GENERAL DESCRIPTION

The ADG819 and the ADG820 are monolithic, CMOS, SPDT (single-pole, double-throw) switches. These switches are designed on a submicron process that provides low power dissipation yet gives high switching speed, low On resistance, and low leakage currents.

Low power consumption and an operating supply range of 1.8 V to 5.5 V make the ADG819 and ADG820 ideal for battery-powered, portable instruments.

Each switch of the ADG819 and the ADG820 conducts equally well in both directions when on. The ADG819 exhibits break-before-make switching action, thus preventing momentary shorting when switching channels. The ADG820 exhibits make-before-break action.

The ADG819 and the ADG820 are available in a 6-lead SOT-23 package and an 8-lead μ SOIC package. The ADG819 is also available in a 2 \times 3 bump 1.14 mm \times 2.18 mm MicroCSP package. This chip occupies only a 1.14 mm \times 2.18 mm area, making it the ideal candidate for space-constrained applications.

NOTES

¹Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

²Overvoltages at IN, S, or D will be clamped by internal diodes. Current should be limited to the maximum ratings given.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG819/ADG820 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
