

## DESCRIPTION

The MPQ3410 is a highly efficient, synchronous, fixed frequency, current-mode step-up converter with output to input disconnect, inrush current limiting and internal soft-start. It includes an error amplifier, ramp generator, comparator, N-Channel switch and P-Channel synchronous rectified switch (which greatly improves efficiency). The output disconnect feature allows the output to be completely isolated from the input in shutdown mode.

The 550kHz switching frequency allows for smaller external components producing a compact solution for a wide range of load currents. The internal compensation and soft-start minimizes the external component count and limits the inrush current during startup. The MPQ3410 has integrated power MOSFET which can support up to 6V output and typical 1.3A switch current.

The MPQ3410 is offered in a thin SOT23-5 package.

## FEATURES

- Guaranteed Industrial/Automotive Temp Range Limits
- Over 90% Efficiency
- Output to Input Disconnect at Shutdown Mode
- Internal Synchronous Rectifier
- Inrush Current Limiting and Internal Soft-Start
- Internal Compensation
- 1.3A Typical Switch Current Limit
- 550kHz Fixed Switching Frequency
- Zero Current Shutdown Mode
- Thermal Shutdown
- 5-Pin TSOT-23 Package
- Available in AEC-Q100 Qualified Grade 1

## APPLICATIONS

- MP3 Players
- Handheld Computers and PDAs
- Digital Still and Video Cameras
- External Modems
- Small LCD Displays

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance.

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## TYPICAL APPLICATION

### ORDERING INFORMATION

Part Number	Package	Top Marking
MPQ3410DJ*	TSOT23-5	P3
MPQ3410DJ-AEC1**	TSOT23-5	P3

\* For Tape & Reel, add suffix -Z (e.g. MP3410DJ-Z)

For RoHS compliant packaging, add suffix -LF (e.g. MP3410DJ-LF-Z)

\*\* For Tape & Reel, add suffix -Z (e.g. MP3410DJ-AEC1-Z)

For RoHS compliant packaging, add suffix -LF (e.g. MP3410DJ-AEC1-LF-Z)

### PACKAGE REFERENCE

#### Absolute Maximum Ratings <sup>(1)</sup>

All Pins ..... -0.3V to +6.5V  
 Continuous Power Dissipation (T<sub>A</sub> = +25°C) <sup>(2)</sup>  
 ..... 0.47W  
 Storage Temperature..... -65°C to +150°C

#### Recommended Operating Conditions <sup>(3)</sup>

Supply Voltage V<sub>IN</sub>..... 1.8V to 6V  
 Output Voltage V<sub>OUT</sub>..... 2.5V to 6V  
 Operating Junction Temp. (T<sub>J</sub>). -40°C to +125°C

Thermal Resistance <sup>(4)</sup>	$\theta_{JA}$	$\theta_{JC}$
TSOT23-5 .....	220 .....	110 .. °C/W

**Notes:**

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub>(MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P<sub>D</sub>(MAX)=(T<sub>J</sub>(MAX)-T<sub>A</sub>)/ $\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7 4-layer board.

## ELECTRICAL CHARACTERISTICS

$V_{EN} = V_{OUT} = 3.3V$ ,  $T_J = -40^{\circ}C$  to  $+125^{\circ}C$ , unless otherwise noted. Typical values are at  $T_J = 25^{\circ}C$ .

