

2:1 Multiplexers and 1:2 Demultiplexers with Loopback

General Description

The MAX9394/MAX9395 consist of a 2:1 multiplexer and a 1:2 demultiplexer with loopback. The multiplexer section (channel B) accepts two low-voltage differential signaling (LVDS) inputs and generates a single LVDS output. The demultiplexer section (channel A) accepts a single LVDS input and generates two parallel LVDS outputs. The MAX9394/MAX9395 feature a loopback mode that connects the input of channel A to the output of channel B and connects the selected input of channel B to the outputs of channel A.

Three LVCMOS/LVTTL logic inputs control the internal connections between inputs and outputs, one for the multiplexer portion of channel B (BSEL), and the other two for loopback control of channels A and B (LB_SELA and LB_SELB). Independent enable inputs for each differential output pair provide additional flexibility.

Fail-safe circuitry forces the outputs to a differential low condition for undriven inputs or when the common-mode voltage exceeds the specified range. The MAX9394 provides high-level input fail-safe detection for HSTL, LVDS, and other GND-referenced differential inputs. The MAX9395 provides low-level fail-safe detection for CML, LVPECL, and other VCC-referenced differential inputs.

Ultra low 91ps_{P-P} (max) pseudorandom bit sequence (PRBS) jitter ensures reliable communications in high-speed links that are highly sensitive to timing error, especially those incorporating clock-and-data recovery, or serializers and deserializers. The high-speed switching performance guarantees 1.5GHz operation and less than 87ps (max) skew between channels.

LVDS inputs and outputs are compatible with the TIA/EIA-644 LVDS standard. The LVDS outputs drive 100Ω loads. The MAX9394/MAX9395 are offered in a 32-pin TQFP package and operate over the extended temperature range (-40°C to +85°C).

Applications

- High-Speed Telecom/Datacom Equipment
- Central Office Backplane Clock Distribution
- DSLAM
- Protection Switching
- Fault-Tolerant Systems

Pin Configurations and Functional Diagram appear at end of data sheet.

Features

- ◆ Guaranteed 1.5GHz Operation with 250mV Differential Output Swing
- ◆ Simultaneous Loopback Control
- ◆ 2ps(RMS) (max) Random Jitter
- ◆ AC Specifications Guaranteed for 150mV Differential Input
- ◆ Signal Inputs Accept Any Differential Signaling Standard
- ◆ LVDS Outputs for Clock or High-Speed Data
- ◆ High-Level Input Fail-Safe Detection (MAX9394)
- ◆ Low-Level Input Fail-Safe Detection (MAX9395)
- ◆ 3.0V to 3.6V Supply Voltage Range
- ◆ LVCMOS/LVTTL Logic Inputs

Pin Description

MAX9394/MAX9395

PIN	NAME	FUNCTION
1, 2, 3, 30, 31, 32	N.C.	No Connection. Not internally connected.
4, 9, 20, 25	GND	Ground
5	ENB	Channel B Output Enable. Drive ENB high to enable the LVDS outputs for channel B. An internal 435k Ω resistor to GND pulls ENB low when unconnected.
6	OUTB	Channel B LVDS Noninverting Output. Connect a 100 Ω termination resistor between OUTB and $\overline{\text{OUTB}}$ at the receiver inputs to ensure proper operation.
7	$\overline{\text{OUTB}}$	Channel B LVDS Inverting Output. Connect a 100 Ω termination resistor between OUTB and $\overline{\text{OUTB}}$ at the receiver inputs to ensure proper operation.
8, 13, 24, 29	V _{CC}	Power-Supply Input. Bypass each V _{CC} to GND with a 0.1 μ F and 0.01 μ F ceramic capacitor. Install both bypass capacitors as close to the device as possible, with the 0.01 μ F capacitor closest to the device.
10	$\overline{\text{INB0}}$	LVDS/HSTL (MAX9394) or LVPECL/CML (MAX9395) Inverting Input. An internal 128k Ω pullup resistor to V _{CC} pulls the input high when unconnected (MAX9394). An internal 68k Ω resistor to GND pulls the input low when unconnected (MAX9395).
11	INB0	LVDS/HSTL (MAX9394) or LVPECL/CML (MAX9395) Noninverting Input. An internal 128k Ω pullup resistor to V _{CC} pulls the input high when unconnected (MAX9394). An internal 68k Ω resistor to GND pulls the input low when unconnected (MAX9395).
12	LB_SELB	Loopback Select for Channel B Output. Connect LB_SELB to GND or leave unconnected to reproduce the INB_ ($\overline{\text{INB}}_+$) differential inputs at OUTB ($\overline{\text{OUTB}}$). Connect LB_SELB to V _{CC} to loop back the INA ($\overline{\text{INA}}$) differential inputs to OUTB ($\overline{\text{OUTB}}$). An internal 435k Ω resistor to GND pulls LB_SELB low when unconnected.
14	$\overline{\text{INB1}}$	LVDS/HSTL (MAX9394) or LVPECL/CML (MAX9395) Inverting Input. An internal 128k Ω pullup resistor to V _{CC} pulls the input high when unconnected (MAX9394). An internal 68k Ω resistor to GND pulls the input low when unconnected (MAX9395).
15	INB1	LVDS/HSTL (MAX9394) or LVPECL/CML (MAX9395) Noninverting Input. An internal 128k Ω pullup resistor to V _{CC} pulls the input high when unconnected (MAX9394). An internal 68k Ω resistor to GND pulls the input low when unconnected (MAX9395).
16	BSEL	Channel B Multiplexer Control Input. Selects the differential input to reproduce at the B channel differential output. Connect BSEL to GND or leave unconnected to select the INB0 ($\overline{\text{INB0}}$) set of inputs. Connect BSEL to V _{CC} to select the INB1 ($\overline{\text{INB1}}$) set of inputs. An internal 435k Ω resistor to GND pulls BSEL low when unconnected.
17	ENA1	Channel A1 Output Enable. Drive ENA1 high to enable the A1 LVDS outputs. An internal 435k Ω resistor to GND pulls the ENA1 low when unconnected.
18	$\overline{\text{OUTA1}}$	Channel A1 LVDS Inverting Output. Connect a 100 Ω termination resistor between OUTA1 and $\overline{\text{OUTA1}}$ at the receiver inputs to ensure proper operation.
19	OUTA1	Channel A1 LVDS Noninverting Output. Connect a 100 Ω termination resistor between OUTA1 and $\overline{\text{OUTA1}}$ at the receiver inputs to ensure proper operation.

