

8-bit ultra-low-power MCU, up to 32 KB Flash, 1 KB Data EEPROM, RTC, LCD, timers, USART, I2C, SPI, ADC, DAC, comparators

Datasheet - production data

Features

- Operating conditions
 - Operating power supply range 1.8 V to 3.6 V (down to 1.65 V at power down)
 - Temp. range: - 40 °C to 85, 105 or 125 °C
- Low power features
 - 5 low power modes: Wait, Low power run (5.1 µA), Low power wait (3 µA), Active-halt with full RTC (1.3 µA), Halt (350 nA)
 - Consumption: 195 µA/MHz + 440 µA
 - Ultra-low leakage per I/O: 50 nA
 - Fast wakeup from Halt: 4.7 µs
- Advanced STM8 core
 - Harvard architecture and 3-stage pipeline
 - Max freq. 16 MHz, 16 CISC MIPS peak
 - Up to 40 external interrupt sources
- Reset and supply management
 - Low power, ultra-safe BOR reset with 5 selectable thresholds
 - Ultra-low-power POR/PDR
 - Programmable voltage detector (PVD)
- Clock management
 - 1 to 16 MHz crystal oscillator
 - 32 kHz crystal oscillator
 - Internal 16 MHz factory-trimmed RC
 - Internal 38 kHz low consumption RC
 - Clock security system
- Low power RTC
 - BCD calendar with alarm interrupt
 - Auto-wakeup from Halt w/ periodic interrupt
- LCD: up to 4x28 segments w/ step-up converter
- Memories
 - Up to 32 KB of Flash program memory and 1 Kbyte of data EEPROM with ECC, RWW
 - Flexible write and read protection modes
 - Up to 2 Kbyte of RAM
- DMA
 - 4 channels; supported peripherals: ADC, DAC, SPI, I2C, USART, timers
 - 1 channel for memory-to-memory
- 12-bit DAC with output buffer
- 12-bit ADC up to 1 Msps/25 channels
 - T. sensor and internal reference voltage
- 2 ultra-low-power comparators
 - 1 with fixed threshold and 1 rail to rail
 - Wakeup capability
- Timers
 - Two 16-bit timers with 2 channels (used as IC, OC, PWM), quadrature encoder
 - One 16-bit advanced control timer with 3 channels, supporting motor control
 - One 8-bit timer with 7-bit prescaler
 - 2 watchdogs: 1 Window, 1 Independent
 - Beeper timer with 1, 2 or 4 kHz frequencies
- Communication interfaces
 - Synchronous serial interface (SPI)
 - Fast I2C 400 kHz SMBus and PMBus
 - USART (ISO 7816 interface and IrDA)
- Up to 41 I/Os, all mappable on interrupt vectors
- Up to 16 capacitive sensing channels supporting touchkey, proximity, linear touch and rotary touch sensors
- Development support
 - Fast on-chip programming and non intrusive debugging with SWIM
 - Bootloader using USART
- 96-bit unique ID

1 Introduction

This document describes the features, pinout, mechanical data and ordering information of the medium-density STM8L151x4/6 and STM8L152x4/6 devices (STM8L151Cx/Kx/Gx, STM8L152Cx/Kx microcontrollers with a 16-Kbyte or 32-Kbyte Flash memory density). These devices are referred to as medium-density devices in the STM8L15x and STM8L16x reference manual (RM0031) and in the STM8L Flash programming manual (PM0054).

For more details on the whole STMicroelectronics ultra-low-power family please refer to [Section 2.2: Ultra-low-power continuum on page 13](#).

For information on the debug module and SWIM (single wire interface module), refer to the STM8 SWIM communication protocol and debug module user manual (UM0470). For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

The medium-density devices provide the following benefits:

- Integrated system
 - Up to 32 Kbyte of medium-density embedded Flash program memory
 - 1 Kbyte of data EEPROM
 - Internal high speed and low-power low speed RC
 - Embedded reset
- Ultra-low power consumption
 - 195 $\mu\text{A}/\text{MHz}$ + 440 μA (consumption)
 - 0.9 μA with LSI in Active-halt mode
 - Clock gated system and optimized power management
 - Capability to execute from RAM for Low power wait mode and Low power run mode
- Advanced features
 - Up to 16 MIPS at 16 MHz CPU clock frequency
 - Direct memory access (DMA) for memory-to-memory or peripheral-to-memory access
- Short development cycles
 - Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals
 - Wide choice of development tools

All devices offer 12-bit ADC, DAC, two comparators, Real-time clock three 16-bit timers, one 8-bit timer as well as standard communication interface such as SPI, I2C and USART. A 4x28-segment LCD is available on the medium-density STM8L152xx line. [Table 2: Medium-density STM8L151x4/6 and STM8L152x4/6 low-power device features and peripheral counts](#) and [Section 3: Functional overview](#) give an overview of the complete range of peripherals proposed in this family.

[Figure 1 on page 14](#) shows the general block diagram of the device family.

