

**GENERAL DESCRIPTION**

The XRP6141 is a synchronous step-down controller for point-of load supplies up to 35A. A wide 4.5V to 22V input voltage range allows for single supply operation from industry standard 5V, 12V and 19.6V rails.

With a proprietary emulated current mode Constant On-Time (COT) control scheme, the XRP6141 provides extremely fast line and load transient response using ceramic output capacitors. It requires no loop compensation hence simplifying circuit implementation and reducing overall component count. The control loop also provides exceptional line regulation and maintains constant operating frequency. A selectable power saving mode, allows the user to operate in discontinuous mode (DCM) at light current loads thereby significantly increasing the converter efficiency.

A host of protection features, including over-current, over-temperature, short-circuit and UVLO, help achieve safe operation under abnormal operating conditions.

The XRP6141 is available in RoHS compliant, green/halogen free space-saving 16-pin 3x3 QFN package.

APPLICATIONS

- **Networking and Communications**
- **Fast Transient Point-of-Loads**
- **Industrial and Medical Equipment**
- **Embedded High Power FPGA**

FEATURES

- **35A Capable Step Down Controller**
 - Wide Input Voltage Range
 - 5V to 22V Single Supply
 - 4.5V to 5.5V Low Vin
 - Integrated high Current 2A/3A Drivers
 - 0.6V to 18V Adjustable Output Voltage
- **Proprietary Constant On-Time Control**
 - No Loop Compensation Required
 - Ceramic Output Cap. Stable operation
 - Programmable 200ns-2 μ s
 - Constant 200kHz-800kHz Frequency
 - Selectable CCM or CCM/DCM Operation
- **Programmable hiccup current limit with thermal compensation**
- **Precision Enable and Power-Good Flag**
- **Programmable Soft-start**
- **Integrated Bootstrap diode**
- **16-pin QFN Package**

ABSOLUTE MAXIMUM RATINGS

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

V _{IN}	-0.3V to 28V
V _{CC}	-0.3V to 6.0V
BST	-0.3V to 34V ²
BST-SW	-0.3V to 6V
SW, ILIM	-5V to 28V ^{1,2}
GH.....	-0.3V to BST+0.3V
GH-SW.....	-0.3V to 6V
ALL other pins.....	-0.3V to V _{CC} +0.3V
Storage Temperature.....	-65°C to 150°C
Junction Temperature	150°C
Power Dissipation	Internally Limited
Lead Temperature (Soldering, 10 sec)	300°C
ESD Rating (HBM - Human Body Model).....	2kV

OPERATING RATINGS

V _{IN}	-0.3V to 22V
V _{CC}	-0.3V to 5.5V
SW, ILIM	-1V to 26V ¹
PGOOD, VCC, TON, SS, EN, GL, FB	-0.3V to 5.5V
Switching Frequency	200kHz-800kHz ³
Junction Temperature Range	-40°C to 125°C

Note 1: SW pin's minimum DC range is -1V, transient is -5V for less than 50ns

Note 2: No external voltage applied

Note 3: Recommended

ELECTRICAL SPECIFICATIONS

Specifications are for Operating Junction Temperature of T_J = 25°C only; limits applying over the full Operating Junction Temperature range are denoted by a "•". Minimum and Maximum limits are guaranteed through test, design, or statistical correlation. Typical values represent the most likely parametric norm at T_J = 25°C, and are provided for reference purposes only. Unless otherwise indicated, V_{IN} = 12V, BST=V_{CC}, SW=GND=PGND=0V, CGH=CGL=3.3nF.

