165-Bump BGA
Commercial Temp
Industrial Temp

72Mb SigmaQuad-II+™ Burst of 4 ECCRAM™

633 MHz–400 MHz
1.8 V V_{DD}
1.5 V I/O

Features

- 2.5 Clock Latency
- On-Chip ECC with virtually zero SER
- Simultaneous Read and Write SigmaQuad™ Interface
- JEDEC-standard package
- Dual Double Data Rate interface
- Byte Write Capability
- Burst of 4 Read and Write
- On-Die Termination (ODT) on Data (D), Byte Write ($\overline{BW}$), and Clock (K, $\overline{K}$) outputs
- 1.8 V +100/–100 mV core power supply
- 1.5 V HSTL Interface
- Pipelined read operation
- Fully coherent read and write pipelines
- ZQ pin for programmable output drive strength
- IEEE 1149.1 JTAG-compliant Boundary Scan
- Pin-compatible with 36Mb and144Mb devices
- 165-bump, 15 mm x 17 mm, 1 mm bump pitch BGA package
- RoHS-compliant 165-bump BGA package available

SigmaQuad™ ECCRAM Overview

The GS8672D20/38BE are built in compliance with the SigmaQuad-II+ ECCRAM pinout standard for Separate I/O synchronous ECCRAMs. They are 75,497,472-bit (72Mb) ECCRAMs. The GS8672D20/38BE SigmaQuad ECCRAMs are just one element in a family of low power, low voltage HSTL I/O ECCRAMs designed to operate at the speeds needed to implement economical high performance networking systems.

Clocking and Addressing Schemes

The GS8672D20/38BE SigmaQuad-II+ ECCRAMs are synchronous devices. They employ two input register clock inputs, K and $\overline{K}$. K and $\overline{K}$ are independent single-ended clock inputs, not differential inputs to a single differential clock input buffer.

Each internal read and write operation in a SigmaQuad-II+ B4 ECCRAM is four times wider than the device I/O bus. An input data bus de-multiplexer is used to accumulate incoming data before it is simultaneously written to the memory array. An output data multiplexer is used to capture the data produced from a single memory array read and then route it to the appropriate output drivers as needed. Therefore the address field of a SigmaQuad-II+ B4 ECCRAM is always two address pins less than the advertised index depth (e.g., the 4M x18 has a 1M addressable index).

On-Chip Error Correction Code

GSI's ECCRAMs implement an ECC algorithm that detects and corrects all single-bit memory errors, including those induced by Soft Error Rate (SER) events such as cosmic rays, alpha particles. The resulting SER of these devices is anticipated to be <0.002 FITs/Mb — a 5-order-of-magnitude improvement over comparable SRAMs with no On-Chip ECC, which typically have an SER of 200 FITs/Mb or more. SER quoted above is based on reading taken at sea level.

However, the On-Chip Error Correction (ECC) will be disabled if a “Half Write” operation is initiated. See the **Byte Write Contol** section for further information.

TCK	Test Clock Input	Input	—
TDO	Test Data Output	Output	—
V_{REF}	HSTL Input Reference Voltage	Input	—
ZQ	Output Impedance Matching Input	Input	—
Qn	Synchronous Data Outputs	Output	—
Dn	Synchronous Data Inputs	Input	—
$\overline{Doff}$	Disable DLL when low	Input	Active Low
CQ	Output Echo Clock	Output	—
$\overline{CQ}$	Output Echo Clock	Output	—
V_{DD}	Power Supply	Supply	1.8 V Nominal
V_{DDQ}	Isolated Output Buffer Supply	Supply	1.5 V Nominal
V_{SS}	Power Supply: Ground	Supply	—
QVLD	Q Valid Output	Output	—
ODT	On-Die Termination	Input	—
NC	No Connect	—	—
NF	No Function	—	—

Notes:

1. NC = Not Connected to die or any other pin
2. NF= No Function. There is an electrical connection to this input pin, but the signal has no function in the device. It can be left unconnected, or tied to V_{SS} or V_{DDQ}.
3. K, or $\overline{K}$ cannot be set to V_{REF} voltage.

Background

Separate I/O SRAMs, from a system architecture point of view, are attractive in applications where alternating reads and writes are needed. Therefore, the SigmaQuad-II+ ECCRAM interface and truth table are optimized for alternating reads and writes. Separate I/O SRAMs are unpopular in applications where multiple reads or multiple writes are needed because burst read or write transfers from Separate I/O ECCRAMs can cut the RAM's bandwidth in half.

SigmaQuad-II+ B4 ECCRAM DDR Read

The status of the Address Input, $\overline{W}$, and $\overline{R}$ pins are sampled by the rising edges of K. $\overline{W}$ and $\overline{R}$ high causes chip disable. A low on the Read Enable pin, $\overline{R}$, begins a read cycle. $\overline{R}$ is always ignored if the previous command loaded was a read command. Clocking in a high on the Read Enable pin, $\overline{R}$, begins a read port deselect cycle.