The medium-density STM8L15x microcontroller family is suitable for a wide range of applications:

- Medical and hand-held equipment
- Application control and user interface
- PC peripherals, gaming, GPS and sport equipment
- Alarm systems, wired and wireless sensors

2 Description

The medium-density STM8L151x4/6 and STM8L152x4/6 devices are members of the STM8L ultra-low-power 8-bit family. The medium-density STM8L15x family operates from 1.8 V to 3.6 V (down to 1.65 V at power down) and is available in the -40 to +85 °C and -40 to +125 °C temperature ranges.

The medium-density STM8L15x ultra-low-power family features the enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low power operations.

The family includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive In-Application debugging and ultra-fast Flash programming.

All medium-density STM8L15x microcontrollers feature embedded data EEPROM and low-power, low-voltage, single-supply program Flash memory.

They incorporate an extensive range of enhanced I/Os and peripherals.

The modular design of the peripheral set allows the same peripherals to be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, and simplified even more by the use of a common set of development tools.

Six different packages are proposed from 28 to 48 pins. Depending on the device chosen, different sets of peripherals are included.

All STM8L ultra-low-power products are based on the same architecture with the same memory mapping and a coherent pinout.

2.2 Ultra-low-power continuum

The ultra-low-power medium-density STM8L151x4/6 and STM8L152x4/6 devices are fully pin-to-pin, software and feature compatible. Besides the full compatibility within the family, the devices are part of STMicroelectronics microcontrollers ultra-low-power strategy which also includes STM8L101xx and STM8L15xxx. The STM8L and STM32L families allow a continuum of performance, peripherals, system architecture, and features.

They are all based on STMicroelectronics 0.13 μm ultra-low leakage process.

- Note:*
- 1 The STM8L151xx and STM8L152xx are pin-to-pin compatible with STM8L101xx devices.
 - 2 The STM32L family is pin-to-pin compatible with the general purpose STM32F family. Please refer to STM32L15x documentation for more information on these devices.

Performance

All families incorporate highly energy-efficient cores with both Harvard architecture and pipelined execution: advanced STM8 core for STM8L families and ARM® Cortex®-M3 core for STM32L family. In addition specific care for the design architecture has been taken to optimize the mA/DMIPS and mA/MHz ratios.

This allows the ultra-low-power performance to range from 5 up to 33.3 DMIPs.

Shared peripherals

STM8L151xx/152xx and STM8L15xxx share identical peripherals which ensure a very easy migration from one family to another:

- Analog peripherals: ADC1, DAC, and comparators COMP1/COMP2
- Digital peripherals: RTC and some communication interfaces

Common system strategy

To offer flexibility and optimize performance, the STM8L151xx/152xx and STM8L15xxx devices use a common architecture:

- Same power supply range from 1.8 to 3.6 V, down to 1.65 V at power down
- Architecture optimized to reach ultra-low consumption both in low power modes and Run mode
- Fast startup strategy from low power modes
- Flexible system clock
- Ultra-safe reset: same reset strategy for both STM8L15x and STM32L15xxx including power-on reset, power-down reset, brownout reset and programmable voltage detector.

Features

ST ultra-low-power continuum also lies in feature compatibility:

- More than 10 packages with pin count from 20 to 100 pins and size down to 3 x 3 mm
- Memory density ranging from 4 to 128 Kbyte

3.1 Low-power modes

The medium-density STM8L151x4/6 and STM8L152x4/6 devices support five low power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Wait mode:** The CPU clock is stopped, but selected peripherals keep running. An internal or external interrupt, event or a Reset can be used to exit the microcontroller from Wait mode (WFE or WFI mode). Wait consumption: refer to [Table 21](#).
- **Low power run mode:** The CPU and the selected peripherals are running. Execution is done from RAM with a low speed oscillator (LSI or LSE). Flash and data EEPROM are stopped and the voltage regulator is configured in ultra-low-power mode. The microcontroller enters Low power run mode by software and can exit from this mode by software or by a reset.
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode. Low power run mode consumption: refer to [Table 22](#).
- **Low power wait mode:** This mode is entered when executing a Wait for event in Low power run mode. It is similar to Low power run mode except that the CPU clock is stopped. The wakeup from this mode is triggered by a Reset or by an internal or external event (peripheral event generated by the timers, serial interfaces, DMA controller (DMA1), comparators and I/O ports). When the wakeup is triggered by an event, the system goes back to Low power run mode.
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode. Low power wait mode consumption: refer to [Table 23](#).
- **Active-halt mode:** CPU and peripheral clocks are stopped, except RTC. The wakeup can be triggered by RTC interrupts, external interrupts or reset. Active-halt consumption: refer to [Table 24](#) and [Table 25](#).
- **Halt mode:** CPU and peripheral clocks are stopped, the device remains powered on. The RAM content is preserved. The wakeup is triggered by an external interrupt or reset. A few peripherals have also a wakeup from Halt capability. Switching off the internal reference voltage reduces power consumption. Through software configuration it is also possible to wake up the device without waiting for the internal reference voltage wakeup time to have a fast wakeup time of 5 μ s. Halt consumption: refer to [Table 26](#).