2:1 Multiplexers and 1:2 Demultiplexers with Loopback

Pin Description (continued)

PIN	NAME	FUNCTION
21	ENA0	Channel A0 Output Enable. Drive ENA0 high to enable the A0 LVDS outputs. An internal 435k Ω resistor to GND pulls ENA0 low when unconnected.
22	$\overline{\text{OUTA0}}$	Channel A0 LVDS Inverting Output. Connect a 100 Ω termination resistor between OUTA0 and $\overline{\text{OUTA0}}$ at the receiver inputs to ensure proper operation.
23	OUTA0	Channel A0 LVDS Noninverting Output. Connect a 100 Ω termination resistor between OUTA0 and $\overline{\text{OUTA0}}$ at the receiver inputs to ensure proper operation.
26	INA	LVDS/HSTL (MAX9394) or LVPECL/CML (MAX9395) Noninverting Input. An internal 128k Ω pullup resistor to V _{CC} pulls the input high when unconnected (MAX9394). An internal 68k Ω resistor to GND pulls the input low when unconnected (MAX9395).
27	$\overline{\text{INA}}$	LVDS/HSTL (MAX9394) or LVPECL/CML (MAX9395) Inverting Input. An internal 128k Ω pullup resistor to V _{CC} pulls the input high when unconnected (MAX9394). An internal 68k Ω resistor to GND pulls the input low when unconnected (MAX9395).
28	LB_SELA	Loopback Select for Channel A Output. Connect LB_SELA to GND or leave unconnected to reproduce the INA ($\overline{\text{INA}}$) differential inputs at OUTA_ ($\overline{\text{OUTA_}}$). Connect LB_SELA to V _{CC} to loop back the INB_ ($\overline{\text{INB_}}$) differential inputs to OUTA_ ($\overline{\text{OUTA_}}$). An internal 435k Ω resistor to GND pulls LB_SELA low when unconnected.

Detailed Description

The LVDS interface standard provides a signaling method for point-to-point communication over a controlled-impedance medium as defined by the ANSI TIA/EIA-644 standard. LVDS utilizes a lower voltage swing than other communication standards, achieving higher data rates with reduced power consumption, while reducing EMI emissions and system susceptibility to noise.

The MAX9394/MAX9395 high-speed, low-power 2:1 multiplexers and 1:2 demultiplexers with loopback provide signal redundancy switching in telecom and storage applications. These devices select one of two remote signal sources for local input and buffer a single local output signal to two remote receivers.

The multiplexer section (channel B) accepts two differential inputs and generates a single LVDS output. The demultiplexer section (channel A) accepts a single differential input and generates two parallel LVDS outputs. The MAX9394/MAX9395 feature a loopback mode that connects the input of channel A to the output of channel B and connects the selected input of channel B to the outputs of channel A. LB_SELA and LB_SELB provide independent loopback control for each channel.

Three LVCMOS/LVTTL logic inputs control the internal connections between inputs and outputs, one for the multiplexer portion of channel B (BSEL), and the other two for loopback control of channels A and B (LB_SELA and LB_SELB). Independent enable inputs for each differential output pair provide additional flexibility.