SigmaQuad-II+ B4 ECCRAM DDR Write

The status of the Address Input, $\overline{W}$, and $\overline{R}$ pins are sampled by the rising edges of K. $\overline{W}$ and $\overline{R}$ high causes chip disable. A low on the Write Enable pin, $\overline{W}$, and a high on the Read Enable pin, $\overline{R}$, begins a write cycle. $\overline{W}$ is always ignored if the previous command was a write command. Data is clocked in by the next rising edge of K, the rising edge of $\overline{K}$ after that, the next rising edge of K, and finally by the next rising edge of $\overline{K}$.

Power-Up Sequence for SigmaQuad-II+ ECCRAMs

SigmaQuad-II+ ECCRAMs must be powered-up in a specific sequence in order to avoid undefined operations.

1. After power supplies power-up and clocks (K, $\overline{K}$) are stablized, 163,840 cycles are required to set Output Driver Impedance.

2. Thereafter, an additional 65,536 clock cycles are required to lock the DLL after it has been enabled.

3. Begin Read and Write operations.

For more information, read **AN1021 SigmaQuad and SigmaDDR Power-Up.**

On-Chip Error Correction

SigmaQuad-II ECCRAMs implement a single-bit error detection and correction algorithm (specifically, a Hamming Code) on each DDR data word (comprising two 9-bit data bytes) transmitted on each 9-bit data bus (i.e., transmitted on D/Q[8:0], D/Q[17:9], D/Q[26:18], or D/Q[35:27]). To accomplish this, 5 ECC parity bits (invisible to the user) are utilized per every 18 data bits (visible to the user).

The ECC algorithm neither corrects nor detects multi-bit errors. However, GSI ECCRAMs are architected in such a way that a single SER event very rarely causes a multi-bit error across any given "transmitted data unit", where a "transmitted data unit" represents the data transmitted as the result of a single read or write operation to a particular address. The extreme rarity of multi-bit errors results in the SER mentioned previously (i.e., <0.002 FITs/Mb measured at sea level).

Not only does the on-chip ECC significantly improve SER performance, but it also frees up the entire memory array for data storage. Very often SRAM applications allocate 1/9th of the memory array (i.e., one "error bit" per eight "data bits", in any 9-bit "data byte") for error detection (either simple parity error detection, or system-level ECC error detection and correction). Such error-bit allocation is unnecessary with ECCRAMs —the entire memory array can be utilized for data storage, effectively providing 12.5% greater storage capacity compared to SRAMs of the same density not equipped with on-chip ECC.

Special Functions

Byte Write Control

Byte Write Enable pins are sampled at the same time that Data In is sampled. A High on the Byte Write Enable pin associated with a particular byte (e.g., $\overline{\text{BW}}$0 controls D0–D8 inputs) will inhibit the storage of that particular byte, leaving whatever data may be stored at the current address at that byte location undisturbed. Any or all of the Byte Write Enable pins may be driven High or Low during the data in sample times in a write sequence.

Each write enable command and write address loaded into the RAM provides the base address for a 4-beat data transfer. The x18 version of the RAM, for example, may write 72 bits in association with each address loaded. Any 9-bit byte may be masked in any write sequence.

Note: If "Half Write" operations (i.e., write operations in which a $\overline{\text{BW}}$n pin is asserted for only half of a DDR write data transfer on the associated 9-bit data bus, causing only 9 bits of the 18-bit DDR data word to be written) are initiated, the on-chip ECC will be disabled for as long as the SRAM remains powered up thereafter. This must be done because ECC is implemented across entire 18-bit data words, rather than across individual 9-bit data bytes.

Byte Write Truth Table

The truth table below applies to write operations to Address "m", where Address "m" is the 18-bit memory location comprising the 2 beats of DDR write data associated with each $\overline{\text{BW}}$*n* pin in a given clock cycle.

$\overline{\text{BW}}$*n*		Input Data Byte *n*		Operation	Result
↑ K (Beat 1)	↑$\overline{\text{K}}$ (Beat 2)	↑K (Beat 1)	↑$\overline{\text{K}}$ (Beat 2)		
0	0	D0	D1	Full Write	D0 and D1 written to Address m
0	1	D0	X	Half Write	Only D0 written to Address m
1	0	X	D1	Half Write	Only D1 written to Address m
1	1	X	X	Abort	Address m unchanged

Notes:
1. $\overline{\text{BW0}}$ is associated with Input Data Byte D[8:0].
2. $\overline{\text{BW1}}$ is associated with Input Data Byte D[17:9].
3. $\overline{\text{BW2}}$ is associated with Input Data Byte D[26:18] (in x36 only).
4. $\overline{\text{BW3}}$ is associated with Input Data Byte D[35:27] (in x36 only).
5. ECC is disabled if a "Half Write" operation is initiated.
6. Although these devices execute Burst of 4 (i.e., 4-beat) write operations, for the purposes of this table they should be viewed as a pair of Burst of 2 (i.e., 2-beat) write operations. As such, valid/allowable Burst of 4 write operations only comprise (any combination of) Burst of 2 Full Write and/or Abort Write operations, as defined above.

