is "DC" (no clock) for all devices.
- 3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.
- 4: These parameters are characterized by similarity, but are tested in manufacturing at FIN = 32 MHz only.
- 5: These parameters are characterized by similarity, but are not tested in manufacturing.

TABLE 26-17: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS				Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended						
Param No.	Symbol	Characteris	Min	Typ <sup>(1)</sup>	Max	Units	Conditions			
OS50		PLL Voltage Controlled Oscillator (VCO) Input Frequency Range <sup>(2)</sup>		3.0	_	8	MHz	ECPLL and MSPLL modes		
OS51	Fsys	On-Chip VCO System Frequency <sup>(3)</sup>		12	_	32	MHz			
OS52	TLOCK	PLL Start-up Time (Lock Time)(3)		_	_	2	mS			
OS53	DCLK	CLKO Stability (Jitter)	(3)	-2	1	+2	%			

- **Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
  - 2: These parameters are characterized by similarity, but are tested in manufacturing at 7.7 MHz input only.
  - 3: These parameters are characterized by similarity, but are not tested in manufacturing. This specification is based on clock cycle by clock cycle measurements. The effective jitter for individual time bases, or communication clocks used by the user application, are derived from dividing the CLKO stability specification by the square root of "N" (where "N" is equal to Fosc, divided by the peripheral data rate clock). For example, if Fosc = 32 MHz and the SPI bit rate is 5 MHz, the effective jitter of the SPI clock is equal to:

$$\frac{DCLK}{\sqrt{\frac{32}{5}}} = \frac{2\%}{2.53} = 0.79\%$$

TABLE 26-18: AC CHARACTERISTICS: INTERNAL FAST RC (FRC) ACCURACY

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended								
Param No.	Characteristic	Min	Тур	Max	Units	Conditions					
	Internal FRC Accuracy @ 7.3728 MHz <sup>(1)</sup>										
F20a	FRC	-1.5	±0.25	+1.5	%	$-40^{\circ}C \le TA \le -10^{\circ}C$					
F20b	FRC	-1	±0.25	+1	%	$-10^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$					
F20c	FRC	-2	±0.25	+2	%	+125°C					

**Note 1:** Frequency is calibrated at +25°C and 3.3V. TUNx bits may be used to compensate for temperature drift.

#### TABLE 26-19: INTERNAL LOW-POWER RC (LPRC) ACCURACY

AC CH	ARACTERISTICS	Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for Extended							
Param No.	Characteristic	Min	Тур	Max	Units	Conditions			
	LPRC @ 32.768 kHz <sup>(1,2)</sup>								
F21a	LPRC	-20	±10	+20	%	-40°C ≤ TA ≤ +85°C			
F21b	LPRC	-30	±10	+30	%	-40°C ≤ TA ≤ +125°C			

Note 1: Change of LPRC frequency as VDD changes.

 LPRC accuracy impacts the Watchdog Timer Time-out Period (TWDT1). See Section 23.4 "Watchdog Timer (WDT)" for more information.

FIGURE 26-3: CLKO AND I/O TIMING CHARACTERISTICS

#### 27.0 PACKAGING INFORMATION

## 27.1 Package Marking Information

18-Lead PDIP

18-Lead SOIC

20-Lead PDIP

20-Lead SSOP

20-Lead SOIC

Example

Example

Example

Example

Example

Legend: XX...X Customer-specific information
Y Year code (last digit of calendar year)
YY Year code (last 2 digits of calendar year)
WW Week code (week of January 1 is week '01')
NNN Alphanumeric traceability code
Pb-free JEDEC designator for Matte Tin (Sn)
This package is Pb-free. The Pb-free JEDEC designator (e3)
can be found on the outer packaging for this package.

**Note:** If the full Microchip part number cannot be marked on one line, it is carried over to the next line, thus limiting the number of available characters for customer-specific information.