Parameter	Min.	Typ.	Max.	Units	Conditions
Power Supply Characteristics

PIN ASSIGNMENT

Fig. 3: XRP6141 Pin Assignment

A New Direction in Mixed-Signal

XRP6141

35A Synchronous Step Down COT Controller

PIN DESCRIPTION

Name	Pin Number	Description
GL	1	Driver output for Low-side N-channel synchronous MOSFET.
NC	2	Internally not connected. Leave this pin floating.
SW	3	Lower supply rail for high-side gate driver GH. Connect this pin to the junction between the two external N-channel MOSFETs.
GH	4	Driver output for high-side N-channel switching MOSFET.
BST	5	High-side driver supply pin. Connect a 0.1uF bootstrap capacitor between BST and SW.
ILIM	6	Over-current protection programming. Connect with a resistor to the Drain of the low-side MOSFET.
EN/MODE	7	Precision enable pin. Pulling this pin above 1.9V will turn the IC on and it will operate in Forced CCM. If the voltage is raised above 3.0V then the IC will operate in DCM or CCM depending on load.
TON	8	Constant on-time programming pin. Connect with a resistor to AGND.
SS	9	Soft-Start pin. Connect an external capacitor between SS and AGND to program the soft-start rate based on the 10uA internal source current.
PGOOD	10	Power-good output. This open-drain output is pulled low when V _{OUT} is outside the regulation.
FB	11	Feedback input to feedback comparator. Connect with a set of resistors to V _{OUT} and GND in order to program V _{OUT} .
AGND	12, 13	Analog ground. Control circuitry of the IC is referenced to this pin.
VIN	14	IC supply input. Provides power to internal LDO.
VCC	15	The output of LDO. For operation using a 5V rail, VCC should be shorted to VIN.
PGND	16	Low side driver ground
Exposed Pad		Thermal pad for heat dissipation. Connect to AGND with a short trace.

DETAILED OPERATION

XRP6141 is a synchronous step-down proprietary emulated current-mode Constant On-Time (COT) controller. The on-time, which is programmed via RON, is inversely proportional to VIN and maintains a nearly constant frequency. The emulated current-mode control allows the use of ceramic output capacitors.

Each switching cycle begins with GH signal turning the high-side (switching) FET for a preprogrammed time. At the end of the on-time the high-side FET is turned off and the low-side (synchronous) FET is turned on for a preset minimum time (250ns nominal). This parameter is termed Minimum Off-Time. After the minimum off-time the voltage at the feedback pin FB is compared to an internal voltage ramp at the feedback comparator. When VFB drops below the ramp voltage, the high-side FET is turned on and the cycle repeats. This voltage ramp constitutes an emulated current ramp and makes possible the use of ceramic capacitors, in addition to other capacitor types, for output filtering.

ENABLE/MODE

EN/MODE pin accepts a tri-level signal that is used to control turn on/off. It also selects between two modes of operation: 'Forced CCM' and 'DCM/CCM'. If EN is pulled below 1.9V the IC shuts down. A voltage between 1.9V and 3V selects the Forced CCM mode, which will run the converter in continuous conduction at all times. A voltage higher than 3V selects the DCM/CCM mode, which will run the converter in discontinuous conduction at light loads. DCM/CCM, which is based on diode emulation, is described below.

Diode Emulation Mode (DCM/CCM)

Diode Emulation Mode is designed to increase the converter efficiency at light loads. Light-load efficiency is increased by preventing negative inductor current. This is achieved by monitoring the inductor current valley (bottom) via SW and turning off the synchronous FET as inductor current I_L approaches zero. I_L is monitored indirectly by monitoring V_{SW} during the synchronous FET conduction (i.e., $V_{SW} = I_L \times R_{ds}$). If V_{SW} does not drop to $-1mV$ the converter operates in continuous conduction as shown in figure 28. If V_{SW} equals $-1mV$ then a zero-crossing is detected (figure 29). Eight consecutive zero-crossings activate the diode emulation mode. Then, on every subsequent switching cycle, GL is turned off when V_{SW} reaches $-1mV$ (figure 30). If I_{OUT} decreases further, discontinuous conduction ensues (figure 30). The constant on-time delivers a fixed energy at the start of each switching cycle. The synchronous FET is turned off when V_{SW} drops to $-1mV$. Remaining inductor energy is discharged through the FET's body diode. Now, because I_{OUT} is low, it takes longer for V_{OUT} to drop below regulation and trigger a new switching cycle. Hence switching frequency f decreases. This increase the efficiency at light loads.