FLXDrive-II Output Driver Impedance Control

HSTL I/O SigmaQuad-II+ ECCRAMs are supplied with programmable impedance output drivers. The ZQ pin must be connected to V_{SS} via an external resistor, RQ, to allow the SRAM to monitor and adjust its output driver impedance. The value of RQ must be 5X the value of the desired RAM output impedance. The allowable range of RQ to guarantee impedance matching continuously is between 175Ω and 275Ω. Periodic readjustment of the output driver impedance is necessary as the impedance is affected by drifts in supply voltage and temperature. The SRAM's output impedance circuitry compensates for drifts in supply voltage and temperature. A clock cycle counter periodically triggers an impedance evaluation, resets and counts again. Each impedance evaluation may move the output driver impedance level one step at a time towards the optimum level. The output driver is implemented with discrete binary weighted impedance steps.

Input Termination Impedance Control

These SigmaQuad-II+ ECCRAMs are supplied with programmable input termination on Data (D), Byte Write ($\overline{\text{BW}}$), and Clock (K/$\overline{\text{K}}$) input receivers. Input termination can be enabled or disabled via the ODT pin (6R). When the ODT pin is tied Low (or left floating -the pin has a small pull-down resistor), input termination is disabled. When the ODT pin is tied High, input termination is enabled. Termination impedance is programmed via the same RQ resistor (connected between the ZQ pin and V_{SS}) used to program output driver impedance, and is nominally RQ*0.6 Thevenin-equivalent when RQ is between 175Ω and 250Ω. Periodic readjustment of the termination impedance occurs to compensate for drifts in supply voltage and temperature, in the same manner as for driver impedance (see above).

Note:
When ODT = 1, Data (D), Byte Write ($\overline{\text{BW}}$), and Clock (K, $\overline{\text{K}}$) input termination is always enabled. Consequently, D, $\overline{\text{BW}}$, K, $\overline{\text{K}}$ inputs should always be driven High or Low; they should never be tri-stated (i.e., in a High-Z state). If the inputs are tri-stated, the input termination will pull the signal to V_{DDQ}/2 (i.e., to the switch point of the diff-amp receiver), which could cause the receiver to enter a meta-stable state, resulting in the receiver consuming more power than it normally would. This could result in the device's operating currents being higher.

Separate I/O SigmaQuad II+ B4 ECCRAM Truth Table

Previous Operation	A	$\overline{R}$	$\overline{W}$	Current Operation	D	D	D	D	Q	Q	Q	Q
K ↑ (t_{n-1})	K ↑ (t_n)	K ↑ (t_n)	K ↑ (t_n)	K ↑ (t_n)	K ↑ (t_{n+1})	$\overline{K}$ ↑ $(t_{n+1\frac{1}{2}})$	K ↑ (t_{n+2})	$\overline{K}$ ↑ $(t_{n+2\frac{1}{2}})$	$\overline{K}$ ↑ $(t_{n+2\frac{1}{2}})$	K ↑ (t_{n+3})	$\overline{K}$ ↑ $(t_{n+3\frac{1}{2}})$	K ↑ (t_{n+4})
Deselect	X	1	1	Deselect	X	X	—	—	Hi-Z/0	Hi-Z/0	—	—
Write	X	1	X	Deselect	D2	D3	—	—	Hi-Z/0	Hi-Z/0	—	—
Read	X	X	1	Deselect	X	X	—	—	Q2	Q3	—	—
Deselect	V	1	0	Write	D0	D1	D2	D3	Hi-Z/0	Hi-Z/0	—	—
Deselect	V	0	X	Read	X	X	—	—	Q0	Q1	Q2	Q3
Read	V	X	0	Write	D0	D1	D2	D3	Q2	Q3	—	—
Write	V	0	X	Read	D2	D3	—	—	Q0	Q1	Q2	Q3

Notes:

1. “1” = input “high”; “0” = input “low”; “V” = input “valid”; “X” = input “don’t care”
2. “—” indicates that the input requirement or output state is determined by the next operation.
3. Q0, Q1, Q2, and Q3 indicate the first, second, third, and fourth pieces of output data transferred during Read operations.
4. D0, D1, D2, and D3 indicate the first, second, third, and fourth pieces of input data transferred during Write operations.
5. Users should not clock in metastable addresses.
6. When On-Die Termination is disabled (ODT = 0), Q drivers are disabled (i.e., Q pins are tri-stated) for one cycle in response to NOP and Write commands, 2.5 cycles after the command is sampled, except when preceded by a Read command.
7. When On-Die Termination is enabled (ODT = 1), Q drivers are enabled Low (i.e., Q pins are driven Low) for one cycle in response to NOP and Write commands, 2.5 cycles after the command is sampled, except when preceded by a Read command. This is done so that the ASIC/Controller can enable On-Die Termination on its data inputs without having to cope with the termination pulling tri-stated data inputs to $V_{DDQ}/2$ (i.e., to the switch point of the data input receivers).