## 27.1 Package Marking Information (Continued)

## 27.2 Package Details

## 18-Lead Plastic Dual In-Line (P) - 300 mil Body [PDIP]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

#### Notes:

- 1. Pin 1 visual index feature may vary, but must be located within the hatched area.
- 2. § Significant Characteristic.
- 3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" per side.
- 4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing C04-007B

## 18-Lead Plastic Small Outline (SO) - Wide, 7.50 mm Body [SOIC]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

Microchip Technology Drawing C04-051C Sheet 1 of 2

## 18-Lead Plastic Small Outline (SO) - Wide, 7.50 mm Body [SOIC]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

## APPENDIX A: REVISION HISTORY

## **Revision A (January 2011)**

This is the initial released version of the document.

## **Revision B (February 2011)**

All major changes are referenced by their respective section in Table A-1.

In addition, minor text and formatting changes were incorporated throughout the document.

TABLE A-1: MAJOR SECTION UPDATES

Section Name	Update Description
High-Performance, Ultra Low Cost 16-bit Digital Signal Controllers	Pin diagram updates (see "Pin Diagrams"):  • 20-pin PDIP/SOIC/SSOP (dsPIC33FJ16MC101):
	<ul> <li>Removed the FLTB1 pin from pin 10</li> <li>28-pin SPDIP/SOIC/SSOP (dsPIC33FJ16MC102): Relocated the FLTB1 pin from pin 12 to pin 14; relocated the FLTA1 pin from pin 16 to pin 15</li> <li>28-pin QFN (dsPIC33FJ16MC102): Relocated the FLTA1 pin from pin 13 to pin 12; relocated the FLTB1 pin from pin 9 to pin 11</li> <li>36-pin TLA (dsPIC33FJ16MC102): Relocated the FLTA1 pin from pin 17 to pin 16; relocated the FLTB1 pin from pin 10 to pin 15</li> </ul>
Section 1.0 "Device Overview"	Added Notes 1, 2, and 3 regarding the FLTA1 and FLTB1 pins to the Pinout I/O Descriptions (see Table 1-1).  Added Section "".
Section 4.0 "Memory Organization"	Updated All Resets value for PxFLTACON and PxFLTABCON to the 6-Output PWM1 Register Map (see Table 4-9).  Added Note 1 to the PMD Register Map (see Table 4-29).
Section 6.0 "Resets"	Removed Reset timing sequence information from <b>Section 6.2</b> " <b>System Reset</b> ", as this information is provided in Figure 6-2.
Section 15.0 "Motor Control PWM Module"	Added Note 2 and Note 3 regarding the FLTA1 and FLTB1 pins to the 6-channel PWM Module Block Diagram (see Figure 15-1).  Added Section 15.2 "PWM Faults" and Section 15.3 "Write-protected Registers".  Added Note 2 and Note 3 regarding the FLTA1 and FLTB1 pins to the note boxes located below the PxFLTACON and PxFLTBCON
Section 17.0 "Inter-Integrated Circuit™ (I <sup>2</sup> C™)"	registers (see Register 15-9 and Register 15-10).  Updated the descriptions for the conditional If STREN = 1 and If STREN = 0 statements for the SCLREL bit in the I2Cx Control Register (see Register 17-1).
Section 23.0 "Special Features"	Added the RTSP Effect column to the dsPIC33F Configuration Bits Description (see Table 23-3).
Section 26.0 "Electrical Characteristics"	Added Parameters 300 and D305 (see Table 26-42 and Table 26-43).
Section 27.0 "Packaging Information"	Modified the pending TLA packaging page.

# **Revision C (June 2011)**

This revision includes the following global update:

· All JTAG references have been removed

All other major changes are referenced by their respective section in Table A-2.

In addition, minor text and formatting changes were incorporated throughout the document.