3.2 Central processing unit STM8

3.2.1 Advanced STM8 Core

The 8-bit STM8 core is designed for code efficiency and performance with an Harvard architecture and a 3-stage pipeline.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing, and 80 instructions.

Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus - single cycle fetching most instructions
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter - 16 Mbyte linear memory space
- 16-bit stack pointer - access to a 64 Kbyte level stack
- 8-bit condition code register - 7 condition flags for the result of the last instruction

Addressing

- 20 addressing modes
- Indexed indirect addressing mode for lookup tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

3.2.2 Interrupt controller

The medium-density STM8L151x4/6 and STM8L152x4/6 feature a nested vectored interrupt controller:

- Nested interrupts with 3 software priority levels
- 32 interrupt vectors with hardware priority
- Up to 40 external interrupt sources on 11 vectors
- Trap and reset interrupts

3.3 Reset and supply management

3.3.1 Power supply scheme

The device requires a 1.65 V to 3.6 V operating supply voltage (V_{DD}). The external power supply pins must be connected as follows:

- V_{SS1} ; V_{DD1} = 1.8 to 3.6 V, down to 1.65 V at power down: external power supply for I/Os and for the internal regulator. Provided externally through V_{DD1} pins, the corresponding ground pin is V_{SS1} .
- V_{SSA} ; V_{DDA} = 1.8 to 3.6 V, down to 1.65 V at power down: external power supplies for analog peripherals (minimum voltage to be applied to V_{DDA} is 1.8 V when the ADC1 is used). V_{DDA} and V_{SSA} must be connected to V_{DD1} and V_{SS1} , respectively.
- V_{SS2} ; V_{DD2} = 1.8 to 3.6 V, down to 1.65 V at power down: external power supplies for I/Os. V_{DD2} and V_{SS2} must be connected to V_{DD1} and V_{SS1} , respectively.
- V_{REF+} ; V_{REF-} (for ADC1): external reference voltage for ADC1. Must be provided externally through V_{REF+} and V_{REF-} pin.
- V_{REF+} (for DAC): external voltage reference for DAC must be provided externally through V_{REF+} .

3.3.2 Power supply supervisor

The device has an integrated ZEROPOWER power-on reset (POR)/power-down reset (PDR), coupled with a brownout reset (BOR) circuitry. At power-on, BOR is always active, and ensures proper operation starting from 1.8 V. After the 1.8 V BOR threshold is reached, the option byte loading process starts, either to confirm or modify default thresholds, or to disable BOR permanently (in which case, the V_{DD} min value at power down is 1.65 V).

Five BOR thresholds are available through option bytes, starting from 1.8 V to 3 V. To reduce the power consumption in Halt mode, it is possible to automatically switch off the internal reference voltage (and consequently the BOR) in Halt mode. The device remains under reset when V_{DD} is below a specified threshold, $V_{POR/PDR}$ or V_{BOR} , without the need for any external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the V_{DD}/V_{DDA} power supply and compares it to the V_{PVD} threshold. This PVD offers 7 different levels between 1.85 V and 3.05 V, chosen by software, with a step around 200 mV. An interrupt can be generated when V_{DD}/V_{DDA} drops below the V_{PVD} threshold and/or when V_{DD}/V_{DDA} is higher than the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

3.3.3 Voltage regulator

The medium-density STM8L151x4/6 and STM8L152x4/6 embeds an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes:

- Main voltage regulator mode (MVR) for Run, Wait for interrupt (WFI) and Wait for event (WFE) modes.
- Low power voltage regulator mode (LPVR) for Halt, Active-halt, Low power run and Low power wait modes.

When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

3.4 Clock management

The clock controller distributes the system clock (SYSCLK) coming from different oscillators to the core and the peripherals. It also manages clock gating for low power modes and ensures clock robustness.

Features

- **Clock prescaler:** to get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler
- **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock sources:** 4 different clock sources can be used to drive the system clock:
 - 1-16 MHz High speed external crystal (HSE)
 - 16 MHz High speed internal RC oscillator (HSI)
 - 32.768 kHz Low speed external crystal (LSE)
 - 38 kHz Low speed internal RC (LSI)
- **RTC and LCD clock sources:** the above four sources can be chosen to clock the RTC and the LCD, whatever the system clock.
- **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** This feature can be enabled by software. If a HSE clock failure occurs, the system clock is automatically switched to HSI.
- **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

Figure 2. Medium-density STM8L151x4/6 and STM8L152x4/6 clock tree diagram

1. The HSE clock source can be either an external crystal/ceramic resonator or an external source (HSE bypass). Refer to *Section HSE clock* in the STM8L15x and STM8L16x reference manual (RM0031).
2. The LSE clock source can be either an external crystal/ceramic resonator or a external source (LSE bypass). Refer to *Section LSE clock* in the STM8L15x and STM8L16x reference manual (RM0031).