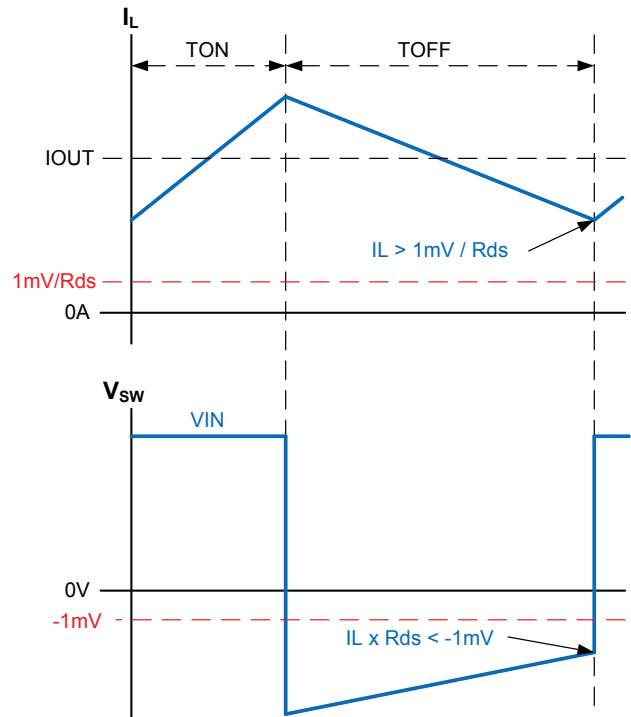

Figure 28. Continuous conduction during diode emulation

Figure 29. Zero-Crossing detection

35A Synchronous Step Down COT Controller

Figure 30. Discontinuous conduction during diode emulation

PROGRAMMING THE ON-TIME

The on-time T_{ON} is programmed via resistor R_{ON} according to following equation:

$$T_{ON} = \frac{(3.4E - 10) \times R_{ON}}{V_{IN}}$$

The required T_{ON} for a given application is calculated from:

$$T_{ON} = \frac{V_{OUT}}{V_{IN} \times f}$$

Note that switching frequency f will increase somewhat, as a function of increasing load current and increasing losses (see figure 22).

OVER-CURRENT PROTECTION (OCP)

If load current exceeds the programmed overcurrent I_{OCP} for four consecutive switching cycles, then IC enters hiccup mode of operation. In hiccup the MOSFET gates are turned off for 110ms (hiccup timeout). Following the hiccup timeout a soft-start is attempted. If OCP persists, hiccup timeout will repeat. The IC will remain in hiccup mode until load current is reduced below the programmed I_{OCP} . In order to program overcurrent protection use the following equation:

$$R_{LIM} = \frac{(I_{OCP} \times R_{DS}) + 8mV}{I_{LIM}}$$

Where:

R_{LIM} is resistor value for programming I_{OCP}

I_{OCP} is the overcurrent value to be programmed

R_{DS} is the MOSFET rated on resistance

8mV is the OCP comparator offset

I_{LIM} is the internal current that generates the necessary OCP comparator threshold (use 45uA)

Note that I_{LIM} has a positive temperature coefficient of 0.4%/°C. This is meant to roughly match and compensate for positive temperature coefficient of the synchronous FET. In order for this feature to be effective the temperature rise of the IC should approximately match the temperature rise of the FET.

SHORT-CIRCUIT PROTECTION (SCP)

If the output voltage drops below 60% of its programmed value, the IC will enter hiccup mode. Hiccup will persist until short-circuit is removed. SCP circuit becomes active after P_{GOOD} asserts high.

OVER-TEMPERATURE PROTECTION (OTP)

OTP triggers at a nominal die temperature of 150°C. The gate of switching FET and synchronous FET are turned off. When die temperature cools down to 135°C, softstart is initiated and operation resumes.

PROGRAMMING THE OUTPUT VOLTAGE

Use an external voltage divider as shown in figure 1 to program the output voltage V_{OUT} .

$$R_1 = R_2 \times \left(\frac{V_{OUT}}{0.6} - 1 \right)$$

R_2 recommended range is 2kΩ to 10kΩ.