TABLE A-2: MAJOR SECTION UPDATES

Section Name	Update Description
High-Performance, Ultra Low Cost 16-bit Digital Signal Controllers	The TMS, TDI, TDO, and TCK pin names were removed from these pin diagrams:
	28-pin SPDIP/SOIC/SSOP
	28-pin QFN
	• 36-pin TLA
Section 1.0 "Device Overview"	Updated the Buffer Type to Digital for the CTED1 and CTED2 pins (see Table 1-1).
Section 4.0 "Memory Organization"	Updated the SFR Address for IC2CON, IC3BUF, and IC3CON in the Input Capture Register Map (see Table 4-7).
	Added the VREGS bit to the RCON register in the System Control Register Map (see Table 4-27).
Section 6.0 "Resets"	Added the VREGS bit to the RCON register (see Register 6-1).
Section 8.0 "Oscillator Configuration"	Updated the definition for COSC<2:0> = 001 and NOSC<2:0> = 001 in the OSCCON register (see Register 8-1).
Section 15.0 "Motor Control PWM Module"	Updated the title for Example 15-1 to include a reference to the Assembly language.
	Added Example 15-2, which provides a C code version of the write-protected register unlock and Fault clearing sequence.
Section 19.0 "10-bit Analog-to-Digital Converter (ADC)"	Updated the CH0 section and added Note 2 in both ADC block diagrams (see Figure 19-1 and Figure 19-2).
	Updated the multiplexer values in the ADC Conversion Clock Period Block Diagram (see Figure 19-3.
	Added the 01110 bit definitions and updated the 01101 bit definitions for the CH0SB<4:0> and CH0SA<4:0> bits in the AD1CHS0 register (see Register 19-5).
Section 22.0 "Charge Time Measurement Unit (CTMU)"	Removed Section 22.1 "Measuring Capacitance", Section 22.2 "Measuring Time", and Section 22.3 "Pulse Generation and Delay"
	Updated the key features.
	Added the CTMU Block Diagram (see Figure 22-1).
	Updated the ITRIM<5:0> bit definitions and added Note 1 to the CTMU Current Control register (see Register 22-3).

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 23.0 "Special Features"	Updated bits 5 and 4 of FPOR, modified Note 2, and removed Note 3 from the Configuration Shadow Register Map (see Table 23-1).
	Updated bit 14 of CONFIG1 and removed Note 5 from the Configuration Flash Words (see Table 23-2).
	Updated the PLLKEN Configuration bit description (see Table 23-3).
	Added Note 3 to Connections for the On-Chip Voltage Regulator (see Figure 23-1).
Section 26.0 "Electrical	Updated the Standard Operating Conditions to: 3.0V to 3.6V in all tables.
Characteristics"	Removed the Voltage on VCAP with respect to VSS entry in Absolute Maximum Ratings <sup>(1)</sup> .
	Updated the VDD Range (in Volts) in Operating MIPS vs. Voltage (see Table 26-1).
	Removed Parameter DC18 and updated the minimum value for Parameter DC 10 in the DC Temperature and Voltage Specifications (see Table 26-4).
	Updated the Characteristic definition and the Typical value for Parameter BO10 in Electrical Characteristics: BOR (see Table 26-5).
	Updated Note 2 in the DC Characteristics: Operating Current (IDD) (see Table 26-6).
	Updated Note 2 in the DC Characteristics: Idle Current (IIDLE) (see Table 26-7).
	Updated Note 2 and Parameters DC60C and DC61a-DC61d in the DC Characteristics: Power-Down Current (IPD) (see Table 26-8).
	Updated Note 2 in the DC Characteristics: Doze Current (IDOZE) (see Table 26-9).
	Added Note 1 to the Internal Voltage Regulator Specifications (see Table 26-13).
	Updated the Minimum and Maximum values for Parameter F20a and the Typical value for Parameter F20b in AC Characteristics: Internal Fast RC (FRC) Accuracy (see Table 26-18).
	Updated the Minimum, Typical, and Maximum values for Parameter F21a and F21b in Internal Low-Power RC (LPRC) Accuracy (see Table 26-19).
	Updated the Minimum, Typical, and Maximum values for Parameter D305 in the Comparator Module Specifications (see Table 26-43).
	Added Parameters CTMUFV1 and CTMUFV2 and updated Note 1 and the Conditions for all parameters in the CTMU Current Source Specifications (see Table 26-46).
	Added Forward Voltage Versus Temperature (see Figure 26-25).