3.5 Low power real-time clock

The real-time clock (RTC) is an independent binary coded decimal (BCD) timer/counter.

Six byte locations contain the second, minute, hour (12/24 hour), week day, date, month, year, in BCD (binary coded decimal) format. Correction for 28, 29 (leap year), 30, and 31 day months are made automatically.

It provides a programmable alarm and programmable periodic interrupts with wakeup from Halt capability.

- Periodic wakeup time using the 32.768 kHz LSE with the lowest resolution (of 61 μ s) is from min. 122 μ s to max. 3.9 s. With a different resolution, the wakeup time can reach 36 hours
- Periodic alarms based on the calendar can also be generated from every second to every year

3.6 LCD (Liquid crystal display)

The liquid crystal display drives up to 4 common terminals and up to 28 segment terminals to drive up to 112 pixels.

- Internal step-up converter to guarantee contrast control whatever V_{DD} .
- Static 1/2, 1/3, 1/4 duty supported.
- Static 1/2, 1/3 bias supported.
- Phase inversion to reduce power consumption and EMI.
- Up to 4 pixels which can be programmed to blink.
- The LCD controller can operate in Halt mode.

Note: Unnecessary segments and common pins can be used as general I/O pins.

3.7 Memories

The medium-density STM8L151x4/6 and STM8L152x4/6 devices have the following main features:

- Up to 2 Kbyte of RAM
- The non-volatile memory is divided into three arrays:
 - Up to 32 Kbyte of medium-density embedded Flash program memory
 - 1 Kbyte of data EEPROM
 - Option bytes.

The EEPROM embeds the error correction code (ECC) feature. It supports the read-while-write (RWW): it is possible to execute the code from the program matrix while programming/erasing the data matrix.

The option byte protects part of the Flash program memory from write and readout piracy.

3.8 DMA

A 4-channel direct memory access controller (DMA1) offers a memory-to-memory and peripherals-from/to-memory transfer capability. The 4 channels are shared between the following IPs with DMA capability: ADC1, DAC, I2C1, SPI1, USART1, the four Timers.

3.9 Analog-to-digital converter

- 12-bit analog-to-digital converter (ADC1) with 25 channels (including 1 fast channel), temperature sensor and internal reference voltage
- Conversion time down to 1 μ s with $f_{SYSCLK} = 16$ MHz
- Programmable resolution
- Programmable sampling time
- Single and continuous mode of conversion
- Scan capability: automatic conversion performed on a selected group of analog inputs
- Analog watchdog
- Triggered by timer

Note: ADC1 can be served by DMA1.

3.10 Digital-to-analog converter (DAC)

- 12-bit DAC with output buffer
- Synchronized update capability using TIM4
- DMA capability
- External triggers for conversion
- Input reference voltage V_{REF+} for better resolution

Note: DAC can be served by DMA1.

3.11 Ultra-low-power comparators

The medium-density STM8L151x4/6 and STM8L152x4/6 embed two comparators (COMP1 and COMP2) sharing the same current bias and voltage reference. The voltage reference can be internal or external (coming from an I/O).

- One comparator with fixed threshold (COMP1).
- One comparator rail to rail with fast or slow mode (COMP2). The threshold can be one of the following:
 - DAC output
 - External I/O
 - Internal reference voltage or internal reference voltage sub multiple (1/4, 1/2, 3/4)

The two comparators can be used together to offer a window function. They can wake up from Halt mode.

3.12 System configuration controller and routing interface

The system configuration controller provides the capability to remap some alternate functions on different I/O ports. TIM4 and ADC1 DMA channels can also be remapped.

The highly flexible routing interface allows application software to control the routing of different I/Os to the TIM1 timer input captures. It also controls the routing of internal analog signals to ADC1, COMP1, COMP2, DAC and the internal reference voltage V_{REFINT} . It also provides a set of registers for efficiently managing the charge transfer acquisition sequence ([Section 3.13: Touch sensing](#)).

3.13 Touch sensing

Medium-density STM8L151x4/6 and STM8L152x4/6 devices provide a simple solution for adding capacitive sensing functionality to any application. Capacitive sensing technology is able to detect finger presence near an electrode which is protected from direct touch by a dielectric (example, glass, plastic). The capacitive variation introduced by a finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists of charging the electrode capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. In medium-density STM8L151x4/6

and STM8L152x4/6 devices, the acquisition sequence is managed by software and it involves analog I/O groups and the routing interface.

Reliable touch sensing solutions can be quickly and easily implemented using the free STM8 Touch Sensing Library.

3.14 Timers

Medium-density STM8L151x4/6 and STM8L152x4/6 devices contain one advanced control timer (TIM1), two 16-bit general purpose timers (TIM2 and TIM3) and one 8-bit basic timer (TIM4).

All the timers can be served by DMA1.

[Table 3](#) compares the features of the advanced control, general-purpose and basic timers.

