

## 4 x 50 W MOSFET quad bridge power amplifier

Datasheet - production data

- Overrating chip temperature with soft thermal limiter
- Output DC offset detection
- Load dump
- Fortuitous open GND
- Reversed battery
- ESD
- Qualification in accordance to AEC Q100 standard

### Description

STPA008 is a breakthrough MOSFET technology class AB audio power amplifier designed for high power car radio. The fully complementary P-Channel/N-Channel output structure allows a rail to rail output voltage swing which, combined with high output current and minimized saturation losses sets new power references in the car-radio field, with unparalleled distortion performances.

STPA008 can operate down to 6V and this makes the IC compliant to the most recent OEM specifications for low voltage operation (so called 'start-stop' battery profile during engine stop), helping car manufacturers to reduce the overall emissions and thus contributing to environment protection.

### Features

- High output power capability:
  - 4 x 50 W/4  $\Omega$  Max.
  - 4 x 28 W/4  $\Omega$  @ 14.4 V, 1 kHz, 10 %
  - 4 x 72 W/2  $\Omega$  Max.
- MOSFET output power stage
- 2  $\Omega$  driving capability
- Capable to operate down to 6 V (suitable for start-stop car operation)
- Excellent GSM noise immunity
- Hi-Fi class distortion
- Low output noise
- High immunity to RF noise injection
- Standby function
- Mute function
- Automute at min. supply voltage detection
- Low external component count
- Internally fixed gain (26 dB)
- Protections:
  - Output short circuit to GND, to  $V_s$ , across the load
  - Very inductive loads

# 1 Overview

STPA008 is a complementary quad audio power amplifier. It is available in two different packages, Flexiwatt25 and Flexiwatt27. It embeds four independent amplifiers working in class AB, a standby and a mute pin, an offset detector and, only for the Flexiwatt27 package, a clipping detector and diagnostics output. The amplifier is fully operational down to a battery voltage of 6 V, without producing pop noise and continuing to play during battery transitions.

STPA008 can drive 2 ohm loads and has a very high immunity to disturbs without need of external components or compensation. It is protected against any kind of short or open circuit, over-voltage and over-temperature.

## 3 Electrical specifications

### 3.1 Absolute maximum ratings

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
$V_S$	Operating supply voltage	18	V
$V_{S(DC)}$	DC supply voltage	28	V
$V_{S(pk)}$	Peak supply voltage (for $t = 50$ ms)	50	V
$I_O$	Output peak current Non repetitive ( $t = 100$ $\mu$ s)	10	A
	Repetitive (duty cycle 10 % at $f = 10$ Hz)	9	A
$P_{tot}$	Power dissipation $T_{case} = 70$ °C	85	W
$T_j$	Junction temperature	150	°C
$T_{stg}$	Storage temperature	-55 to 150	°C
$GND_{max}$	Ground pins voltage	-0.3 to 0.3	V
$V_{in max}$	Input pin max voltage	-0.3 to 8	V
$V_{SB max}$	ST-BY pin max voltage	-0.3 to $V_{S(pk)}$	V
$V_{mute max}$	Mute pin max voltage	-0.3 to 6	V

### 3.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	Value	Unit
$R_{th j-case}$	Thermal resistance junction-to-case	Max 1	°C/W

### 3.3 Electrical characteristics

Refer to the test and application diagram,  $V_S = 14.4\text{ V}$ ;  $R_L = 4\ \Omega$ ;  $R_g = 600\ \Omega$ ;  $f = 1\text{ kHz}$ ;  $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ ; unless otherwise specified.

**Table 5. Electrical characteristics**

## 4 General information

### 4.1 Operation

STPA008's inputs are ground-compatible. If the standard value for the input capacitors (0.22  $\mu\text{F}$ ) is adopted, the low frequency cut-off is 16 Hz. The input capacitors should be 1/4 of the capacitor connected to AC-GND pin for optimum pop performances (see [Figure 2: Application circuit \(STPA008-4WX\)](#)).

Standby and mute pins are both 3.3 V CMOS compatible.

RC cells at both mute and stand-by pins have always to be used in order to smooth the transitions for preventing any audible transient noise.

In case the stand-by function is not used, it could steadily be connected to  $V_S$ , but a 470 kohm resistance should be present between the power supply and the pin.

The capacitance on SVR sets the start-up and shut-down times and helps to have pop-noise free transitions. Its minimum recommended value is 10  $\mu\text{F}$ . To have a fast start-up time, the internal resistor on SVR pin, used to set the time constant, is reduced from 50 k $\Omega$  to 3 k $\Omega$  till voltage on SVR reaches  $V_{CC}/4 - 2V_{BE}$  and then released. In this way the capacitor on SVR is charged very quickly to  $V_{CC}/4$ , as shown in the following figure.

The time constant to be assigned to the standby pin in order to obtain a virtually pop-free transition has to be slower than 2.5 V/ms.

Figure 20. SVR charge diagram

SVR pin accomplishes multiple functions:

- it is used as a reference voltage for input pins ( $V_{CC}/4$ )
- the capacitor connected to SVR improves the supply voltage ripple rejection
- it is used as a reference to generate the  $V_{CC}/2$  reference for the outputs

When the amplifier goes in standby mode or goes out from this condition, it is recommended to put the amplifier in mute to ensure the absence of audible noise. Then the stand-by pin can be set to the appropriate value (ground or  $> 2.6$  V) and the capacitor on SVR pin is discharged or charged consequently.