## **Revision D (April 2012)**

This revision includes updates in support of the following new devices:

- dsPIC33FJ32GP101
- dsPIC33FJ32GP102
- dsPIC33FJ32GP104
- dsPIC33FJ32MC101
- dsPIC33FJ32MC102
- dsPIC33FJ32MC104

Also, where applicable, new sections were added to peripheral chapters that provide information and links to the related resources, as well as helpful tips. For examples, see Section 18.1 "UART Helpful Tips" and Section 18.2 "UART Resources".

This revision includes text and formatting changes that were incorporated throughout the document.

All other major changes are referenced by their respective section in Table A-3.

## TABLE A-3: MAJOR SECTION UPDATES

Section Name	Update Description
"16-Bit Digital Signal Controllers (up to 32- Kbyte Flash and 2-Kbyte	The content on the first page of this section was extensively reworked to provide the reader with the key features and functionality of this device family in an "at-a-glance" format.
SRAM)"	TABLE 2: "dsPIC33FJ32(GP/MC)101/102/104 Device Features" was added, which provides a feature overview of the new devices.
	All pin diagrams were updated (see "Pin Diagrams").
Section 1.0 "Device	Updated the notes in the device family block diagram (see Figure 1-1).
Overview"	Updated the following pinout I/O descriptions (Table 1-1):  • ANx  • CNx  • RAx  • RCx  • CVREFIN (formerly CVREF)  Relocated 1.1 "Referenced Sources" to the previous chapter (see "Referenced")
	Sources").
Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers"	Updated the Recommended Minimum Connection diagram (see Figure 2-1).
Section 4.0 "Memory Organization"	Updated the existing Program Memory Map (see Figure 4-1) and added the Program Memory Map for dsPIC33FJ16(GP/MC)101/102 Devices (see Figure 4-1).
	Updated the existing Data Memory Map (see Figure 4-4) and added the Data Memory Map for dsPIC33FJ32(GP/MC)101/102/104 Devices with 2-Kbyte RAM (see Figure 4-5).
	<ul> <li>The following Special Function Register maps were updated or added:</li> <li>TABLE 4-5: Change Notification Register Map for dsPIC33FJ32(GP/MC)104 Devices</li> <li>TABLE 4-6: Interrupt Controller Register Map</li> <li>TABLE 4-8: Timers Register Map for dsPIC33FJ32(GP/MC)10X Devices</li> <li>TABLE 4-15: ADC1 Register Map for dsPIC33FJXX(GP/MC)101 Devices</li> <li>TABLE 4-17: ADC1 Register Map for dsPIC33FJ32(GP/MC)104 Devices</li> <li>TABLE 4-22: Peripheral Pin Select Input Register Map</li> <li>TABLE 4-26: Peripheral Pin Select Output Register Map for dsPIC33FJ32(GP/MC)104 Devices</li> <li>TABLE 4-28: PORTA Register Map for dsPIC33FJ32(GP/MC)101/102 Devices</li> <li>TABLE 4-29: PORTA Register Map for dsPIC33FJ32(GP/MC)104 Devices</li> </ul>
	TABLE 4-36: PORTC Register Map for dsPIC33FJ32(GP/MC)104 Devices
	TABLE 4-39: PMD Register Map