Table 3. Timer feature comparison

Timer	Counter resolution	Counter type	Prescaler factor	DMA1 request generation	Capture/compare channels	Complementary outputs
TIM1	16-bit	up/down	Any integer from 1 to 65536	Yes	3 + 1	3
TIM2			Any power of 2 from 1 to 128		2	None
TIM3						
TIM4	8-bit	up	Any power of 2 from 1 to 32768		0	

3.14.1 TIM1 - 16-bit advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver.

- 16-bit up, down and up/down autoreload counter with 16-bit prescaler
- 3 independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- 1 additional capture/compare channel which is not connected to an external I/O
- Synchronization module to control the timer with external signals
- Break input to force timer outputs into a defined state
- 3 complementary outputs with adjustable dead time
- Encoder mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)

3.14.2 16-bit general purpose timers

- 16-bit autoreload (AR) up/down-counter
- 7-bit prescaler adjustable to fixed power of 2 ratios (1...128)
- 2 individually configurable capture/compare channels
- PWM mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)
- Synchronization with other timers or external signals (external clock, reset, trigger and enable)

3.14.3 8-bit basic timer

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow or for DAC trigger generation.

3.15 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

3.15.1 Window watchdog timer

The window watchdog (WWDG) is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

3.15.2 Independent watchdog timer

The independent watchdog peripheral (IWDG) can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the internal LSI RC clock source, and thus stays active even in case of a CPU clock failure.

3.16 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

3.17 Communication interfaces

3.17.1 SPI

The serial peripheral interface (SPI1) provides half/ full duplex synchronous serial communication with external devices.

- Maximum speed: 8 Mbit/s ($f_{\text{SYSCLK}}/2$) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on 2 lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- Hardware CRC calculation
- Slave/master selection input pin

Note: SPI1 can be served by the DMA1 Controller.

3.17.2 I²C

The I²C bus interface (I²C1) provides multi-master capability, and controls all I²C bus-specific sequencing, protocol, arbitration and timing.

- Master, slave and multi-master capability
- Standard mode up to 100 kHz and fast speed modes up to 400 kHz.
- 7-bit and 10-bit addressing modes.
- SMBus 2.0 and PMBus support
- Hardware CRC calculation

Note: I²C1 can be served by the DMA1 Controller.

3.17.3 USART

The USART interface (USART1) allows full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

- 1 Mbit/s full duplex SCI
- SPI1 emulation
- High precision baud rate generator
- SmartCard emulation
- IrDA SIR encoder decoder
- Single wire half duplex mode

Note: USART1 can be served by the DMA1 Controller.

3.18 Infrared (IR) interface

The medium-density STM8L151x4/6 and STM8L152x4/6 devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

3.19 Development support

Development tools

Development tools for the STM8 microcontrollers include:

- The STice emulation system offering tracing and code profiling
- The STVD high-level language debugger including C compiler, assembler and integrated development environment
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

Single wire data interface (SWIM) and debug module

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The single-wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, CPU operation can also be monitored in real-time by means of shadow registers.

Bootloader

A bootloader is available to reprogram the Flash memory using the USART1 interface. The reference document for the bootloader is *UM0560: STM8 bootloader user manual*.

- At power-up, the PA1/NRST pin is a reset input pin with pull-up. To be used as a general purpose pin (PA1), it can be configured only as output open-drain or push-pull, not as a general purpose input. Refer to Section *Configuring NRST/PA1 pin as general purpose output* in the STM8L15x and STM8L16x reference manual (RM0031).
- Available on STM8L152xx devices only.
- In the 3.6 V tolerant I/Os, protection diode to V_{DD} is not implemented.
- [] Alternate function remapping option (if the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).
- In the 5 V tolerant I/Os, protection diode to V_{DD} is not implemented.
- A pull-up is applied to PB0 and PB4 during the reset phase. These two pins are input floating after reset release.
- In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, weak pull-up and protection diode to V_{DD} are not implemented).
- Available on STM8L151xx devices only.
- The PA0 pin is in input pull-up during the reset phase and after reset release.
- High Sink LED driver capability available on PA0.

Note: The slope control of all GPIO pins, except true open drain pins, can be programmed. By default, the slope control is limited to 2 MHz.

4.1 System configuration options

As shown in [Table 5: Medium-density STM8L151x4/6, STM8L152x4/6 pin description](#), some alternate functions can be remapped on different I/O ports by programming one of the two remapping registers described in the “Routing interface (RI) and system configuration controller” section in the STM8L15xxx and STM8L16xxx reference manual (RM0031).

5 Memory and register map

5.1 Memory mapping

The memory map is shown in [Figure 9](#).

Figure 9. Memory map

1. [Table 6](#) lists the boundary addresses for each memory size. The top of the stack is at the RAM end address.
2. The VREFINT_Factory_CONV byte represents the LSB of the V_{REFINT} 12-bit ADC conversion result. The MSB have a fixed value: 0x6.
3. The TS_Factory_CONV_V90 byte represents the LSB of the V₉₀ 12-bit ADC conversion result. The MSB

have a fixed value: 0x3.

