

NCP51530

High and Low Side Gate Driver, High Performance, 700 V, with 3.5 A Source and 3 A Sink Currents

NCP51530 is a 700 V high side and low side driver with 3.5 A source & 3 A sink current drive capability for AC-DC power supplies and inverters. NCP51530 offers best in class propagation delay, low quiescent current and low switching current at high frequencies of operation. This device is tailored for highly efficient power supplies operating at high frequencies. NCP51530 is offered in two versions, NCP51530A/B. NCP51530A has a typical 60 ns propagation delay, while NCP51530B has a typical propagation delay of 25 ns. NCP51530 comes in SOIC8 and DFN10 packages.

Features

- High voltage range: Up to 700 V
- NCP51530A: Typical 60 ns Propagation Delay
- NCP51530B: Typical 25 ns Propagation Delay
- Low Quiescent and Operating Currents
- 15 ns Max Rise and Fall Time
- 3.5 A Source / 3 A Sink Currents
- Under-voltage Lockout for Both Channels
- 3.3 V and 5 V Input Logic Compatible
- High dv/dt Immunity up to 50 V/ns
- Pin to Pin Compatible with Industry Standard Half-bridge ICs.
- Matched Propagation Delay (7 ns Max)
- High Negative Transient Immunity on Bridge Pin
- DFN10 Package Offers Both Improved Creepage and Exposed Pad

Applications

- High-density SMPS for Servers, Telecom and Industrial
- Half/Full-bridge & LLC Converters
- Active Clamp Flyback/Forward Converters
- Solar Inverters & Motor Controls
- Electric Power Steering

GENERAL DESCRIPTION

For popular topologies like LLC, half bridge converters, full bridge converters, two switch forward converter etc. low-side high-side drivers are needed which perform the function of both buffer and level shifter. These devices can drive the gate of the topside MOSFETs whose source node is a dynamically changing node. The bias for the high side driver in these devices is usually provided through a bootstrap circuit.

In a bid to make modern power supplies more compact and efficient, power supply designers are increasingly opting for high frequency operations. High frequency operation causes higher losses in the drivers, hence reducing the efficiency of the power supply.

NCP51530 is a 700 V high side-low side driver for AC-DC power supplies and inverters. NCP51530 offers best in class propagation delay, low quiescent current and low switching current at high frequencies of operation. This device thus enables highly efficient power supplies operating at high frequencies.

NCP51530 is offered in two versions, NCP51530A/B. NCP51530A has a typical 60 ns propagation delay, while NCP51530B has propagation delay of 25 ns.

NCP51530 comes in SOIC8 and DFN10 packages. SOIC8 package of the device is pin to pin compatible with industry standard solutions.

NCP51530 has two independent input pins HIN and LIN allowing it to be used in a variety of applications. This device also includes features wherein, in case of floating input, the logic is still defined. Driver inputs are compatible with both CMOS and TTL logic hence it provides easy interface with analog and digital controllers. NCP51530 has under voltage lock out feature for both high and low side drivers which

ensures operation at correct V_{CC} and V_B voltage levels. The output stage of NCP51530 has 3.5 A/3 A current source/sink capability which can effectively charge and discharge a 1 nF load in 15 ns.

FEATURES

INPUT STAGES

NCP51530 has two independent input pins HIN and LIN allowing it to be used in a variety of applications. The input stages of NCP51530 are TTL and CMOS compatible. This ensures that the inputs of NCP51530 can be driven with 3.3 V or 5 V logic signals from analog or digital PWM controllers or logic gates.

The input pins have Schmitt triggers to avoid noise induced logic errors. The hysteresis on the input pins is typically 1.3 V. This high value ensures good noise immunity.

NCP51530 comes with an important feature wherein outputs (HO, LO) stays low in case any of the input pin is floating. At both the input pins there is an internal pull down resistor to define its logic value in case the pin is left open or NCP51530 is driven by open drain signal. The input logic is explained in the Table 7 below.

NCP51530 input pins are also tolerant to negative voltage below the GND pin level as long as it is within the ratings defined in the datasheet. This tolerance allows the use of transformer as an isolation barrier for input pulses.

NCP51530A features a noise rejection function to ensure that any pulse glitch shorter than 30 ns will not produce any output. These features are well illustrated in the Figure 26 below.

NCP51530B has no such filters in the input stages. The timing diagram NCP51530B is Figure 27 below.