TABLE A-3: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 7.0 "Interrupt	Updated the Interrupt Vectors (see Table 7-1).
Controller"	The following registers were updated or added:
	Register 7-5: IFS0: Interrupt Flag Status Register 0
	Register 7-11: IEC1: Interrupt Enable Control Register 1
	Register 7-21: IPC6: Interrupt Priority Control Register 6
Section 9.0 "Power- Saving Features"	Updated 9.5 PMD Control Registers.
Section 10.0 "I/O Ports"	Updated TABLE 10-1: Selectable Input Sources (Maps Input to Function) <sup>(1)</sup> .
	Updated TABLE 10-2: Output Selection for Remappable Pin (RPn)
	The following registers were updated or added:
	Register 10-4: RPINR4: Peripheral Pin Select Input Register 4
	Register 10-6: RPINR8: Peripheral Pin Select Input Register 8
	Register 10-19: RPOR8: Peripheral Pin Select Output Register 8
	Register 10-20: RPOR9: Peripheral Pin Select Output Register 9
	Register 10-21: RPOR10: Peripheral Pin Select Output Register 10
	Register 10-22: RPOR11: Peripheral Pin Select Output Register 11
	Register 10-23: RPOR12: Peripheral Pin Select Output Register 12
Section 12.0 "Timer2/3 and Timer4/5"	The features and operation information was extensively updated in support of Timer4/5 (see Section 12.1 "32-Bit Operation" and Section 12.2 "16-Bit Operation").
	The block diagrams were updated in support of the new timers (see Figure 12-1, Figure 12-2, and Figure 12-3).
	The following registers were added:
	Register 12-3: T4CON Control Register(1)
	Register 12-4: T5CON Control Register(1)
Section 15.0 "Motor	Updated TABLE 15-1: Internal Pull-down resistors on PWM Fault pins.
Control PWM Module"	Note 2 was added to Register 15-5: PWMXCON1: PWMx Control Register 1 <sup>(1)</sup> .
Section 19.0 "10-Bit	The number of available input pins and channels were updated from six to 14.
Analog-to-Digital Converter (ADC)"	Updated FIGURE 19-1: ADC1 Block Diagram for dsPIC33FJXX(GP/MC)101 Devices.
( = = )	Updated FIGURE 19-2: ADC1 Block Diagram for dsPIC33FJXX(GP/MC)102 Devices.
	Added FIGURE 19-3: ADC1 Block Diagram for dsPIC33FJ32(GP/MC)104 Devices.
	The following registers were updated:
	Register 19-4: AD1CHS123: ADC1 Input Channel 1, 2, 3 Select Register
	Register 19-5: AD1CHS0: ADC1 INPUT Channel 0 select Register
	Register 19-6: AD1CSSL: ADC1 Input Scan Select Register Low <sup>(1,2,3)</sup>
	• Register 19-7: AD1PCFGL: ADC1 Port Configuration Register Low <sup>(1,2,3)</sup>

TABLE A-3: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 26.0 "Electrical	Updated the Absolute Maximum Ratings.
Characteristics"	Updated TABLE 26-3: Thermal Packaging Characteristics.
	Updated TABLE 26-6: DC Characteristics: Operating Current (Idd).
	Updated TABLE 26-7: DC Characteristics: Idle Current (lidle).
	Updated TABLE 26-8: DC Characteristics: Power-Down Current (Ipd).
	Updated TABLE 26-9: DC Characteristics: Doze Current (Idoze).
	Updated TABLE 26-10: DC Characteristics: I/O Pin Input Specifications.
	Replaced all SPI specifications and figures (see Table 26-29 through Table 26-44 and Figure 26-11 through Figure 26-26).
Section 27.0 "Packaging Information"	Added the following Package Marking Information and Package Drawings:  • 44-Lead TQFP
	<ul><li>44-Lead QFN</li><li>44-Lead VTLA (referred to as TLA in the package drawings)</li></ul>

# **Revision E (September 2012)**

This revision includes updates to the values in Section 26.0 "Electrical Characteristics" and updated packaging diagrams in Section 27.0 "Packaging Information". There are minor text edits throughout the document.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104

NOTES:	

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

# CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

#### CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- · Distributor or Representative
- · Local Sales Office
- · Field Application Engineer (FAE)
- · Technical Support
- · Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

## **READER RESPONSE**

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

dsPIC33FJ16(GP/MC)101/102 AND dsPIC33FJ32(GP/MC)101/102/104
NOTES:

### Note the following details of the code protection feature on Microchip devices:

- · Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

# QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV ISO/TS 16949

#### **Trademarks**

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC<sup>32</sup> logo, rfPIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MTP, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

Analog-for-the-Digital Age, Application Maestro, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICkit, PICtail, REAL ICE, rfLAB, Select Mode, SQI, Serial Quad I/O, Total Endurance, TSHARC, UniWinDriver, WiperLock, ZENA and Z-Scale are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

GestIC and ULPP are registered trademarks of Microchip Technology Germany II GmbH & Co. & KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

## Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

**«JONHON»** (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