Parameter	Symbol	Condition	Min	Typ	Max	Units	
Startup Supply Voltage	$V_{ST}$	$I_{LOAD} = 0mA$	$T_J = 25^{\circ}C$	1.5	1.6	1.8	V
			$T_J = -40^{\circ}C$ to $+125^{\circ}C$	1.4		1.8	
		$R_{LOAD} = 50\Omega$			1.65		
Output Voltage Range	$V_{OUT}$		2.5		6.0	V	
Supply Current (Shutdown)		$V_{EN} = V_{OUT} = 0V$ , $V_{SW} = 5V$	$T_J = 25^{\circ}C$		0.15	0.5	$\mu A$
			$T_J = -40^{\circ}C$ to $+125^{\circ}C$			5	
Supply Current		$V_{FB} = 1.3V$		360		$\mu A$	
Feedback Voltage	$V_{FB}$	$T_J = 25^{\circ}C$	1.15	1.19	1.23	V	
		$T_J = -40^{\circ}C$ to $+125^{\circ}C$	1.14		1.24		
Feedback Input Current		$V_{FB} = 1.19V$		50		nA	
Switching Frequency	$f_{SW}$	$T_J = 25^{\circ}C$	410	550	690	KHz	
		$T_J = -40^{\circ}C$ to $+125^{\circ}C$	330		690		
Maximum Duty Cycle	$D_{MAX}$		80	90	95	%	
EN Input Low Voltage					0.4	V	
EN Input High Voltage (see Chart EN high voltage vs Input for details)		$V_{IN} = 1.8V$	1.05			V	
		$V_{IN} = 3.3V$	1.65				
		$V_{IN} = 5V$	2.15				
EN Pull Down Resistor				1		M $\Omega$	
Low-Side On Resistance <sup>(5)</sup>	$R_{ONLS}$	$V_{OUT} = 3.3V$		300		m $\Omega$	
Low-Side Current Limit <sup>(5)</sup>	$I_{LIM}$			1.3		A	
High-Side On Resistance <sup>(5)</sup>	$R_{ONHS}$	$V_{OUT} = 3.3V$		530	700	m $\Omega$	
Thermal Shutdown <sup>(5)</sup>				160		$^{\circ}C$	
Thermal Shutdown Hysteresis <sup>(5)</sup>				30		$^{\circ}C$	

**Note:**

5) Guaranteed by design, not tested.

## PIN FUNCTIONS

Pin #	Name	Description
1	FB	Regulation Feedback Input. Connect to an external resistive voltage divider from the output to FB to set the output voltage.
2	GND	Ground.
3	OUT	Supply Input for the MPQ3410. Connect to the output of the converter.
4	SW	Output Switching Node. SW is the drain of the internal low-side N-Channel MOSFET and high-side P-Channel MOSFET. Connect the inductor to SW to complete the step-up converter.
5	EN	Regulator On/Off Control Input. A logic high input turns on the regulator. A logic low input ( $V_{EN} < 0.4V$ ) puts the MPQ3410 into low current shutdown mode. EN Input High Voltage will shift upward for a higher $V_{IN}$ . For a given $V_{IN}$ , as long as the voltage applied at EN pin is equal to or higher than correspondent EN-High-min value specified in the EC table, the part can turn on normally.

**Figure 1—Functional Block Diagram**

## OPERATION

The MPQ3410 uses a 550kHz fixed-frequency, current-mode regulation architecture to regulate the output voltage. The MPQ3410 measures the output voltage through an external resistive voltage divider and compares that to the internal 1.2V reference to generate the error voltage. The current-mode regulator compares the error voltage to the inductor current to regulate the output voltage. The use of current-mode regulation improves transient response and control loop stability.

When the MPQ3410 is disabled (EN = Low), both power switches are off. The body of the P-Channel MOSFET connects to SW and there is no current path from SW to OUT. Therefore, the output voltage discharges to ground. When the MPQ3410 is enabled (EN = High), the body of the P-Channel MOSFET connects to OUT and forms a forward diode from SW to OUT. Thus the output voltage rises up toward the input voltage. When output voltage crosses 1.6V the MPQ3410 starts the controller and regulates the output voltage to the target value.

At the beginning of each cycle, the N-Channel MOSFET switch is turned on, forcing the inductor current to rise. The current at the

source of the switch is internally measured and converted to a voltage by the current sense amplifier. That voltage is compared to the error voltage. When the inductor current rises sufficiently, the PWM comparator turns off the switch, forcing the inductor current to the output capacitor through the internal P-Channel MOSFET rectifier, which forces the inductor current to decrease. The peak inductor current is controlled by the error voltage, which in turn is controlled by the output voltage. Thus the output voltage controls the inductor current to satisfy the load.