Table 7. INPUT TABLE

S.No	LIN	HIN	LO	HO

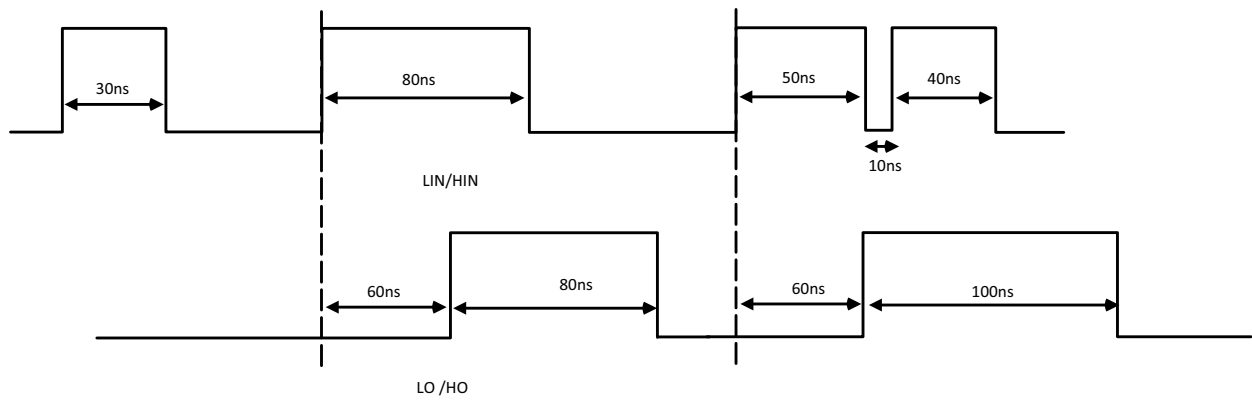

Figure 26. Input Filter (NCP51530A)

Figure 27. No Input Filter (NCP51530B)

Figure 28. UVLO Timing Diagram

UNDER VOLTAGE LOCK-OUT

NCP51530 has under voltage lockout protection on both the high side and the low side driver. The function of the UVLO circuits is to ensure that there is enough supply voltages (V_{CC} and V_B) to correctly bias high side and low side circuits. This also ensures that the gate of external MOSFETs are driven at an optimum voltage.

If the V_{CC} is below the V_{CC} UVLO voltage, the low side driver output (LO) and high side driver output (HO) both remain low.

If V_B is below V_B UVLO voltage the high side driver output (HO) remains low. However if the V_{CC} is above V_{CC} UVLO voltage level, the low side driver output (LO) can still turn on and off based on the low side driver input (LI)

and is not affected by the V_B status. This ensures proper charging of the bootstrap capacitor to bring the high side bias supply V_B above UVLO voltage.

Both the V_{CC} and V_B UVLO circuits are provided with hysteresis feature. This hysteresis feature avoids errors due to ground noise in the power supply. The hysteresis also

ensures continuous operation in case of a small drop in the bias voltage. This drop in the bias can happen when device starts switching MOSFET and the operating current of the device increases. The UVLO feature of the device is explained in the Figure 30.

Figure 29. NCP51530 Turn ON-OFF Paths

OUTPUT STAGES

The NCP51530 is equipped with two independent drivers. The output stage of NCP51530 has 3.5 A/3 A current source/sink capability which can effectively charge and discharge a 1 nF load in 15 ns.

The outputs of NCP51530 can be turned on at the same time and there is no internal dead-time built between them. This allows NCP51530 to be used in topologies like two switch forward converter.

The figure below show the output stage structure and the charging and discharging path of the external power MOSFET. The bias supply V_{CC} or V_B supply the energy to charge the gate capacitance C_{gs} of the low side or the top

side external MOSFETs respectively. When a logic high is received from input stage, Qsource turns on and V_{CC}/V_B starts charging C_{gs} through R_g . Once the C_{gs} is charged to the drive voltage level the external power MOSFET turns on the external MOSFET to discharge to GND/HB level.

When a logic low signal is received from the input stage, Qsource turns off and Qsink turns on providing a path for gate terminal of

As seen in the figure, there are parasitic inductances in charging and discharging path of the C_{gs} . This can result in a little dip in the bias voltages V_{CC}/V_B . If the V_{CC}/V_B drops below UVLO the power supply can shut down the device.

NCP51530

Figure 30. Low Side Turn-ON Propagation Delay (NCP51530A)

FAST PROPAGATION DELAY

NCP51530 boasts of industry best propagation delay between input and output. NCP51530A has a typical of 60 ns propagation delay. The best in class propagation delay in NCP51530 makes it suitable for high frequency operation.

Since NCP51530B doesn't have the input filter included, the propagation delay are even faster. NCP51530B offers 25 ns propagation delay between input and output.

NCP51530

Figure 34. Bootstrap Circuit

COMPONENT SELECTION

C_{BOOT} CAPACITOR VALUE CALCULATION

NCP51530 has two independent drivers for driving high side and low side external MOSFETs. The bias for the high side driver is usually provided through a bootstrap circuit. A typical bootstrap circuit is shown in the figure 8 below.

