

DESCRIPTION

PT2268 is a remote control encoder utilizing CMOS Technology specially designed for use with the PT2128. Using a special coding technique, PT2268 increases noise immunity to a very great extent. It is housed in 16-Pins DIP Package and has a maximum of eight (8) input channels. Its high performance features make PT2268 a MUST in every fan and other electrical home appliance remote control application.

PTC provides a new version of PT2268 which can be identified by the “B” mark on the lower right hand corner of the IC’s topcode (beside the date code). Please refer to the diagram on the Order Information Section. The difference between the old and new version is the external application circuit in the OSC1 and OSC2 pins. (see Oscillator Section)

FUNCTION DESCRIPTION

KEY INPUT

Up to eight (8) keys can be directly connected to pins I1 ~ I8. Please refer to the diagram below.

Furthermore, PT2268 has a built-in pull-low resistor of about 60K ~ 110KΩ which reduces the need for external components.

OSCILLATOR

An oscillation circuit can be constructed using the CMOS Inverter and Built-in Feedback Resistor, 455KHz Crystal and two 220pF capacitors. The carrier frequency is 38KHz.

Unless any of the 8 keys (I1 ~ I8) is being operated, the oscillation is automatically stopped. Thus, power consumption is considerably reduced.

TRANSMISSION WAVEFORM

When any of the 8 keys (I1 ~ I8) is set to “High”, the TxOUT outputs one start word followed by 2 identical data words and a space. The code will be continuously outputted until the key is released. If for any reason, the key was released during the code transmission process, the code that is being transmitted during the key release action will still be completely outputted. Please refer to the following diagram.

Note: OSC=455KHz

TRANSMISSION CODE WAVEFORM

The transmission waveforms of the Start Word and the different Data Words generated when a specific input key (I1 ~ I8) is pressed are illustrated below (see also Transmission Code Pattern Section).