Byte Write Clock Truth Table

$\overline{BW}$	$\overline{BW}$	$\overline{BW}$	$\overline{BW}$	Current Operation	D	D	D	D
K↑ (t_{n+1})	$\overline{K}$↑ ($t_{n+1½}$)	K↑ (t_{n+2})	$\overline{K}$↑ ($t_{n+2½}$)	K↑ (t_n)	K↑ (t_{n+1})	$\overline{K}$↑ ($t_{n+1½}$)	K↑ (t_{n+2})	$\overline{K}$↑ ($t_{n+2½}$)
T	T	T	T	Write Dx stored if $\overline{BWn}$ = 0 in all four data transfers	D0	D1	D2	D3
T	F	F	F	Write Dx stored if $\overline{BWn}$ = 0 in 1st data transfer only	D0	X	X	X
F	T	F	F	Write Dx stored if $\overline{BWn}$ = 0 in 2nd data transfer only	X	D1	X	X
F	F	T	F	Write Dx stored if $\overline{BWn}$ = 0 in 3rd data transfer only	X	X	D2	X
F	F	F	T	Write Dx stored if $\overline{BWn}$ = 0 in 4th data transfer only	X	X	X	D3
F	F	F	F	Write Abort No Dx stored in any of the four data transfers	X	X	X	X

Notes:

1. “1” = input “high”; “0” = input “low”; “X” = input “don’t care”; “T” = input “true”; “F” = input “false”.
2. If one or more $\overline{BWn}$ = 0, then $\overline{BW}$ = “T”, else $\overline{BW}$ = “F”.

Absolute Maximum Ratings
(All voltages reference to V_{SS})

Symbol	Description	Value	Unit
V_{DD}	Voltage on V_{DD} Pins	–0.5 to 2.4	V
V_{DDQ}	Voltage in V_{DDQ} Pins	–0.5 to V_{DD}	V
V_{REF}	Voltage in V_{REF} Pins	–0.5 to V_{DDQ}	V
$V_{I/O}$	Voltage on I/O Pins	–0.5 to V_{DDQ} +0.5 (≤ 2.4 V max.)	V
V_{IN}	Voltage on Other Input Pins	–0.5 to V_{DDQ} +0.5 (≤ 2.4 V max.)	V
I_{IN}	Input Current on Any Pin	+/–100	mA dc
I_{OUT}	Output Current on Any I/O Pin	+/–100	mA dc
T_J	Maximum Junction Temperature	120	^oC
T_{STG}	Storage Temperature	–55 to 125	^oC

Note:
Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Recommended Operating Conditions, for an extended period of time, may affect reliability of this component.

Recommended Operating Conditions

Power Supplies

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	V_{DD}	1.7	1.8	1.9	V
I/O Supply Voltage	V_{DDQ}	1.4	—	1.6	V
Reference Voltage	V_{REF}	V_{DDQ}/2 – 0.05	—	V_{DDQ}/2 + 0.05	V

Note:
The power supplies need to be powered up simultaneously or in the following sequence: V_{DD}, V_{DDQ}, V_{REF}, followed by signal inputs. The power down sequence must be the reverse. V_{DDQ} must not exceed V_{DD}. For more information, read AN1021 SigmaQuad and SigmaDDR Power-Up.

Operating Temperature

Parameter	Symbol	Min.	Typ.	Max.	Unit
Junction Temperature (Commercial Range Versions)	T_J	0	25	85	°C
Junction Temperature (Industrial Range Versions)*	T_J	–40	25	100	°C

Note:
* The part numbers of Industrial Temperature Range versions end with the character “I”. Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.

Thermal Impedance

Package	Test PCB Substrate	θ JA (C°/W) Airflow = 0 m/s	θ JA (C°/W) Airflow = 1 m/s	θ JA (C°/W) Airflow = 2 m/s	θ JB (C°/W)	θ JC (C°/W)
165 BGA	4-layer	15.25	12.38	11.41	4.79	1.31

Notes:

1. Thermal Impedance data is based on a number of of samples from mulitple lots and should be viewed as a typical number.
2. Please refer to JEDEC standard JESD51-6.
3. The characteristics of the test fixture PCB influence reported thermal characteristics of the device. Be advised that a good thermal path to the PCB can result in cooling or heating of the RAM depending on PCB temperature.

HSTL I/O DC Input Characteristics

Parameter	Symbol	Min	Max	Units	Notes
Input Reference Voltage	V_{REF}	V_{DDQ} /2 – 0.05	V_{DDQ} /2 + 0.05	V	—
Input High Voltage	V_{IH1}	V_{REF} + 0.1	V_{DDQ} + 0.3	V	1
Input Low Voltage	V_{IL1}	–0.3	V_{REF} – 0.1	V	1
Input High Voltage	V_{IH2}	0.7 * V_{DDQ}	V_{DDQ} + 0.3	V	2,3
Input Low Voltage	V_{IL2}	–0.3	0.3 * V_{DDQ}	V	2,3

Notes:

1. Parameters apply to K, $\overline{\text{K}}$, SA, D, $\overline{\text{R}}$, $\overline{\text{W}}$, $\overline{\text{BW}}$ during normal operation and JTAG boundary scan testing.
2. Parameters apply to Doff, ODT during normal operation and JTAG boundary scan testing.
3. Parameters apply to ZQ during JTAG boundary scan testing only.