PROGRAMMING THE SOFTSTART

Place a capacitor C_{SS} between the SS and GND pins to program the softstart. In order to program a softstart time of TSS, calculate the required capacitance C_{SS} from the following equation:

$$C_{SS} = T_{SS} \times \frac{10\mu A}{0.6V}$$

FEED-FORWARD CAPACITOR CFF

A feed-forward capacitor C_{FF} is recommended. C_{FF} provides a low-impedance/high-frequency path for the output voltage ripple to be transmitted to FB. It also helps get an optimum load transient response. Calculate C_{FF} from:

$$C_{FF} = \frac{1}{2 \times \pi \times f_s \times 0.1 \times R_1}$$

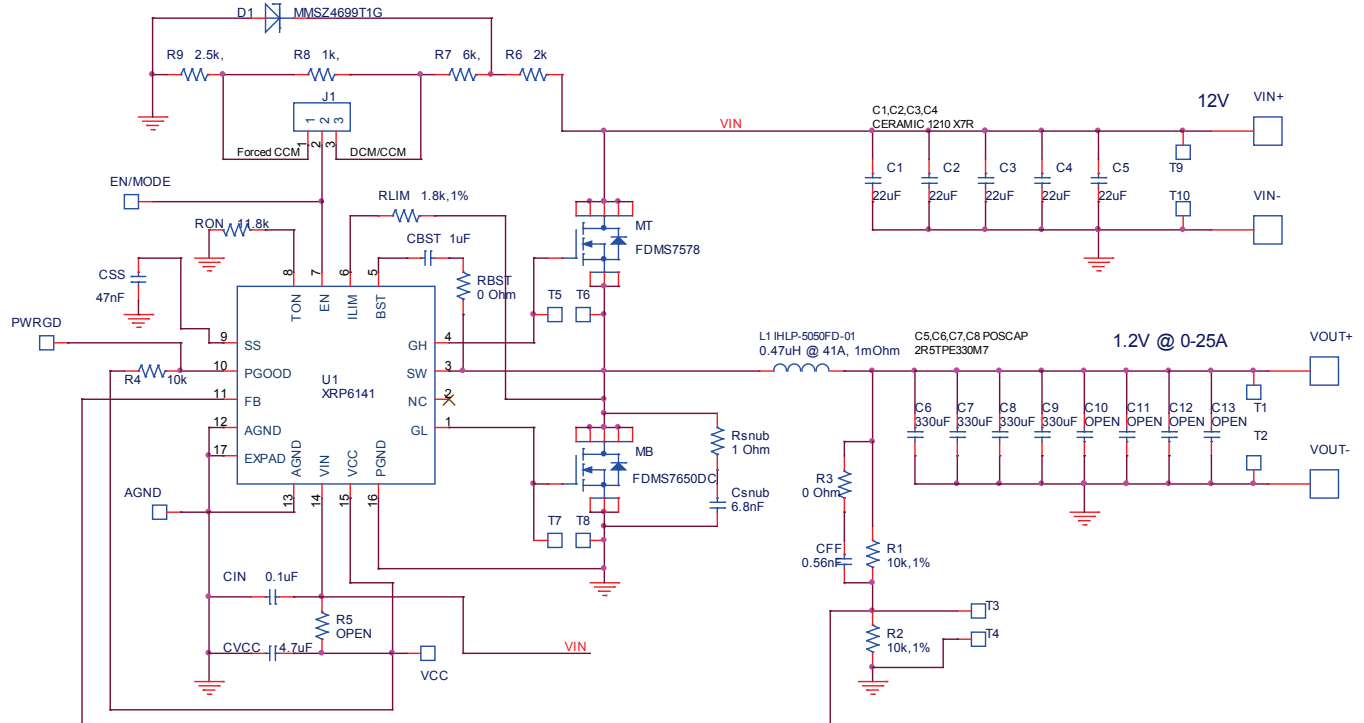

A New Direction in Mixed-Signal

XRP6141

35A Synchronous Step Down COT Controller

Applications Circuit

Note: If jumper J1 is set to CCM position, the converter will operate in 'Forced CCM' at $V_{IN}=12V(+/-10\%)$. In order to operate in Forced CCM over a wider V_{IN} range, remove Jumper and apply an auxiliary voltage in the 1.9V-3V range to the EN/MODE test point.

If jumper J1 is set to DCM/CCM position the converter will operate at DCM or CCM, depending on load, at $V_{IN}=12V(+/-10\%)$. In order to operate in DCM/CCM over a wider V_{IN} range, remove Jumper and apply an auxiliary voltage in the 3.1V-5V range to the EN/MODE test point.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
