**DESCRIPTION**

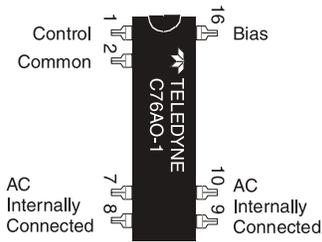

The Series C76 solid-state computer input/output modules are designed expressly for application in computerized control systems where reliable noise-free interface of switching is required to isolate computer logic elements from high conducted noise encountered in industrial environments. Sensitive logic circuitry is kept noise-free by means of optical isolation between logic and power lines.

Output modules allow either TTL or CMOS level signals to control the switching of power to high voltage and high current loads. Hysteresis at the input significantly increases the noise margin when used in the CMOS input mode, preventing false triggering in noisy environments

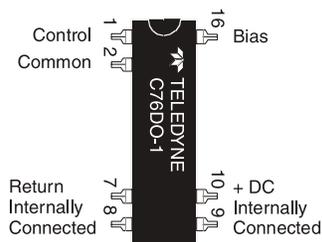

Input modules convert the presence or absence of load level voltages from pressure, flow, temperature and other transducers, limit switches, solenoids or relays to "clean" low level logic signals for computer input. An ENABLE function maintains the module's output in an "open" state until the ENABLE terminal is brought up to the bias supply level.

**TRUTH TABLE FOR ENABLE FUNCTION**

$V_{IN}^1$	ENABLE <sup>2</sup>	OUTPUT <sup>3</sup>
0	0	0
1	0	0
0	1	0
1	1	1

1. For C76AI-1:

When using 115 Vrms input,  $V_{IN}$  is a "1" when the voltage is  $\geq 90$  Vrms  
When using 220 Vrms input,  $V_{IN}$  is a "1" when the voltage is  $\geq 180$  Vrms

2. For C76AI-1 and C76DI-1:

The Enable input is a "1" when the Enable voltage  $V_E$  is  $\geq 2.0$  Vdc.  
The Enable input is a "0" when the Enable voltage  $V_E$  is  $\leq 0.4$  Vdc.

3. A "0" represents an open output switch.

A "1" represents a closed output switch.

**NOTE:**

When used in the CMOS input configuration, the C76AO-1 and the C76DO-1 provide inversion. When the input voltage is 0.5 Vdc or less the output will be guaranteed "On". When the input voltage is 2.8 Vdc or more the output will be guaranteed "Off".