HSTL I/O AC Input Characteristics

Parameter	Symbol	Min	Max	Units	Notes
Input Reference Voltage	V_{REF}	V_{DDQ} /2 – 0.08	V_{DDQ} /2 + 0.08	V	—
Input High Voltage	V_{IH1}	V_{REF} + 0.2	V_{DDQ} + 0.5	V	1,2,3
Input Low Voltage	V_{IL1}	–0.5	V_{REF} – 0.2	V	1,2,3
Input High Voltage	V_{IH2}	V_{DDQ} – 0.2	V_{DDQ} + 0.5	V	4,5
Input Low Voltage	V_{IL2}	–0.5	0.2	V	4,5

Notes:

1. $V_{IH(MAX)}$ and $V_{IL(MIN)}$ apply for pulse widths less than one-quarter of the cycle time.
2. Input rise and fall times must be a minimum of 1 V/ns, and within 10% of each other.
3. Parameters apply to K, $\overline{\text{K}}$, SA, D, $\overline{\text{R}}$, $\overline{\text{W}}$, $\overline{\text{BW}}$ during normal operation and JTAG boundary scan testing.
4. Parameters apply to Doff, ODT during normal operation and JTAG boundary scan testing.

Capacitance

($T_A = 25^oC$, f = 1 MHz, $V_{DD} = 1.8$ V)

Parameter	Symbol	Test conditions	Typ.	Max.	Unit
Input Capacitance	C_{IN}	$V_{IN} = 0$ V	4	5	pF
Output Capacitance	C_{OUT}	$V_{OUT} = 0$ V	4.5	5.5	pF

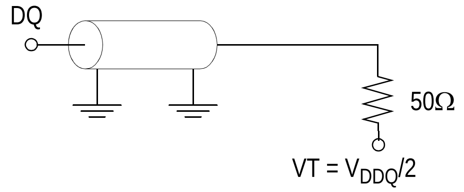
Note:
This parameter is sample tested.

AC Test Conditions

Parameter	Conditions
Input high level	1.25 V
Input low level	0.25 V
Max. input slew rate	2 V/ns
Input reference level	0.75 V
Output reference level	$V_{DDQ}/2$

Note:
Test conditions as specified with output loading as shown unless otherwise noted.

AC Test Load Diagram



RQ = 250 Ω (HSTL I/O)
$V_{REF} = 0.75$ V

Input and Output Leakage Characteristics

Parameter	Symbol	Test Conditions	Min.	Max

JTAG Port Operation

Overview

The JTAG Port on this RAM operates in a manner that is compliant with IEEE Standard 1149.1-1990, a serial boundary scan interface standard (commonly referred to as JTAG). The JTAG Port input interface levels scale with V_{DD}. The JTAG output drivers are powered by V_{DD}.

Disabling the JTAG Port

It is possible to use this device without utilizing the JTAG port. The port is reset at power-up and will remain inactive unless clocked. TCK, TDI, and TMS are designed with internal pull-up circuits.To assure normal operation of the RAM with the JTAG Port unused, TCK, TDI, and TMS may be left floating or tied to either V_{DD} or V_{SS}. TDO should be left unconnected.

JTAG Pin Descriptions

Pin	Pin Name	I/O	Description
TCK	Test Clock	In	Clocks all TAP events. All inputs are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.
TMS	Test Mode Select	In	The TMS input is sampled on the rising edge of TCK. This is the command input for the TAP controller state machine. An undriven TMS input will produce the same result as a logic one input level.
TDI	Test Data In	In	The TDI input is sampled on the rising edge of TCK. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP Controller state machine and the instruction that is currently loaded in the TAP Instruction Register (refer to the TAP Controller State Diagram). An undriven TDI pin will produce the same result as a logic one input level.
TDO	Test Data Out	Out	Output that is active depending on the state of the TAP state machine. Output changes in response to the falling edge of TCK. This is the output side of the serial registers placed between TDI and TDO.

Note:

This device does not have a TRST (TAP Reset) pin. TRST is optional in IEEE 1149.1. The Test-Logic-Reset state is entered while TMS is held high for five rising edges of TCK. The TAP Controller is also reset automaticly at power-up.

JTAG Port Registers

Overview

The various JTAG registers, refered to as Test Access Port or TAP Registers, are selected (one at a time) via the sequences of 1s and 0s applied to TMS as TCK is strobed. Each of the TAP Registers is a serial shift register that captures serial input data on the rising edge of TCK and pushes serial data out on the next falling edge of TCK. When a register is selected, it is placed between the TDI and TDO pins.

Instruction Register

The Instruction Register holds the instructions that are executed by the TAP controller when it is moved into the Run, Test/Idle, or the various data register states. Instructions are 3 bits long. The Instruction Register can be loaded when it is placed between the TDI and TDO pins. The Instruction Register is automatically preloaded with the IDCODE instruction at power-up or whenever the controller is placed in Test-Logic-Reset state.