Input Fail-Safe

The differential inputs of the MAX9394/MAX9395 possess internal fail-safe protection. Fail-safe circuitry forces the outputs to a differential-low condition for undriven inputs or when the common-mode voltage exceeds the specified range. The MAX9394 provides

high-level input fail-safe detection for LVDS, HSTL, and other GND-referenced differential inputs. The MAX9395 provides low-level input fail-safe detection for LVPECL, CML, and other VCC-referenced differential inputs.

Select Function

BSEL selects the differential input pair to transmit through OUTB ($\overline{\text{OUTB}}$) for LB_SELB = GND or through OUTA_ ($\overline{\text{OUTA_}}$) for LB_SELA = VCC. LB_SEL_ controls the loopback function for each channel. Connect LB_SEL_ to GND to select the normal inputs for each channel. Connect LB_SEL_ to VCC to enable the loopback function. The loopback function routes the input of channel A to the output of channel B, and the inputs of channel B to the outputs of channel A. See Tables 1 and 2 for a summary of the input/output routing between channels.

Enable Function

The EN_ _ logic inputs enable and disable each set of differential outputs. Connect EN_ 0 to VCC to enable the OUT_0/ $\overline{\text{OUT_0}}$ differential output pair. Connect EN_0 to GND to disable the OUT_0/ $\overline{\text{OUT_0}}$ differential output pair. The differential output pairs assert to a differential low condition when disabled.

Applications Information

Differential Inputs

The MAX9394/MAX9395 inputs accept any differential signaling standard within the specified common-mode voltage range. The fail-safe feature detects common-mode input signal levels and generates a differential output low condition for undriven inputs or when the common-mode voltage exceeds the specified range ($V_{CM} \geq V_{CC} - 0.6V$, MAX9394; $V_{CM} \leq 0.6V$, MAX9395). Leave unused inputs unconnected or connect to VCC for the MAX9394 or to GND for the MAX9395.

2:1 Multiplexers and 1:2 Demultiplexers with Loopback

Table 1. Input Select Truth Table

LOGIC INPUTS			DIFFERENTIAL OUTPUTS	
LB_SELA	LB_SELB	BSEL	OUTA_ / OUTA_	OUTB / OUTB
0	0	0	INA selected	INB0 selected
0	0	1	INA selected	INB1 selected
0	1	X	INA selected	INA selected
1	0	0	INB0 selected	INB0 selected
1	0	1	INB1 selected	INB1 selected
1	1	0	INB0 selected	INA selected
1	1	1	INB1 selected	INA selected

X = Don't care.

Differential Outputs

The output common-mode voltage is not properly established if the LVDS output is higher than 0.6V when the supply voltage is ramping up at power-on. This condition can occur when an LVDS output drives an LVDS input on the same chip. To avoid this situation for the MAX9394/MAX9395, connect a 10kΩ resistor from the noninverting output (OUT₊) to ground, and connect a 10kΩ resistor from the inverting output (OUT₋) to ground. These pull-down resistors keep the output below 0.6V when the supply is ramping up (Figure 7).

Power-Supply Bypassing

Bypass each VCC to GND with high-frequency surface-mount ceramic 0.1μF and 0.01μF capacitors in parallel as close to the device as possible. Install the 0.01μF capacitor closest to the device.

Differential Traces

Input and output trace characteristics affect the performance of the MAX9394/MAX9395. Connect each input and output to a 50Ω characteristic impedance trace. Maintain the distance between differential traces and eliminate sharp corners to avoid discontinuities in differential impedance and maximize common-mode noise immunity. Minimize the number of vias on the differential input and output traces to prevent impedance discontinuities. Reduce reflections by maintaining the 50Ω characteristic impedance through connectors and across cables. Minimize skew by matching the electrical length of the traces.

Output Termination

Terminate LVDS outputs with a 100Ω resistor between the differential outputs at the receiver inputs. LVDS outputs require 100Ω termination for proper operation.

Ensure that the output currents do not exceed the current limits specified in the *Absolute Maximum Ratings*.

Table 2. Loopback Select Truth Table

LB_SEL ₋	OUT ₋
GND or open	Normal inputs selected.
VCC	Loopback inputs selected.

Figure 7. Pull-down Resistor Configuration for LVDS Outputs

Observe the total thermal limits of the MAX9394/MAX9395 under all operating conditions.

Cables and Connectors

Use matched differential impedance for transmission media. Use cables and connectors with matched differential impedance to minimize impedance discontinuities. Avoid the use of unbalanced cables.

Balanced cables such as twisted pair offer superior signal quality and tend to generate less EMI due to canceling effects.

Board Layout

Use a four-layer printed circuit (PC) board providing separate signal, power, and ground planes for high-speed signaling applications. Bypass VCC to GND as close to the device as possible. Install termination resistors as close to receiver inputs as possible. Match the electrical length of the differential traces to minimize signal skew.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

JONHON

«**JONHON**» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)
