

4.5Ω/20Ω, 300MHz Bandwidth, Dual SPDT Analog Switches in UCSP

MAX4717/MAX4718

General Description

The MAX4717/MAX4718 low-voltage, low on-resistance (R_{ON}), dual single-pole/double throw (SPDT) analog switches operate from a single +1.8V to +5.5V supply. These devices are designed for USB 1.1 and audio switching applications.

The MAX4717 features two 4.5Ω R_{ON} (max) SPDT switches with 1.2Ω flatness and 0.3Ω matching between channels. The MAX4718 features one 4.5Ω R_{ON} (max) SPDT switch and one 20Ω R_{ON} (max) SPDT switch. The 20Ω switch has a guaranteed matching and flatness of 0.4Ω and 1.2Ω, respectively. These switches offer break-before-make switching (1ns) with $t_{ON} < 80ns$ and $t_{OFF} < 40ns$ at +2.7V. The digital logic inputs are +1.8V logic compatible with a +2.7V to +3.6V supply.

These switches are packaged in a chip-scale package (UCSP™), significantly reducing the required PC board area. The chip occupies only a 2.0mm x 1.50mm area and has a 4 x 3 bump array with a bump pitch of 0.5mm. These switches are also available in 10-pin μMAX® and 10-pin TDFN packages.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

The MAX4717/MAX4718 high-speed, low-voltage, low on-resistance (R_{ON}), dual SPDT analog switches operate from a single +1.8V to +5.5V supply. The switches feature break-before-make switching operation and fast switching speeds ($t_{ON} = 80\text{ns}$ (max), $t_{OFF} = 40\text{ns}$ (max)).

These switches have low 15pF on-channel capacitance, which allows for 12Mbps switching of the data signals for USB 1.0/1.1 applications. The MAX4717 is designed to switch D+ and D- USB signals with a guaranteed skew of less than 2ns (see Figure 4) as measured from 50% of the input signal to 50% of the output signal.

Applications Information

Digital Control Inputs

The MAX4717/MAX4718 logic inputs accept up to +5.5V regardless of supply voltage. For example, with a +3.3V supply, IN_{-} can be driven low to GND and high to +5.5V allowing for mixing of logic levels in a system. Driving the control logic inputs rail-to-rail minimizes power consumption. For a +3V supply voltage, the logic thresholds are 0.5V (low) and 1.4V (high); for a +5V supply voltage, the logic thresholds are 0.8V (low) and 2.0V (high).

Analog Signal Levels

The on-resistance of the MAX4717/MAX4718 changes very little for analog input signals across the entire supply voltage range (see the *Typical Operating Characteristics*). The switches are bidirectional, so the NO_{-} , NC_{-} , and COM_{-} pins can be either inputs or outputs.

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{+} before applying analog signals, especially if the analog signal is not current-limited.