4. Refer to [Table 9](#) for an overview of hardware register mapping, to [Table 8](#) for details on I/O port hardware registers, and to [Table 10](#) for information on CPU/SWIM/debug module controller registers.

Table 6. Flash and RAM boundary addresses

Memory area	Size	Start address	End address
RAM	2 Kbyte	0x00 0000	0x00 07FF
Flash program memory	16 Kbyte	0x00 8000	0x00 BFFF
	32 Kbyte	0x00 8000	0x00 FFFF

0x00 4911	-	TS_Factory_CONV_V90 ⁽²⁾	Temperature sensor output voltage	0xXX

1. The VREFINT_Factory_CONV byte represents the 8 LSB of the result of the VREFINT 12-bit ADC conversion performed in factory. The MSB have a fixed value: 0x6.
2. The TS_Factory_CONV_V90 byte represents the 8 LSB of the result of the V90 12-bit ADC conversion performed in factory. The 2 MSB have a fixed value: 0x3.

1. The Low power wait mode is entered when executing a WFE instruction in Low power run mode. In WFE mode, the interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. When the interrupt is configured as a wakeup event, the CPU wakes up and resumes processing.
2. The interrupt from PVD is logically OR-ed with Port E and F interrupts. Register EXTI_CONF allows to select between Port E and Port F interrupt (see [External interrupt port select register \(EXTI_CONF\)](#) in the RM0031).
3. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated memory block.

All option bytes can be modified in ICP mode (with SWIM) by accessing the EEPROM address. See [Table 12](#) for details on option byte addresses.

The option bytes can also be modified 'on the fly' by the application in IAP mode, except for the ROP and UBC values which can only be taken into account when they are modified in ICP mode (with the SWIM).

Refer to the STM8L15x Flash programming manual (PM0054) and STM8 SWIM and Debug Manual (UM0470) for information on SWIM programming procedures.

OPTBL	OPTBL[15:0]: This option is checked by the boot ROM code after reset. Depending on content of addresses 00 480B, 00 480C and 0x8000 (reset vector) the CPU jumps to the bootloader or to the reset vector. Refer to the UM0560 bootloader user manual for more details.

8 Unique ID

STM8 devices feature a 96-bit unique device identifier which provides a reference number that is unique for any device and in any context. The 96 bits of the identifier can never be altered by the user.

The unique device identifier can be read in single bytes and may then be concatenated using a custom algorithm.

The unique device identifier is ideally suited:

- For use as serial numbers
- For use as security keys to increase the code security in the program memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal memory.
- To activate secure boot processes

9 Electrical parameters

9.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS} .

9.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^{\circ}\text{C}$ and $T_A = T_A \text{ max}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics is indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ($\text{mean} \pm 3\Sigma$).

9.1.2 Typical values

Unless otherwise specified, typical data is based on $T_A = 25\text{ }^{\circ}\text{C}$, $V_{DD} = 3\text{ V}$. It is given only as design guidelines and is not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ($\text{mean} \pm 2\Sigma$).

9.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

9.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 10](#).

Figure 10. Pin loading conditions

9.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 11](#).

Figure 11. Pin input voltage

MSv37775V1

9.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 15: Voltage characteristics](#), [Table 16: Current characteristics](#), and [Table 17: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Device mission profile (application conditions) is compliant with JEDEC JESD47 Qualification Standard, extended mission profiles are available on demand.

Table 15. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DD} - V_{SS}$	External supply voltage (including V_{DDA} and V_{DD2}) ⁽¹⁾	- 0.3	4.0	V
V_{IN} ⁽²⁾	Input voltage on true open-drain pins (PC0 and PC1)	$V_{SS} - 0.3$	$V_{DD} + 4.0$	V
	Input voltage on five-volt tolerant (FT) pins (PA7 and PE0)	$V_{SS} - 0.3$	$V_{DD} + 4.0$	
	Input voltage on 3.6 V tolerant (TT) pins	$V_{SS} - 0.3$	4.0	
	Input voltage on any other pin	$V_{SS} - 0.3$	4.0	
V_{ESD}	Electrostatic discharge voltage	see Absolute maximum ratings (electrical sensitivity) on page 115		

1. All power (V_{DD1} , V_{DD2} , V_{DDA}) and ground (V_{SS1} , V_{SS2} , V_{SSA}) pins must always be connected to the external power supply.
2. V_{IN} maximum must always be respected. Refer to [Table 16](#) for maximum allowed injected current values.

Table 16. Current characteristics

Symbol	Ratings	Max.	Unit
I_{VDD}	Total current into V_{DD} power line (source)	80	mA
I_{VSS}	Total current out of V_{SS} ground line (sink)	80	
I_{IO}	Output current sunk by IR_TIM pin (with high sink LED driver capability)	80	
	Output current sunk by any other I/O and control pin	25	
	Output current sourced by any I/Os and control pin	- 25	
$I_{INJ(PIN)}$	Injected current on true open-drain pins (PC0 and PC1) ⁽¹⁾	- 5 / +0	mA
	Injected current on five-volt tolerant (FT) pins (PA7 and PE0) ⁽¹⁾	- 5 / +0	
	Injected current on 3.6 V tolerant (TT) pins ⁽¹⁾	- 5 / +0	
	Injected current on any other pin ⁽²⁾	- 5 / +5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) ⁽³⁾	± 25	

1. Positive injection is not possible on these I/Os. A negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer to [Table 15](#) for maximum allowed input voltage values.
2. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer to [Table 15](#) for maximum allowed input voltage values.
3. When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values).