The high side driver is biased by the C_{boot} (bootstrap capacitor). As can be seen in the circuit, C_{boot} will charge only when HB goes to GND level. Low value of C_{boot} can result in a little dip in the bias voltages V_B. If the V_B drops below UVLO the power supply can shut down the high side driver. Therefore choosing the right value of C_{boot} is very important for a robust design.

An example design for C_{boot} is given below.

$$Q_g = 30 \text{ nC}, V_{CC} = 15 \text{ V} \quad (\text{eq. 1})$$

$$Q_b = I_{BQ} * t_{\text{discharge}} = 81 \mu\text{C} * 5 \mu\text{S} = 405 \text{ pC} \quad (\text{eq. 2})$$

$$Q_{\text{tot}} = Q_g + Q_b = 30 \text{ nC} + 405 \text{ pC} = 30.4 \text{ pC} \quad (\text{eq. 3})$$

$$C_{\text{boot}} = \frac{Q_{\text{tot}}}{V_{\text{ripple}}} = \frac{30.4 \text{ nC}}{150 \text{ mV}} = 203 \text{ nF} \quad (\text{eq. 4})$$

Q_g is equivalent gate charge of the FET

I_{BQ} is the boot quiescent current

t_{discharge} is the discharge time for bootstrap capacitor

V_{ripple} is the allowed ripple voltage in the bootstrap capacitor

It is recommended to use a larger value so as to cover any variations in the gate charge and voltage with temperature.

R_{boot} RESISTOR VALUE CALCULATION

R_{boot} resistor value is very important to ensure proper function of the device. A high value of R_{boot} would slow down the charging of the C_{boot} while too low a value would push very high charging currents for C_{boot}. For NCP51530 a value between 2 Ω and 10 Ω is recommended for R_{boot}.

For example R_{boot} = 5 Ω

$$I_{\text{boot(pk)}} = \frac{V_{CC} - V_D}{R_{\text{boot}}} = \frac{15 \text{ V} - 1 \text{ V}}{5 \Omega} = 2.8 \text{ A} \quad (\text{eq. 5})$$

Where V_D is the bootstrap diode forward drop.

Thus, R_{boot} value of 5 Ω keeps the peak current below 2.8 A.

HIN AND LIN INPUT FILTER

For PWM connection on the LIN and HIN pin of the NCP51530, a RC is recommended to filter high frequency input noise.

This filter is particularly important in case of NCP51530B where no internal filter is included.

The recommended value for R_{LIN}/R_{HIN} and C_{HIN}/C_{LIN} are as below.

$$R_{\text{LIN}}/R_{\text{HIN}} = 100 \Omega$$

$$C_{\text{HIN}}/C_{\text{LIN}} = 120 \text{ pF}$$

V_{CC} CAPACITOR SELECTION

V_{CC} capacitor value should be selected at least ten times the value of C_{boot}. In this case thus C_{VCC} > 2 μF.

R_{gate} SELECTION

R_{gate} are selected to limit the peak gate current during charging and discharging of the gate capacitance. This resistance also helps to damp the ringing due to the parasitic inductances.

For example for a R_{gate} value of 5 Ω, the peak source and sink currents would be limited to the following values.

$$R_{gate} = 5\Omega \quad (\text{eq. 6})$$

$$I_{LO_Source} = \frac{V_{CC}}{R_{Lgate} + R_{LOH}} = \frac{15\text{ V}}{6.7\ \Omega} = 2.23\text{ A} \quad (\text{eq. 7})$$

$$I_{LO_Sink} = \frac{V_{CC}}{R_{Lgate} + R_{LOL}} = \frac{15\text{ V}}{6.8\ \Omega} = 2.20\text{ A} \quad (\text{eq. 8})$$

$$I_{HO_Source} = \frac{V_{CC} - V_{Dboot}}{R_{Lgate} + R_{HOH}} = \frac{14\text{ V}}{6.7\ \Omega} = 2.09\text{ A} \quad (\text{eq. 9})$$

$$I_{HO_Sink} = \frac{V_{CC} - V_{Dboot}}{R_{Lgate} + R_{HOL}} = \frac{15\text{ V} - 1\text{ V}}{6.8\ \Omega} = 2.06\text{ A} \quad (\text{eq. 10})$$

TOTAL POWER DISSIPATION

Total power dissipation of NCP51530 can be calculated as follows.

