

Automotive 5 V low dropout voltage regulator

Datasheet - production data

- Early warning
- Very wide stability range with low value output capacitor
- Thermal shutdown and short-circuit protection
- Wide temperature range ($T_j = -40\text{ °C}$ to 150 °C)

Description

L5150CJ and L5150CS are low dropout linear regulators with microprocessor control functions such as power on reset, low voltage reset, early warning.

Typical quiescent current is $55\text{ }\mu\text{A}$ at very low output current.

On chip trimming results in high output voltage accuracy ($\pm 2\%$). Accuracy is kept over wide temperature range, line and load variation. Early warning circuit monitors the input voltage and compares it with an internal voltage reference.

Output voltage reset threshold can be adjusted down to 3.5 V by means of an external voltage divider.

The maximum input voltage is 40 V . The max output current is internally limited. Internal temperature protection disables the voltage regulator output. In addition, only low-value ceramic capacitor on output is required for stability.

Features

Max DC supply voltage	V_S	40V
Max output voltage tolerance	ΔV_O	$\pm 2\%$
Max dropout voltage	V_{dp}	500 mV
Output current	I_o	150 mA
Quiescent current	I_{qn}	$55\text{ }\mu\text{A}^{(1)}$

1. Typical value.

- AEC-Q100 qualified
- Operating DC supply voltage range 5.6 V to 40 V
- Low dropout voltage
- Low quiescent current consumption
- Precision output voltage $5\text{ V} \pm 2\%$
- Reset circuit sensing the output voltage
- Programmable reset pulse delay with external capacitor
- Adjustable reset threshold

Table 2. Pins description

Pin name	PowerSSO-12 pin #	SO-8 pin #	Function
R_{es_Adj}	1	8	Reset adjustable threshold. Connected to an appropriate external voltage divider, it allows to properly set the reset threshold down to 3.5 V. Connect to GND if not needed.
R_{es}	2	1	Reset output. Internally connected to V_o through a 20 K Ω pull up resistor. This pin is pulled low when $V_o < V_{o_th}$. Keep open if not needed.
V_{cr}	3	2	Reset delay. Connect an external capacitor between V_{cr} pin and ground to adjust the reset delay time. Keep open if not needed.
GND	4	3	Ground reference.
NC	5, 11, 8, 9	-	Not connected.
V_o	6	4	5 V regulated output. Block to GND with a ceramic capacitor ($C_o \geq 220$ nF for regulator stability).
V_S	7	5	Supply voltage, block directly to GND on the IC with a capacitor.
EW_i	10	6	Early warning input. This pin monitors the V_S voltage level through a resistor divider. Connect to V_S if not needed.
EW_o	12	7	Early warning output. Internally connected to V_o through 20 K Ω pull up resistor. This pin is pulled low when EW_i is below bandgap reference voltage. Keep open if not needed.
TAB	-	-	TAB is connected to the substrate of the chip: connect to GND or leave open (see Figure 2 for PowerSSO-12 only).

2 Electrical specifications

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the [Table 3: Absolute maximum ratings](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

3 Application information

3.1 Voltage regulator

The voltage regulator uses a p-channel mos transistor as a regulating element. With this structure a very low dropout voltage at current up to 150 mA is obtained. The output voltage is regulated up to input supply voltage of 40 V. The high-precision of the output voltage ($\pm 2\%$) is obtained with a pre-trimmed reference voltage. The voltage regulator automatically adapts its own quiescent current to the output current level. In light load conditions the quiescent current goes to 55 μA only (low consumption mode). This procedure features a certain hysteresis on the output current (see [Figure 7](#)). Short-circuit protection to GND and a thermal shutdown are provided.

Figure 21. Application schematic

The input capacitor $C_1 \geq 100 \mu\text{F}$ is necessary as backup supply for negative pulses which may occur on the line. The second input capacitor $C_2 \geq 220 \text{ nF}$ is needed when the C_1 is too distant from the V_S pin and it compensates smooth line disturbances. The C_0 ceramic capacitor, connected to the output pin, is for bypassing to GND the high-frequency noise and it guarantees stability even during sudden line and load variations. Suggested value is $C_0 = 220 \text{ nF}$ with $\text{ESR} \geq 100 \text{ m}\Omega$.

Stability region is reported in [Figure 22](#).

Figure 22. Stability region

Figure 23. Maximum load variation response

3.2 Reset

The reset circuit monitors the output voltage V_o . If the output voltage becomes lower than V_{o_th} then R_{es} goes low with a delay time (t_{rr}). When the output voltage becomes higher than V_{o_th} then R_{es} goes high with a delay time t_{rd} . This delay is obtained by 32 periods of oscillator. The oscillator period is given by:

Equation 1

$$T_{osc} = [(V_{Rhth} - V_{Rlth}) \times C_{tr}] / I_{cr} + [(V_{Rhth} - V_{Rlth}) \times C_{tr}] / I_{dr}$$

where:

$I_{cr} = 20 \mu A$ is an internally generated charge current,

$I_{dr} = 20 \mu A$ is an internally generated discharge current,

$V_{Rhth} = 2.5 V$ (typ) and $V_{Rlth} = 0.9 V$ (typ) are two voltage thresholds,

C_{tr} is an external capacitor put between V_{cr} pin and GND.

Reset pulse delay T_{rd} is given by:

Equation 2

$$t_{rd} = 32 \times T_{osc}$$

The Output Voltage Reset threshold can be adjusted via an external voltage divider $R_1 + R_2$ (R_1 connected between R_{es_Adj} and V_0 , R_2 connected between R_{es_Adj} and GND) according to the following formula:

Equation 3

$$V_{thre} = [(R_1 + R_2) / R_2] \times V_{Res_adj}$$

The Output Voltage Reset threshold can be decreased down to 3.5 V. If it is needed to maintain it to its default value (8% below V_{0_ref} typical), it is enough to connect the R_{es_Adj} pin directly to GND.

Figure 24. Reset time diagram

3.3 Early warning

This circuit compares the EW_i input signal with the internal voltage reference (typically 2.5 V). The use of an external voltage divider makes the comparator very flexible in the application. This function can be used to supervise the supply input voltage either before or after the protection diode and to give additional information to the microprocessor such as low voltage warnings.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