1. $f_{SYSCLK} = f_{CPU}$

2. 1.8 V at power-up, 1.65 V at power-down if BOR is disabled

3. To calculate $P_{Dmax}(T_A)$, use the formula $P_{Dmax} = (T_{Jmax} - T_A) / \Theta_{JA}$ with T_{Jmax} in this table and Θ_{JA} in "Thermal characteristics" table.

4. T_{Jmax} is given by the test limit. Above this value the product behavior is not guaranteed.

9.3.3 Supply current characteristics

Total current consumption

The MCU is placed under the following conditions:

- I All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)
- I All peripherals are disabled except if explicitly mentioned.

In the following table, data is based on characterization results, unless otherwise specified.

Subject to general operating conditions for V_{DD} and T_A .

HSE crystal/ceramic resonator oscillator

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

9.3.6 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DD} (for standard pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error, out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation, LCD levels, etc.).

The test results are given in the following table.

Table 37. I/O current injection susceptibility

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I_{INJ}	Injected current on true open-drain pins (PC0 and PC1)	-5	+0	mA
	Injected current on all five-volt tolerant (FT) pins	-5	+0	
	Injected current on all 3.6 V tolerant (TT) pins	-5	+0	
	Injected current on any other pin	-5	+5	

9.3.7 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

The reset network shown in [Figure 33](#) protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max. level specified in [Table 42](#). Otherwise the reset is not taken into account internally.

For power consumption sensitive applications, the external reset capacitor value can be reduced to limit the charge/discharge current. If the NRST signal is used to reset the external circuitry, attention must be paid to the charge/discharge time of the external capacitor to fulfill the external devices reset timing conditions. The minimum recommended capacity is 10 nF.

1. f_{SYSCLK} must be at least equal to 8 MHz to achieve max fast I²C speed (400 kHz).

2. Data based on standard I²C protocol requirement, not tested in production.

Note: For speeds around 200 kHz, the achieved speed can have a $\pm 5\%$ tolerance
 For other speed ranges, the achieved speed can have a $\pm 2\%$ tolerance
 The above variations depend on the accuracy of the external components used.

- The current consumption through V_{REF} is composed of two parameters:
 - one constant (max 300 μA)
 - one variable (max 400 μA), only during sampling time + 2 first conversion pulses.
 So, peak consumption is $300+400 = 700\text{ }\mu\text{A}$ and average consumption is $300 + [(4\text{ sampling} + 2) / 16] \times 400 = 450\text{ }\mu\text{A}$ at 1MSPs
- V_{REF-} or V_{DDA} must be tied to ground.
- Guaranteed by design.
- Minimum sampling and conversion time is reached for maximum $R_{ext} = 0.5\text{ k}\Omega$
- Value obtained for continuous conversion on fast channel.
- The time between 2 conversions, or between ADC ON and the first conversion must be lower than t_{IDLE} .
- The t_{IDLE} maximum value is ∞ on the "Z" revision code of the device.

In the following three tables, data is guaranteed by characterization result, not tested in production.

Figure 39. Typical connection diagram using the ADC

1. Refer to [Table 53](#) for the values of R_{AIN} and C_{ADC} .
2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.

General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 41](#) or [Figure 42](#), depending on whether V_{REF+} is connected to V_{DDA} or not. Good quality ceramic 10 nF capacitors should be used. They should be placed as close as possible to the chip.

Figure 42. Power supply and reference decoupling (V_{REF+} connected to V_{DDA})

9.3.15 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Table 58. EMS data

Symbol	Parameter	Conditions		Level/ Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = +25\text{ }^{\circ}\text{C}$, $f_{CPU} = 16\text{ MHz}$, conforms to IEC 61000		3B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = +25\text{ }^{\circ}\text{C}$, $f_{CPU} = 16\text{ MHz}$, conforms to IEC 61000	Using HSI	4A
			Using HSE	2B

Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm IEC61967-2 which specifies the board and the loading of each pin.

Table 59. EMI data ⁽¹⁾

Symbol	Parameter	Conditions	Monitored frequency band	Max vs.	Unit

			130 MHz to 1 GHz	4	
			SAE EMI Level	2	-

1. Not tested in production.

Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). Two models can be simulated: human body model and charge device model. This test conforms to the JESD22-A114A/A115A standard.

Table 60. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Maximum value ⁽¹⁾	Unit
V _{ESD(HBM)}	Electrostatic discharge voltage (human body model)	T _A = +25 °C	2000	V
V _{ESD(CDM)}	Electrostatic discharge voltage (charge device model)		500

Static latch-up

- **LU:** 3 complementary static tests are required on 6 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

10.8 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in [Table 18: General operating conditions on page 66](#).