## 4.2 Battery variations

### 4.2.1 Low voltage operation

The most recent OEM specifications require automatic stop of car engine at traffic lights, in order to reduce emissions of polluting substances. STPA008, thanks to its innovating

design, allows a continuous operation when battery falls down. At 6 V it is still fully operational, only the maximum output power is reduced according to the available voltage supply.

If the battery voltage drops below the minimum operating voltage of 6V the amplifier is fast muted, the capacitor on SVR is discharged and the amplifier restarts when the battery voltage returns to the correct voltage.

### 4.2.2 Cranks

STPA008 can sustain worst case cranks from 16 V to 6 V, continuing to play and without producing any pop noise.

Examples of battery cranking curves are shown below, indicating the shape and duration of allowed battery transitions.

**Figure 21. Battery cranking curve example 1**

V1 = 16 V; V2 = 6 V; V3 = 7 V; V4 = 8 V

t1 = 2 ms; t2 = 50 ms; t3 = 5 ms; t4 = 300 ms; t5 = 10 ms; t6 = 1 s; t7 = 2 ms

**Figure 22. Battery cranking curve example 2**

V1 = 16 V; V2 = 6 V; V3 = 7 V

t1 = 2 ms; t2 = 5 ms; t3 = 15 ms; t5 = 1 s; t6 = 50 ms

### 4.2.3 Advanced battery management (hybrid vehicles)

In hybrid vehicles, the engine ignition causes a fast increase of battery voltage which can reach 16 V in less than 10 ms. In addition to compatibility with low  $V_{batt}$ , STPA008 is able to sustain upwards fast battery transitions without causing unwanted audible effects, like pop noise, and without any sound interruption thanks to the innovative circuit topology.

Figure 23. Upwards fast battery transitions diagram

## 4.3 Protections

### 4.3.1 Short circuits and open load operation

When the IC detects a short circuit to ground, to  $V_{batt}$  or across the load, the output of the amplifier is put in three-state (high impedance condition).

In case of short circuit to ground or  $V_{cc}$ , the amplifier exits from the three-state condition only when the short-circuit is released and the output returns inside the limits imposed by an internal voltage comparator.

When a short across the load is present, the power stage sees an over-current and is brought in protection mode for about 100  $\mu$ s. After this time, if the short circuit condition is removed the amplifier returns to play, otherwise the high impedance state is maintained and the check is repeated every 100  $\mu$ s.

Disconnection of load (open load condition) doesn't affect the amplifier, which continues to play.

### 4.3.2 Over-voltage and load dump protection

When the battery voltage is higher than 19 V, the amplifier put in tri-state. It stops playing till the supply voltage returns in the permitted range.

The amplifier is protected against load dump surges having amplitude as high as 50 V and a rising time as low as 2 ms (see [Figure 24](#)).

**Figure 24. Load dump protection diagram**

### 4.3.3 Thermal protection

If the junction temperature of the IC overcomes  $T_j = 150\text{ }^\circ\text{C}$ , a smooth mute is applied to reduce output power and limit power dissipation. If this is not enough and the junction temperature continues to increase, the amplifier is switched off when it reaches the maximum temperature of  $170\text{ }^\circ\text{C}$ .

**Figure 25. Thermal protection diagram**

## 4.4 Warnings

### 4.4.1 DC offset detection (OD pin)

STPA008 integrates a DC offset detector to avoid that an anomalous input DC offset is multiplied by the amplifier gain producing a dangerous large offset at the output. In fact an output offset may lead to speakers damage for overheating. The detector works with the amplifier un-muted and no signal at the inputs.

When the differential output voltage is out of a window comparator with thresholds  $\pm 2V$  (typ), the OD pin is pulled down.

### 4.4.2 Clipping detection and diagnostics (CD-DIAG pin)

When clipping occurs, the output signal is distorted. If the signal distortion on one of the output channels exceeds 1%, the CD-DIAG pin is pulled down. This information can be sent to an audio processor in order to reduce the input signal of the amplifier and reduce the clipping.

A short to ground and short to  $V_{cc}$  is pointed out by CD-DIAG. This pin is pulled down to 0 V till these shorts are present to inform the user a protection occurred.

CD-DIAG acts also as thermal warning. In fact every time  $T_j$  exceeds  $140^\circ C$ , it is pulled down to notify this occurrence.

Figure 26. Audio section waveforms

## 4.5 Heat sink definition

Assuming a power dissipation of 26 W (e.g. in the worst case situation of frequent clipping occurrence), considering  $T_j$  max is 150°C and assuming ambient temperature is 70 °C, the available temperature gap for a correct dissipation is 80 °C.

This means the thermal resistance of the system  $R_{Th}$  has to be  $80 \text{ °C}/26 \text{ W} = 3 \text{ °C/W}$ .

The junction to case thermal resistance is 1 °C/W. So the heat sink thermal resistance should be approximately 2 °C/W. This would avoid any thermal shutdown occurrence even after long-term and full-volume operation.

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com).

ECOPACK<sup>®</sup> is an ST trademark.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