### Soft-Start

The MPQ3410 includes a soft-start timer that limits the voltage at the error amplifier output during startup to prevent excessive current at the input. This prevents premature termination of the source voltage at startup due to inrush current. This also limits the inductor current at startup, forcing the input current to rise slowly to the amount required to regulate the output voltage during soft-start.

## APPLICATION INFORMATION

### COMPONENT SELECTION

#### Setting the Output Voltage

Set the output voltage by selecting the resistive voltage divider ratio. The voltage divider drops the output voltage to the 1.19V feedback voltage. Use a 100kΩ resistor for R2 of the voltage divider. Determine the high-side resistor R1 by the equation:

$$R1 = \frac{V_{OUT} - V_{FB}}{\left(\frac{V_{FB}}{R2}\right)}$$

Where  $V_{OUT}$  is the output voltage,  $V_{FB}$  is the 1.19V feedback voltage and  $R2=100k\Omega$ .

#### Selecting the Input Capacitor

An input capacitor is required to supply the AC ripple current to the inductor, while limiting noise at the input source. Multi-layer ceramic capacitors are the best choice as they have extremely low ESR and are available in small footprints. Use an input capacitor value of 4.7μF or greater. This capacitor must be placed physically close to the device.

#### Selecting the Output Capacitor

A single 4.7μF to 10μF ceramic capacitor usually provides sufficient output capacitance for most applications. Larger values up to 22μF may be used to obtain extremely low output voltage ripple and improve transient response. The impedance of the ceramic capacitor at the switching frequency is dominated by the capacitance, and so the output voltage ripple is mostly independent of the ESR. The output voltage ripple  $V_{RIPPLE}$  is calculated as:

$$V_{RIPPLE} = \frac{I_{LOAD}(V_{OUT} - V_{IN})}{V_{OUT} \times C2 \times f_{SW}}$$

Where  $V_{IN}$  is the input voltage,  $I_{LOAD}$  is the load current,  $C2$  is the capacitance of the output capacitor and  $f_{SW}$  is the 550kHz switching frequency.

#### Selecting the Inductor

The inductor is required to force the output voltage higher while being driven by the lower input voltage. A good rule for determining the inductance is to allow the peak-to-peak ripple current to be approximately 30%-50% of the maximum input current. Make sure that the peak inductor current is below the minimum current limit at the duty cycle used (to prevent loss of regulation due to the current limit variations).

Calculate the required inductance value L using the equations:

$$L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{V_{OUT} \times f_{SW} \times \Delta I}$$

$$I_{IN(MAX)} = \frac{V_{OUT} \times I_{LOAD(MAX)}}{V_{IN} \times \eta}$$

$$\Delta I = (30\% - 50\%) I_{IN(MAX)}$$

Where  $I_{LOAD(MAX)}$  is the maximum load current,  $\Delta I$  is the peak-to-peak inductor ripple current and  $\eta$  is efficiency. For the MPQ3410, typically, 4.7μH is recommended for most applications. Choose an inductor that does not saturate at the peak switch current as calculated above with additional margin to cover heavy load transients and extreme startup conditions.

### Selecting the Feed-Forward Capacitor

A feed-forward capacitor C3 in parallel with the high-side resistor R1 can be added to improve the output ripple at discontinuous conduction mode and the load transient response (see Figure 2). Up to 220pF for this capacitor is recommended for 3.3V output applications.

### Selecting the Schottky Diode

A Schottky diode D1 in parallel with the high-side P-Channel MOSFET is necessary to clamp the SW node to a safe level for outputs of 4V or above. A 0.5A, 20V Schottky diode can be used for this purpose. See Figure 3.

### LAYOUT CONSIDERATIONS

High frequency switching regulators require very careful layout for stable operation and low noise. All components must be placed as close to the IC as possible. All feedback components must be kept close to the FB pin to prevent noise injection on the FB pin trace. The ground return of C1 and C2 should be tied close to the GND pin. See the MPQ3410 demo board layout for reference.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
