Detailed Description

The DS4100H is a low-jitter HCSL 100MHz clock oscillator. It combines an AT-cut crystal, an oscillator, and a low-noise PLL in a 5mm by 3.2mm ceramic package. The typical phase jitter is 0.9ps_{RMS} from 12kHz to 20MHz. The device operates from a single +3.3V supply.

PLL

The PLL generates a 1.6GHz high-speed clock signal based on the 25MHz crystal oscillator output. Clock-divider circuit M generates the output clock by scaling the VCO output frequency. Clock-divider circuit N applies a scaled version of the output clock signal to the phase/frequency detector (PFD) circuit.

Output Drivers

The DS4100H is available with HCSL output buffers. When not needed, the output buffers can be disabled by driving the OE input to a logic-low. OE has an internal pullup resistor so that, if OE is left open, the outputs are enabled by default. When disabled, the output buffer goes to a high-impedance state.