1. Static power loss of device (excluding drivers) while switching at an appropriate frequency.

$$P_{operating} = V_{boot} * I_{BO} + V_{CC} * I_{CCO} \quad (\text{eq. 11})$$

$$= 14\text{ V} * 0.4\text{ mA} + 15\text{ V} * 0.4\text{ mA} = 11.6\text{ mW}$$

I_{BO} is the operating current for the high side driver

I_{CCO} is the operating current for the low side driver

2. Power loss of driving external FET (Hard Switching)

$$P_{drivers} = ((Q_g * V_{boot}) + (Q_g * V_{CC}))f \quad (\text{eq. 12})$$

$$= ((30\text{ nC} * 14\text{ V}) + (30\text{ nC} * 15\text{ V})) * 100\text{ kHz} = 87\text{ mW}$$

Q_g is total gate charge of the MOSFET

3. Power loss of driving external FET (Soft Switching)

$$P_{drivers} = ((Q_{gs} * V_{boot}) + (Q_{gs} * V_{CC})) * f \quad (\text{eq. 13})$$

$$= ((4\text{ nC} * 14\text{ V}) + (4\text{ nC} * 15\text{ V})) * 100\text{ kHz} = 11\text{ mW}$$

4. Level shifting losses

$$P_{levelshifting} = (V_r + V_b) * Q * f \quad (\text{eq. 14})$$

$$= 415\text{ V} * 0.5\text{ nC} * 100\text{ kHz} = 20.75\text{ mW}$$

V_r is the rail voltage

Q is the substrate charge on the level shifter

5. Total Power Loss (Hard Switching)

$$P_{total} = P_{driver} + P_{operating} + P_{levelshifting} \quad (\text{eq. 15})$$

$$= 11.6\text{ mW} + 87\text{ mW} + 20.75\text{ mW} = 119.35\text{ mW}$$

6. Junction temperature increase

$$t_J = R_{\theta JA} * P_{total} = 183 * 0.14 = 25^\circ\text{C} \quad (\text{eq. 16})$$

LAYOUT RECOMMENDATIONS

NCP51530 is a high speed and high current high side and low side driver. To avoid any device malfunction during device operation, it is very important that there is very low parasitic inductance in the current switching path. It is very important that the best layout practices are followed for the PCB layout of the NCP51530. An example layout is shown in the figure below. Some of the layout rules to be followed are listed below.

- Keep the low side drive path LO-Q1-GND as small as possible. This reduces the parasitic inductance in the path and hence eliminates ringing on the gate terminal of the low side MOSFET Q1.
- Keep the high side drive loop HO-Q2-HB as small as possible. This reduces the parasitic inductance in the

path and hence eliminates ringing on the gate terminal of the low side MOSFET Q1.

- Keep C_{VCC} as near to the V_{CC} pin as possible and the $V_{CC}-C_{VCC}-GND$ loop as small as possible.
- Keep C_{VB} as near to V_B pin as possible and $V_B-C_{VB}-HB$ loop as small as possible.
- Keep the $HB-GND-Q1$ loop as small as possible. This loop has the potential to produce a negative voltage spike on the HB pin. This negative voltage spike can cause damage to the driver. This negative spike can increase the boot capacitor voltage above the maximum rating and hence cause damage to the driver.

NCP51530AMNTWG	60	Yes	DFN10 4x4 (Pb-Free)	4000 / Tape & Reel
NCP51530BMNTWG	25	No	DFN10 4x4 (Pb-Free)	4000 / Tape & Reel

[†]For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specification Brochure, BRD8011/D.

NCP51530

PACKAGE DIMENSIONS

SOIC-8 NB
CASE 751-07
ISSUE AK

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.80	5.00	0.189	0.197
B	3.80	4.00	0.150	0.157
C	1.35	1.75	0.053	0.069
D	0.33	0.51	0.013	0.020
G	1.27 BSC		0.050 BSC	
H	0.10	0.25	0.004	0.010
J	0.19	0.25	0.007	0.010
K	0.40	1.27	0.016	0.050
M	0°	8°	0°	8°
N	0.25	0.50	0.010	0.020
S	5.80	6.20	0.228	0.244

SOLDERING FOOTPRINT*

SCALE 6:1 ($\frac{\text{mm}}{\text{inches}}$)

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

PACKAGE DIMENSIONS

DFN10 4x4, 0.8P
CASE 506DJ
ISSUE O

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.25 AND 0.30 MM FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.
5. FOR DEVICE OPN CONTAINING W OPTION, DETAIL A ALTERNATE CONSTRUCTION A-2 AND DETAIL B ALTERNATE CONSTRUCTION B-2 ARE NOT APPLICABLE.

DIM	MILLIMETERS	
	MIN	MAX
A	0.80	1.00
A1	0.00	0.05
A3	0.20	REF
b	0.25	0.35
D	4.00	BSC
D2	2.90	3.10
E	4.00	BSC
E2	1.85	2.05
E3	0.375	BSC
e	0.80	BSC
K	0.90	---
L	0.35	0.45
L1	0.00	0.15

RECOMMENDED MOUNTING FOOTPRINT*

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