Bypass Register

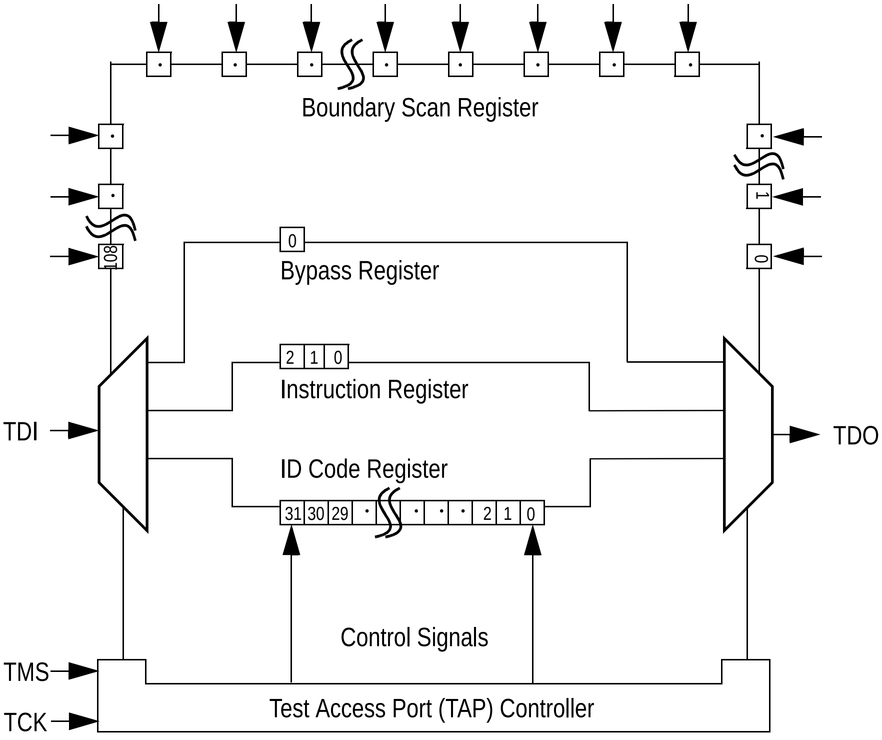
The Bypass Register is a single bit register that can be placed between TDI and TDO. It allows serial test data to be passed through the RAM's JTAG Port to another device in the scan chain with as little delay as possible.

Boundary Scan Register

The Boundary Scan Register is a collection of flip flops that can be preset by the logic level found on the RAM's input or I/O pins. The flip flops are then daisy chained together so the levels found can be shifted serially out of the JTAG Port's TDO pin. The Boundary Scan Register also includes a number of place holder flip flops (always set to a logic 1). The relationship between the device pins and the bits in the Boundary Scan Register is described in the Scan Order Table following. The Boundary Scan

Register, under the control of the TAP Controller, is loaded with the contents of the RAMs I/O ring when the controller is in Capture-DR state and then is placed between the TDI and TDO pins when the controller is moved to Shift-DR state. SAMPLE-Z, SAMPLE/PRELOAD and EXTEST instructions can be used to activate the Boundary Scan Register.

JTAG TAP Block Diagram



Identification (ID) Register

The ID Register is a 32-bit register that is loaded with a device and vendor specific 32-bit code when the controller is put in Capture-DR state with the IDCODE command loaded in the Instruction Register. The code is loaded from a 32-bit on-chip ROM. It describes various attributes of the RAM as indicated below. The register is then placed between the TDI and TDO pins when the controller is moved into Shift-DR state. Bit 0 in the register is the LSB and the first to reach TDO when shifting begins.

ID Register Contents

	See BSDL Model																				GSI Technology JEDEC Vendor ID Code											Presence Register