The maximum chip-junction temperature, T_{Jmax} , in degree Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W
- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)
- P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$ represents the maximum power dissipation on output pins

Where:

$$P_{I/Omax} = \Sigma (V_{OL} \cdot I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \cdot I_{OH}),$$

taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Date	Revision	Changes
06-Aug-2009	1	Initial release
10-Sep-2009	2	Updated peripheral naming throughout document. Added <i>Figure: STM8L151Cx 48-pin pinout (without LCD)</i>. Added capacitive sensing channels in <i>Features</i>. Updated PA7, PC0 and PC1 in <i>Table: Medium density STM8L15x pin description</i>. Changed CLK and REMAP register names. Changed description of WDGHALT. Added typical power consumption values in <i>Table 18</i> to <i>Table 26</i>. Corrected VIH max value.
11-Dec-2009	3	Added WLCSP28 package Modified <i>Figure: Memory map</i> and added 2 notes. Modified Low power run mode in <i>Section: Low power modes</i>. Added <i>Section: Unique ID</i>. Modified <i>Table: Interrupt mapping</i> (added reserved area at address 0x00 8008) Modified OPT4 option bits in <i>Table: Option byte addresses</i>. <i>Table: Option byte description</i>: modified OPT0 description ("disable" instead of "enable") and OPT1 description Added OPTBL option bytes Modified <i>Section: Electrical parameters</i>.
02-Apr-2010	4	Changed title of the document (STM8L151x4, STM8L151x6, STM8L152x4, STM8L152x6) Changed pinout (V_{SS1}, V_{DD1}, V_{SS2}, V_{DD2} instead of V_{SS}, V_{DD}, V_{SSIO}, V_{DDIO}) Changed packages Changed first page Modified note 1 in <i>Table: Medium density STM8L15x pin description</i>. Added note to PA7, PC0, PC1 and PE0 in <i>Table: Medium density STM8L15x pin description</i>. Modified <i>Figure: Memory map</i>. Modified <i>Table: WLCSP28 – 28-pin wafer level chip scale package, package mechanical data</i> (min and max columns swapped) Modified <i>Figure: WLCSP28 – 28-pin wafer level chip scale package, package outline</i> (A1 ball location) Renamed Rm, Lm and Cm EXTI_CONF replaced with EXTI_CONF1 in <i>Table: General hardware register map</i>. Updated <i>Section: Electrical parameters</i>.

10-Feb-2012	8	<i>Features</i>: replaced “Dynamic consumption” with ‘Consumption’. <i>Table: Medium density STM8L15x pin description</i>: updated OD column of NRST/PA1 pin. <i>Table: Interrupt mapping</i>: removed tamper 1, tamper 2 and tamper 3. <i>Figure: UFQFPN48 package outline</i>: replaced. <i>Table: UFQFPN48 package mechanical data</i>: updated title. <i>Figure: UFQFPN32 - 32-lead ultra thin fine pitch quad flat no-lead package outline (5 x 5)</i>: removed the line over A1. <i>Figure: UFQFPN28 package outline</i>: replaced to improve readability of UFQFPN28 package dimensions A, L, and L1. <i>Figure: Recommended UFQFPN28 footprint (dimensions in mm)</i>: updated title. <i>Figure: WLCSP28 package outline</i>: updated title. <i>Table: WLCSP28 package mechanical data</i>: updated title.
02-Mar-2012	9	Updated <i>Table: UFQFPN48 package mechanical data</i>. Updated <i>Figure: UFQFPN28 package outline</i>, <i>Figure: Recommended UFQFPN28 footprint (dimensions in mm)</i> and <i>Table: UFQFPN28 package mechanical data</i>. <i>Table: WLCSP28 package mechanical data</i>: Min and Max values removed for e1, e2, e3, e4, F and G dimensions.
30-Mar-2012	10	<i>Figure: SPI1 timing diagram - master mode(1)</i>: changed SCK signals to ‘output’ instead of ‘input’. <i>Figure: Medium density STM8L15x ordering information scheme</i>: added ‘Tape & reel’ to package section.
26-Apr-2012	11	Updated <i>Table: WLCSP28 package mechanical data</i> .
12-Nov-2013	12	Updated <i>Table: WLCSP28 package mechanical data</i>. Updated <i>Table: Medium-density STM8L15x pin description</i>. Updated <i>Table 2: Medium density STM8L15x low power device features and peripheral counts</i>. Added <i>Figure: Recommended LQFP48 footprint</i> and <i>Figure: Recommended LQFP32 footprint</i>.
12-Aug-2013	13	Changed the default setting value of OPT5 to 0x00 in <i>Table: Option byte addresses</i>. Added tTEMP ‘BOR detector enabled’ and ‘disabled’ characteristics in <i>Table: Embedded reset and power control block characteristics</i>. Updated E2, D2 and ddd in <i>Table: UFQFPN48 package mechanical data</i>

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