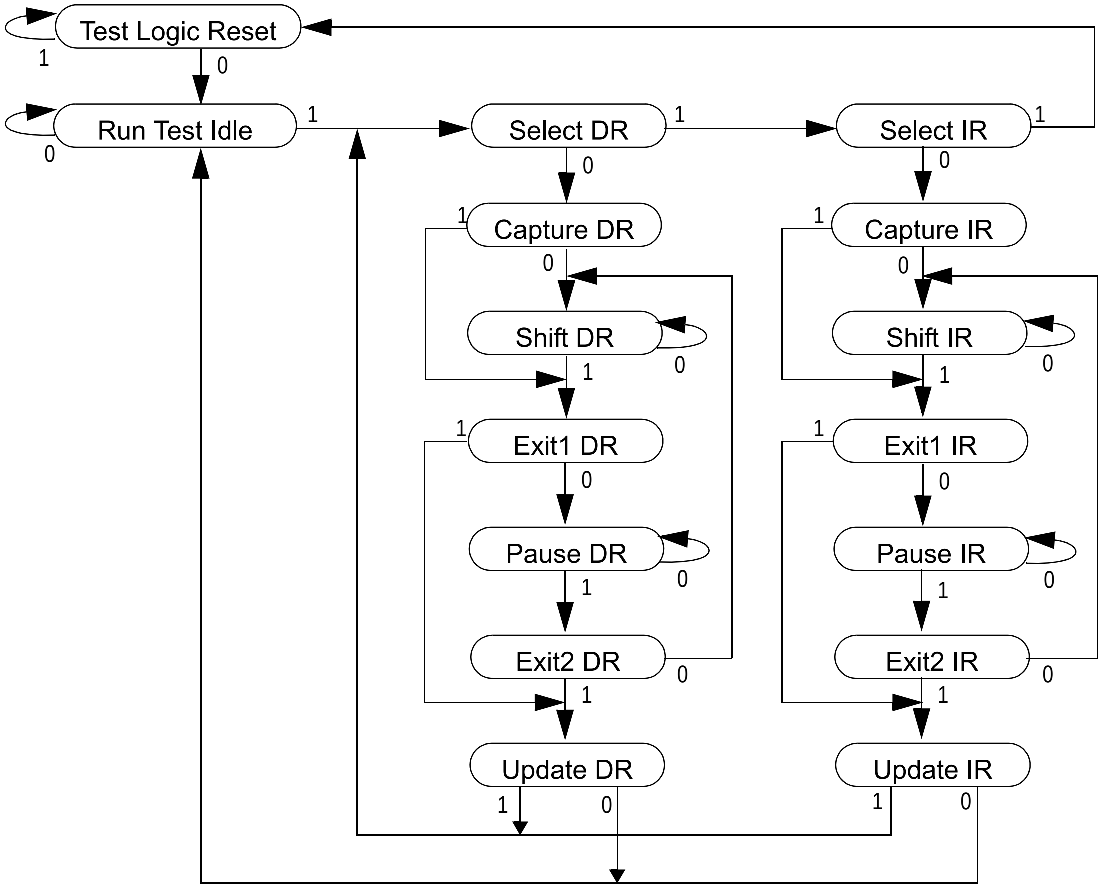
Tap Controller Instruction Set

Overview

There are two classes of instructions defined in the Standard 1149.1-1990; the standard (Public) instructions, and device specific (Private) instructions. Some Public instructions are mandatory for 1149.1 compliance. Optional Public instructions must be implemented in prescribed ways. The TAP on this device may be used to monitor all input and I/O pads, and can be used to load address, data or control signals into the RAM or to preload the I/O buffers.

When the TAP controller is placed in Capture-IR state the two least significant bits of the instruction register are loaded with 01. When the controller is moved to the Shift-IR state the Instruction Register is placed between TDI and TDO. In this state the desired instruction is serially loaded through the TDI input (while the previous contents are shifted out at TDO). For all instructions, the TAP executes newly loaded instructions only when the controller is moved to Update-IR state. The TAP instruction set for this device is listed in the following table.

JTAG Tap Controller State Diagram



Instruction Descriptions

BYPASS

When the BYPASS instruction is loaded in the Instruction Register the Bypass Register is placed between TDI and TDO. This occurs when the TAP controller is moved to the Shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE / PRELOAD instruction is loaded in the Instruction Register, moving the TAP controller into the Capture-DR state loads the data in the RAMs input and I/O buffers into the Boundary Scan Register. Boundary Scan Register locations are not associated with an input or I/O pin, and are loaded with the default state identified in the Boundary Scan Chain table at the end of this section of the datasheet. Because the RAM clock is independent from the TAP Clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e. in a metastable state). Although allowing the TAP to sample metastable inputs will not harm the device, repeatable results cannot be expected. RAM input signals must be stabilized for long enough to meet the TAPs input data capture set-up plus hold time (tTS plus tTH). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the Boundary Scan Register. Moving the controller to Shift-DR state then places the boundary scan register between the TDI and TDO pins.

EXTEST

EXTEST is an IEEE 1149.1 mandatory public instruction. It is to be executed whenever the instruction register is loaded with all logic 0s. The EXTEST command does not block or override the RAM's input pins; therefore, the RAM's internal state is still determined by its input pins.

Typically, the Boundary Scan Register is loaded with the desired pattern of data with the SAMPLE/PRELOAD command. Then the EXTEST command is used to output the Boundary Scan Register's contents, in parallel, on the RAM's data output drivers on the falling edge of TCK when the controller is in the Update-IR state.

Alternately, the Boundary Scan Register may be loaded in parallel using the EXTEST command. When the EXTEST instruction is selected, the sate of all the RAM's input and I/O pins, as well as the default values at Scan Register locations not associated with a pin, are transferred in parallel into the Boundary Scan Register on the rising edge of TCK in the Capture-DR state, the RAM's output pins drive out the value of the Boundary Scan Register location with which each output pin is associated.

IDCODE

The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in Capture-DR mode and places the ID register between the TDI and TDO pins in Shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the Test-Logic-Reset state.

SAMPLE-Z

If the SAMPLE-Z instruction is loaded in the instruction register, all RAM outputs are forced to an inactive drive state (high-Z) and the Boundary Scan Register is connected between TDI and TDO when the TAP controller is moved to the Shift-DR state.

JTAG TAP Instruction Set Summary

Instruction	Code	Description	Notes
EXTEST	000	Places the Boundary Scan Register between TDI and TDO.	1
IDCODE	001	Preloads ID Register and places it between TDI and TDO.	1, 2
SAMPLE-Z	010	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO. Forces all RAM output drivers to High-Z except CQ.	1
GSI	011	GSI private instruction.	1
SAMPLE/PRELOAD	100	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO.	1
GSI	101	GSI private instruction.	1
GSI	110	GSI private instruction.	1
BYPASS	111	Places Bypass Register between TDI and TDO.	1

Notes:

1. Instruction codes expressed in binary, MSB on left, LSB on right.
2. Default instruction automatically loaded at power-up and in test-logic-reset state.

JTAG Port Recommended Operating Conditions and DC Characteristics

Parameter	Symbol	Min.	Max.	Unit	Notes
Test Port Input Low Voltage	V_{ILJ}	–0.3	0.3 * V_{DD}	V	1
Test Port Input High Voltage	V_{IHJ}	0.7 * V_{DD}	V_{DD} +0.3	V	1
TMS, TCK and TDI Input Leakage Current	I_{INHJ}	–300	1	uA	2
TMS, TCK and TDI Input Leakage Current	I_{INLJ}	–1	100	uA	3
TDO Output Leakage Current	I_{OLJ}	–1	1	uA	4
Test Port Output High Voltage	V_{OHJ}	V_{DD} – 0.2	—	V	5, 6
Test Port Output Low Voltage	V_{OLJ}	—	0.2	V	5, 7
Test Port Output CMOS High	V_{OHJC}	V_{DD} – 0.1	—	V	5, 8
Test Port Output CMOS Low	V_{OLJC}	—	0.1	V	5, 9

Notes:

1. Input Under/overshoot voltage must be –1 V < Vi < V_{DDn} +1 V not to exceed 2.4 V maximum, with a pulse width not to exceed 20% tTKC.
2. $V_{ILJ} \le V_{IN} \le V_{DDn}$
3. $0 \text{ V} \le V_{IN} \le V_{ILJn}$
4. Output Disable, V_{OUT} = 0 to V_{DDn}
5. The TDO output driver is served by the V_{DD} supply.
6. I_{OHJ} = –2 mA
7. I_{OLJ} = + 2 mA
8. I_{OHJC} = –100 uA
9. I_{OLJC} = +100 uA

JTAG Port AC Test Conditions

Parameter	Conditions
Input high level	V_{DD} – 0.2 V
Input low level	0.2 V
Input slew rate	1 V/ns
Input reference level	$V_{DD}/2$
Output reference level	$V_{DD}/2$

Notes:
1. Include scope and jig capacitance.
2. Test conditions as shown unless otherwise noted.

4M x 18	GS8672D20BGE-400	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	400	C
4M x 18	GS8672D20BGE-633I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	633	I
4M x 18	GS8672D20BGE-550I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	550	I
4M x 18	GS8672D20BGE-500I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	500	I
4M x 18	GS8672D20BGE-450I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	450	I
4M x 18	GS8672D20BGE-400I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	400	I
2M x 36	GS8672D38BGE-633	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	633	C

Notes:

1. For Tape and Reel add the character “T” to the end of the part number. Example: GS8672D20BE-400T.
2. C = Commercial Temperature Range. I = Industrial Temperature Range.

Ordering Information—GSI SigmaQuad-II+ B4 ECCRAM (Continued)

Org	Part Number[1]	Type	Package	Speed (MHz)	T_J[2]
2M x 36	GS8672D38BGE-550	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	550	C
2M x 36	GS8672D38BGE-500	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	500	C
2M x 36	GS8672D38BGE-450	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	450	C
2M x 36	GS8672D38BGE-400	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	400	C
2M x 36	GS8672D38BGE-633I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	633	I
2M x 36	GS8672D38BGE-550I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	550	I
2M x 36	GS8672D38BGE-500I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	500	I
2M x 36	GS8672D38BGE-450I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	450	I
2M x 36	GS8672D38BGE-400I	SigmaQuad-II+ B4 ECCRAM	RoHS-compliant 165-bump BGA	400	I

Notes:

1. For Tape and Reel add the character “T” to the end of the part number. Example: GS8672D20BE-400T.
2. C = Commercial Temperature Range. I = Industrial Temperature Range.

SigmaQuad-II+ Revision History

File Name	Format/Content	Description of changes
8672D20_38B_r1		• Creation of datasheet
8672D20_38B_r1a	Content	• Added 633 MHz
8672D20_38B_r1_01	Content	• Added Operating Currents data
8672D20_38B_r1_01a	Content	• Removed 633 MHz for x36 config
8672D20_38B_r1_02	Content	• Added 633 MHz for x36 config • (Rev1.02a: Editorial updates) • (Rev1.02b: Corrected 165 thermal numbers)
8672D20_38B_r1_03	Content	• Updated to reflect MP status • (Rev1.03a: Removed V_{TIN} reference in Abs Max section) • (Rev1.03b: Added missing text from 2nd paragraph in Byte Write section) • (Rev1.03c: Corrected erroneous information in Input and Output Leakage Characteristics table)

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения **«JONHON»**, а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов **«FORSTAR»**.

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
